times for 'free trade,' if it works hard, all you have to do is buckle a knapsack to your back, or mount a pedlar's cart, and pioneer your way with your goods to the new settlements, the foreigners will not follow you there, and you can make profitable trips; the tinner have stood it, and so can you. Would not any merchant in the country feel himself insulted if such language were addressed to one of that respectable profession, and yet this in substance is said to others who have the same right to protection in their business, as the ship owners have in theirs.

Then again, the tariff puts a duty of a cent on foreign tallow, which makes candles come dear to a poor man with his last penny. Well, how was it in your free trade times? Foreign tallow in those days instead of paying one cent, paid ten cents duty; where was your sympathy for the poor man and his penny then?

But the cabinet maker, the hatter, the shoemaker, the carriage maker, are all oppressed, says Mr Woodward, though they are protected in their business, by duties of thirty per cent, on foreign articles like those they make, and receive such raw materials as mahogany, dye stuffs, furs, hides and skins, free of duty! It was but a short time ago that Mr Condy Raguet, the great leader of the foreign system, complained of all these people as monopolists and extortioners. He said among other things that we paid an odious bounty of three dollars to the cabinet makers, on a coffin or cradle costing ten dollars, because imported cabinet ware is taxed with thirty per cent duty.—He would probably have us send to Europe for our cradles and coffins. The New York Evening Post, another foreign system advocate, selected hats, and boots and shoes, the last week, as among the most odious articles protected by the tariff, and represented the hatters and shoemakers, as taking thirty per cent more for their articles than they deserve to have, because of the duties on foreign hats, boots and shoes. Mr Woodward does not go that length,—he thinks, or says he thinks, those are oppressed, whom his leader, Mr Raguet, and his sub-leader of the Evening Post, represents as thriving under government bounty. Who shall decide when doctors differ? The article that appears to be most obnoxious to Mr Woodward, as well as his fellow laborer, Mr Peck, is leather.—They both select that as a specimen of oppressive duties. It is abominable, they say, that English leather should pay a protecting duty to favor our tanners and curriers. Suppose Mr Woodward and Mr Peck should be gratified in letting English leather come in freely, to put down our tanneries. Mr Raguet will come along next, and insist upon English hats, boots and shoes, saddles, harnesses, bookbinders' work, cabinet work and carriages, coming in free to break up the establishment of the men whom he represents as monopolists and extortioners. Mr Somebodyelse will then come, and insist that all the rest should be served alike, and he too being gratified, we should find ourselves in that glorious state of 'free trade,' which Mr Robertson, a distinguished member of Parliament, lately said, they meant to put us in, when the British, 'by means of the great advantages they enjoyed, should get a monopoly of all our markets for their manufactures.'—*Columbian Register*.

Turtle Catchers on the Coast of Darien.—At San Blas, on the coast of Darien, a small settlement of Indians is established for the sole purpose

of taking turtle. The settlement is situated among a group of bays, and has a small but very secure harbor, in which coasters may safely ride. It is under the management of three English, two American, and three Colombian traders, who make a vast profit from the shells. The quantity of tortoise-shell taken by them amount on an average to 15,000 lbs. per year, the value of which is about 28,000*l*. The produce of their employment varies very much according to the nature of the season, as in some years they take as much as 32,000*l*. worth of shell; an enormous produce for one out of the many like establishments on this coast. It is a curious fact that the handsomest shell, and consequently the most valuable, is stripped from the animal while living, the beauty of the shell always becoming less as the animal dies. The dreadful torture which the creature endures by the operation, finds no consideration in the minds of the traders.—*Foreign Publication*.

Canine Rivalship and Revenge.—A short time ago, a fine dog of great value, was added to the stock kept by Sir W. M. Napier of Milliken. On arrival, he found that a setter dog was a very great favorite. Unable to supplant him in his master's favor he began to manifest towards his favored rival the most decided enmity, and the greatest care had to be taken, by keeping him in a chain, to prevent hostilities. The English dog was lent to a gentleman a few days ago, for a day's shooting, and, after the sport was over, he was locked into a stable at Johnstone Castle. Finding himself at liberty, and what was better, without a chain, he thought of his rival, and resolved on war. He soon succeeded by gnawing the standards of the stable window, in making his escape, when he set off full speed, on hostile strife intent, for Milliken policies, found out and attacked his rival, and before the morning dawned, left him lifeless on the field of battle. Dearly, however, did the favorite sell his life, for so dreadfully mangled was the assailant, that his master, moved by pity at his dreadful agony, consented that a period should be put to his sufferings.—*Glasgow Courier*.

Zinc.—Zinc is mostly found in the state of a sulphuret, and accompanies lead in most mines. It is found in the Southampton lead mines in granite and gneiss. It is found in crystals of a waxy hue and almost transparent, in the godfearous lime rock (or swine stone) everywhere from Genesee river to 20 or 30 miles west of Niagara Falls. It is one of the most abundant metals in nature except iron; and in Wales its ore was employed till lately in mending the roads. It is used in China for the current coin, and for that purpose is employed in the utmost purity. It is a very combustible metal, and when broken appears of a shining bluish white. It becomes fusible in a temperature of 70 deg. F. above zero, and is 7 times heavier than water.—*Naturalist*.

A new kind of Paper has been lately manufactured in France, which is stated to be superior to any other for certain purposes. It is made from the root of the *Althea officinalis*, and is spoken of as 'by far the best kind of tracing paper, permitting the use of ink on the black lead pencil, besides being of a purer color than any other.'

Silk.—We notice that the inhabitants of the town of Poughkeepsie intend applying to the Legislature of New York for the incorporation of a company, with a capital of thirty thousand dollars, to be employed in the cultivation of Silk.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 4, 1832.

FRUITS AND FRUIT TREES.

The following valuable remarks are extracted and abridged from a review of *A Guide to the Orchard and Kitchen Garden, &c.* by GEORGE LINDLEY: originally published in *London's Magazine*.

All our garden fruits are but ameliorated varieties of such as are wild. The amelioration has resulted from human skill, time and accident; and being so produced can only by art be continued. Hence the two great operations for procuring and perpetuating improved varieties of fruits are, amelioration and propagation.

Amelioration 'consists either in acquiring new or improved varieties of fruit, or in increasing their good qualities when acquired. There is in all beings a disposition to deviate from their original nature when cultivated, or even in a wild state.—But this disposition is so strong in some as to render them particularly adapted to become subject to domestication: for instance the dog, the pigeon, and the barn-yard fowl are cases in which this tendency is most strongly marked in animals; and domesticated fruits are a parallel case in the vegetable world.

'Cultivators increase this disposition chiefly in two ways: either by constantly selecting the finest existing varieties for seed, or by intermixing the pollen and stigma of two varieties for the purpose of procuring something of an intermediate nature. The power of obtaining cross-bred varieties at pleasure has only existed since the discovery of sexes in plants. In selecting seed from the finest existing varieties, we should, moreover, take care to select it from the landmost, largest and most perfectly ripened specimens of those varieties; for "a seedling plant will always partake more or less of the character of its parent, the qualities of which are concentrated in the embryo, when it has arrived at full maturity." Now, if the general qualities of a given variety are concentrated in the embryo under any circumstances, it is reasonable to suppose that they will be most especially concentrated in a seed taken from that part of a tree in which its peculiar good qualities reside in the highest degree. For instance in the fruit of an apple, growing upon a north wall, there is a smaller formation of sugar than in the same variety growing on a south wall; and it can be easily understood that the seed of that fruit, which is itself least capable of forming saccharine solutions, will acquire from its parent a less power of the same nature than if it had been formed within a fruit in which the saccharine principle was abundant. It should, therefore, be always an object with a gardener, in selecting a variety to become the parent of a new sort, to stimulate that variety by every means in his power to produce the largest and most fully ripened fruit that it is capable of bearing. The importance of doing this is well known in regard to melons and cucumbers, and also in preserving fugitive varieties of flowers; but it is not generally practised in raising fruit trees.'

Cross-bred Varieties.—The power of procuring intermediate varieties by the intermixture of the pollen and stigma of two different parents is, however, that which most deserves consideration. We all know that hybrid plants are constantly produced in every garden, and that improvements

of the most remarkable kind are yearly occurring in consequence. All cases, however, of cross-fertilization are subject to "a practical consequence of great importance," namely, that "the new variety will take chiefly after its polleniferous or male parent; and that at the same time it will acquire some of the constitutional peculiarities of its mother. The limits within which experiments of this kind must be confined are, however, narrow. It seems that cross-fertilization will not take place at all, or very rarely, but between different species, unless these species are nearly related to each other, and that the offspring of the two distinct species is itself sterile, or, if it possesses the power of multiplying itself by seed, its progeny returns back to the state of one or other of its parents.

'Hence it seldom or never has happened that domesticated fruits have had such an origin. We have no varieties raised between the apple and the pear, or the quince and the latter, or the plum and cherry, or the gooseberry and currant.—On the other hand, new varieties, obtained by the intermixture of two pre-existing varieties, are not less prolific, but on the contrary often more so than either of their parents; witness the numerous sorts of Flemish pears, which have been raised by cross-fertilization from bad bearers within the last twenty years, and which are the most prolific fruit trees with which gardeners are acquainted; witness also Mr Knight's cherries, raised between the May duke and the graffion, and Eve's golden drop plum, raised from the green gage fertilized by the yellow magnum bonum. It is, therefore, to the intermixture of the most valuable existing varieties of fruit that gardeners should trust for the amelioration of their stock.'

To cause bad bearers to be prolific, the means are, '1. By ringing the bark. 2. By bending branches downwards. 3. By training; and 4. By the use of different kinds of stocks. All these practices are intended to produce exactly the same effects by different ways. Whatever tends to cause a rapid diffusion of the sap and secretions of any plant, causes also the formation of leaf buds instead of flower buds; and on the contrary, whatever tends to cause an accumulation of sap and secretions has the effect of producing flower buds in abundance.' Ringing, by tending to prevent the return of sap to the part below the ring, also tends to cause the desired accumulation of sap in the part above the ring.

Bending down the branches effects the same accumulation with more certainty. When branches are in their natural or erect position, the fluids are diffused through their vessels or tissue uninterruptedly and rapidly; but by bending down the branches, the vessels become more or less compressed, and contribute to the accumulation of the juices or sap, by preventing its rapid diffusion.—Training, as branches in this process are usually bent, effects the same object in the same manner; as well as by fixing the branches, and so preventing their being agitated by winds, as this agitation is known to facilitate the movement of the fluids. Nor is the influence of the stock of an essentially different nature. In proportion as the scion and the stock approach each other closely in constitution, the less effect is produced by the latter; and on the contrary, in proportion to the constitutional difference between the stock and the scion is the effect of the former important. Thus when pears are grafted or budded on the wild species; applies

upon crabs, plums upon plums, and peaches upon peaches or almonds, the scion is, in regard to fertility, exactly in the same state as if it had not been grafted at all; while on the other hand, a great increase of fertility is the result of grafting pears upon quinces, peaches upon plums, apples upon white thorn, and the like. In the latter cases, the food absorbed from the earth by the root of the stock is communicated slowly and unwillingly to the scion; under no circumstances is the communication between the one and the other as free and perfect as if their natures had been more nearly the same: the sap is impeded in its ascent, and the proper juices are impeded in their descent; whence arises that accumulation of secretion which is sure to be attended with increased fertility.

To be continued.

Treasurer of the Commonwealth.—Among the candidates for this office, we notice the name of JONAS PRICE, Esq., of Roxbury. Although we take no part in political matters, we cannot, in this case, refrain from expressing a hope that the claims of Mr PRICE will be favorably considered by the agricultural interest in the Legislature.—His superior abilities as an accountant, and his efficient and disinterested services for many years, as Treasurer of the Massachusetts Society for promoting Agriculture, present we think, strong claims in his favor.

SAUER KRAUT.

This is salted cabbage, much used in Germany, is an excellent and wholesome article of diet, and a cheap and effectual preparation for long keeping. It may not be agreeable to an untainted palate, but is much liked by all accustomed to its use, and the relish is as easily acquired as that for mustard, tomatoes, pickles, and a hundred other things that we learn to love in order to enlarge the circle of our enjoyments. Every new taste is a new pleasure. The following is the mode of preparation.

Shred cabbage fine and lay it in a barrel—first a sprinkle of fine salt, then a layer of a few inches of cabbage, and so on alternately until the barrel is filled, beating it down soundly with a heavy maul or pestle at every layer.

Eighty to one hundred cabbages and three pints or two quarts of salt will fill a barrel. Cover it with a head that will just pass down within the barrel, on which lay heavy weights. Some pour on the whole, after filling, a gallon or two of strong brine. After some time softening and fermenting, it will be fit for use. It may be boiled with pork, or fried.

COUSIN TATIANA.

N. B. In return for all my good receipts, I request some one will give me directions for making and preserving APPLE BUTTER.—*Ans. Farmer.*

DOMESTIC SILK.

We have been shown by Messrs Pratt, Howe & Co., merchants of this city, a piece of silk levantine, similar to the foreign article for vestings, of the same fabric, which was manufactured in Mansfield, in this State. With the exception of the 'finish,' which has not been brought to a complete state of perfection, the quality of the goods shown us will compare with the imported product. We understand from the Courant, that the inhabitants of Mansfield have for many years been engaged in raising silk worms, and that a large quantity of sewing silk has been annually manufac-

nured there, from which a handsome income has been derived, but that until recently no attempts have been made at weaving. A manufactory of this kind is now in operation, with the most favorable prospect of success. We cannot but hope, that inasmuch as a company has been organized, and arrangements made by several citizens of Mansfield to prosecute the business of silk manufactory, that our merchants will, by their patronage, secure to those who had engaged in the enterprise, a handsome profit on capital so laudably invested.—*Connecticut Mirror.*

Manufacture of Leather in Canada.—The Montreal Courant states that this important branch of manufacture has wonderfully increased of late.—A few years back, the colony was almost entirely dependent on New York for supplies of leather. It is now certain that it can be manufactured in Canada and brought to market at as low a price as imported leather. Canada possesses immense quantities of hemlock in her woods, and now, since the tanning business has been introduced so generally, these hemlock forests will prove to be mines of gold. Some opinion of the extent to which tanning is carried on in Montreal and vicinity may be formed from the following statement of twelve tanneries connected with one house in that city. Costs of tannery, £15,600; number of hides manufactured yearly, 40,500; average weight, 30 lbs.; weight of sole leather produced, 1,215,000; average cost of manufacturing, 4d.; average value per pound, 1s. 3d.; total value, £103,137 10s. Besides the twelve tanneries above mentioned, there are many others in the city, and other places, at which the cost of manufacturing is about the same as those enumerated. It is added, 'This gives a sum of about £70,000 distributed among the working classes of the district of Montreal, which a few years ago was expended in the United States.'

A letter from a correspondent in Mexico to the Pennsylvania Inquirer, says, that in the city of Puebla, containing 70,000 inhabitants, there is no newspaper published.

ERRATA.—In our last N. E. Farmer, in the communication on 'Dots in Horses,' the following errors occurred: page 186, 19th line from the bottom of 1st column, for 'now,' read *nor*; 2d column, 25th line from the bottom, for 'he'd' read *head*.

A Gardener Wanted.
Wanted, a Gardener, who can bring good recommendations of his industry, sobriety and honesty. No one need apply who has so high an opinion of himself, as not to be willing to follow without complaint or scruple the directions given to him, as it is not my intention to hire a master over myself. Good wages and kind treatment will be given, but entire obedience is expected in return.
JOHN LOWELL.

Boston, Jan. 2, 1832.

tf

Historical Parallels.
Just published by LILLY & WAIT, Historical Parallels, Vol. 1.—being No. 20 of the Library of Entertaining Knowledge, price 40 cts. Each No. contains more than 200 pages, and numerous engravings on wood, beautifully executed.

Lilly & Wait have also now preparing for press, and will speedily publish—The New American Clerk's Magazine, containing the most useful and necessary Forms of Writing, which commonly occur between man and man;—and that will be found equally necessary and convenient for the farmer, the mechanic, the clerk, the apprentice, the merchant, the lawyer, and for every man, of whatever occupation, who has any interest in ordinary business transactions. Calculated for the use of the citizens of the United States, and made conformable to law.
jan 3

Black Currant Wine.
Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its astringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'Its use has been attended with remarkable success in the early stages of cholera morbus and dysentery;—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had subsided. It has been strikingly remedial in the low states of typhoid and bilious fever.' The late Capt. Gheib, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle.

Ammunition
Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1

Cobbett's Advice to Young Men, &c.
Just received and for sale at J. B. Russell's Seed Store, No. 50½ North Market Street, Boston—

Advice to Young Men, and (incidentally) to Young Women, in the Middle and Higher Ranks of Life; in a series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a subject. By William Cobbett. Price 50 cts.

Also—A Ride of eight hundred miles in France, containing a sketch of the agriculture, &c. of the country. By J. P. Cobbett. Price 50 cts.

Also—Cobbett's Ride through the Netherlands. Price 50 cts.

One copy only, just received from London, of London's Encyclopedia of Gardening, with many hundred wood engravings; new edition, greatly enlarged and improved. Price \$11.00. Dec. 28.

Fresh White Mulberry Seed.
Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Tea Wheat.
A few bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. ix, page 105—and vol. vi, page 82. Dec. 14.

Seeds for Country Dealers.
Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed that can be furnished at the New England Farmer's office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, nearly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

¶ The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves.
Nov. 12.

BRIGHTON MARKET.—Monday, Jan. 2.

[Reported for the Daily Advertiser and Patriot.]

At market, this day, 497 Beef Cattle, 127 Stores, 1072 Sheep, and 300 Swine. A few Beef Cattle, 200 Sheep and all the Swine, we have reported before.

Prices.—Beef Cattle.—The market was not quite so brisk and sales slow; some qualities were lower. We shall quote for extra 5 12½ a 5 50, prime 4 88 a 5, good 4 50 a 4 75, thin 3 25 a 4 25.

Barrelling Cattle.—Mess \$1 17 a 4 25; No. 1, 3 62 a 3 75.

Stores and Working Oxen.—Very few sales were effected, rather out of season for Stores.

Cows and Calves.—We noticed none at market but ordinary, and only one or two were sold at low prices.

Sheep.—Dull, not half at market were sold; one large lot of 4 or 500 were driven back—those sold were some prime wethers and some extra Cosset wethers, viz. one lot of wethers at 2 87½, one lot at 3 25, eleven Cosset wethers a trifle short of \$6 each.

Swine.—Dull, and no sales except at reduced prices—one or two small Barrows were taken at 4c. At retail, 3 a 4 for Sows, 4 a 4½ for Barrows.

New York Cattle Market, Dec. 30.—Beef Cattle in good demand and sales very brisk. Only 400 head in market. Sheep and Lambs—About 2000 in. Good Sheep very scarce. Two lots of 50 each sold at 5 50 a 6 50; for ordinary Sheep—prices range from 2 75 a 3 50. Lambs from 2 a 3 50.—*Daily Ad.*

MISCELLANY.

THE CARRIER'S ADDRESS TO HIS PATRONS.

Time, an old cynical curmudgeon,
A busy body, ever bugging,
Who never, since the earth begun
To spin her long yarns round the sun,
(His every aberration reckoned,)
Has lost one nineteenth of a second!
Active, but never in a flurry,
Whom forty hurricanes can't hurry;
And all the world, and all that's in it,
Can no more baffle to stop a minute,
Than I, by stamping on the ground,
Can stop the globe from turning round—
That personage, who is, you're sensible,
Created being's indispensable,
Has brought your Carrier once more
Before your Eminence's door,
With compliments in rhyme and reason,
Well cut and dried to suit the season—
To wish, as Sternhold said you may
Be blest 'forever—and a day,
And eke as merry as a lorn,
Until the next day's afternoon.

Last year it seemed no question whether
Our articles of wind and weather
Were manufactured at the shop
Of Tristram Shandy's Doctor Slop.
'T was feared the skies, by dint of dripping,
Would make our high ways roads for shipping,
And leave us naught, which one could term a
Good solid foot of terra firma;
But earth, ere rain would cease to pour,
Would be a sea without a shore.

Our atmosphere, transformed in wrath
To one great shower and vapor bath,
Made sweet Miss Flora cross and crusty,
Pomona's Sunday suit grew rusty,
Dance Ceres' garb of home-spun, plain,
But neat, so smirched with mud and rain:—
Her goddess ship appeared a slattern,
Cut from the queen of quann's worst pattern;
The toil-worn farmer's phiz 't is stated
Waxed wo begone and elongated;
The jobbernowl of many a clopale
Might serve surveyors for a rod-pole,
For that whereon untimely rain
Had hurt his hay, and grown his grain;
Though turnips, corn and grass in pasture
This very rain brought forward faster.

What hurts one helps another crop,
A fact which should such murmurs stop;
What is, is right, well under-tood,
And partial ill is general good;
A solemn truth, without a trope,
Long since enforced by poet Pope.

Each master of the Farmer's art,
Intent on acting well his part,
Has different sorts of produce growing
In ploughed land, pasturing and mowing;
The season then, which mischief brings
To one crop, may have balmy wings
For some anticipated yields
In products of some other fields;
And by such management as this,
No season can come much amiss,
But, on an average, its round,
With competence at least be crowned.

That wight deserves to be eschewed
For baseness and ingratitude,
Who hesitates to yield applause
To our good Gardeners, because
They introduce 't enrich the nation
New articles of cultivation.—
Not only giving man a greater
D minion o'er the realms of nature,
But means of plentiful subsistence
To human beings, whose existence
Will be a boon, entirely owing
To benefits of their bestowing.

Malthus said poor folks should not breed,
And those who cannot clothe and feed
Their precious little ones, no doubt
Are rather better off without.
Life scarcely can be styled a blessing,
With nought in life that's worth possessing.
Besides, our cultivators, giving
New ways and means to make a living,
Their country cause, by such donation,
A sure increase in population,
In yeomen, moral and industrious,
Who make a nation more illustrious
Than nobles, armies, towers and palaces—
All bloated grandeur's gorgeous fallacies,
Superb monstrosities of state,
Which, if they prove a nation great,
Are like hydropical inflations,
Diseases' direst demonstrations.
Princes and kings, as Gold-mith said,
A breath may make, a breath has made,
But arts alone of cultivation
Can fabricate a mighty nation.

But lest you think my moralising
Is setting up for sermonising,
Though never yet ordained a preacher,
Nor wise enough to be a teacher,
I'll shut the floodgate of my lays,
And throw cold water on that blaze,
Which must more hydrogen require,
To make it right poetic fire.

But still, may't please you, ere that I
Bid you pre-eminence good bye,
A quarter, or a pair of dimes,
May balance my account for rhymes:
But then, I hope, you'll owe me still
A great abundance of good will,
A sort of stock in which my betters
I beg might always be my debtors.

JANUARY 1, 1832.

PARODY OF A POACHER.

A poor strolling player in England, was once
caught performing the part of a poacher, and being
taken before the magistrates assembled at quarter
sessions, for examination, one of them asked what
right he had to kill a hare, when he replied in the
following parody on Brutus' speech to the Romans,
in defence of his killing Cæsar:

'Britons, hungrymen, and epicures!
Hear me for my cause, and be silent that you may
hear, believe me for my honor, and have respect for my
honor that you may believe: censure me not in your
wisdom, and awake your senses that you may better
judge. If there be any in this assembly, any dear friend
of this hare, to him I say that a poacher's love for
hare is no less than his. If then he demand why a
poacher rose against a hare, this is my answer: not
that I loved hare less, but that I loved eating more.
Had you rather this hare were living than I had
died quite starving—than that this hare were dead,
that I might live a jolly fellow? As this hare was

pretty, I weep for him; as he was plump, I honor
him; as he was nimble, I rejoice at it; but as he was
eatable, I slew him. There are tears for his beauty,
honor for his condition, joy for his speed, death for
his toothlessness. Who is here so cruel, would
see me a starved man? if any, speak, for him have I
offended. Who is he so silly, that would not make a
tit-bit?—if any, speak, for him have I offended. Who
is he so sleek, that does not love his belly?—if any,
speak, for him have I offended.'

'You have offended Justice, sirrah,' cried out one
of the magistrates, out of all patience with this long
and strange harangue, which had begun to invade
the time that his own belly had arrived.

'Then,' said the culprit, guessing at the hungry
feelings of the bench, 'since Justice is dissatisfied,
it must needs have something to devour. Heaven
forbid I should keep any justice from dinner!—so, if
you please, I'll wish your lordship a good day and a
good hare to dinner!'

The magistrates, eager to retire, and somewhat
pleased with the fellow's last wish, gave him a reprimand and let him go.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street,
Boston, is constantly supplied with a good assortment
of Watches, Silver and Plated Ware, Jewelry, Cutlery,
Trays of all kinds, Fancy Goods, &c, &c, which he will
dispose of at as low a rate as can be purchased in the
city. [] Watches repaired and warranted.

Sir Thomas Browne's Works.

HILLIARD & BROWN, Booksellers to the University,
Cambridge, have this day published—The Library of
the Old English Prose Writers, Vol. III., containing the
Miscellaneous Works of Sir Thomas Browne, with some
account of his life and writings. Edited by the Rev.
Alexander Young. This volume contains the whole of
'The Religion of a Physician,' treated as 'Un-Burial,'
the Letter to a Friend on the death of his intimate
Friend, and selections from the 'Vulgar Errors.'
H. & B. have a few copies remaining of the first
and second vols. of this collection, containing Fuller's Holy
State, Sidney's Defence of Poesie, and Selden's Table
Talk. Each volume may be obtained separately, neatly
bound in linen, or elegantly in calf and gilt. Dec. 21.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, fur-
nished to order, ready planed (by steam power) and
tongued or grooved, of any required dimensions. Quality
good, and price lower than they can be elsewhere had.
Apply to E. COPELAND, Jr., 65, Broad street.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Ware-
house and Seed Store, No 50 1/2 North Market street,
A Manual, containing information respecting the
Growth of the Mulberry Tree, with suitable Directions
for the Culture of Silk.—In three parts—with colored en-
gravings. By J. H. COBB, A. M. Published by direction
of His Excellency Gov. Lincoln, agreeably to a
Resolve of the Legislature of Massachusetts. Price 37 1/2
cents. Oct. 26.

Published every Wednesday Evening, at \$3 per annum,
payable at the end of the year—but those who pay within
sixty days from the time of subscribing, are entitled to a deduc-
tion of fifty cents.

[] No paper will be sent to a distance without payment
being made in advance.

Cork Tree in the Botanic Garden, Chelsea, England.

THE CORK TREE.

MR FESSENDEN—It has always appeared to me to be very desirable, and practicable, to introduce into this country from Europe the Cork tree and the Spanish Chestnut. Of the latter I will speak on some future occasion.

It may not be known to all that the Cork tree is a variety of the oak (*Quercus suber*.) This tree is indigenous or at least abundant in Spain, Portugal, Italy, and the States of Barbary. It would be a most important acquisition to the United States. In the opinion of Michaux, it will thrive wheresoever the Live Oak subsists; the soil of the pine barrens would be in general too meagre to sustain its vegetation. The inhabitants of the Southern States and neighboring islands would probably find it advantageous to rear it in such parts of their plantations as are unfit for the cultivation of cotton. The bark of the Cork Oak could be transported to the Northern States or made into corks on the spot, and thus become a great article of commerce. It is computed that 120 millions of corks are annually used in France; 2500 tons of cork were imported into Great Britain in 1827. I have no means of ascertaining the amount of cork imported into this country.

The tree grows to the height of 30 to 40 feet, and 2 to 3 feet in diameter, with evergreen leaves, though the greater part of them fall and are renewed in the spring; the wood is hard, compact and heavy, though rather less durable than many other kinds of oak, its great value being in its bark. Cork is the bark which the tree pushes outwards, as is common to all trees, but in this case the bark is of larger quantity and is more speedily renewed, when removed; there is a *liber*, or inner bark, below it, and from this the cork is renewed in the course of a few years, while the tree is said to live longer, and grow more vigorously than if the cork were not removed. The cork is first taken off when the tree is about 15

years old; the bark is then thin, hard, full of fissures, and consequently of little value, and is used by fishermen to buoy up their nets, &c. The second crop is also inferior. After this the operation is repeated once in 8 or 10 years, the produce being greater in quantity, and superior in quality each successive time. Dulamey says a cork tree thus barked will live 150 years.

The bark is removed in July and August, being slit with a knife in a perpendicular direction from the top to the bottom, with two incisions across, one near the top and one near the bottom of the trunk. For the purpose of stripping off the bark, a knife with a wedge-shaped handle at each end is used. After the incision is made, the bark is heaved to detach it from the *liber*; it is then lifted up by introducing the wedged handle, taking care to leave sufficient of the inner lamina upon the wood, without which precaution the tree would die. The bark being thus removed, is divided into convenient lengths, then flattened, and slightly charred to contract the pores. This substance is the rough cork of commerce; and is then fit to be cut into floats, stoppers, shoe soles, and other articles for domestic use. The cork of the best quality is firm, elastic, and of a slightly red color.

Branch of the Cork Oak—*Quercus suber*.

Fresh acorns of the cork tree for planting in the United States, could no doubt be easily obtained by some of our Horticultural Societies, or public spirited individuals, through the agency of U. S. Consuls in Europe, who would take an interest in procuring the true sort, and in having them packed in sand to ensure their vegetation.

QUERCUS.

FOR THE NEW ENGLAND FARMER.

ON MAKING GOOD BUTTER.

MR FESSENDEN—SIR—In cooperation with your correspondent, H. C., whose remarks on agricultural premiums (New England Farmer, vol. 10, page 177,) are both sound and sensible; and more

particularly in reference to the late award of premiums for the best butter, I have looked over the numbers of the Massachusetts Agricultural Repository and Journal for the past years, and send you the names of all those persons who have received the premiums on butter, from the time of the first exhibition, in 1821, to the present time. It is certainly a just claim of the public when money has been paid by it, as a reward, to know the process by which the article receiving the reward was made, not only the results, but the means and process by which such results are obtained; more especially if as heretofore, (though not in the last offer,) one of the conditions was that such communications should be made. I doubt not the very respectable individuals, who have exhibited the result of their skill and had their reward, will communicate through you to the public, in addition to what they may have communicated to the committee, their whole dairy process. The first award was made in 1821, and the first premium of \$10 paid to Col. Stephen Hastings, of Sterling. The second premium of \$5 to Luke Bemis, Watertown.

1822, 1st prem. \$10, to Mary Clark, Watertown; 2d, \$5, Col. Hastings, Sterling.

1823, 1st prem. \$15, Jonathan Upham, Newton; 2d, \$10, S. Hastings, Sterling; 3d, \$7, Jephthah Parker, Chelmsford; 4th, \$5, Rev. L. Capen, Boston.

1824, 1st prem. \$15, Michael Crosby, Bedford; 2d, \$10, Luke Bemis, Watertown; 3d, \$7, S. Hastings, Sterling.

1825, 1st prem. \$15, Luther Chamberlain, Westboro'; 2d, \$10, Charles Cutter, Weston; 3d, \$7, G. Crosby, Bedford; 4th, \$5, S. Hastings, Sterling.

1826, 1st prem. \$15, Rev. Mr Capen, Boston; 2d, \$10, M. Crosby, Bedford; 3d, \$7, L. Chamberlain; 4th, \$5, Jacob Deane, Mansfield.

1827, 1st prem. \$15, Charles Cutter, Weston; 2d, \$10, M. Crosby, Bedford; 3d, \$7, L. Chamberlain; 4th, \$5, Adam Hemenway, Framingham.

1828, 1st prem. \$15, M. Crosby, Bedford; 2d, \$10, L. Chamberlain; 3d, \$7, Jonathan Wait, Whitely.

1829, first year of an offer of \$100, none was entered considered worthy of the premium—none even worthy of the 1st Agricultural premium; 2d, \$10, Geo. Crosby, Bedford; 3d, \$7, Margaret T. Crosby.

1830, 1st prem. \$15, M. Crosby, Bedford; 2d, \$10, Nahum Hardy, Waltham; 3d, \$7, L. Chamberlain; 4th, \$5, Adam Fay, Westbury.

1830, December, 1st prem. \$100, Henry Sprague, Charlton; 2d, \$50, Moses Newhall, West Newbury.

1831, December, 1st prem. \$100, Luther Chamberlain, Westboro'; 2d, \$50, Henry Sprague, Princeton, formerly of Charlton; 3d, \$30, Seth Davenport, Mendon; 4th, \$20, Samuel Sawyer, Sterling; 5th, \$15, Gabriel Parker, Southboro'; 6th, \$10, Lydia Page, Hardwick.

While the premiums were small and given ex-

*See the article on TIMBER TREES in the Library of Entertaining Knowledge: a popular and instructive work republished by Lilly & Wait, of this city.

*In vol. 9, page 266 of New England Farmer, an extract is made from every communication received from the competitors, which could be useful to the public in relation to the manufacture of butter.

clusively by the Agricultural Society, it was perhaps more a duty that the mode of manufacture, (if peculiar,) should be published, than after a larger premium was offered, which although awarded by a Committee of the Society, was contributed by individuals, and as much perhaps with the object of attracting good butter to the market, as enlightening the farmer in its manufacture.

In the publication of the Bath and West of England Society's papers, vol. 5, page 67, No. 19, an essay of fifty-four pages was published by Dr. Anderson, on the mode of making butter, very minute in its directions. Thirteen years after an abridgment of this was published in the Massachusetts Agricultural Repository and Journal for 1806, vol. 2d, page 70, and is I believe the only essay full and practical on the subject published in this region. Occasional communications of new modes, both of making and preserving butter, have appeared in your valuable record, but few, if any with a name, or with entire directions, merely experiments communicated on the supposition that those who wish to try them, know already how to make butter.

The grand watch word of the dairy, should, like the Indian's solution of the three articles he liked best, be a repetition, cleanliness, cleanliness, cleanliness: this, commenced with the hands that milk, and never forgotten in any of the changes from the strainer to the market stall, and the butter will be good, if the cows are only ordinary; but if the stock be well selected, the food well adapted, and all facilities for the work from cellar to salt be well provided, the butter will be of course be better, and the gradation will then be good, better, best, instead of the present degrees of good, not so good, too bad. I send you a very sensible letter from a thoroughly experienced and successful cultivator, in answer to some inquiries made by Mr. Sullivan, the Corresponding Secretary of the Massachusetts Society for Promoting Agriculture, in relation to the management of a dairy and stock, which will serve as a model of the sort of information desired in relation to the management of cows, as well as in the accuracy and completeness of the details.

W. W.

Brookline, 22d March, 1831.

DEAR SIR.—It would give me much pleasure to answer your questions upon the subject of the dairy, could I do it with satisfaction to myself or benefit to the public. My farm is so small it is not suited to that object. Yet, although my knowledge of the subject is so inadequate to your purpose, I will cheerfully give you as nearly as I can the result of the little experience I have had.

I keep only two cows; one would be sufficient were it not that a part of the time we should lack a supply of milk, and they are better contented together than single, and were I able to sell all the surplus milk, they would be as profitable as anything my farm would produce. A main object has been always to have an abundant supply of milk for my men to drink in the summer season, as well as for all other uses of the family, these calls being various will not admit of a precise calculation. Of late years I have had no regular opportunity to sell all the surplus; part we have made into butter and part disposed of otherwise. Formerly we had a man call regularly for what we had to spare, for which he paid never less than 12½ cents a gallon, which affords data in part for the quantity produced. In looking over the ac-

count for 1819, 1820 and 1821, I find we delivered averaging the three years, 735 gallons a year.—As to the quantity otherwise used and disposed of, it must in some measure be conjecture; I think I am within bounds to say it could not average less than 6 quarts a day, making 547 gallons a year.—Total 1282 gallons at the moderate price of 12½ cents a gallon, amounts to \$160 25, to which add the proceeds of two calves, \$15 33, gives \$175 58, or \$87 79 for each cow.

I have never observed particularly as to the quantities given at the three divisions of time you describe, but generally they vary very much from each other; they also vary very much in this particular according to the season of the year in which they calve—for instance, if they calve on the 1st of December, the food for the first three months will be hay, if in May, grass, which will vary much the quantity. Of my cows, the one which goes dry the longest, (at least two months,) gives the most milk on the whole; the other would give it the whole time did we continue to take it from her; the first also produces the best calf, and is the most profitable cow.

So various are the qualities of land of which farms are composed, also their location in regard to a market for the produce, that no particular rule will apply to all. It does not admit of a doubt with me, that farmers within a reasonable distance of a market, will always be best rewarded by *generous feeding*, and I think the same effect will generally follow.

As to the application of milk to butter and cheese, I have no practical knowledge. The manner of keeping my cows and the cost is as follows. I have taken about three acres of mowing land, which is always supplied with water, by a brook passing at the foot of it. The cows are put into it, when the grass is three or four inches, which is about the 10th of May, varying a little according to the seasons; this affords a plenty of food till I have cut the grass from an adjoining lot of about two acres, and the grass has again started to a suitable height; I then change the pasture, giving time for a further growth in the first, which is again fed, and late in the autumn, for a month perhaps, they are allowed to feed on other mowing land, and in these ways they get all their food for six months. I calculate the cost as follows:

The three acres would produce 4 tons of Hay, which I value, standing in the field, at eight dollars a ton, \$32.

This pasture affords food for 17 weeks, the remaining 9 weeks I value at \$1.50 per week for both cows,

The other six months I keep them almost wholly upon rowen, which I estimate at 5 tons, and value it, in the barn, at \$10 per ton, A little meal, at times most needed, 6 bushels in the whole, at 60 cents, Green vegetables valued at the same,

Taking this from the proceeds of the milk and calves, which, as before stated, is \$175 58, leaves \$72 88 profit.

So that over and above what the produce of the same land would bring, I gain a clear profit of \$72 88, which more than furnishes the ample supply for the use of my family.

To recapitulate.—The proceeds of two cows for one year, Deduct the cost of keeping them the same time,

Balance, \$72 88

being a net profit over the value of the produce of

the land if otherwise disposed of. The cows I do not consider naturally above mediocrity; if their profit is greater, it is to be attributed to *good keeping* which always insures reward.

Very respectfully,

Your obedient servant,

HON. RICHARD SULLIVAN.

REMARKS ON FRUIT AND FRUIT TREES.

Continued from page 198.

The editor proceeds to consider upon what principle the flavor of particular fruits may be improved, and deems all improvements 'entirely due to the increased action of the vital functions of leaves.' The nature of the stock does not, he argues, at all influence the flavor of the fruit of the season. 'Those who fancy, for instance, that the quince, [used as a stock to the pear] communicates some portion of its austerity to the pear, can scarcely have considered the question physiologically, or they would have seen that the whole of the food communicated from the albumen of the quince to that of the pear is in nearly the same state as when it entered the roots of the former. Whatever elaboration it undergoes, must necessarily take place in the foliage of the pear; where, far from the influence of the quince, secretions natural to the variety, go on with no more interruptions, than if the quince formed no part of the individual.' The fluid or sap collected by the roots, when elaborated in the leaves, is so modified by the combined action of air, light and evaporation, as to acquire the peculiar character of the final secretions of the individual from which it is formed. 'From these secretions,' as discharged by the foliage into the system of the plant, 'the fruit has the power of attracting such portions as are necessary for its maturation. Hence it follows, that the more we can increase the peculiar secretions of a plant, the higher will become the quality of the fruits and *vice versa*. Pruning and training, and the exposure of branches to the most light in the sunniest aspects, promote the former effect.'

The next subject considered is, 'the mode of multiplying improved varieties of pears, so as to continue in the progeny exactly the same qualities, as existed in the parent.' Seeds will not perpetuate a variety undeviatingly; buds will. 'A plant is really an animated body, composed of infinite multitudes of systems of life; all indeed, united in a whole, but each having a power of emitting descending fibres in the form of roots, and also of ascending in the form of stem. The first of these buds is the embryo [in a seed]; the others are subsequently formed on the stem emitted by the embryo. As these secondary buds develop, their descending roots combine and form the wood, their ascending stems give rise again to new buds. These buds are all exactly like each other; they have the same constitution, the same organic structure, and the individuals they are capable of producing are, consequently, all identically the same; allowance of course being made for such accidental injuries or alterations as they may sustain during their subsequent growth. It is upon the existence of such a remarkable physiological peculiarity in plants that propagation entirely depends; an evident proof of which may be seen in this circumstance: take a cutting of a vine consisting of the space which lies between two buds, an internodium, as botanists would call the piece,

and no art will succeed in ever making it become a new plant, however considerable the size of the internodium may be. But, on the other hand, take the bud of a vine, without any portion of the stem adhering to it, and it will throw out stem and root, and become a new plant immediately. The various modes of artificial propagation, such as increasing by eyes, striking from cuttings, laying, budding and grafting, all consist in the application of these principles under various forms. Increasing by eyes or buds is illustrated by the above instances of the vine. Striking by cuttings consists in placing a stem, bearing more buds than one, in circumstances fit for the continuance of life; and this method has an advantage over propagation by single buds, as 'the stem of the cutting forms an important reservoir of nutriment' for the buds it bears, until they can emit roots into the soil to eat for themselves. That bud which is nearest the bottom of the cutting emits its roots 'first into the earth,' and a 'good operator always takes care that the lower end of his cutting is pared down as close to the base of the bud as may be practicable, without actually destroying any part of the bud itself: by this means the first emitted roots, instead of having to find their way downwards between the bark and wood, strike at once into the earth, and become a natural channel by which nutriment is conveyed into the general system of the cutting.'

Laying is nothing but striking from cuttings, that are still allowed to maintain their connexion with the mother plant, by means of a portion, at least of their stem. Tonguing the layer, has the effect of enabling the roots to be emitted into the soil through the wound more readily than if they had to pierce through the bark.'

Budding and Grafting.—Budding differs from grafting in this, that a portion of the stem is not made to strike root on another stem; but that on the contrary, a bud deprived of all trace of the woody part of a stem is introduced beneath the bark of the stock, and there induced to strike root. In performing either of these operations, the great point to be attended to is to secure the exact contact of similar parts.'

Transplanting.—The success of this important operation, the writer conceives, may be proved to depend exclusively upon these two conditions: 1. The preservation of the spongioles of the roots; and 2. The prevention of excessive evaporation. The spongioles are the extremities of the fibres, and consist of bundles of vessels surrounded by cellular tissue in a very lax spongy state. Plants absorb all or nearly all of their fluids through these spongioles, and, as the latter are exceedingly delicate in their organization, their destruction will be effected in exact proportion to the violence or carelessness with which their transplantation is performed. 'It is because of the security of the spongioles from injury, when the earth is undisturbed, that plants reared in pots are transplanted with so much more success than if taken immediately from the soil.' As every fibre is terminated by a spongiole, cutting through the roots of large trees to induce the formation of fibres, the year previous to removing them, contributes to successful transplanting. When destroyed, the spongioles are often speedily replaced, particularly in orchard trees, provided a slight degree of growth continues to be maintained. This is one of the reasons why trees removed in October succeed better than if transplanted at any other time. The first impulse

of nature, when the tree finds itself in a new situation, is to create new mouths by which to feed, when the season for growing again returns.'

Evaporation.—The prodigious evaporation of plants, is first attested by quotations from Hales, Gnetard, and Knight. A plant of sun-flower perspired seventeen times more than a man.—This loss has all to be supplied by the moisture introduced into the system by the spongioles; and hence if the spongioles are destroyed, and evaporation takes place before they can be replaced, a plant must necessarily die. From this principle arises the impracticability of transplanting deciduous trees when in leaf. Hence also 'certain evergreens can be transplanted in almost all months; this arises from their perspiration being much less copious than in deciduous trees, wherefore the spongioles have less difficulty in supplying the loss occasioned by it.'

In damp or wet weather this evaporation is least; in hot dry weather it is greatest. Conformably with these conditions, and consistently with the foregoing principle, it is, that deciduous plants, if taken from the ground in summer, are put into pots, and put in a hot bed to recover; not for the sake of the heat, but because the atmosphere of a hot bed is so charged with humidity that perspiration cannot go on, so that the vital energies of the plant, instead of being wasted by evaporation are directed to the formation of new mouths by which to feed.'

From the American Farmer.

CULTURE OF INDIAN CORN.

MR SMITH:

Dresden, June 1, 1831.

Indian corn being an important production of our soil, and extensively grown by our farmers, it is desirable that we should attain the mode of cultivating it, at the same time most easy and most productive. To contribute something to this end, I shall make some observations on the best mode of cultivating this grain, and point out some errors into which I conceive many of our farmers have fallen with regard to it. To ascertain the proper mode of culture for any plant it is necessary to examine into its nature and qualities, and the kind of soil to which it is best adapted, and we should proceed accordingly. The want of proper attention to this rule has produced much wild theory and bad practice in agriculture. The corn plant requires a loose alluvial soil to bring it to its greatest perfection, we should therefore in preparing ground for its reception render it as light and mellow as possible, ploughing as deep as the nature of the soil will admit; harrowing the ground previous to planting is advantageous in hard cloddy soils, but is not generally necessary. The seed should be deposited in furrows struck as deep as the ground is ploughed, and lightly covered with loose earth, if too much earth is thrown upon it there is danger of its rotting in cold wet weather, which sometimes succeeds the season of planting. By this mode of planting the plants are more firmly fixed in the earth, the roots striking deep draw a greater supply of nourishment to support them, they are likewise more secure from drought which often proves very destructive to the corn crop, the stalks will generally grow as tall as those which are planted superficially, but are thicker and stronger and produce

larger ears. The best process of cultivation is, that which will preserve a level surface, and most effectually destroy the weeds. This is most effectually done by drawing a large harrow over the rows, (the depth of the furrows will preserve the plants from injury) the weeds should be carefully removed, and the furrows filled up around the plants as they become large enough to bear it. If this operation is well done, (and much of the success of the crop depends upon its being so) one ploughing will be sufficient; in doing this the earth should be thrown to the corn, but care should be taken not to ridge it, which is very injurious, as it carries off the rain from the corn which requires a plentiful supply of moisture, especially when earing.

Many farmers pursue a quite different course, just skimming the surface, and planting their seed almost on the top of the ground; the consequence is that the roots, unable to penetrate the hard earth beneath, afford but little sustenance to the plants which run up spindling, and being often exposed to drought, yield but a scanty crop; this may be often seen by examining the outer rows of corn where the ground could not be well ploughed. What seems to have led to this practice is the cultivation of new ground where it could not be ploughed deep, the strength of the soil produces abundantly with any kind of culture. The superficial farmer continues skimming the surface until it becomes exhausted, when supposing the land worn out he abandons it to wiser cultivators.

Another error which some practise is so abused as almost to carry with it its own confutation, this is to plough so deep as to cut and mangle the roots of corn with the idea of making it produce better. This causes what is called fired corn, that is, the blades wither and die before it is fully ripe.

Though I conceive the above observations to be supported by reason, they are somewhat the result of experience, the best proof of theory. I once planted in the same field with some who ploughed shallow, while my part was broken up beam deep and furrowed with the plough one after the other in the same furrow; the consequence was that I had a better crop than they, with much less labor, and I am convinced that every similar trial would produce a similar result.

A WESTERN FARMER.

Save your Ashes.—It is now a well attested fact that the fine ashes of Schuylkill coal will make an excellent fire if made into balls of the consistence of thick mortar. A friend of mine showed me a fire last evening which had been burning six hours, made principally of these ash balls, which was then as good and as warm a fire as it would have been if he had made it of coal. The manner in which these balls are made is as follows: mix the water with the fine ashes of the coal, and then make them into balls about the size of an egg, let the grate be half full of coal, and fill it with these balls, then put on the blower, and in a few minutes it will be in a blaze and make a good fire.—*Working Man's Advocate.*

A Chambersburgh paper asks—May not our dreadful influenza be the dreaded cholera of Europe, in a modified form? What say the physicians?

DR FISKE'S ADDRESS.

Continued from page 197.

Thus, by the exertions of public spirited individuals, and the operation of the mental machinery embodied in our agricultural and other popular societies, we have already attained an elevated standing, and may soon compete with any country of similar soil, climate and population. Having conducted my auditory to this commanding height, it will doubtless be gratifying to our love of country, and national pride, to make it an observatory from whence we may descry the first footsteps, and trace the courses of our early progress.

The science of agriculture, in our country, is necessarily of modern origin. Our Pilgrim fathers did not, like their descendants, explore a wilderness for a more congenial climate, or more fruitful soil—but to plant the seeds and enjoy the fruits of civil liberty and religion—a better inheritance to their children, and legacy to their posterity, than all the riches and cultivated possessions they abandoned in the old world, or could hope to acquire in the new. This hallowed enterprise gave beauty to a sterile soil, on a bleak and dreary coast, in the depths of a rugged winter. It infused tranquility and joy amid the roaring of the elements, and the more hideous din of these first disturbed, and prior occupants of the wilderness. Had their expedition emanated from any secular views, this disheartening spectacle of the country, presented at their first landing, would have driven them back in despair, leaving not even their dead to possess it! Thanks to a sustaining Providence for their unconquerable zeal to establish on earth a heavenly inheritance. This, in the form of civil and religious institutions they have transmitted, with the soil, to bless and sustain an empire which they founded.

Doubtless many of our progenitors brought with them a competent knowledge of husbandry. But the display of agricultural skill is only to be exemplified on permanent possessions, in a season of public tranquility. Its great efforts are to be known only in fertile and populous regions, where the soil is tasked to sustain an undue accumulation of inhabitants.

When our ancestors had become sufficiently potent to carry a war of extermination into the territories of their savage foe, with a foresight characteristic of their descendants, they cast a scrutinizing eye upon the soil, with the lurking hope of possession. This resulted in their occupancy of the rich valley of the Connecticut, and other fertile regions which they traversed.

Farms were laid out, and in a manner cultivated. But in the early period of their establishment, the best system of husbandry could not be adopted, if known, until experience had tested the capacity of a new soil, and its congeniality to productions for the various uses to which they were to be applied.

The art of husbandry has been preserved through the dark ages, and most cultivated in the enlightened, by the clerical profession. The Norman clergy, particularly the monks, after the conquest of England, were greater improvers than any other class; and the lands of the church were conspicuous for their superior cultivation. It was so much the custom of the monks of this period, to assist in the cultivation of the lands, especially in seed time, laying, and harvest, that the famous Thomas Becket, after he was Archbishop of Canterbury, was accustomed to go out to the fields

with the monks of the monasteries, where he happened to reside, and assist in reaping their grain, and making their hay. This is a trait of the modern clergy, and arises alike from their superior improvement. In our history of agriculture, in New England more especially, it will be perceived, also, that the spirit of husbandry, like the vestal flame, has been preserved, or enkindled, through the instrumentality of the priests.

The Rev. Mr Elliot, I apprehend, was the first and best practical farmer found in the country, at his day. His system of husbandry, probably the oldest American production on agriculture, is not only venerated for its antiquity, but quoted as an oracle whose responses are adapted to most of the inquiries of the present period.

‘No work upon the subject of agriculture has perhaps ever been published in the United States, which has sustained so great, and so well-founded reputation, as Dr Dean’s New England Farmer, or Geographical Dictionary.—And its being adapted to our own soil and climate, must give it a decided advantage, in point of practical utility, to the American cultivator over foreign publications!—A third edition, much enlarged and improved, was published in 1822. This is the production of a Clergyman.

One of the oldest Societies of this Commonwealth for the promotion of agriculture, was founded by the Clergy of Brookfield, Charlton, Western and Newbairtree, assisted by some of their public spirited parishioners. Public meetings were held for the furtherance of the object, in these towns alternately. At one of them I had the honor and gratification to deliver my first agricultural address. This association gave a spirit and impetus to the system of farming, which was soon apparent, and is still progressive. Essays were furnished by members, and published in some of the early numbers of the Massachusetts Repository of Husbandry. This Society was in operation until the general one of the county superseded its use.

One of the earliest premiums from the Massachusetts Society for promoting agriculture, was awarded to the late Rev. Mr Holcomb of Sterling, for the best crop of wheat. The Rev. Dr Crane of Northbridge, has for many years relinquished a portion of the small compensation for his parochial services, to enjoy a better independence, if not a more successful culture, on the abundant productions of his little farm.

It was generally observable through the country, until within a few years, that the clergyman of the town, or parish, was the best farmer within its limits. This was not only conspicuous on his farm, but in the arrangements of his homestead. The fact, if not already explained, admits of easy solution.

This order of men were generally more scientific than the most of their parishioners. There were few lawyers to take the lead, at that day, in any commendable work—and the physician, not of the learned profession, was held in respect for no quality, except the all-sufficient one, of having been born a doctor. The clergy, of whom I am now speaking, usually possessed small, but good farms. They had the means of obtaining such information from books, or otherwise, as would afford them aid in their practical avocations. Having this foundation, they are stimulated by a laudable incentive. They have been proverbial for their obedience to an early command; and their calling restrains them from becoming ‘worse than

an infidel.’ Under these circumstances, they feel the necessity of husbanding their resources arising, generally, from their inadequate salaries; and of making the most of them, by the assistance of their young operatives, in causing their farms to be productive in the ratio of their families. This necessary and delightful occupation need be no impediment to their parochial duties. While it imparts health to the frame, it gives vigor to the mind. It renders the minister a pattern to the people on his farm, while it better prepares him for the more interesting and prior duties of the pulpit.

I am aware that this fascinating employment may become inordinate, and engrossing, and usurp too much of that time which ought to be devoted to the religious instruction, and moral improvement of the people. That the dearth of healthy and palatable nourishment, where they have been accustomed to find it administered, may induce the flock to remain in their folds, or to stray into better pastures. This, though a rare perversion, cannot be too severely rebuked.

I have dwelt on the connection between good farming and good preaching perhaps longer than may have been useful, to illustrate my position, that science is essential to the character of a good farmer.

I may be permitted to speak gratefully and affectionately of this order of men, having derived my parentage from one of this class, and find a covert from many of the ills of life, by an early apprenticeship on his farm. Under so competent an instructor, I imbibed a taste for rural occupations, and some experience of their practical application. I cannot be too thankful to a beneficent Providence, that my lot was cast under circumstances so propitious, for the knowledge of an employment which was the best substitute to our progenitors for their loss of Paradise; and the best solace to their posterity for the miseries they entailed! This sustains me under all reverses; more especially, in the deprivation of a faculty, which I once valued as the source of the best enjoyments of social life. In my rural occupations, I hold communion with nature, and enjoy its delights; and often in mute precepts, acquire more wisdom from the material creation, than could have been imparted from an intercourse with the intellectual world.

In this pleasing employment, it requires but faint picturing of the imagination to conceive myself the principal of a juvenile establishment, where good habits are to be formed, and wrong propensities corrected, by the controlling discipline of the master. Here are the infant and Primary Schools, in this Asylum, for the deaf and dumb, in their successive gradations, up to the period of maturity, when they are transplanted, a blessing and ornament to the world, by their future productions.

Enjoying this refuge and comfort for my declining years, you will permit me to press on your consideration the importance of combining a rural with the mechanical and intellectual education of your children. This will afford them a resort, when riches and honors fail. A healthful exercise promotes a cheerful mind. In this retreat, the rust of indolence, so wasteful to life, and the cancer of all its enjoyments, will be kept from accumulating and corroding by constant attrition.—Here, solitude will offer attractions, when society has ceased to charm. In this sanctuary, the mind is both harmonized and inured to ‘look through Nature, up to Nature’s GOD.’

From the Frugal Housewife.

PUDDINGS.

Baked Indian Pudding.—Indian pudding is good baked. Scald a quart of milk, (skimmed milk will do,) and stir in seven table spoonfuls of sifted Indian meal, a tea-spoonful of salt, a tea-cupful of molasses, and a great spoonful of ginger, or sifted cinnamon. Baked three or four hours. If you want whey, you must be sure and pour in a little cold milk, after it is all mixed.

Boiled Indian Pudding.—Indian pudding should be boiled four or five hours. Sifted Indian meal and warm milk should be stirred together pretty stiff. A little salt, and two or three great spoonfuls of molasses, added; a spoonful of ginger, if you like that spice. Boil it in a tight covered pan, or a very thick cloth; if the water gets in, it will ruin it. Leave plenty of room; for Indian swells very much. The milk with which you mix it should be merely warm; if it be scalding, the pudding will break to pieces. Some people chop sweet suet fine, and warm in the milk; others warm thin slices of sweet apple to be stirred into the pudding. Water will answer instead of milk.

Flour or Batter Pudding.—Common flour pudding, or batter pudding, is easily made. Those who live in the country can beat up five or six eggs with a quart of milk, and a little salt, with flour enough to make it just thick enough to pour without difficulty. Those who live in the city, and are obliged to buy eggs, can do with three eggs to a quart, and more flour in proportion.—Boil about three quarters of an hour.

Bread Pudding.—A nice pudding may be made of bits of bread. They should be crumbled and soaked in milk over night. In the morning, beat up three eggs with it, add a little salt, tie it up in a bag, or in a pan that will exclude every drop of water, and boil it little more than an hour. No puddings should be put into the pot, till the water boils. Bread prepared in the same way makes good plum puddings. Milk enough to make it quite soft; four eggs; a little cinnamon; a spoonful of rose-water, or lemon-brandy, if you have it; a tea-cupful of molasses, or sugar to your taste, if you prefer it; a few dry, clean raisins, sprinkled in, and stirred up thoroughly, is all that is necessary. It should bake or boil two hours.

Rennet Pudding.—If your husband brings home company when you are unprepared, rennet pudding may be had at five minutes' notice; provided you keep a piece of calf's rennet ready prepared soaking in a bottle of wine. One glass of this wine to a quart of milk will make a sort of cold custard. Sweetened with white sugar, and spiced with nutmeg, it is very good. It should be eaten immediately; in a few hours it begins to curdle.

Custard Puddings.—Custard puddings sufficiently good for common use can be made with five eggs to a quart of milk, sweetened with brown sugar, and spiced with cinnamon, or nutmeg, and very little salt. It is well to boil your milk, and set it away till it gets cold. Boiling milk enriches it so much, that boiled skim-milk is about as good as new milk. A little cinnamon, or lemon peel, or peach leaves, if you do not dislike the taste, boiled in the milk, and afterwards strained from it, give a pleasant flavor. Bake fifteen or twenty minutes.

Rice Pudding.—If you want a common rice pudding to retain its flavor, do not soak it, or put

it in to boil when the water is cold. Wash it, tie it in a bag, leave plenty of room for it to swell, throw it in when the water boils, and let it boil about an hour and a half. The same sauce answers for all these kinds of puddings. If you have rice left cold, break it up in a little warm milk, pour custard over it, and bake it as long as you should custard. It makes very good puddings and pies.

Bird's Nest Pudding.—If you wish to make what is called 'bird's nest puddings,' prepare your custard,—take eight or ten pleasant apples, pare them, and dig out the core, but leave them whole, set them in a pudding dish, pour your custard over them, and bake them about thirty minutes.

From Cobbett's Advice to Young Men.

MARRIED LIFE.

A bare glance at the thing shows that a farmer, above all men living, can never carry on his affairs with profit without a wife, or a mother, or a daughter, or some person. To be sure a wife would cause some trouble, perhaps to this young man. There may be the doctor and the nurse to gallop after at midnight; there might be, and there ought to be, if called for, a little complaining of late hours; but what are these, and all the other troubles that could attend a married life, what are they, compared to the one single circumstance of the want of a wife at your bedside during one single night of illness! A nurse! what is a nurse to do for you? Will she do the things that a wife will do? Will she watch your looks and motions and your half uttered wishes? Will she use the urgent persuasions so often necessary to save life in such cases? Will she by her acts convince you that it is not a toil, but a delight, to break her rest for your sake? In short, now it is that you find that what women themselves say is strictly true, namely, that without wives men are poor helpless mortals.

As to the expense, there is no comparison between that of a woman servant and a wife, in the house of a farmer or a tradesman. The wages of the former is not the expense; it is the want of a common interest with you; and this you can obtain in no one but a wife. But there are the children. I for my part firmly believe that a farmer, married at twentyfive, and having ten children during the first ten years, would be able to save more money during these years, than a bachelor of the same age would be able to save, on the same farm, in a like space of time, he keeping only one maid servant. One single fit of sickness of two months' duration, might sweep away more than all the children would cost in the whole ten years, to say nothing of the continual waste and pillage, and the illness, going on from the first day of the ten years to the last.

Besides, is the money all? What a life to lead! No one to talk with without going from home, or without getting some one to come to you; no friend to sit and talk to; no pleasant evenings to pass! Nobody to share with you your sorrows or your pleasures; no soul having a common interest with you; all around you taking care of themselves, and no care of you; no one to cheer you in moments of depression; to say all in a word, no one to love you, and no prospect of ever seeing any such one to the end of your days. For, as to parents and brethren, if you have them, they have other and very different ties; and, however laudable your feelings as son and brother, those feelings are of a very different character.

It does very well in bantering songs to say that a bachelor's life is 'devoid of care.' My observation tells me the contrary, and reason concurs, in this regard, with experience. When he quits his home, he carries with him cares that are unknown to the married man. If, indeed, like the common soldier, he have merely a lodging place, and a bundle of clothes given in charge to some one, he may be at his ease; but, if he possesses anything of a home, he is never sure of its safety; and this uncertainty is a great enemy to cheerfulness; and as to efficiency in life, how is the bachelor to equal the married? In the case of the farmers and tradesmen, the latter have so clearly the advantage over the former, that one need hardly insist upon the point; but it is and must be the same in all situations in life. To provide for a wife and children is the greatest of all spurs to exertion.—Many a man naturally prone to idleness has become active and industrious when he saw a family around him; many a dull sluggard has become, if not a bright man, at least a bustling man, when roused to exertion by his love. Indeed, if a man will not exert himself for the sake of a wife and children, he can have no exertion in him; or he must be dead to all the dictates of nature.

Our Children can do as we did.—Dr — told me, that when the schoolmaster went to one of the families, the man treated the schoolmaster politely, but could not encourage him; but the good wife said, 'I have no notion of these schoolmasters; it is only to make money. I know as much as most people do; and when I was young, a schoolmaster came round, and I was signed for a quarter, and I went two or three days, and I did not know one bit more than I did before I went, and then I was signed to the singing school, and I went two or three days, and I did not know one bit more than I did before, and I reckon I know as much as most people, who go to these schools, and our children can do as we did.'

From East India Papers.

An extra number of the India Gazette, which we have unfortunately mislaid, contains a long and friendly notice of Dr Bowditch's translation of *La Place*. Some mortification is expressed, that the work should have come from Boston, in North America, instead of Cambridge, in England.—'Why is it,' the reviewer asks, 'that British mathematicians should have so tamely allowed this glory to be snatched from their hands.'

The Hobart-Town (Van Diemen's Land) Courier celebrates a radish, 'as thick as a stout man's thigh, and from ten to eleven feet high.'

Infant Schools have been established at the British Colony in South Africa.

It is a proof at once of the universality of the press and of the English language, that the same discussions on the question of parliamentary reform, which have circulated throughout the United Kingdom and North America, are also finding their way through India in the Calcutta gazettes.—*Salom Gazette.*

Most Unfortunate.—The insurance of Mrs Staats, of Buffalo, whose loss is estimated at \$10,000 by the late fire, expired at 12 o'clock of the very day on which the conflagration occurred in the afternoon!

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Jan. 11, 1832.

BLACK OAK, YELLOW OAK, &c.

We have received a long communication on the above, and some other subjects, from our Portsmouth correspondent "A. R." which contains useful information, blended with matter, which cannot be interesting to our readers, and is therefore omitted.

Mr. A. R. accuses Mr. E. of inaccuracy, because the latter says "What is called the Yellow Oak in this vicinity, is the common Black Oak." What I call the Yellow Oak, is a species or variety, that does not appear black in any case, but has the same yellow of the Black Oak, when examined. The Black Oak is peculiar to light, bushy, lilly, rocky, poor, sandy soils. They are intermixed with other species of oak, walnut, &c. Sometimes they are among the Pitch Pine. They are very speedy in their growth, when young, even in the poorest soils. They seldom attain to a large size, neither are they long lived. They have a fine bark, and assume their hue at an early stage. They are the only oak, which produce what is called the Oak Apple, which is the most curious thing in nature.—They are tolerably good timber, for many uses, but not so durable as the White Oak. If cut and used green, when in a vigorous state of growing, they are the best fuel of any within my knowledge. They burn free and bright, and give great heat. A stick will outlast four of walnut of the same size. Their acorns are from $\frac{1}{4}$ to $\frac{1}{2}$ the size of the White Oak acorns.

"The Yellow Oak is generally found on better soils, having more frequently the white and red oaks for their neighbours. They attain to a large size, not unlike the red, are seldom found with so large a trunk, but are quite as tall, and less branched. Their timber is similar to the black oak. Their outward appearance in the same forest is so similar to the red oak, that I have found it impossible, in selecting them for timber, to distinguish them from the red, only by bruising and cutting the bark, when the inside is found yellow, but of not quite so high a tinge as the black oak. Their acorns are about half the size of the black oak, more flat, are covered more with the cup shell, out of which they seldom fall. The latter described resemble the Grey Oak of Maine, which are very frequent there, and are much used in ship building. The bark of the Black Oak, and that of the Yellow Oak, have their similar worth for tanning and colouring. A. R. then cautions against the use of the Swamp Sumac, which he says is poisonous.

As respects the supposed difference between Black Oak and Yellow Oak, we will observe that they are varieties of the same species, viz. the *Quercus tinctoria*, (coloring oak) of Michaux. This is one of the most important of our forest trees, as it produces an article of commerce called Quercitron, much used in Europe, in dyeing, staining, &c. but we believe not so well known, nor its merits so highly appreciated in the U. States. In the 25th year of George III. Dr Edward Bancroft obtained an act of the British Parliament, giving him an ex-

clusive right "of the use and application of certain vegetables for dyeing" &c. In the specification of Dr Bancroft's claim for his exclusive right, three different sorts of vegetable substances are mentioned, viz: the barks of the Yellow Oak, alias Black Oak, (*Quercus tinctoria*) the Walnut, (*Juglans alba*), and the Red Mangrove, (*Ricophora mangle*). In giving a description of the Yellow Oak, Dr. Bancroft says, "The first is a species of oak," growing spontaneously on the continent of North America, and particularly within the thirteen United States, in some of which, particularly in the Massachusetts Bay, it is commonly called *Yellow Oak*, and in others, particularly in Pennsylvania *Black Oak*, being that species, which in the writings of the celebrated Carolus Linnæus is termed *Quercus nigra*, (Black Oak). The bark of this oak is the part most useful in giving color; it is very rough, and of a dark brown or black color on the outside, and of a light yellowish brown within: and may be distinguished from the bark of all other oaks, with which I am acquainted, by the following circumstance or effects, viz. if boiled in water, its decoction becomes yellow by the addition of alum; or if, instead of alum, a suitable quantity of green vitriol, or other solution of iron, by some other mineral or vegetable acid be added, it produces a kind of olive, or olive brown colour, instead of a black, which would be produced by the decoction of any other kind of oak, known to me. There are several varieties of this species of oak.—all agree with it in giving a yellow color by the help of alum, and I claim the exclusive right of dyeing, &c. of all the oaks possessing that property, &c.

The bark above mentioned was named by Dr Bancroft Quercitron bark, from the latin words *quercus* (oak) and *citron* (yellow). It has become an article of commerce, of great use in Great Britain, and is we believe, as regularly placed on prices current as flour or potash.

Michaux's North American Sylva describes and gives plates of 29 different species of oaks, found in the U. S. and an additional catalogue of a number more, which are not figured. He describes what he calls the *Yellow oak*, (*Quercus prinus acuminata*) but says "the banks of the Delaware may be assumed as the Northern climate of the Yellow Oak!" He says nothing of the different varieties of the Black Oak, or coloring oak, but there are varieties and it would be well if some man of science would trace and describe them, and ascertain their relative value both for coloring and fuel. If A. R. does not mistake, when he asserts that a stick of Black Oak will outlast four of walnut, and burn free and bright, this oak must deserve cultivation for fuel as well as its other good properties.

Michaux in describing the black alias Yellow Oak says "From the cellular integuments of the Black Oak is obtained the quercitron, of which great use is made in dyeing wool, silk, and paper hangings. According to several authors who have written on this subject, and among others Dr Bancroft, to whom we are indebted for this discovery, one part of quercitron yields as much coloring matter as eight or ten parts of wood. This decoction is of a

brownish yellow, which is rendered deeper by an alkali, and lighter by acids. A solution of alum causes a small portion of the coloring matter to fall in a deep red precipitate of a bright hue.

"To dye wool it is sufficient to boil the quercitron with an equal weight of alum: in dipping the stuff, the deepest shade is given first, and afterwards the straw color: to animate the tint the stuff may be passed, in coming out of the dye, through water whitened with a little washed chalk. A brighter color is obtained by means of solution of tin. Quercitron may be substituted for wood, in giving all the shades of yellow to silk: the proportion is one part by weight to twelve parts of silk. In the advertisements of Philadelphia for February, 1808, this substance is rated at 40 dollars a ton, and from that city chiefly it is exported to Europe."

American Silk.—Mr D. M. Russell, of Plymouth, N. H., has sent to the Farmer office a beautiful specimen of sewing silk, manufactured at Plymouth, N. H. by Mrs William Green. The latitude of Plymouth is fortythree degrees, fortyfive minutes, thirtynone seconds north. This proves that our climate is not too cold, as some have supposed, for this valuable article, which we hope will yet be a staple commodity in the Northern as well as in the Southern States.

BRIGHTON MARKET FOR THE YEAR 1831.

First quarter ending March 28.		
5207 Beef Cattle,	estimated sales,	186,452 00

Adv. and Patriot.

To Correspondents.

We are compelled to omit this week several able communications, among which are Judge BULL's valuable table of Pears—an article from Doct. PECK of Foxborough, on the late fatal epidemic among horses—further remarks on different breeds of Live Stock—on the Holly, as a plant for Hedges, &c. &c.

Sweet Herbs, &c.

FOR sale at the New England Seed store, 52, North Market street.—The following Sweet Herbs, pulverized, and packed in tin canisters for domestic use, viz:

Sweet Marjoram, 37½ cts.—Thyme, 33 cts.—Summer Savory, 25 cts.—Sage, 17 cts.—per canister. Also—Black Currant Wine for medicinal purposes, 75 cts per bottle. Tomato Ketchup, 75 cts per bottle. jan11

Wanted.

TWO or three copies of the 1st, 2d and 3d volumes of the New England Farmer, for which a fair price will be paid—Apply at this office. jan11

Elegant Camellia Japonica & Bouquets.

THE Subscriber, Gardener to John Prince, Esq. at Jamaica Plains, can furnish a constant supply of elegant Bouquets—also superb double flowers of white, and several other sorts of Camellia Japonica, at prices lower than in former years. Also—very superior Mushrooms, and a great variety of Green-House plants.

T.H.O'S MASON.

Jamaica Plains, Jan. 10, 1832.

Grape Cuttings, &c.

WILLIAM PRINCE & SONS, near New York, offer for sale the following:

30,000 cuttings of the Isabella, Alexander, or Schuykill Muscadell, Catawba, Winne, Herbenmont's Madeira, Bland, Elsingburg, Elkton, Worthington, White Fox, Luthorough, Long's Arkansas, Missouri, Muncy, Norton's Virginia Seedling, Scappemong, York Madeira, and other native and foreign Grape Vines, at reasonable rates.

Scions of Fruit Trees for grafting, which can now be sent with safety to any part of the Union, will be supplied—of all the various kinds.

Above 150 varieties of Double Dahlias, including the New Anemone flowered, and Dwarf varieties, and also several White flowering varieties.

500 New Chinese Mulberry or Morus multicaulis, so superior for silk worms.

500 lbs. seed of the Locust tree, of the Long Island variety, so noted for ship timber.

Orders for these articles, or for Fruit Trees, Flowering Shrubs and Plants, Green House Trees and Plants, Bulbous Flower Roots, &c. will receive the utmost attention. Orders can be sent by mail—and Catalogues will be sent gratis to all those who desire them.

Flushing, N. Y. Jan. 5, 1832.

2w

A Gardener Wanted.

WANTED, a Gardener, who can bring good recommendations of his industry, sobriety and honesty. No one need apply who has so high an opinion of himself, as not to be willing to follow without complaint a scrupulous directions given to him, as it is not my intention to hire a master over myself. Good wages and kind treatment will be given, but entire obedience is expected in return.

JOHN LOWELL.

Boston, Jan. 2, 1832.

if

Historical Parallels.

JUST published by LILLY & WAIT, Historical Parallels, Vol. I.—being No. 20 of the Library of Entertaining Knowledge, price 40 cts. Each No. contains more than 200 pages, and numerous engravings on wood, beautifully executed.

Lilly & Wait have also now preparing for press, and will speedily publish—The New American Clerk's Magazine, containing the most useful and necessary Forms of Writing, which commonly occur between man and man—and that will be found equally necessary and convenient for the farmer, the mechanic, the clerk, the apprentice, the merchant, the lawyer, and for every man, of whatsoever occupation, who has any interest in ordinary business transactions. Calculated for the use of the citizens of the United States, and made conformable to law. jan 3

Tea Wheat.

A FEW bushels of this very valuable variety of spring wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St. John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. x, page 105—and vol. vi, page 82. Dec. 14.

Seeds for Country Dealers.

TRADERS in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer's office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds most useful in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Cobbett's Advice to Young Men, &c.

JUST received and for sale at J. B. Russell's Seed Store, No. 50½ North Market Street, Boston—Advice to Young Men, and (incidentally) to Young Women, in the Middle and Higher Ranks of Life; in a series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a subject. By William Cobbett. Price 50 cents.

Also—A Ride of eight hundred miles in France, containing a sketch of the agriculture, &c. of the country. By J. P. Cobbett. Price 50 cents.

One copy only, just received from London, of London's Encyclopedia of Gardening, with many hundred wood engravings; new edition, greatly enlarged and improved. Price \$11.00. Dec. 28.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1.

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c. &c. which he will dispose of at as low a rate as can be purchased in the city. If Watches repaired and warranted.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr., 65, Broad street.

Black Currant Wine.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its stringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Penney, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'Its use has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle.

BRIGHTON MARKET—Monday, Jan. 9.

[Reported for the Daily Advertiser and Patriot.]

At market this day 312 Beef Cattle, 18 Stores, 750 Sheep, 130 Swine. The Swine are the same we reported last week.

Prices—Beef Cattle—An attempt was made in the morning to advance the price, and was effected on some qualities. We quote for extra \$5 25 a 5 50, prime \$5, good 4 67 a 4 84, thin 3 50 a 4 50.

Cows and Calves—A few only were at market—no sales noticed.

Sheep—We noticed about 300 sold by the pound, alive, at 4c. which was probably something less than their real value. A lot of Co-set Wethers were taken at \$4 58 each, and a lot at about \$6 each.

Scine—No sales.

New York Cattle Market, Dec. 30.—Beef Cattle—in market this week 500 head, generally far superior cattle to those last week, and sales have averaged 50c. per hundred better. Prices \$5 50 a 7 50; principal sales at \$6 50. Sheep and lambs—about 1500 in; proportion of lambs very short; good sheep unusually scarce; sales from \$3 50 to 5 50, and brisk; lambs \$2 a 3 50.—D. Adv.

MISCELLANY.

The following beautiful Hymn was written by the Rev. J. Pierpont, of Boston, for the recent dedication of a new House of Public Worship, in Plymouth, Mass.

ORIGINAL HYMN.

The winds and waves were roaring;
The Pilgrims met for prayer;
And here, their God adoring,
They stood, in open air.
When breaking day they greeted,
And when its close was calm,
The leafless woods repeated
The music of the psalm.

Not thus, O God, to praise thee,
Do we, their children throng;
The temple's arch we raise thee
Gives back our choral song.
Yet, on the winds, that bore thee,
Their worship and their prayers,
May ours come up before thee
From hearts as true as theirs!

What have we, Lord, to bind us
To this, the Pilgrim's shore?—
Their hill of graves behind us,
Their watery way before,
The wintry surge, that dashes
Against the rocks they trod,
Their memory, and their ashes—
Be thou their guard, O God!

We would not, Holy Father,
Forsake this hallowed spot,
Till on that shore we gather,
Where graves and griefs are not:
The shore where true devotion
Shall rear no pillared shrine,
And see no other ocean
Than that of love divine.

HOW TO TELL BAD NEWS.

SCENE. Mr G.'s Room, at Oxford. Enter, his Father's Steward.

Mr G.—Ha! Jervas, how are you, my old boy? how do things go on at home?

Steward.—Bad enough, your honor, the magpie's dead.

Mr G.—Poor Mag! so he's gone. How came he to die?

Steward.—Over-ate himself, sir.

Mr G.—Did he, faith? a greedy dog; why, what did he get he liked so well?

Steward.—Horse flesh, sir; he died of eating horse flesh.

Mr G.—How came he to get so much horse flesh?

Steward.—All your father's horses, sir.

Mr G.—What! are they dead too?

Steward.—Aye, sir, they died of over-work.

Mr G.—And why were they overworked, pray?

Steward.—To carry water, sir,

Mr G.—To carry water? and what were they carrying water for?

Steward.—Sure, sir, to put out the fire.

Mr G.—Fire! what fire?

Steward.—Oh, sir, your father's house is burned down to the ground.

Mr G.—My father's house burned down! and how came it set on fire?

Steward.—I think, sir, it must have been the torches.

Mr G.—Torches! what torches?

Steward.—At your mother's funeral.

Mr G.—My mother dead!

Steward.—Ah, poor lady! she never looked up after it.

Mr G.—After what?

Steward.—The loss of your father.

Mr G.—My father gone too?

Steward.—Yes, poor gentleman, he took to his bed as soon as he heard of it.

Mr G.—Heard of what?

Steward.—The bad news, sir, and please your honor.

Mr G.—What! more miseries? more bad news?

Steward.—Yes, sir; your bank has failed, and your credit is lost, and you are not worth a shilling in the world. I made bold, sir, to come to wait on you about it, for I thought you would like to hear the news!

A CHINESE BRIDE.

The greatest rarity, however, after this feast, was the sight of a Chinese bride. The son of our host having been married a few days before, we were honored (according to the usage of the country, during the honey-moon) with permission to look at his wife, as she stood at the door of her apartment, while we were passing out. The lady was surrounded by several old women, who held tapers and lamps above and about her, that we might have a more complete view of her figure and attire. She was a young person, (perhaps seventeen years of age,) of middle stature, with very agreeable features and a light complexion, though she seemed to us to have used paint. She wore a scarlet robe, superbly trimmed with gold, which completely covered her from the shoulders to the ground. The sleeves were very full, and along the bottom ran a beautiful fringe of small bells. Her head-dress sparkled with jewels, and was most elegantly beaded with rows of pearls, encircling it like a coronet; from the front of which a brilliant angular ornament hung over her forehead and between her eye-brows. She stood in a modest and graceful attitude, having her eyes fixed on the floor, though she occasionally raised them, with a glance of timid curiosity, towards the spectators. Her hands, joined together, but folded in her robe, she lifted several times towards her face, and then lowered them very slowly.—Her attendants, presuming that the guests would be gratified with a peep at that consummation of Chinese beauty, the lady's feet, raised the hem of the mantle from her's, for a moment or two.—They were of the most diminutive kind, and reduced to a mere point at the toe. Her shoes, like the rest of her bridal apparel, were scarlet, embroidered with gold. In justice to the poor creature, during this torturing exhibition, (as we imagine it must have been to her,) her demeanor was natural and becoming, and once or twice something like half a smile, for an instant, showed that she was not entirely unconscious of the admiration which her appearance excited, nor much displeased by it.—*Tyerman and Bennet's Journal.*

Lord Brougham.—There lives in England a man whose daily labors last for twenty hours out of the twenty-four, who presides in the House of Lords and in a Court of Justice, who attends at the Council, who gives audiences each day to Barristers belonging to both kingdoms, and who still finds time to write articles on politics and jurisprudence in the *Edinburgh Review*, besides elementary works, which are distributed gratis throughout the kingdom, and who is the Director of at least ten associations for the diffusion of useful knowledge amongst the working classes. We need hardly to add that the person herein alluded to is no other than Lord Brougham.

Parliamentary Qualifications.—A candidate by the name of Chadwick, in standing for a seat in the British House of Commons, sums up his qualifications thus:

'I am a man of family; I am a man of no business—I have never been used to it; but I can shout, laugh, hark and spit; and cough, stamp, hiss, hoot and huzza; and what more can be wanted from an M. P.? I do not doubt but my stamping, shouting, &c., would have as much effect in the House of Commons as most speeches generally have.'

MR FESSENDEN.—At a meeting of the Framingham Lyceum this week, the question for discussion was—'Has a man a moral right, under ordinary circumstances, to lead a single life?'

On this question the inclosed communication was read by the Vice President. You are at liberty to give it a place in your poet's corner in the New England Farmer, next week. W. B.

ON MATRIMONY.

Pray let a young lady, sir President, speak.

Though not versed in logic, or Latin, or Greek.

I'm sure you'll excuse if for once we come out

On a subject where boys that are beardless will spout.

The question is this—'Shall a man be excused,

If, wayward, or restive, he will not be nosed?'

Now who ever heard such a question as that?

You might just as well talk of nosing a cat.

Your sex would all marry, there's not the least doubt,

Could they get our consent to nose us about.

But not having got it, if we can unite,

I'll tell you what rules we intend to indite.

First,—none shall consent to quit single bliss

Except on condition of something like this:

We resolve to expunge that base term—*obey*,

For we think we can govern as wisely as they;

But still, to keep peace, we'll consent to divide,

While they hold the helm, we'll sit close beside:

Then, when we are bridled, they cannot complain

If we give them the bit, and hold fast to the rein.

And as to the whip,—when we ride for a dash,

The handle we'll keep,—but we'll give them the lash.

So in all other matters—*divide, and we'll choose*—

We will not unite if they dare to refuse.

In one thing we'll give them exclusive control,

And, standing aloof, we'll leave them the whole:

Should they sigh for a halter, we'll never claim half,

One rope won't accommodate more than one calf.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, JANUARY 18, 1832.

NO. 27.

FOR THE NEW ENGLAND FARMER.

DESCRIPTION OF SELECT PEARS.

I consider LINDLEY'S 'Guide to the Orchard and Kitchen Garden,' equal, if not superior, to any work extant, as a standard authority for the nomenclature and relative value of cultivated fruits. This opinion is formed not only from the high reputation of the author and publisher, but from the very superior opportunities which they had of forming correct conclusions upon these subjects. This has induced me to concentrate, in a tabular form, the most material facts, particularly in regard to the pear, for my private use and convenience. As the catalogue of pears has been greatly enlarged by European varieties of recent origin, which are but little known, and imperfectly appreciated among us, I have transcribed from my tables, and now send you, descriptions of 56 varieties, old and new, which I have selected as most worthy of cultivation. These are all *dessert*, or eating fruits. I would have added a few more, as also some varieties adapted for *baking and steaming*, but for want of room on my sheet. Among the best for the kitchen, however, I will name the Bezi d'Hery, Chaptal, Franc-real d'Alver, Uvedale's St Germain, Catilae, Bellissime d'Alver, &c. To your readers who have not access to larger works I hope the table will be useful.

The time of ripening is graduated for the climate of England. The period of maturity with us is or will be probably two weeks or more earlier.—Under *skin*, the first line has reference to the ordinary color, when gathered, the other to the more ripe appearance, or extraneous circumstances. The abbreviations may be explained, by the printer, if thought necessary. Mr Lindley observes, in regard to both summer and autumn pears, that, generally, they will prove better, and keep longer, if they are taken from the tree before they are fully ripe.

J. BUEL.

ALBANY NURSERY, Dec. 26, 1831.

SECTION I.—SUMMER, ROUND FRUITED.

NAME AND SYNONYMS.	SIZE AND FORM.	EYE.	STALK.	SKIN.	FLESH.	JUICE.	IN USE.	DESCRIBED.	CHARACTER, ORIGIN, &c.
1. AMBROSIA. <i>Early Beurré</i> .	Medium, roundish.	Rather sunk.	1 in. slender.	Smooth, gr. & a little bent.	Tender.	Rich, sugary & perfumed.	Middle of September.	Lindley No. 1.	Very good, but will not keep long.
2. *EARLY BERGAMOT.	$\frac{2}{3}$ by $\frac{3}{4}$ roundish.	Depressed.	$\frac{1}{2}$ mod. thick.	Gr. yel. tinged broadish streaks.	Yellowish white crisp and gritty.	Abundant, very rich and sugary.	End of Aug. beginning of Sept.	Pom. M. 101. Lindley No. 2.	A most excellent fruit, abundant bearer, sent by M. Thouin to the L. H. Society in 1820.
3. GREEN CHISEL.	$\frac{1}{4}$ each way globular.	Large, prominent.	$\frac{3}{4}$ straight, no cavity.	Quite green, faint bright tinge.	Gritty.	A little sugary slightly perfumed.	Beg. & middle of August.	Lindley 6.	Branches short and erect. Fruit in clusters. An abundant bearer.
4. SUMMER BERGAMOT. <i>Handen's Bergt. Bergt. d'été, Milton blanc, &c.</i>	Medium round.	Small, shallow basin.	$\frac{1}{2}$ thick small cavity.	Greenish yel. russet and specks.	Melting.	Sugary, high flavored.	Beg. & middle of September.	Duh. 45. Lindley 13.	One of the finest pears of the season, if eaten before it is too ripe. Ripens at Philadelphia in July.— <i>Coxe</i> .
5. SUMMER ROSE. <i>Thorny rose, Epine Rose, Thorny Rose, &c.</i>	$\frac{2}{3}$ by $\frac{2}{3}$ round and depressed.	Open, shallow, depressed.	1, slender, small round cavity.	Yellow, russet, brown spots.	White, juicy.	Rich & sugary.	Middle and end of August.	Pom. M. 102 Lind. 14.	A most excellent and beautiful variety. Bears well.

SECTION II.—SUMMER, CONICAL FRUITED.

6. JARGONELLE. <i>Epagne, Beau Présent, Saint Sampson, Gros Cuisse Madame, Saint Lambert, &c.</i>	$\frac{3}{4}$ to 4 ob pyramidal.	Open, with long seg of calyx.	2 in. obliquely inserted.	Greenish yel. low tinge, brown, red.	Yellowish white, juicy & melting.	Peculiarly rich and agreeable.	Middle and end of Aug.	Pom. M. 108 Lind. 20.	Dangling branches, pubescent leaves. Hardy tree. Fine fruit.
7. MADELEINE. <i>Citron des Carmes.</i>	$\frac{2}{3}$ by $\frac{2}{3}$ turbinate.	Slightly hollowed.	1 in. slender, ob. inserted.	Yel., green, tinge of red.	White, melting, buttery.	Sweet & high flavored.	Latter part of July.	Pom. M. 5. Lindley 25.	An excellent early variety, bearing freely.
8. ROY D'ETE. <i>Gros Rousselle, Duh. 34.</i>	$\frac{3}{4}$ by $\frac{2}{3}$ turbinate.	Small open flat crown.	$\frac{1}{2}$ slender, small cavity.	Pale green, red, rus. sps.	Half buttery & melting.	Very agreeable, juicy subacid.	End of Aug. beg. Sept.	Lind. 31.	
9. ROUSSELET DE RHEIMS. <i>Petit Rousselet.</i>	$\frac{2}{3}$ by $\frac{1}{2}$ pyramidal.	Small open flatish apex.	1 in thick, no cavity.	Greenish, gray, & yellow russety specks.	Melting, half buttery.	Very high flavored and musky.	End of Aug. beg. Sept.	Lind. 32. Duh. 32.	Cultivated among us as the <i>SPICE PEAR</i> . We have hardly any summer variety surpassing it in excellence.
10. SABINE D'ETE.	Medium pyramidal.	Small, shallow.	1 in. in shallow cavity.	Smooth, yel. sear, & dot.	White and melting.	Abundant and high flavored.	Beg. & middle of Aug.	Lind. 33.	Raised in 1819 by M. Stoffles, of Mecklin.
11. SKINLESS. <i>Poir Sans peau, Fleur de Guignes.</i>	$\frac{2}{3}$ by $\frac{1}{2}$ pyramidal.	Slightly dep. small.	$\frac{1}{2}$ slender, crooked.	Very thin pale green red.	Melting.	Most excellent sweet & per.	Beg. & middle of Aug.	Lind. 35. Duh. 35.	Tree and foliage of delicate growth.— <i>Coxe</i> .
12. SUMMER BUNCHRETIEN. <i>Bonchretien d'été, Graciose.</i>	$\frac{1}{2}$ by 3 irregular, pyramidal.	Small, prominent shall. basin.	$\frac{2}{3}$ crooked, ob. inserted.	Pale lemon, small green dots.	Yellowish, breaking firm.	Abundant, sweet and excellent.	Middle of Sept.	Pom. M. 14. Lind. 36.	Wood long, flexuose or zigzag, smooth with prominent buds, forming a drooping tree, like the Jargonelle.— <i>P. M.</i>
13. SUMMER FRANCREAL. <i>Francreal d'été, Fondante.</i>	$\frac{3}{4}$ by 3 turbinate.	Mod. depressed, cumulant.	Short, thick.	Green, nearly smooth, yel. green.	White, firm, juicy, buttery, melting.	Rich and excellent.	Middle of Sept.	Lind. 37. P. Mag. 106.	A valuable variety, coming in after the Jargonelle.— <i>P. M.</i>
14. WILLIAMS' BUNCHRETIEN. <i>Bortlett.</i>	$\frac{3}{4}$ by 2 3 ir. pyr.	On summit no cavity.	1, very gross and fleshy.	Pale gr. mot. yel. & red.	Whitish, tender, delicate.	Sweet and agreeably per.	End of Aug. mid. of Sep.	Lind. 38.	

SECTION III.—AUTUMNAL, ROUND FRUITED.

15. *ASTON TOWN.	$\frac{2}{3}$ by $\frac{2}{3}$ roundish turbinate.	Small, shallow.	$\frac{1}{2}$ slender, protruding.	Pale greenish white, russety specks.	Tender, buttery.	Most excellent saccharine & perfume.	All October.	Pom. M. 139 Lind. 41.	Branches slender, twisting, a most excellent pear, constant bearer.—Fruit resembling Crasanne.
16. AUTUMN BERGAMOT. <i>Common Bergamot, York Bergamot.</i>	$\frac{2}{3}$ by $\frac{2}{3}$ globular.	Small open shallow depress.	Short, thick, wide cavity.	Rough yel. green, dull brown.	Whitish, melting, little gritty.	Sugary and richly perfumed.	All October. Pear and Quince.	Pom. M. 120 Lind. 42.	One of the best pears of the season.
17. BEZI DE LA MOTT. <i>Bein Arnudi, Beurré blanc de Jersey.</i>	$\frac{3}{4}$ by 3 round, tur.	Small, open sunk.	1 inch bent, strong.	Yellowish green, rusty specks.	White & melting.	Rich, sugary, and high flavored.	All Oct. and Nov. Pear & Quince.	Pom. M. 143 Lind. 46.	It is a most excellent new Flemish variety.
18. CHAS. D'AUTRICHE.	$\frac{3}{4}$ by 3 like White Beurré.	In confined hollow, not deep.	1 inch.	Greenish yel. full of brown specks.	White & melting.	High flavored, little perfumed.	All Nov.	Lind. 47.	L. H. S. A very fine and beautiful fruit, raised by Van Mons and sent to L. H. S. 1816.
19. CRASANNE. <i>Duh. 49. Beurré Plat.</i>	$\frac{2}{3}$ by $\frac{2}{3}$ round, tur.	Small deep narrow basin.	$\frac{1}{2}$ in. crooked slender.	Greenish yel. gray russets.	Extremely buttery & tender.	Plentiful, rich & saccharine.	Nov. & Dec.	Lind. 48.	A most excellent bearer.

NAME AND SYNONYMS.	SIZE AND FORM.	EYE.	STOCK.	SKIN.	FLESH.	JUICE.	IN USE.	DESCRIBED.	CHARACTER, ORIGIN, &c.
20. GANSEL'S BERGAMOT. <i>Broca's Bergamot, Ice's Bergamot, Bon Rouge,</i>	3 by 3½ ovate.	Small, short calyx.	Short and fleshy.	Dull brown like brown Beurre.	White and melting.	Very rich, sweet and high flavored.	Mid. Nov. Mid. Dec.	Lind. 52. Pom. Magazine, 35.	A most excellent pear, a native of England.
21. GREEN SYLVANGE. <i>Sylvange Vert, Bergamot Sylvaenge,</i>	Somewhat like Bergamot.	Small, in a deep hollow.	Short, slender old inserted.	Rough, br. green, gray spots.	Green & white, soft and melting.	Succ & agreeable flavor.	All Oct. and Nov. Pear and Quince.	Lind. 33.	An excellent pear, but tree rather tender.
22. GRAY DOYENNE. <i>Red Doyenne, Doyenne Gris, Doyenne Rour, d'Antonne Doyenne,</i>	2½ by 2½ each way turbinate.	Very small shallow impression.	1 in. stout, rather deep.	Cinnamon russet, red next to sun.	Yellowish white rich melting.	Sugary and excellent flavor.	Last Oct. & Nov. Pear & Quince.	Pom. Mag. 74. Lind. 54.	A very hardy and handsome fruit.
23. SWISS BERGAMOT. <i>Bergamotte Suisse,</i>	2½ by 2½ turbinate.	Small, shallow basin.	¾ in. slender obl. cavity.	Green, striped with red.	Melting and juicy.		En. Sep. beg Oct. Pear & Quince.	Lind. 59.	
SECTION IV.—AUTUMNAL CONICAL FRUITED.									
24. AH! MON DIEU. <i>Mon Dieu, Poire d'Amour,</i>	2 by 2½ ob. turbinate.	Small, prominent.	1 in. stoutish curved.	Yellow and red, dotted.	White, tender.	Abund. rich & perfumed.	En. Sep. Oct. Pear & Quince.	Lind. 61. Duh. 38.	
25. BELLE LUCRATIE. <i>Fondante d'Antonne,</i>	3 by 2½ oblong.	Open shallow impression.	1 in. strong curved.	Pale yellow & green & red.	Soft, mellow & tender.	Very sugary & agreeable.	Mid. middle Oct. 68.	Lind. 64.	Another new and good Flemish pear.
26. BEZI VAET.	A little swans egg.	Small sunk.	¾ inch long.	Dull green, russet spots.	Yellowish melting.	Remarkably sweet & agreeable.	November.	Lind. 71.	Raised by M. Parmentier and exhibited at Hort. Soc. in 1820.
27. BROWN BEURRE. <i>Beurre Gris, Beurre Rouge, Beurre d'or, Beurre d'Injou, Beurre d'Or, Beurre d'Amboise, Beurre d'Amboise, Isambert, Red Beurre, Golden Beurre, Beurre du Roi,</i>	1 by 3 oblong.	Small shallow depression.	¾ rather stout.	Greenish yellow through a thin russet.	White, with greenish veins.	Rich and excellent.	October.	Pom. Mag. 114.	A highly esteemed and well known old variety, tender and requires a sound dry soil.
28. CAPIAUMONT. <i>Capiaumont, Beurre de Capiaumont,</i>	3½ by 2½ turbinate.	Level with the extremity.	Half an inch, no cavity.	Fine cinnamon bright red.	Yellowish melting, buttery.	Very rich & high flavored.	Mid. Oct 3 weeks. Pear and Quince.	Pom. Mag. 69. Lind. 73.	One of the best new Flemish pears raised by M. Capiaumont, of Mons.
29. DILLEN. <i>Gros Dillen,</i>	¾ by 3½ oblate irr. turbinate.	Flat only.	Short & thick.	Yellow green, speck brown.	White, little core.	Slightly musky.	Mid. Oct 3 weeks.	Pom. Mag. 69. Lind. 77.	A fine buttery pear of the 1st order, and handsome from Van Mons in 1817.
30. DUCHESS OF ANGOULEME. <i>Duchesse d'Angouleme,</i>	3½ by 3½ round oblong.	Deep incurved regular hollow.	1 in. stout, deep in irregular cavity.	Dull yellow br. russet patches.	Rich, melting, juicy.	High fl. most agreeably perfumed.	Oct. & Nov.	Pom. Mag. 76. Lind. 80.	The very best of the late Autumn pears, first noticed in 1815.
31. GREEN SUGAR. <i>Sucre Vert,</i>	3½ by 2½ oblong.	Small, open narrow depression.	¾ strong small cavity.	Smooth, very green.	Glossy, but buttery.	Abdt. highly sweet & musky.	Mid. & end 4 October.	Lind. 42. Duh. 68.	
32. LOUISE-BONNE.	3½ by 2½ pyramidal.	Small very little sunk.	¾ straight obl. inserted.	Pale green & bee, yellow.	Extra. tender & juicy.	Succ. & well flavored.	Nov. & Dec.	Lind. 97. Lind. 90.	
33. MARIE LOUISE.	3½ by 2½ ovate.	Open obl. inserted.	1½ in. obl. inserted.	Greenish yellow, bee, a rich yellow.	Yellow, melting, juicy.	Succ & highly vinous.	Mid. middle October.	Pom. Mag. 122. Lind. 91.	A most excellent pear, raised by the Abbe Du Quesne, and sent to England, 1816.
34. NAPOLEON. <i>M'daille,</i>	3½ by 3½ like a Colmar.	Small, little depression.	¾ an in. thick straight.	Sm. bt. green & pale green.	Melting & unusually juicy.	Rich & agreeable.	Mid. Nov.	Pom. Mag. 75. Lind. 91.	An excellent variety, raised by Van Mons. Sent to England in 1816.
35. SECKLE. <i>New York Red Check, Sytle, Red checked Seckle,</i>	2½ by 2½ so turbinate.	Small, prominent.	¾ ob. inserted, sm. cavity.	Dull brown, red check.	Tender, juicy, melting.	Pec. rich, powerful, agreeable.	Mid. and end Oct.	Pom. Mag. 72. Lind. 101.	One of the finest pears in cultivation. Of American origin.
36. URBANISTE.	3½ by 2½ py. ovate.	Little sunk in crown.	1 in. ob. inserted.	Pale green, greenish yellow.	White, deepening to red, yellow.	Very sweet, little perfume.	End Sept. mid. Oct.	Lind. 103.	Raised by Compt. Coloma and exhibited to Lon. Hort. Soc. in 1823.
7. VERTE LONGUE. <i>Mouille Bouche, Muscat Fleuri,</i>	3½ by 2½ pyramidal.	Small, open, prominent.	1 in. straight, no cavity.	Green.	White, melting, juicy.	Succ. high flavored.	Mid. Oct.	Duh. 73. Lind. 104.	An old variety cultivated in America under the synonyme of Mouille Bouche.
38. SWAN'S EGG.	2 long 1½ small, oval turbinate.	Small, prominent shallow.	¾ slender obl. inserted.	Greenish yellow russet specks.	Soft and melting.	Very rich, musky, saccharine.	End of Sept. beginning October.	Lind. 110.	Its great certainty in bearing and the excellence of the fruit render it an universal favorite.
39. WHITE DOYENNE. <i>Doyenne Blanc, Doyenne, Beurre Blanc, Bonne Aule, St Michel, Carlisle, Citron de Septembre, Kaiserbirne, Poire à courte queue, Poire de Limon, Poire de Nive, Poire de Seigneur, Poire Monsieur, Valencia, White Beurre,</i>	3½ by 2½ round oblong.	Very small shallow, depressed.	¾ rather thick.	Citron, yellow russet specks.	White, juicy very buttery.	Delicious.	End of Sept. beg. Oct.	Pom. Mag. 60. Lind. 107.	Cultivated in New York, erroneously under the name of Vergaleu. In very high estimation. Good bearer.
40. EASTER BERGAMOT. <i>Bergamotte Bugi, Bergamot de Pâques, Bergamotte d'hiver, La Grillière, Paddington, Sarling, Serling, Winter Bergamot,</i>	3 or more by 3 ro. turbinate.	Small, closed, shallow.	Short, thick, af. inserted.	Green, gray specks, bec. yellowish gray.	White, half buttery.	Sugary, well flavored.	Jan. to May. P'r & quince.	Duh. 52. Lind. 110.	An excellent variety.
41. GERMAN MUSCAT. <i>Muscat d'Allemagne,</i>	3 by 3 turbinate.	Small sh. shallow.	1½ slender small cavity.	Covered with russet.	Pale yellow but very melting.	Sugary, musky, perfumed.	Mar. to May. P'r & quince.	Lind. 112. Duh. 72.	This is also an esteemed old variety.
42. GILGOL. <i>Gil-ô-Gile,</i>	3½ by 3½ obovate.	Large deep shallow hole 2 lipped cav.	1 deep.	Deep cl. rus. tinged br. red.	White juicy breaking.	Sweet and pleasant.	December to April.	Pom. Mag. 65. Lind. 113.	A valuable winter pear, though not of first rate excellence.
43. BEURRE D'ARENBERGH. <i>Beurre d'Arenbergh, Duc d'Arenbergh, Poire d'Arenbergh, Colmar des Champs,</i>	3½ by 2½ turbinate.	Small.	1 strong straight.	Delicate pale green, slightly clouded with russet.	Whitish, firm, juicy, melting.	Extraordinary rich, sweet and high flavored.	October till February.	Pom. M. 83. Lind. 119.	This most excellent pear was raised by M. Deschamps, and sent to the London Hort. Soc. in 1820.
44. ANGELIQUE DE ROME.	2½ by 2½	Very small shallow basin.	¾ small cavity.	Rough, pale red citron.	Yellowish, tender, melting.	Sugary, rich, fragrant flav.	December to March.	Duh. 108. Lindley, 118.	A very excellent pear, on a good soil and favorable situation.

NAME AND SYNONYMS.	SIZE AND FORM.	EYE.	STOCK.	SKIN.	FLESH.	JUICE.	IN USE.	DESCRIBED.	CHARACTER, ORIGIN, &c.
45. ANGELIQUE DE BORDEAUX, <i>Poir Anglique, St Martial, Gros Francal, &c.</i>	$\frac{3}{4}$ by $\frac{2}{3}$ py. turb.	Small, narrow and deep hollow.	$\frac{1}{2}$, strong, crooked.	Somewhat yellowish, ft. purple.	Tender and buttery.	Sugary.	February till April.	Duh. 88. Lindley, 117.	A good pear. Tree rather tender in England.
46. BEURRE DIEU, <i>Dieu's Butterbierne, Dorothé Royale, Poir de Melon, &c.</i>	$\frac{1}{2}$ by $\frac{3}{4}$	Close, deep surrounded by knobs.	$\frac{1}{2}$, strong, woody, deep.	Light green to a bright orange.	Clear white melting, juicy.	Delicious, rich aromatic, saccharine.	November till January.	Pom. Mg. 19. Lind. 120.	This noble pear was raised by Dr Van Mons, of Louvain, say about 1816. A great bearer.
47. BEURRE RANCE, <i>Beurre Epine, Hardemont de Prutenus,</i>	$\frac{3}{4}$ by 3 ob. along.	Small, open slightly sunk.	$\frac{1}{2}$ slender, no cavity.	Dark green, russ. specks.	Greenish white melting.	Delicious rich flavor.	December to April.	Pom. M. 88. Lindley, 121.	A very excellent pear, raised by Counsellor Hardemont, of Mons. Sent to England in 1820. The best late melting pear yet known. A most productive variety.
48. BEZI DE CASSOY, <i>Roulette d'Injon, Petit Beurre d'Hiwer, Nutmeg pear,</i>	$\frac{1}{2}$ by $\frac{1}{2}$ oblong.	Very small shallow basin.	$\frac{1}{2}$, in a deep cavity.	Green and yellow, spotted with red.	Buttery.	Very rich.	November to March.	Lind. 122. Duh. 59.	A most productive variety.
49. CHATEAUMONTIELE, <i>Beurre d'Hiwer, Bezi de Chateaumontelle,</i>	$\frac{3}{4}$ by 3 oblong.	Small, deep angular basin.	Short, deep, angular cav.	Yellowish green purplish.	Melting juicy.	Sugary & highly perfumed.	November to February.	Lind. 123. Duh. 78.	A very valuable fruit and good bearer.
50. COLMAR, <i>Poire Mauve, Bergt. Turdie, incomparable</i>	$\frac{3}{4}$ by $\frac{2}{3}$ py. tur.	Large, deeply hollowed.	1, thick, bent, ob. cavity.	Smooth, green, yellow, gray specks.	Greenish white, very tender.	Abundant, sweet, rich, high flavored.	November till January.	Lind. 124. Duh. 94.	A very good old variety.
51. EASTER BEURRE, <i>Bergt. de la Pentecote, Beurre d'Hiwer de Bruxelles, &c.</i>	4 by $\frac{3}{4}$ ro. oblong.	Small deep depression.	Short, thick, deep cavity.	Green, thick russ. dots.	Yellowish, buttery, melting.	Extremely high flavored.	Nov. to May.	Pom. M. 78. Lind. 126.	The very best of late keeping pears. Of recent introduction. A great bearer.
52. GLOUT MORCEAU, <i>Gloze Morceau,</i>	4 by $\frac{3}{4}$ oval.	Small, deep ob. hollow.	1, deep, ob. cavity.	Pale olive green russ. specks.	Whitish, firm, juicy.		November to March.	Lind. 129.	This very beautiful and very fine variety was sent to England in 1820, by Van Mons.
53. PASSE COLMAR, <i>Passe Colmar gris, dit Preced, Passe Colmar, Epineux, Foudante de Paris, Poire Preced, Colmar Epineux, Beurre Colmar gris, dit Preced, Chappau's,</i>	$\frac{3}{4}$ by 3 ob. conical.	Open, slightly sunk.	$\frac{1}{2}$, strong, ob. cavity.	Green, yellow spr. with russet.	Yellowish, melting, juicy.	Very rich and most excellent.	December to January.	Pom. Mag. 64. Lind. 137.	A very superior pear, raised by Counsellor Hardemont. A most abundant bearer.
54. VERGOLUSE, <i>Bec-jaleuf, Chambrette, Poire glace,</i>	$\frac{3}{4}$ by $\frac{2}{3}$ ob. pyra.	Small, deep sunk.	1, in a small ob. cavity.	Very smooth, grass green, to citron.	Melting, buttry.	Excellent, rich and high flavored.	November to January.	Lin. 146. Duh. 95.	This is a most excellent pear, requiring a good soil.
55. WINTER BOSCHRE, <i>Tien. Borchreien d'hiwer,</i>	4 by $\frac{3}{4}$ irr. pyramid.	Medium, in a deep hole.	$\frac{1}{2}$ a little bent ob. ins.	Yellowish with a brown tinge.	Very tender and breaking.	Plentiful, very rich, sweet and perfumed.	January and February.	Lin. 147. Duh. 87.	Undoubtedly one of the very best winter pears. Requires a good soil.
56. WINTER NELIS, <i>Ne-lis d'Hiwer, Bonne de Maloues, La Bonne Maloise,</i>	$\frac{3}{4}$ by $\frac{2}{3}$ ob. oval.	Open, narrow basin.	$\frac{1}{2}$ in a deep cavity.	Dull gray, green gray dots.	Yellow, white, melting, buttry.	Plentiful, sugary, rich, high flavored and musky.	December to January.	Pom. M. 126. Lind. 148.	This most excellent and valuable pear was raised by M. Nelis of Mechlin.

LIVERPOOL SALT FOR BUTTER.

This salt presents a beautiful appearance to the eye, has a powdery form and its color is of snowy whiteness. These qualities are very inviting to purchasers who are not particularly acquainted with its character. The Liverpool, or blown salt is prepared on the Western borders of England by boiling sea-water or salt spring water, saturated with the rock salt of Norwich, in large, shallow, iron pans. It contains a mixture of foreign ingredients technically called slack and bittern, which unite with the salt, and render it unfit for use, except for culinary purposes. It is not used by the people in the neighborhood of Liverpool, either in preserving beef, pork or butter, which is designed to keep any length of time. If butter is packed down with this salt, it is very liable to become rancid, soft and gluey and otherwise much debased in its quality, so that in a few weeks it loses its agreeable taste and odor and is unfit for the table. Instead of using the Liverpool salt is now too generally the practice, our farmers would receive a much higher compensation for their expense and labor in making butter, if they would prepare it with the coarse Turk Island salt, which should be purified of all foreign ingredients by washing it, having it thoroughly dried, and ground in a clean mill. It should be used in the proportion of about six pounds to every hundred weight of butter. Last week, a gentleman who lives 40 miles from Portsmouth brought 400 pounds of Butter into our market. It was made with Liverpool salt. On inspection, it was found to rank with No. 3 but-

ter, and he obtained only eight dollars per hundred; whereas, prime butter was then quick at twelve dollars and a half. We have known of several other instances of the same kind within a short time. Thousands of dollars are lost to the farmers of New Hampshire every year in consequence of the inferior quality of their butter, which inferiority is to be attributed in part though not altogether, to the use of Liverpool salt in its manufacture.—*State Herald.*

GENERAL MAXIMS FOR HEALTH.

Rise early. Eat simple food. Take plenty of exercise. Never fear a little fatigue. Let not children be dressed in tight clothes; it is necessary their limbs and muscles should have full play, if you wish for either health or beauty.

Avoid the necessity of a physician, if you can, by careful attention to your diet. Eat what best agrees with your system, and resolutely abstain from what hurts you, however well you may like it. A few days' abstinence, and cold water for a beverage, has driven off many approaching diseases.

If you find yourself really ill, send for a good physician. Have nothing to do with quacks; and do not tamper with quack medicines. You do not know what they are; and what security have you that they know what they are?

Wear shoes that are large enough. It not only produces corns, but makes the feet misshapen to cramp corns.

Wash very often, and rub the skin thoroughly with a hard brush.

Let those who love to be invalids drink strong green tea, eat pickles, preserves, and rich pastry. As far as possible, eat and sleep at regular hours.

Wash the eyes thoroughly in cold water every morning. Do not read or sew at twilight, or by too dazzling a light. If far-sighted, read with rather less light, and with the book somewhat nearer to the eye, than you desire. If near-sighted, read with a book as far off as possible. Both these imperfections may be diminished in this way.

Clean teeth in pure water two or three times a day; but, above all, be sure to have them clean before you go to bed.

Have your bed-chamber well aired; and have fresh bed linen every week. Never have the wind blowing directly upon you from open windows during the night. It is not healthy to sleep in heated rooms.

Let children have their bread and milk before they have been long up. Cold water and a run in the fresh air before breakfast.

Too frequent use of an ivory comb injures the hair. Thorough combing, washing in suds, or N. E. run, and thorough brushing, will keep it in order; and the washing does not injure the hair, as is generally supposed. Keep children's hair cut close until ten or twelve years old; it is better for health and the beauty of the hair. Do not sleep with hair frizzled or braided. Do not make children cross-eyed, by having hair hang about their foreheads, where they see it continually.—*Frugal Housewife.*

NUTTALL'S ORNITHOLOGY.

A work entitled 'A Manual of the Ornithology of the United States and of Canada; by THOMAS NUTTALL, A. M., F. L. S., has just been published from the press of Hilliard & Brown, Booksellers to the University of Cambridge. A work of this kind, well executed, is of more importance to Cultivators than by some may be apprehended. The feathered bipeds, which compose the most beautiful part of the animal creation are mostly either adversaries or coadjutors of the Farmer—they either help him or annoy him. A knowledge of their natural history, habits, manners, beneficial and mischievous propensities, is as useful as it is amusing, and every rural economist ought to be able to take advantage of the one and to counteract the other. For these and other reasons, which we have not time nor room to specify, we were much gratified with the appearance of the work named above.

The following extract from the Author's Preface, will show his views and resources; and his reputation as a man of science is a guarantee for the faithful performance of his undertaking.

'After so many excellent works have appeared on the Birds of the United States, it may almost appear presumptuous, at present, to attempt any addition to the list. A compendious and scientific treatise on the subject, at a price so reasonable as to permit it to find a place in the hands of general readers, seemed, however, still a desideratum; and to supply this defect has been a principal object with the author of the present publication.

'Besides exploring the ever fruitful field of nature in this delightful and fascinating kingdom, every available aid has been employed; and, as might be expected, invaluable assistance has been derived from the labors of the immortal Wilson and of the justly celebrated Audubon. In the scientific part of the Manual, constant recurrence has also been had to the useful labors of C. L. Bonaparte, Prince of Musignano, and also to the well known treatise on European Ornithology by the accurate and elaborate Temminck, as well as to other authors of established reputation; such as Brisson, Buffon, Latham, White, and Pennant.

'To a number of obliging friends who have assisted him in obtaining specimens, or relations concerning the habits of our birds, the author offers his grateful acknowledgments; particularly to Charles Pickering, M. D., to whom he is indebted for much valuable information on their geographical limits; to William Cooper, Esq., well known by his devotion to the study of ornithology; to Mr Oakes, of Ipswich; to T. W. Harris, M. D., Librarian of Harvard University; to S. E. Greene, Esq. of Boston; to Mr Nathaniel J. Wyeth, Mr James Brown, Mr John Bethune, and Mr Russell, of Cambridge.'

We subjoin an extract:

outer tail-feathers rusty-white at tip.—Male with a changeable ruby-colored throat.—In the female and young, the throat is nearly white, strongly inclining to yellow in the young male.)

This wonderfully diminutive and brilliant bird is the only one of an American genus, of more than 100 species, which ventures beyond the limit of tropical climates. Its approaches towards the north are regulated by the advances of the season. Fed on the honeyed sweets of flowers, it is an exclusive attendant on the varied bounties of Flora. By the 10th to the 20th of March, it is already seen in the mild forests of Louisiana, and the warmer maritime districts of Georgia, where the embowering and fragrant *Gelsemium* (Carolina Jessamine,) the twin-leaved Bignonia,* and the white-robed *Mylocarion*,† with a host of daily expanding flowers, invite our little sylvan guest to the retreats he had reluctantly forsaken. Desultory in his movements, roving only through the region of blooming sweets, his visits to the Northern States are delayed to the month of May.—Still later, as if determined that no flower shall blush unseen, or waste its sweetness on the desert air, our little sylph, on wings as rapid as the wind, at once launches without hesitation into the flowery wilderness which borders on the arctic circle.

The first cares of the little busy pair are now bestowed on their expected progeny. This instinct alone propelled them from their hybernal retreat within the tropics; strangers amidst their numerous and brilliant tribe, they only seek a transient asylum in the milder regions of their race. With the earliest dawn of the northern spring, in pairs, as it were with the celerity of thought, they dart, at intervals, through the dividing space, till they again arrive in the genial and more happy regions of their birth. The enraptured male is now assiduous in attention to his mate; forgetful of selfish wants, he feeds his companion with nectared sweets; and jealous of danger and interruption to the sole companion of his delights, he often almost seeks a quarrel with the giant birds which surround him; he attacks even the King-Bird, and drives the gliding Martin to the retreat of his box. The puny nest is now prepared in the long accustomed orchard or neighboring forest. It is concealed by an artful imitation of the mossy branch to which it is firmly attached and incorporated.—Bluish-gray lichens, agglutinated by saliva, and matched with surrounding objects, instinctively form the deceiving external coat; portions of the cunning architecture, for further security, are even tied down to the supporting station. Within are laid copious quantities of the pappus or other down of plants; the inner layer of this exquisite bed is finished with the short wool of the huddling *Platanus*, the mullein, or the soft clothing of unfolding fern-stalks. The eggs, as in the whole genus, are white, and only 2, so nearly oblong as to present no difference of ends. Incubation, so tedious to the volatile pair, is completed in the short space of 10 days, and in the warmer States, a second brood is raised. On approaching the nest, they dart around the intruder, within a few inches of his face: and the female, if the young are out, often resumes her seat, though no more than three or four feet from the observer. In a single week the young are on the wing, and in

this situation still continue to be fed with their nursing sweets by the assiduous parents. Creatures of such delicacy and uncommon circumstances, the wondrous sports of nature, everything appears provided for the security of their existence. The brood are introduced to life in the warmest season of the year; variation of temperature beyond a certain medium, would prove destructive to these exquisite forms. The ardent heats of America have alone afforded them support; no region, so cool as the United States, produces a set of feathered beings so delicate and tender; and, consequently, any sudden extremes, by producing chill and famine, are fatal to our Humming-Birds. In the present remarkably wet summer, (1831,) very few of the young have been raised in New England. In other seasons they comparatively swarm, and the numerous and almost gregarious young are then seen, till the close of September, eagerly engaged in sipping the nectar from various showy and tubular flowers, particularly those of the trumpet Bignonia, and wild balsam, with many other conspicuous productions of the fields and gardens. Sometimes, they may also be seen collecting diminutive insects, or juices from the tender shoots of the pine tree.—While thus engaged in strife and employment, the scene is peculiarly amusing. Approaching a flower, and vibrating on the wing before it, with the rapidity of lightning, the long, cleft, and tubular tongue is exerted to pump out the sweets, while the buzzing or humming of the wings reminds us of the approach of some larger Sphinx or drowing bee. No other sound or song is uttered, except occasionally a slender chirp while flitting from a flower, until some rival bird too nearly approaches the same plant; a quick, faint, and petulant squeak is then uttered, as the little glowing antagonists glide up in swift and angry gyrations into the air. The action, at the same time, is so sudden, and the flight so rapid, that the whole are only traced for an instant, like a gray line in the air. Sometimes without any apparent provocation, the little pugnacious vixen will, for mere amusement, pursue larger birds, such as the Yellow-Bird and Sparrows. To man they show but little either of fear or aversion, quietly feeding on their favorite flowers often, when so nearly approached as to be caught. They likewise frequently enter the green-houses and windows of dwellings where flowers are kept in sight. After feeding, for a time, the individual settles on some small and often naked bough or slender twig, and dresses its feathers with great composure, particularly preening and clearing the plumes of the wing.

The old and young are soon reconciled to confinement. In an hour after the loss of liberty, the little cheerful captive will often come and suck diluted honey, or sugar and water, from the flowers held out to it; and in a few hours more it becomes tame enough to sip its favorite beverage from a saucer, in the interval flying backwards and forwards in the room for mere exercise, and then resting on some neighboring elevated object. In dark, or rainy weather, they seem to pass the time chiefly dozing on the perch. They are also soon so familiar as to come to the hand that feeds them. In cold nights, or at the approach of frost, the pulsation of this little dweller in the sunbeam, becomes nearly as low as in the torpid state of the dormouse; but on applying warmth, the almost stagnant circulation revives, and slowly increases to the usual state.

RUBY-THROATED HUMMING-BIRD.

(*Trochilus colubris*, L. WILSON, ii. p. 26, pl. 10, fig. 3 and 4. AUDUBON, pl. 47, [a numerous group of old and young.] Orn. Bog. i. p. 248. Phil. Museum, No. 2520.)

COMMUNICATIONS.

HEATING BY HOT WATER.

Brookline, Dec. 28, 1831.

MR FESSENDEN—In your paper of November 30th, Gen. Dearborn published a letter of mine to him, on the subject of heating green houses with hot water. At that time I had not put in practice the mode I intended for warming my house; since then, however, I have been perfectly satisfied that this mode of heating is the best that has been hitherto applied to this purpose. My gardener had been used to flues only, in heating a house, and his prejudices were of course in favor of that practice. Since he has experienced the good effects of the hot water mode of supplying heat, he much prefers it to flues; and the weather has been such as to give the experiment a fair test.

The following is his report to me in relation to his operations the last week, on 22d and 23d inst.

The fire was kindled under the boiler at 3 o'clock, P. M.; at 10 o'clock at night, the external air was 4° below zero; the water in the boiler was 204°; that in the reservoir, 87 feet distant from the boiler, was 196°; the air in the house at same time was 50°; fuel was added at that hour, and the house left, with the damper nearly closed.—At sunrise, the following morning, the external air was still at 4°, and the water in the reservoir 120°; the air in the house 42°. The weather during Friday was very severe; the mercury in the house continued to rise through the forenoon, and was at 50° when I visited it. The air is thought to be much more congenial to the growth of plants, than that from flues, and the trouble less in attending the fire. If I am correct in my calculation, the area of the house contains 13,680 cubic feet of air, to be heated. The front wall and upright sashes are 8 feet high; the back wall 20 feet high; the length of the house 56 feet, and the pitch of the glass 34°, or about what is called one third pitch; width of house 20 feet. This will enable others to correct me if I have miscalculated its contents; the quantity of water to be heated in the boiler, reservoir and pipes, is about 400 gallons. When the fire has been lighted five or six hours, there is a difference of about 8° between the water in the boiler and that in the reservoir; when about ten hours, the heat of the water is about the same in the reservoir as in the boiler.

Jan. 19th, 1832. I have deferred sending you the above, that I might profit by the experience of the present month—which confirms what has been stated in the preceding.

Your obedient servant,

T. H. PERKINS.

FOR THE NEW ENGLAND FARMER.

DISEASED QUINCE TREES.

MR FESSENDEN—Having read in your paper the extract from the Genesee Farmer, stating the loss of quince trees, and having experienced something of the same last summer, although my knowledge of natural history is not sufficient to name the depredator, I will attempt to give some account of a remedy. By some pains and expense, I had obtained a quince tree in my garden, which had come to maturity, and blossomed last spring, and young quinces had grown considerably; but I discovered one day as I passed by it, that the leaves began to turn yellow, and decay, and continued so to do. But on examination the bark was found to be dead just under the surface of the

ground, with the appearance of worms. The earth was taken away from the tree two or three inches below the surface, and a quantity of ashes laid around the tree, and then a little mound of earth raised round the tree over the ashes. The tree was examined two or three weeks after, when the leaves appeared to be as dry and as fragile as though it had been cut down long before; which dissipated all hopes of longer life. I therefore concluded in the fall to take it up, and not cumber the ground with it; but on examination, to my surprise, life appeared to have been restored, and some short limbs had vegetated, and probably some new roots had grown out into the raised earth, which was very pleasing, for although quince trees are frequent in the old colony, they are very scarce in this section of the country, perhaps not another in town, except one other young one in my garden. We think this method of treatment would generally save them, for we frequently save our decaying pear trees in the same way. We would also recommend a timely application of ashes as a preventive.

S. C.

Minot, Me., Jan. 11, 1832.

From the Harrisburgh Chronicle.

FRUIT TREES.

Much good fruit has been introduced into this neighborhood of late years, but the demand increases faster than the production. It is as easy to raise good fruit as bad or indifferent and, when the good is brought to market, it will bring nearly double the price of the other. The first cost of fruit trees is the only difference in expense, but the produce of a single season will amply remunerate this.

Some difficulty is experienced with regard to the time and mode of planting fruit trees, to obviate which we make the following extract from Mr Prince's treatise on the management of fruit and ornamental trees, &c.

Seasons for Transplanting.—Spring is the season when we find the most pleasure in making our rural improvements, and from this circumstance probably it has become the general season for planting trees, but experience has proved the fall planting to be the most successful, especially in those parts of the United States which are subject to droughts, as the trees planted in autumn suffer little or none from a drought, when those set out in spring often perish in consequence of it.

Notwithstanding, with regard to those fruits that have been originally brought from warmer climates—such as the peach, apricot, nectarine, and almond, which are natives of Persia, Armenia, &c. It is necessary for us to consult the operations of climate also; and, from a consideration of these attendant circumstances, I have come to the following conclusions. In localities south of New York the fall season is preferable for transplanting all trees—north of New York, the fall is preferable only for the apple, pear, plum, cherry, quince, and all other trees of northern latitude; whereas the spring is to be preferred for the peach, apricot, nectarine, and almond, which for the reasons before stated, might, during severe winters, suffer from the intensity of the frosts. Still I do not mean to assert that trees of these kinds are certain to be injured by the winter, as in very many seasons they are not in the least affected; still they are exposed to vicissitudes which may or may not occur. Many gentlemen, however, of excellent judgment, make their plantations in the fall, which

only serves to prove, that, even in the most intelligent minds, a diversity of opinion exists.

Trees, &c., on their arrival at the place of destination.—As soon as the trees arrive at the place where they are to be planted, let a trench be dug in cultivated ground, the bundles unpacked, and the roots well wet, and immediately covered with earth in the trench, observing to make the earth fine that is spread over them, so as not to leave vacancies for the admission of air to dry the roots, it having been found by experience that the thriftiness of trees, the first year after transplantation, depends much on the fine fibres of the roots being kept moist, and not suffered to dry from the time they are taken up until they are replanted; their increase, therefore, must depend principally on the subsequent management on their arrival at the place of destination: for, if, when the bundles are unpacked, the trees are carelessly exposed to drying winds, the young fibres of the roots must perish, and the trees, if they live at all, cannot thrive the first season, as they can receive little or no nourishment until those fibres are replaced.

Manner of planting.—Let the holes be dug somewhat larger than is sufficient to admit the roots in their natural position, and of sufficient depth to allow the tree to be placed two or three inches deeper than it was before transplanting; take care to cut off any wounded parts of the root, and to reduce the top full one third, by shortening the branches or thinning them out. Let from two to four shovelfuls of well rotted stable manure, in proportion to the size of the tree, be incorporated with the earth, and the whole made fine previous to filling it in; and, during the operation of filling in the earth, let the tree be several times shaken, in order that the soil may be admitted among the finer roots; and when completely filled in, let the ground be well trodden down, and finish by making a hollow or basin around the tree, to catch the rain and convey it to the roots, or to receive the watering which it will be necessary to give it, should the season prove dry.

To cause the trees to thrive.—The ground where they are planted must be kept cultivated; young trees will not thrive if the grass is permitted to form a sod around them, and, if it should be necessary to plant them in grass ground, care must be taken to keep the earth mellow and free from grass for three or four feet distant around them, and, every autumn, some well rotted manure should be dug in and around each tree, and every spring the bodies of the apple, pear, plum, and cherry trees, and others that it is particularly desirable to promote the growth of, should be brushed over with common soft soap, undiluted with water; this treatment will give a thriftiness to the trees surpassing the expectation of any one who has not witnessed its effect. Should the first season after transplanting prove dry, regular watering will be necessary, as, from a neglect of proper attention in this respect, many lose a large portion of their trees during a drought.

Large Pears.—We have seen at the Boston Athenaeum two Pears of the variety called Pound Pear, raised by Doct. Hildreth, Marietta, Ohio, one of which weighed 38 ounces, and the other 34 oz.

Antiquarian Society.—Christopher C. Baldwin, Esq., of Worcester has been elected Librarian of this institution, which is to be hereafter continually open. Two wings have recently been added to the building.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Jan. 18, 1832.

QUARTERLY REVIEW.

LILLY & WATT have this day re-published the Quarterly Review, No. 91, which is filled with elaborate articles on the following subjects:—Croker's edition of Boswell's Life of Johnson—Archbishop of Dublin's Lectures on Political Economy—Royal Geographical Society—Jones on the Distribution of Wealth and Sources of Taxation—Monk's Life of Doct. Bentham—Papers relative to East Indian Spasmodic Cholera—Moore's Life of Lord Fitzgerald—Directions in Case of Pestilence—Reform Question. Republished quarterly at Boston, at \$5 per annum.

Extract of a letter from a correspondent in Manchester, England, dated Nov. 23, 1831, to the Publisher of the New England Farmer.

"I have lately had the pleasure of attending Scotland's Great Sale of Improved Short Horn Live Stock at auction, near Liverpool, which was attended by farmers of every grade from Earls, downward, and dressed in every fashion I ever recollect to have seen. A great entertainment was given, in which true old English hospitality was exhibited in a favorable manner. I herewith transmit you a catalogue, with the prices brought by each animal. The prices of Cows ranged from £10 to £26 sterling each: two years old Heifers from 9 to £27; Yearling Heifers from 5 to £11, and one for £22; Heifer Calves from £4 10s. to £6 10s.; Bull Calves from 10 to £20; Bulls from 11 to £15—and one fine animal, "Young Magnum Bonum," roan color, 2 years and 5 months old, by Heber, dam by Brampton, for £47; Steers from 9 to £15, and one very large beef steer, red and white, 3 years old, for £50. There were eighty animals sold, as you will perceive by the catalogue, which you will keep, as it may be of interest to breeders of cattle."

Extract of a letter from a correspondent in G. I. Ives, N. Y., to the Editor of the New England Farmer.

"Permit me just to say incidentally, that a Town Agricultural Society has been recently organized in this place, and that hopes are entertained by numbers of our best cultivators, that if they can bring their operations fairly into comparison with those of their brethren in various sections of the country, they shall not suffer deeply by the contrast. In the construction and use of the plough, they expect to bear away the palm—and perhaps will contend stoutly for the credit of producing the greatest amount of profit in the cultivation of a few of the leading crops,—such as corn, potatoes, flax, &c."

METHOD OF MAKING LEATHER IMPERVIOUS TO WATER.

MR FESSENDER—The following method of preserving boots tight against water, may be relied on as infallible, as I know from eight years' experience. It is used almost universally by New England fishermen, and has been for more than one hundred years.

A pint of boiled linseed oil, half a pound of mutton-suet, six ounces of clean bees-wax, and four ounces of rosin, are melted and well mixed over a fire. Of this, while warm, not so hot as may burn the leather, with a brush, lay plentifully on new boots or shoes, when they are quite dry and clean. The leather is left pliant. Fishermen stand in their boots in water, hour after hour, without in-

convenience. For three years past all my shoes, even of calf skin, have been so served; and have in no instance admitted water to pass through the leather.

From the New York Farmer.

ON THE CHOICE OF SUITABLE LAND FOR FARMING.

MR FLEET—The remark will, at first view, strike most persons as a kind of contradiction in terms, that the very richest land is not that on which farmers have the best success, and yet nothing is more certain. The first quality of land is generally considered to be river alluvion; next to this, the richest upland, such as a fat and retentive loam; then a sandy loam, or sand and clay; and finally a dry gravel. Of all these descriptions of soil, 1st, 2d, 3d and 4th, the last is that on which we generally find the best farmers, not only, but the most successful farming. I have traversed most parts of the United States, from Maine to North Carolina, and between the great western Lakes and the Atlantic, and have everywhere seen proof of the correctness of these remarks.—The first choice of land in the settlement of every new country, taking the qualities as designated above, is always in the numerical order, as they stand; and the 4th, after some 20 to 60 years, always becomes, except in some very rare cases of river alluvion, the first, and the whole order is reversed! There may be particular exceptions, but as a general remark, the above observations will be found, on the strictest examination, to be sanctioned by general facts. Such was the case, in the early history of the settlement of this continent, such it has been, in every part of the country, and such it still is, as settlements advance, everywhere. One generation succeeds another, the second invariably adopting different views from the first, if continuing to reside on the same land; and yet all others, all of those who are un instructed by personal experience and observation, or very nearly all, advance to the wilds with the old fashioned errors of opinion! Were we to omit taking into consideration the grounds of this mistake, the general perseverance in it would seem to imply a strange want of prudent foresight, or even a want of common understanding. Let us examine this matter a little, for it is one of very general importance.

Lands in a state of nature, wild lands, to which so large a proportion of the young men resort, for future farms, if clothed with timber, forest trees, present very delusive appearances, such, exactly, as would be likely to mislead the judgment.—Excepting only the river alluvion, universally sought as of the first quality, almost without looking at the soil, the three other qualities are found, the second and third, covered with a thick deposit of vegetable matter, leaves, partly decayed, "soft as an under bed," black as my shoe. Such is the surface. On tearing up some handfuls of the ground, this is well blackened of course, and little is thought of looking for the sub-soil, as those invariably do, who have once been deceived by black muck, and these soft beds of leaves. Brooks are plenty in such woods, though they will be scarce, on the same land, when opened to the sun, and the blankets and bed of leaves are removed, so as to dry the surface of the ground.

On the 4th quality of land, the dry and warm gravel, there is none of this great store of slowly

rotting leaves, because they rot rapidly, and fires often burn them up, the land being dry; and brooks, and springs, are even more scarce than they will be when the woods are destroyed. The ground, having its surface uncovered, and the woods generally more open, present an appearance of nakedness, especially after having passed over black muck lands, shrouded in leaves. With an allowance for the far greater frequency of fires, to burn off the leaves, and to destroy much of the growth of wood, keeping the woods more open, this land is condemned for barrenness, and the land of muck is chosen, all blanketed and carpeted with leaves. We may, on reading this, admitting it to be a true and faithful outline or delineation, all agree that we would act more wisely, and yet 99 in a hundred of us, un instructed by experience, would probably choose the carpeted land, as 99 in a hundred have done before, in all parts of the United States. I would not, and did not, but my father did, much to his regret, and I had the benefit of his experience, as well as my own, having been born and bred on one of those carpeted farms.

Land, that is cold and wet, may bear immense growths of trees, as of the elm, ash, basswood, birch, beech, maple and hickory; and having a very thick shade, the ground will be cold, and wet, and the leaves must, of course, decay very slowly. Hence the carpeting, which is invariably a sure indication of either cold or wet land, or of both.—If of both, it never will make a firm for grain; and grass, for pasture, and for hay, which grows on such land, is always very inferior in richness, to that grown on land that is warm and dry. The difference is very great. The most nutritious grass grows only where the land is so dry, and warm, that it must be sown frequently with seed, in order to keep up the sward. This is what I call a *medium soil*, good, alike for grass and grain, on which I should no more expect crops of grass, except from seed, than of grain. One acre of such ground, in pasture, or meadow, will keep as much stock as one and a half, or even two, or three, of your black muck cold and wet grass land. The appearance, to be sure, in pasture, will be very different. The grass may be very long, in your wet, cold land pasture, but very poor feed; in the other, it will be far more nutritious, short and sweet, like a well told story.

With land that is dry and warm, the good husbandman may always succeed in getting good crops. He may even make the soil as fertile as that of the very richest of land, and far more sure in its crops. Good husbandry constantly enriches the soil. But it is almost impossible to do this, with land naturally cold and wet. It has not warmth enough, of temperament, to be sensitive to kind treatment, but is like some men, so phlegmatic, as to offer no principle of life to act upon. Heat, and cold, are always antipodes. You can never, by the utmost kindness, overcome natural antipathies. The very cause of the muck, which misleads so many in the choice of lands, is a natural coldness in the soil, where leaves are preserved from decay, by cold, and by wet, not moisture, but an excess of wetness. Such lands, when cleared, will produce grain crops, while the muck lasts, and is rotting by the power of the sun, but is sterile, ever afterwards, unless covered with a new soil, made artificially and at more expense than the cost of warm and good land. This can be effected by trench-ploughing, underdraining, quick

line as a masure, bringing up the hard-pan, almost always the only sub-soil of mucky lands, but the cost is too great for anything but experiment, and on a small scale. It will be done, when lands, from being sence, shall be worth fifty dollars an acre, but that time is far distant.

This is a long story, Mr Editor, as it will seem to those of your readers, if any such there be, who take no interest in knowing how to appreciate the different qualities of land for farming. I venture to say, however, that no topic yet embraced in these papers, is of more general interest to your agricultural and horticultural readers, and that none of the Nos. will be more extensively and attentively read by them, particularly the farmers, than this and the three next, which I mean to devote to the same subject.

I shall not attempt to speak of soils of all descriptions, land of every quality, but dwell principally on the two leading characteristics, of *cold and wet land*, underlaid by *hard-pan*; and *warm and dry land*, properly the *medium soils*, however constituted, closing with some observations on good grazing and meadow land, for dairy and stock farms.

Important to Farmers and others.

THE late Gov. De Witt Clinton, having, in his annual message to the legislature, recommended to the people of the State of New York the culture of the *Golden Leaf Tobacco* as a matter of great interest, and intimated that the seed might be had in the State of Maryland, the subscriber, after sending, at much expense, without success, to different parts of that State, has the past spring procured some by means of the Hon. Wm. G. ANGEL, member of Congress; and the crop far exceeded all expectation. I have not been apprised that any other person in the State has been able to get the seed; I have saved a large quantity for the benefit of the public, as will appear by the certificate of Judge Brooks, and E. & J. S. Perkins, Esqrs.

ZERUBABEL MATTESON.

Burlington, Oregon Co. March 31, 1831.

Sir—Agreeably to your request, I have procured you a small quantity of the *Golden Leaf Tobacco* seed, by means of a member of Congress, from Maryland, who assured me it was genuine, and by far the best kind in America.

Most respectfully, yours, W. G. ANGEL.
Z. Matteson, Esq., Exeter.

We certify, that the past summer, about 3 weeks after we planted our common tobacco, we learnt that Z. Matteson had planted of the *Golden Leaf*; we procured some, and say that more than three times the weight of tobacco was on each plant than were on the common kind; was as early and as pleasant for use as soon as cured as the old kind is years old. We believe that a boy 14 years old will raise a ton in less than a month's labor, and that it is of high importance to the northern States, as they might export, in a short time, millions of dollars' worth, instead of paying it away.

THOMAS BROOKS,
E. PERKINS,
J. S. PERKINS.

Exeter, Dec. 1831.

Any person enclosing a dollar bill, directed to Matteson Mills, post office, Exeter, Oregon Co. N. Y. post paid, shall have a large spoonful of the above seed sent them free of postage (sufficient for two acres.)

Jan. 18. HIRAM MATTESON.

Old Beans and Peas.

FOR sale at the Seed Store connected with the New England Farmer Office—

About 20 bushels of Peas and Beans of various sorts, of the growth of 1830—being a part of our stock for seed left over unsold, and are now offered at a low price as food for sheep. Jan. 18.

Nuttall's Ornithology.

JUST received by J. B. Russell, No. 50 1-2 North Market Street, Boston—

A Manual of the Ornithology of the United States and of Canada. By Thomas Nuttall, A. M., F. L. S.; with 53 engravings. Price \$3.50. Jan. 18.

Sweet Herbs, &c.

FOR sale at the New England Seed store, 52, North Market street—The following Sweet Herbs, pulverized, and packed in tin canisters for domestic use, viz:

Sweet Majorum, 37½ cts.—Thyme, 37 cts.—Summer Savory, 25 cts.—Sage, 17 cts.—per canister. Also—Black Currant Wine for medicinal purposes, 75 cts per bottle. Tomato Ketchup, 37½ cts per bottle. Jan 11

Wanted,

TWO or three copies of the 1st, 2d and 3d volumes of the New England Farmer, for which a fair price will be paid—Apply at this office. Jan 11

Elegant Camellia Japonicas & Bouquets.

THE Subscriber, Gardener to John Prince, Esq. at Jamaica Plains, can furnish a constant supply of elegant Bouquets—also superb double flowers of white, and several other sorts of Camellia Japonicas, at prices lower than in former years. Also—very superior Mushrooms, and a great variety of Green-House plants.

THO'S MASON.

Jamaica Plains, Jan. 10, 1832.

Grape Cuttings, &c.

WILLIAM PRINCE & SONS, near New York, offer for sale the following:

20,000 cuttings of the Isabella, Alexander, or Schuykill Muscadell, Catawba, Wines, Herbermont's Madeira, Bland, Elmsburg, Elkton, Worthington, White Fox, Luthorough, Long's Arkansas, Missouri, Muney, Norton's Virginia Seedling, Scuppernon, York Madeira, and other native and foreign Grape Vines, at reasonable rates.

Scions of Fruit Trees for ingrafting, which can now be sent with safety to any part of the Union, will be supplied—of all the various kinds.

Above 150 varieties of Double Dahlias, including the New Anemone flowered, and Dwarf varieties, and also several White flowering varieties.

500 New Chinese Mulberry or Morus multicaulis, so superior for silk worms.

500 lbs. Seed of the Locust tree, of the Long Island variety, so noted for ship timber.

Orders for these articles, or for Fruit Trees, Flowering Shrubs and Plants, Green House Trees and Plants, Bulbous Flower Roots, &c. will receive the utmost attention. Orders can be sent by mail—and Catalogues will be sent gratis to all those who desire them. Flushing, N. Y. Jan. 5, 1832. 2w

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Historical Parallels.

JUST published by LILLY & WAIT, Historical Parallels, Vol. 1—being No. 29 of the Library of Entertaining Knowledge, price 40 cts. Each No. contains more than 200 pages, and numerous engravings on wood, beautifully executed.

Lilly & Wait have also now preparing for press, and will speedily publish—The New American Clerk's Magazine, containing the most useful and necessary Forms of Writing, which commonly occur between man and man;—and that will be found equally necessary and convenient for the farmer, the mechanic, the clerk, the apprentice, the merchant, the lawyer, and for every man, of whatsoever occupation, who has any interest in ordinary business transactions. Calculated for the use of the citizens of the United States, and made conformable to law. Jan 3

Tea Wheat.

A FEW bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. x, page 105—and vol. vi. page 82. Dec. 14.

BRIGHTON MARKET—Monday, Jan. 16.

[Reported for the Daily Advertiser and Patriot.]

At market this day 423 Beef Cattle, 47 Stores, 588 Sheep, and 125 Swine. The Swine are a part of those we reported some five or six weeks since.

Prices.—Beef Cattle—More extra Cattle were at market today than is usual, say from 40 to 45. We shall not after our quotations from last week—extra \$5 25 a 5 50; prime 5 good 4 67 a 4 84, thin 3 50 a 4 50.

Cows and Calves—We noticed the following sales—\$20, 21, 24, 26 and 29.

Sheep—We noticed a lot of about 170 Wethers, which averaged about \$2 67 each, a lot of about 30 at \$3 a 3 25 each; also a lot of 150 at \$4 17 each.

Swine—One lot of 25 a 30 were taken without weighing, and about the same number were retailed at 4c. for Sows and 5c. for Barrows.

New York Cattle Market, Jan. 13.—In market this week about 1000 head of Beef Cattle, in addition to some 200 head left over of last week, and about 1050 Sheep. Demand very limited and sales generally dull. Beef Cattle—Sales at \$5 a 5 50, and some superior at \$6 75 a 7. Good Cows \$30. Sheep—Sales at \$2 50 a 5 50; a few at \$6 50.—Daily Ad.

MISCELLANY.

From the Songs of James Hogg.

THE MOON WAS A-WANING.

The moon was a-waning,
The tempest was over;
Fair was the maiden,
And foud was the lover;
But the snow was so deep,
That his heart it grew weary,
And he sunk down to sleep
On the moorland so dreary.

Soft was the bed
She had made for her lover;
White were the sheets,
And embroider'd the cover;
But his sheets are more white,
And his canopy grander,
And sounder he sleeps
Where the hill foxes wander.

Alas! pretty maiden,
What sorrows attend you!
I see you sit shivering,
With lights at your window;
But long may you wait
Ere your arms shall enclose him,
For still, still he lies,
With a wreath on his bosom!

How painful the task
The sad tidings to tell you!
An orphan you were
Ere this misery befell you—
And far in you wild
Where the death-tapers hover,
So cold, cold, and win
Lies the corpse of your lover!

SAGACITY OF BEES.

Anything relating to the natural history of Bees, is particularly interesting at this period, when so many of our intelligent countrymen are endeavoring to introduce them among the farmers of New England.

The following anecdote is extracted from a letter from J. Hector St John, a farmer in Pennsylvania to a friend in England, first published, we believe, in 1781.

The sagacity of these animals, which have long been the tenants of my farm, astonishes me; some of them seem to surpass even men in memory and sagacity. I could tell you singular instances of that kind. What then is this instinct which we so debase, and of which we are taught to entertain so diminutive an idea? My bees above any other tenants of my farm, attract my attention and respect. I am astonished to see that nothing exists but what has its enemy: one species pursues and lives upon the other. Unfortunately our king-birds are the destroyers of these industrious insects: but, on the other hand, these birds preserve our fields from the depredation of crows, which they pursue on the wing with great vigilance and astonishing dexterity. Thus divided by two interested motives, I have long resisted the desire I had to kill them, until last year, when I thought they increased too much, and my indulgence had been carried too far. It was at the time of swarming, when they all came and fixed themselves on the neighboring trees, whence they caught those bees that returned from the field.—This made me resolve to kill as many as I could,—and I was just ready to fire, when a bunch of bees, as big as my fist, issued from one of the hives, rushed on one of these birds, and probably stung him, for he instantly screamed, and flew, not as before in an irregular manner, but in a direct line. He was followed by the same bold phalanx,

at a considerable distance, which unfortunately becoming too sure of victory, quitted their military array and disbanded themselves. By this inconsiderate step they lost all that aggregate of force which made the bird fly off. Perceiving their disorder, he immediately returned, and snapped as many as he wanted, may he had even the impudence to alight on the very twig from which the bees had driven him. I killed him, and immediately opened his craw, from which I took 171 bees. I laid them all on a blanket, in the sun, and, to my great surprise, 54 returned to life, licked themselves clean, and joyfully went back to the hive; where they probably informed their companions of such an adventure and escape, as I believe had never happened before to American bees!

EDITORIAL DIFFICULTIES.

Next to poverty, delinquent subscribers and duns, to which most editors are subject, the greatest difficulty is to please the public. For so great is the variety of public taste and feeling, that had the conductor of a periodical paper as many heads and as many pens as his paper has readers, he could never hope to please all; for they cannot please themselves. Does he speak out in language plain and simple? it is mere common place; the taste of the learned is not gratified; it is fit only for the vulgar. Does he aspire to elegance? the unlearned cannot understand, and the learned regard him as a pedantic fellow, dabbling in what he has no real pretensions to. Does he show his colors, and boldly contend for his ground? he is too severe. Does he hide himself behind a mass of equivocal matter? he is a temporizing hypocrite. If he publishes extracts that are better than he can write, he has no talents of his own to display; and if he fills his paper with original matter, he might have given something better from the works of others. If he attempts to philosophize, it is dull and uninteresting; and if he write on plain and familiar subjects, everybody knew them before. Does he attempt to instruct? he needs to be instructed. Does he use his endeavors to amuse? it is light and trifling. People generally are fond of being praised, and one would suppose this might satisfy them. But let an editor try the expedient, and he will soon find out his mistake. For such is the power of envy that no one will thank him for praising him, and every one will hate him for praising others. Most people are fond of hearing their neighbors slandered; but if you attempt to point out either the vices or follies of mankind, every one will find something applicable to himself; and here again you encounter the hatred of the whole mass. Every person can tell you how to conduct a paper to please himself, and of course to offend every one else.—These being stubborn facts, there is no alternative but for an editor to please himself if he can, and hazard the consequences. If he does this he will be certain of satisfying one, which is more than he can say if he tries to please all.—*Upland Union.*

Let this idea dwell in our minds, that our duties to God and our duties to men, are not distinct and independent duties, but are involved in each other; that devotion and virtue are not different things, but the same thing; either in different stages or in different stations, in different points of progress, or circumstances, or situations. What we call devotion for the sake of distinction, during its initiatory and instrumental exercises,

is devotion in its infancy; the virtue which, after a time it produces, is virtue in its maturity; the contemplation of Deity is devotion at rest; the execution of his commands is devotion in action.—Praise is religion in the temple, or in the closet; industry, from a sense of duty, is religion in the shop or field; commercial integrity is religion in the mart; the communication of consolation is religion in the chamber of sickness; paternal instruction is religion at the hearth; justice is religion on the bench; patriotism is religion in the public councils.

Silk a Protection against Infection.—A silk covering of the texture of a common handkerchief is said to possess the peculiar property of resisting the noxious influence, and of neutralising the effects of malaria. If, as is supposed, the poisonous matter is received into the system through the lungs, it may not be difficult to account for the action of this very simple preventative; it is well known that such is the nature of malaria poison, that it is easily decomposed by even feeble chemical agents. Now it is probable that the heated air proceeding from the lungs may form an atmosphere within the veil of silk of power sufficient to decompose the miasma in its passage to the mouth, although it may be equally true that the texture of the silk covering may act mechanically as a nonconductor, and prove an impediment to the transmission of the deleterious substance.

Sage.—Sir John Sinclair, author of the Code of Health, strongly recommends the use of sage tea, made from common garden sage, as a remedy for disorders of the throat which arise from a bad state of the stomach. He tried the experiment on himself, using a bath of vinegar and water for his throat when sore from a cold—and the sage with great success, when the other remedy failed. He drank a pint of the tea in a day, in doses of a wine-glass full at a time.

A young lady, who had been severely interrogated by an ill-natured counsel, observed, on leaving the witness box, that she never before fully understood what was meant by cross examination.

A printer, whose talents were but indifferent, turned physician. He was asked the reason of it. 'In printing,' answered he, 'all the faults are exposed to the eye; but in physic they are buried with the patient, and one gets more easily off.'

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

DISEASE IN HORSES.

THOMAS G. FESSENDEN, ESQ.—As there were many opinions respecting the late epidemic which proved so fatal to horses, I addressed a line to Dr. Peck of Foxborough, a gentleman of sound judgment, and an accurate observer of facts, and who had lost a valuable horse by the complaint, requesting him to give me his opinion respecting the disease, and the proper treatment to be pursued, and to make such remarks as he thought proper.—The following is a copy of his answer. Should you think it will be useful to the public, you are at liberty to give it a place in that depository of useful knowledge, the New England Farmer.

Your obed^t servant,
Mansfield, Jan. 1832. R. GREEN.

Foxborough, Nov. 8, 1831.

SIR—Numerous professional duties have delayed a compliance with your request, much longer than was expected, when it was received. The demands of friendship, and the benevolence of the object forbid me to hesitate in giving you my views respecting the epidemic, which has effected so great a loss of property, inflicted so much suffering, and occasioned death in so many instances in that noble race of animals, the horse. It is not, however, without embarrassment and diffidence of opinion created by the novelty of the subject, and increased by the want of leisure, and the means to ascertain what is already made public in books on veterinary medicine.

My opinions will be founded principally upon the disease, as it occurred in the mare I lost in September last. A concise history of this case will afford you the best means of judging of their correctness and prevent the necessity of introducing detached portions by the way of explanation.

On the 7th of September my boy took her from the pasture a little before sunset and harnessed her in the sulkey. While standing at the door, I observed she slavered freely and was stupid and downcast, in her appearance. I discovered that she was loath to go faster than the walk, and although repeatedly urged forward by the whip, would shortly resume the walk. Once or twice on ascending a hill, she stopped for a moment, as if fatigued, or in pain, and several times in descending small pitches she appeared in great danger of falling from the very bungling manner of using her fore feet.

She had been turned to grass for a few weeks to recover from an injury of one of her limbs, and deprived of grain to which she had long been accustomed. This change in her living and want of exercise, I thought at first might account for her lack of spirit and activity, as well as for the awkwardness of her gait. I therefore continued my ride without discovering anything further till the latter part of the evening, except that whenever the whip was applied, a distinct interval was obvious between the time it struck her and the time she perceived the blow. When she did perceive it, the effect was greater than was expected, for she started off as if surprise had been added to the usual effects of the lash. This singular phenomenon I observed several times in the course of the evening.

I might also mention, that checking her up appeared to cause pain and very much retarded her motion. On my return home in the latter part of the evening, I experienced great difficulty in keeping her in the road, on account of an obstinate and constant tendency to the left, that required a strong effort to counteract. She could scarcely be urged out of the walk, and it was perfectly evident that she was laboring under some alarming disease.—I now made a careful examination and found the whole surface of the body cold and tremulous, countenance dull and listless, a leaning and stepping to the left, with so much appearance of general weakness, as to induce the fear that she would fall in the harness. With much ado I got home, which was then but a short distance. She however grew worse very fast, and when she arrived home, did not recognise her own stable. She was now well rubbed and a gallon of blood taken from the neck. While this was doing, and afterwards, she often kicked violently with her left foot. About 11 P. M. I was called from home and did not return till next day about 2 P. M., when she was down and incapable of rising. She was left in the care of a farrier who had bled her again and given her several cathartic medicines without effect. She lay stretched out upon the floor with her head drawn back and the muscles of the neck, abdomen, and limbs frequently convulsed. At short intervals she would revive, or attempt to get up, but could only get upon her hind feet, for her fore legs appeared to be completely paralyzed. She would, however, make a powerful exertion to rise forwards, and throw herself several feet ahead, without regarding anything that might be in her way. No material alteration took place till next morning, except a gradual diminution of strength and exertion. In the morning she commenced moving her legs backwards and forwards, was generally convulsed and apparently in the greatest distress. This state of things continued till 9 A. M. when she expired.

From the first appearance of illness, her fore legs were disproportionately affected. The retina retained its sensibility to the last; it did not however, appear to communicate any impression to the brain.

Examination one hour after death.—The cavity of the chest and abdomen were opened and each viscus carefully examined: no disease was discovered except a slight inflammation of the mucous surface of the urinary bladder, which probably resulted from a retention of urine.

The vessels of the brain were remarkably turgid and between the pia mater and arachnoid membrane, numerous small collections of water were found in the depressions upon the surface of the brain. The water in the ventricles did not much exceed half a gill. The cerebellum was surrounded with water inclosed in the membranes above mentioned and the effusion was still more abundant around the medulla oblongata and medulla spinalis. The interior of both cerebrum and cerebellum appeared more vascular than I supposed to be natural. The head was separated from the trunk by a section between the second and third cervical vertebra, and the extremity of the spine being made dependent, water to a considerable amount gradu-

ally dripped from it. The posterior half of the processus tentorie was found completely ossified. This circumstance I mention, not as having anything to do with the disease, but as it was probably a morbid deposit; hence we learn how unimportant was this affection of the animal, which, until this illness had been perfectly good.

The morbid appearances discovered on dissection will explain the symptoms except the inclination to the left, which might have been owing to an unequal affection of the two hemispheres of the brain. The affection of the fore legs resulted, probably from inflammation of the spine.

Such were the symptoms and such the autopsic appearances; but the more difficult and the more important of your inquiries remain to be answered. To start an hypothesis or to dictate a treatment from the observations made in a single case, would seem a most hazardous, if not presumptuous undertaking; but from what I can learn of others, there is a great uniformity of symptoms in cases that have occurred in this quarter, and as it is evidently an epidemic disease, there can be little doubt that it exhibited its peculiar attributes, more or less clearly, in all cases that occurred unmixt with other complaints. If this be so, we are warranted in drawing general conclusions respecting the nature of the disease, from the case before us, and in deducing therefrom the principal objects to be kept in view in the use of therapeutic means.

In respect to the cause, numerous opinions are in circulation. Some impute this malady to the watery quality of the grass arising from frequent rains and heavy dews; others to the great abundance of it, supplying an excess of nutriment and thence inducing an inflammatory diathesis; while others again, ascribe it to noxious plants and poisonous insects eaten by the horse. The two first of these although directly opposed to each other, may be worthy of a passing notice. That very wet and very dry seasons produce material and opposite effects upon grasses, is well known to every one. In very dry seasons, they contain much more nutritive matter, in a given quantity, than in very wet seasons.

The past season has abounded with rains and hence the quality of grass has been inferior to that of common years. I have heard many remark that horses slavered much more than common. No doubt an inferior quality of food and so copious a salivation may very much weaken the animal and prepare his system to be acted upon with greater facility by morbid agents. In order to show that it was of itself competent to produce the disease, it will be necessary in the first place to prove that the disease was co-extensive with this deterioration of the grass; but this I suspect will not be pretended. The second is less adequate than the first, unless it be supposed that the excess in quantity be more than sufficient to counterbalance the deficiency in quality. But were it even so, the effect must be limited to a general effection or of the system very different from actual disease and the same objection might be brought against it as against the first. Great and sudden changes in the temperature of the atmosphere sometimes produce epidemic diseases; but this was not only

somewhat out of season, but for too limited in extent to be attributed to this cause.

If malaria (miasma) be an adequate cause, and if, moreover, the symptoms and nature of the disease bear a close analogy to the known effects of malaria upon the animal system, then certainly it would be very unphilosophic to adduce others, except as mere auxiliaries. I need not attempt to show that this is an adequate cause, or that such analogy exists. In looking at the history of the case you will at once recognise the most prominent effects of this agent exerting its deadly powers in a manner too obvious to require further proof. Indeed it would seem that this disease of the horse, closely simulated some of those violent forms of fever, which in different parts of the world has destroyed great numbers of the human race.—You will recollect that history furnishes us with the account of several epidemics in which domestic animals were simultaneously affected with man, and that too with very similar diseases. From these, we learn the susceptibility of their systems to malaria and its analogous effects in different races of animals. But it is said the horse is not subject to idiopathic fever. Whether this proposition be true or false, depends on the definition given to the term fever. While some make fever to consist of inflammation, others say it consists of a peculiar affection of the nervous system, associated or not, with inflammation. It is therefore idle to contend upon this point, and all I wish to say, is, that whatever we call it, its pathology more closely resembles the violent form of fevers than any other disease with which I am acquainted.—Adopting the older hypothesis of the two, I regard indisposition to motion, lassitude, and prostration of strength, as resulting from the primary effects of the deleterious influence of malaria upon the nervous system, and inflammation, when it occurs, as it generally does in all severe cases, as the sequence of such influence.

According to this theory, the disease does not consist in a simple acute inflammation of the brain as might be inferred from the autopsy appearances, but in an inflammation superinduced in a system greatly prostrated by previous affection. Inflammation may succeed so immediately as to afford no opportunity to mark that other and primary affection which laid the foundation, or if I may so say, created the necessity of its occurrence. Yet, notwithstanding this rapid succession, the fact of its existence, I regard as beyond reasonable doubt, and its admission made necessary in explaining the phenomena of the disease. It is also of further importance in reference to the use of curative means. Should the physician, on discovering inflammation of the brain, stomach or intestines in typhus fever, adopt the same course as in ordinary attacks of acute phrenitis, gastritis or enteritis, without regard to the complicated nature of the disease, he would deserve very little credit for his skill. True, the same means might be necessary, but the measure and adaptation of them must be widely different to insure success.

Having in a very hurried and imperfect manner, given, thus far my pathological views, I shall now proceed to state, in a general way, what I suppose to be the most rational plan of treatment. The constitution of the horse is known to differ materially from man in respect to the influence of some of the most energetic medicines we possess.—Whatever may be the knowledge of others in the use of medicines in the complaints of horses my

own is so limited, that I shall confine my remarks principally to the management of blood-letting, the most efficient, if not the only remedy worth consideration. But before coming to particulars it is proper to state that the objects to be regarded in the treatment, are, the prevention of inflammation when the earlier symptoms are noticed, and the cure of it where it already exists.

When the first symptoms, such as loss of appetite, languor, and indisposition to motion, are timely observed, a warm but well ventilated stable, a light diet, and some mild cathartic, as neutral salts, may perhaps prevent the further development of the disease. My mare was in a pasture near the house, and several of my family have expressed their belief, that she was unwell two or three days before I knew it. They drew this conclusion from her standing about in a listless and unusual manner. Cold rigors with more or less delirium will generally announce the formative stage of inflammation. This will commonly be followed by a reaction more or less perfect, attended with corresponding heat and high vascular excitement.—When the heat of surface is nearly uniform, a large opening should be made in one of the jugular veins, and the blood allowed to flow, regardless of the quantity taken, till faintness is induced. Should the same symptoms continue, the blood-letting may be repeated in the same way, in 4, 6, or eight hours, according to the violence of the case, and even a third or fourth time, should it be necessary to control the disease. An active cathartic and cold applications to the head and neck, a dark stable and the most perfect stillness may be regarded as valuable assistants.

These cases, in which the reaction is imperfect and the extremities continue cool and the heat of surface inconstant, will be found, by far, the most unmanageable. When the cold stage is protracted, friction, warm blankets, and warm aromatic drinks will be useful, and should these not succeed in a reasonable time, a small quantity of blood may be taken to unload the congested organs, and spirit diluted with warm water, may be frequently administered till the object is gained, and stop as soon as the circulation is developed. As soon as the circulation is restored, the treatment must be the same as above mentioned. The bleedings should ever be small when there are frequent alternations of heat and cold, and proportioned to the degree and permanency of heat. When no reaction takes place, or where it is long protracted every variety of treatment will fail.

Should the violence of the disease be subdued and the horse does not convalesce, blisters applied on each side of the cervical spine, with laxatives, rest, and light diet will be the probable means to remove the remainder of the disease. During convalescence it will be necessary to avoid over exertion, feeding, and exposure to cold.

If the views taken in this paper be correct, it will not be singular if other organs than the brain were sometimes found inflamed.

Already having extended this paper to a great length, I am compelled to omit many things worthy of notice; but I shall need to make an apology, rather for what I have, than for what I have not written; for I am free to confess, that however satisfactory it may be, to reason from analogy on the same species of animals, it is very liable to lead us into error when this method is extended from one species to another.

Respectfully,
Doct. ROLAND GREEN.

GARDNER M. PECK.

FOR THE NEW ENGLAND FARMER.

WILD CHERRY TREE LEAVES.

T. G. FESSENDEN, ESQ.

SIR—As there has been much written on wild cherry tree leaves, and your correspondents appear to be in as much need of information on the subject as myself after having lived almost half a century, I was in hopes that some one would have come to the point, and saved me the trouble of writing; and nothing but the duty I owe to the public induces me to undertake. As I am in the habit of laying hides at all seasons, I bought one which was taken from a beast that died by eating wild cherry tree leaves. I observed to the owner that if wild cherry tree leaves would kill cattle, it was a wonder that there were any in the country, as these leaves could be found on almost every farm. I will give you his own words: '*they must be wilited to just such a pitch.*' He opened the creature, and found that all the leaves stuck fast on the belly; and that a mortification had taken place under the leaves.

I asked a gentleman, a few days past, if he ever knew wild cherry leaves to hurt cattle? He observed that he knew a heifer of one of his neighbors that died by eating them after they were wilited. I asked him what effect it had on her? He said it disordered her stomach so that she could not raise her end; but she was not opened. A other case was that of an ox that was turned in a lot the next day after the cherry tree was cut, and he came near dying, but recovered after ten days. There is nothing that a cow can eat that gives the milk such a disagreeable taste as these leaves, and it will sour in half the time that it will when the cows are fed on grass, which must of course affect the taste of the butter or cheese; and might be the cause of much scolding and scalding about sour milk, when the cause of its sourness was not known.

If you do not receive any better communication on this subject, you may publish as much of this as you may think will be of service to the public.

Providence, Jan. 20, 1882. CALVIN DEAN.

P. S. I do not suppose that there is any poison in wild cherry tree leaves made into tea, green or dry. But it is the gluey substance in the leaf that when eaten makes it adhere to the stomach or intestines, and there is nothing to remove it. My opinion is that they are more hurtful in June and July than later in the season. The cow died, I think, in June; and the ox ate the leaves sometime after laying; and when cherries were ripe, I have seen the ground covered with the bushes, in all stages from green to dry, and never knew them to hurt any creature at that season. C. D.

To those engaged in the manufacture of Kiln Dried Corn Meal, the following hints from the Journal of Commerce may be of use.

KILN DRIED CORN MEAL.

Kiln dried meal must be made of the best yellow corn; white would not sell. Hogsheds should be made of the best seasoned white oak stuff, 4 feet 5½ inches long, and be 2 feet 3¼ inches across the head. Four iron hoops on each hids. The rest of the hoops strong, smooth hickory. The hids. must be made tight, as they are sold for rum hids. in the West Indies—the only market for them.

The corn is dried in a large sheet-iron cylinder, or in pans, (put in motion by the mill) in a heated

air-chamber of brick. The meal is sifted; the cloth as open as the common middlings cloth in a sup-rect, and about 4 feet long.

The weight in each hhd. 800 lbs. and the hhd. must be branded with the name of the maker and *kiln dried corn meal*, No. 1, 800 lbs. The meal must be of a bright yellow, and smell strongly of the kiln, or it will not pass inspection. Ten hhds. per day is moderate work for a good pair of hurs and a good kiln, sixteen bushels of good corn will make a hhd.—old corn less. Ten to 12,000 hhds. are made in N. York yearly for the West Indies.

It would not be safe for a new hand to conduct a kiln, without the presence of an experienced workman who has put them up.—The sheet iron pans are better than the cylinders.

The price in New York varies from \$13 to 15 through the year, when corn is plenty. The cost of a complete kiln with pans, is \$400 to \$500.

The vegetative principle must be entirely destroyed, and the point of sufficient dryness can be easily ascertained by the smell of the meal while grinding. Great pains must be taken in making the hhds. well, and of stiff' long seasoned; or the meal will make them shrink so much that they will fall to pieces before they reach the market.

From Prince's Pongological Manual.

GRAFFIAN. PR. CAT. FOR.

Bigarreau. Hook. Pom. For. and of the English publications generally, and of some American collections. *Bigarreau*. *Graffian*. Lond. Hort. cat. *Crisse ambrée*. *Guindou blanc*. { N. Duh. *Crisier à fruit ambré*, fruit blanc. } *Amber*, or *Imperial*. Cox.

Yellow Spanish, of most American collections. *Harrison heart* of some English gardens, according to Forsyth.

This tree is one of the largest of all the varieties that belong to the same species; its branches are strong and vigorous, and form a handsome and well supported head. The growth of the young trees is particularly thrifty; their lateral shoots are remarkable for taking an almost horizontal direction and the bark is marked with small dots. The fruit is the largest I have ever seen, except the Prince's duke; it is round at the extremity and somewhat flattened at the base, borne upon peduncles of from fifteen to twentyfour lines in length; the skin is delicate, a little firm before maturity, of an amber yellow, partially tinged with red in small spots when at full maturity, and especially on the side exposed to the sun; the flesh is white, bland, and luscious, with a honied sweetness. This fruit ripens in June, and if there are long continued rains at the time of its maturity, it is apt to rot. It is remarked in the New-Duhamel, that this cherry is but partially disseminated in France, and that it would merit culture more than any other, on account of its excellence, if it were not for the defect of its fruit not being apt to set well. On this point, so far as my opportunities have allowed me to judge, and they have been rather numerous, as the tree is much cultivated in this vicinity, I have found it to produce good crops and to be a constant bearer. This tree was imported from London, by the father of the author, in the year 1802, under the name of *Yellow Spanish*, and one of the original trees is now growing in his garden, where it produces abundantly, and there is little doubt that from his stock have originated most of the trees of this kind now in our country, as he has taken much pains to recommend it. During a visit to the vicinity of Boston, in the

year 1826, at the period when the cherry trees were in fruit, I noticed that this variety was by some called the *Bigarreau*, and by others the *Carnation*, but the error has no doubt been corrected ere this, through the great intelligence and accuracy of their Horticultural Society. There is another European cherry, called *Ambrée* or *Amber*, which is far smaller than this, and also very inferior in flavor; its only advantage being that of ripening at an earlier period.

CARNATION. PR. CAT. LAW. LANG. MIL. FOR. LOND. HORT. CAT.

Late Spanish. *Wax Carnation*. *Wax Cherry*. *Grolette d'Espagne*, erroneously.

This fruit, which derives its title from its color, is of a large size, and nearly of a round form; the skin is a yellowish white, beautifully mottled with red; the flesh yellow, rather firm, and of a pleasant taste, but less sweet than many other varieties; the juice is sprightly and of a pale color. If eaten before it is fully mature, it has a slight degree of bitterness. This cherry ripens among the late varieties in July, and is held in high esteem for preserves. The tree is of low stature, being more spreading than lofty, and its branches have often somewhat of a horizontal or even a drooping appearance. Its foliage indicates much vigor, and the fruit is less subject to the attacks of birds and insects than most of the other fine varieties of cherries, and also remains without decay or rotteness for a longer period than other sorts usually do. The tree bears tolerably well, but not abundantly. A tree imported from London, some years since, as the *Late Spanish*, and one from the north of France, under the title of *Grolette d'Espagne*, have both borne fruit of this kind; the latter variety, however, is in fact a dark colored fruit, and the above circumstance must have arisen from error.

HEMP IN MAINE.

LIVERMORE HEMP COMPANY.—We understand that Messrs. Haines and Winslow have disposed of the works which they erected for the dressing and manufacture of Hemp, and a company has been formed of practical farmers who design to give the business a fair trial. This they will be the better enabled to do, as they will have large quantities of hemp to be worked by their own machinery. The water where the new factory is to be erected is of a temperature favorable to its continuing in operation in winter as well as summer.

We rejoice to learn that such an enterprising spirit prevails, and have no doubt that the undertaking will be crowned with success, and that the culture and manufacture of Hemp will become an important and profitable branch of industry in Maine.

We subjoin an extract from a letter from one of the gentlemen engaged in the enterprise:

I will give you a short history of our intentions and the business generally, and you may make such use of it as you see fit.

Well then to begin, a number of us (consisting of fifteen) have formed ourselves into a company for the purpose of dressing hemp—have purchased a first rate water-power in the centre of Livermore, and intend erecting a Factory, to be ready about the first of August next. It is the design of the company to invest such funds as shall enable them

to pay in ready cash the highest price for hemp-stem, as soon as delivered at the factory.

From several experiments which have been tried at the late Factory of Messrs. Haines & Winslow we are convinced the business may be made a very profitable one to the farmers of Maine whenever the best methods of cultivation are resorted to.—With these views and intentions the company will prosecute the business, trusting the Legislature and a generous public will render them their aid.

I will only add—our Factory will be capable of fitting for market annually, about one hundred tons of Hemp. Several of the farmers in this vicinity, who have used good management, have obtained fifty or sixty dollars from one acre of Hemp. This information we are willing should be made public, that our neighbors may share with us this lucrative business.

STEALING FRUIT.

An esteemed friend presented me with *Noah Webster's Elementary Spelling Book* for examination; and among the great number of useful remarks which this indefatigable author has selected or prepared for the instruction of children, I was particularly pleased to find the following:

'It is no more right to steal apples or water-melons from another's garden or orchard than it is to steal money from his desk. Besides, it is the meanest of all low tricks to creep into a man's enclosure to take his property.'

For this service, if I lived near *Noah Webster*, I would treat him to the earliest and best fruit of my garden.

Much as I am pleased with the course taken by our Legislature for suppressing the plundering of gardens and orchards, and much as might be done by editors and periodical papers, I am satisfied that to eradicate the evil, the axe ought to be laid to the root—that is it ought to be imperatively enjoined on all teachers who derive any part of their pay from the funds of the state, to lecture their scholars on the leading principles of morality; and as stealing fruit is the most common of all larcenies, that its enormities should be particularly pointed out. We might then hope in a very few years that the fruit in a garden, or an orchard, would be as safe as the clevis on a plough in the field, or an axe in the door-yard.

It is said that a clevis or an axe would be more easily detected; and that it is harder to resist temptation when it leads to immediate enjoyment—let it be remembered that the temptation is not greater than what is hourly presented to the youth of a city, and that a craving appetite is only one of the motives that lead to the plundering of fruit: a frolic, and the idea of doing something smart or cunning is no inconsiderable inducement with many grown boys. Let public opinion render this vice as disgraceful as the robbing of hen-roosts—which might be done by proper lectures in common schools—and one branch of iniquity would be lopped.—*Genesee Farmer*.

The price of coals has risen everywhere in England. At Lewes it is ten shillings a chaldron higher than the customary price before the duty of six shillings was taken off.

From the Frugal Housewife.

FISH.

Cod has white stripes, and a haddock black stripes; they may be known apart by this. Haddock is the best for frying; and the cod is best for boiling, or for a chowder. A thin tail is a sign of a poor fish; always choose a thick fish.

When you are buying mackerel, pinch the belly to ascertain whether it is good. If it gives under your finger, like a bladder half filled with wind, the fish is poor; if it feels hard like butter, the fish is good. It is cheaper to buy one large mackerel for ninepence, than two for fourpence halfpenny.

Fish should not be put in to fry until the fat is boiling hot; it is very necessary to observe this.—It should be dipped in Indian meal before it is put in; and the skinny side uppermost, when first put in, to prevent its breaking. It relishes better to be fried after salt pork, than to be fried in lard alone. People are mistaken, who think fresh fish should be put into cold water as soon as it is brought into the house; soaking it in water is injurious.—If you want to keep it sweet, clean it, wash it, wipe it dry with a clean towel, sprinkle salt inside and out, put it in a covered dish, and keep it on the cellar floor until you want to cook it. If you live remote from the seaport, and cannot get fish while hard and fresh, wet it with an egg beaten, before you meal it, to prevent its breaking.

Fish gravy is very much improved by taking out some of the fat, after the fish is fried, and putting in a little butter. The fat thus taken out will do to fry fish again; but it will not do for any kind of shortening. Shake in a little flour into the hot fat, and pour in a little boiling water; stir it up well, as it boils, a minute or so. Some people put in vinegar; but this is easily added by those who like it.

A common sized cod-fish should be put in when the water is boiling hot, and boil about twenty minutes. Haddock is not as good for boiling as cod; it takes about the same time to boil.

A piece of halibut which weighs four pounds is a large dinner for a family of six or seven. It should boil forty minutes. No fish put in till the water boils. Melted butter for sauce.

Clams should boil about fifteen minutes in their own water; no other need be added, except a spoonful to keep the bottom shells from burning. It is easy to tell when they are done, by the shells starting wide open. After they are done, they should be taken from the shells, washed thoroughly in their own water, and put in a steaming pan. The water should then be strained through a cloth, so as to get out all the grit; the clams should be simmered in it ten or fifteen minutes; a little thickening of flour and water added; half a dozen slices of toasted bread or cracker; and pepper, vinegar and butter to your taste. Salt is not needed.

Four pounds of fish are enough to make a chowder for four or five people; half a dozen slices of salt pork in the bottom of the pot; hang it high, so that the pork may not burn; take it out when done very brown; put in a layer of fish, cut in lengthwise slices, then a layer formed of crackers, small or sliced onions, and potatoes sliced as thin as a fourpence, mixed with pieces of pork you have fried; then a layer of fish again, and so on. Six crackers are enough. Strew a little salt and pepper over each layer; over the whole pour

a bowl-full of flour and water, enough to come up even with the surface of what you have in the pot. A sliced lemon adds to the flavor. A cup of tomato catsup is very excellent. Some people put in a cup of beer. A few clams are a pleasant addition. It should be covered so as not to let a particle of steam escape, if possible. Do not open it, except when nearly done, to taste if it be well seasoned.

Salt fish should be put in a deep plate, with just water enough to cover it, the night before you intend to cook it. It should not be boiled an instant; boiling renders it hard. It should lie in scalding hot water two or three hours. The less water is used, and the more fish is cooked at once, the better. Water thickened with flour and water while boiling, with sweet butter put in to melt, is the common sauce. It is more economical to cut salt pork into small bits, and try it till the pork is brown and crispy. It should not be done too fast, lest the sweetness be scorched out.

Salt shad and mackerel should be put into a deep plate and covered with boiling water for about ten minutes after it is thoroughly broiled, before it is buttered. This makes it tender, takes off the coat of salt, and prevents the strong oily taste, so apt to be unpleasant in preserved fish.—The same rule applies to smoked salmon.

Salt fish mashed with potatoes, with good butter or pork scraps to moisten it, is never the second day than it was the first. The fish should be minced very fine, while it is warm. After it has got cold and dry, it is difficult to do it nicely.—Salt fish needs plenty of vegetables, such as onions, beets, carrots, &c.

There is no way of preparing salt fish for breakfast, so nice as to roll it up in little balls, after it is mixed with mashed potatoes; dip it into an egg, and fry it brown.

A female lobster is not considered so good as a male. In the female, the sides of the head, or what look like cheeks, are much larger, and jut out more than those of the male. The mouth of a lobster is surrounded with what children call "purses," edged with a little fringe. If you put your hand under these to raise it, and find it springs back hard and firm, it is a sign the lobster is fresh; if they move flabbily, it is not a good omen.

Fried salt pork and apples is a favorite dish in the country; but it is seldom seen in the city.—After the pork is fried, some of the fat should be taken out, lest the apples should be oily. Acid apples should be chosen, because they cook more easily; they should be cut in slices, across the whole apple, about twice or three times as thick as a new dollar. Fried till tender, and brown on both sides—laid around the pork. If you have cold potatoes, slice them and brown them in the same way.

A SUGGESTION.—As this is generally a season of leisure to agriculturists, we would suggest that an hour or two might be profitably employed in recording some of the many observations they may have made during the past season for publication in the Farmer. There is not a farmer or a planter in the United States but could thus add something useful and valuable to our stock of agricultural knowledge. If all our subscribers would do this, the observations of the whole would soon be in the possession of each, and thus their own contributions would return to them with several thousand per cent interest. Is not this suggestion worthy of consideration?—*Am. Farmer.*

From the Genesee Farmer.

CULTURE OF RUTA BAGA.

A wish to have others profit by my experience, induces me to send you, Mr Editor, half a sheet of remarks on the culture of Ruta Baga, as a food for domestic animals. I have cultivated from half an acre to three acres of this root every year, for thirteen years in succession, and feel competent to give rules for its culture, and confidence in recommending it as a valuable and profitable crop.

The soil must be rich and dry; and the more it inclines to a sand loam the better. Clay is the worst, and wet soils will not answer at all.

Preparations.—My general practice has been, to manure well a piece of pasture, or clover ley, from which the hay has first been cut, plough it handsomely over, and harrow it well.

Sowing, &c.—I sow in rows, at two and an half or three feet, with a drill-barrow. The sooner the preceding operations succeed each other the better. I have sown broadcast, but the expense of thinning and culture is increased. A man will drill in three or four acres in a day. We allow a pound of seed to the acre, though half this, properly distributed, is enough. Sow from the 26th June to the 10th July.

Culture.—I use a cultivator, that may be graduated to the space between the rows, drawn by a horse, as soon as the plants can be well distinguished. This is repeated in a few days, back and forward, and the implement carried so close to the drills as to leave only strips of four to ten inches, which are then thoroughly cleaned with a skim-hoe, and the plants thinned to eight and ten inches distance. The cultivator soon follows, for a third time, and if necessary, the skim-hoe, when the crop is generally left till harvest.—The great aim is to extirpate the weeds, and to do this while they are small.

Harvesting is postponed as long as the season will permit. The roots are then pulled up, and laid on the ground, the tops of two rows towards each other. The pullers are followed by a man or boy with a bill-hook, who with a light blow cuts the tops as fast as three or four can pull.—Three men will in this way harvest, of a good crop, 300 bushels in a day. The tops are gathered into heaps, and taken to the yard, in carts, daily, for the stock, until they are consumed. An acre will give from five to ten cart-loads of tops. The roots are piled on the field, if dry,—the pits two or two and an half feet broad, covered with straw and earth, and as the cold weather approaches, with manure, to prevent frost.—N. B. With a crowbar make one or more holes on the crown of the pit, which must be left open, to let off the rarified air, and prevent the roots from heating.

Use.—The tops serve for autumn. As soon as the mild weather of spring will justify, I break through the frost, and take the contents of a pit to my barn, and cover the roots with straw or hay. From thence they are fed to my stock, being first chopped up with a *snick* (Dutch meat chopper) or spade. They are excellent for sheep, especially for ewes that have young,—and hogs and horses eat them freely. Steamed, they are used in the north of England, for horses, as a substitute for grain. I have fattened sheep and bullocks upon them with profit. They constitute, particularly from February to June, an excellent culinary vegetable for the table. A bullock will thrive fast upon

two bushels a day, and will consume hardly any hay, and requires no drink.

Product and cost.—My average crop has been 600 bushels per acre, though others have raised much heavier products. The cost, in manure and labor, when they are secured for winter, has been from two and a half to three cents per bushel.

N. B. Cattle or sheep, fattened upon this root, should be kept from eating them for eight or ten days before they are slaughtered, otherwise the meat will have an unpleasant flavor. J. B.

Albany, Dec. 26.

From the same.

HEDGING.

In a land so generally arable as the western parts of New York,—where the inducement to clear off the primitive forest is so strong, where timber for fences is continually becoming scarcer, and where good stone in most places is not easily procured,—hedging is a subject of increasing importance. Almost in the first settling of this country, some farmers foresaw the result; and though twenty years have elapsed since a few attempts at this business were made, I know not of one hedge in this region which serves to protect a grain field.

I have doubted the propriety of employing *eradic* plants for this purpose. After continuing many years in a flourishing condition, the *privet** or *prim* hedges of the southeastern part of Pennsylvania, as well as those on Long Island, perished from some unknown cause; and those of *English thorn* soon after shared a similar fate. Already fears are entertained that the hedges in the vicinity of Philadelphia will not be durable.—Some *English thorns* in this quarter have been greatly injured by insects; and a *sweet briar* hedge of our own planting, which for a while was very flourishing and beautiful, and which fully re-

* Since the destruction of the *prim* and the *English black thorn*, few attempts have been made to raise hedges. In the town of East Hampton, in Suffolk county, by the best computation, at least two hundred miles of good *prim* hedge died in the course of two or three years, which was a greater loss to the inhabitants than if every house in the township had burned down at the same time. It has not as yet been discovered what occasioned the destruction of the *prim*. The *English black thorn* in Southampton was nearly equal to the *prim* in East Hampton. *This has lately all died there, as it has in every other part of the country where it grew.* A certain fly makes a hole through the bark of the thorn, and there deposits its eggs.—*Hortædieu* in Transactions of the [New York State] Society for the Promotion of Agriculture, &c. (1794?) vol. 1, p. 136.

† The *prim* did some years ago promise something of the kind; but *this has been long since dead*, and there appears no probability that it will ever flourish again.—*The black thorn* has been destroyed by a worm that preys upon its twigs.—*Hævens* in the same vol. p. 288.

‡ In a letter from Bucks Co. Pennsylvania, dated 11 mo. 1, 1831, my correspondent says, 'The thorn hedges near Philadelphia appear to be declining rapidly in consequence of the ravages of some insect—I shall not be disappointed if our hedges should die as suddenly as the *Privet* (Prunus) hedges did about the year 1765.' I have not understood whether the hedges near Philadelphia are of English, or of Washington thorn. Neither the *privet* nor the *sweet briar* are indigenous to this country.

§ Genesee Farmer, Vol. 1, p. 373. 'Where the English thorn was tried, that part of the hedge which was clipped, was mostly destroyed by a small snow-white insect, with which it was in many cases literally covered. That which was not clipped did better—because the insects preferred the young shoots and leaves, and left the older and more rigid leaves to perform their necessary functions. Last summer my English and Norway maples were greatly infested by such an insect. Is it a native of our country?

alized my hopes in lessening the severity of the bleak winds on the west side of my garden, is visibly on the decline.

I have often admired the appearance of our wild thorn in the old Indian clearings which remained a few years ago in a waste state. Many of these shrubs, in consequence of being nipped by sheep and cattle, presented very thick, neat, and regular sides from the ground upward, and were several feet in diameter. A hedge is evidently stronger when each plant has room to attain a good size; and I have been disposed to question the advantage of setting thorns so thick that they must necessarily be kept in a stunted state.

In elucidation of this view it may be observed that a plant which branches and covers a given space, will be preserved in better health and vigor than several other plants of the same kind which are crowded together in a space of the same dimensions. In cultivating the taller kinds of Indian corn, a few supernumeraries are destructive to the crop; and all are familiar with the sickly aspect of culinary vegetables surrounded by weeds. Now a stunted *quick* in a hedge, feeble from starvation, must be less capable of recovering from the ravages of insects, or of withstanding extraordinary vicissitudes of the weather.

Light is essential to the healthy vegetation of those plants; and from this cause, neglected hedges soon become open near the ground. The branches which form the lower part of the hedge, ought therefore to be but sparingly shaded. With this object in view, the hedge is often trimmed with a slope from each side, so as to form a sharp edge at the height of five or six feet. For the same reason from this point, the *main stems* ought to be naked for two or three feet higher, and then the top may be allowed to spread and extend itself without any restraint.

A hedge, crowded with plants in the usual manner and annually cut down to the level of five or six feet, presents a collection of rods, which if not intervened, may be readily parted and passed by unruly animals. If these rods are *spiny* however, most of the live stock of a farm will be repelled; and if these are elevated on a good bank with ditches, which breaks the force of heavy cattle, it will be very effectual.

Although *spiny* plants have been commonly selected for hedges, it is not quite certain that such are always the best. In *Hart's* account of his travels in the southeastern part of Germany, published about the middle of the last century, he mentions hedges of horn beam which bordered the road for miles in continuous lines. The hedge consisted of two rows, bent in different directions. Where the opposite trees were brought to *touch*, a piece of bark was removed from each, and they were then tied together by some single bandage. In the course of a short period, they were firmly connected by the new wood.

The American horn beam (swamp beech) seems to be equally well adapted for hedges; and as far as I have observed, it is less infested by insects, and less liable to be injured by mice, than many other shrubs. Some forest trees have this property also in an eminent degree, and some have been proposed for hedges; but it may be well to consider whether their great and vigorous growth will not be difficult to manage and restrain; and whether such can be reduced to a dwarfish state without impairing their constitutions or lessening their durability?

Some of the American thorns have been found rather difficult to raise from the seeds; but those of the crab apple grow as freely as the seeds of the common apple, and the plant is very formidable.

Very respectfully,

DAVID THOMAS.

Greatfield, Cayuga co., 12 mo. 20, 1831.

FEEDING CATTLE.

'In young growing animals the powers of digestion are so great, that they require food which is less rich, than such as are of mature age. They also require more exercise. If rich food is supplied in liberal quantities, and exercise withheld, diseases are generated, the first of which may be excessive fatness: growth is impeded by very rich food, for experience shows, that the coarsest fed animals have the largest bones. Common sense will suggest the propriety of preferring a medium course between very rich and very poor nutriment.'—*London.*

Regularity of feeding cattle is of prime importance. Three times a day precisely at a certain hour, cattle, according to Mr Lawrence, should be furnished with their food. Mr Dean observed, that neat cattle and horses should not have so much laid before them at once as will quite serve to fill them. The hay they have breathed on much, they will not eat up clean, unless they are very hungry. It is best, therefore, to fodder them twice at night, and twice in the morning. Let neat cattle as well as horses have both light and fresh air let in upon their fodder when the weather is not too cold and stormy to allow the windows to be open. What one sort of cattle leave should be thrown to another sort. Those that chew the cud will eat the leavings of those that do not, and *vice versa*.

LIVERPOOL AND MANCHESTER RAIL ROAD.—The first year of travelling on the Liverpool and Manchester railway has expired—during a part of the time, however, there was not full accommodation for either passengers or goods, yet it seems that 416,000 persons have travelled its whole distance, and about 34,000 persons short distances—a total of 450,000—and whose fares reach £29,600 sterling—a prodigious sum. The exact sum produced by the carriage of goods is not ascertained, but it is estimated at £90,000. This is surely a convincing proof of the utility of Rail Roads, and the favor with which they are regarded by the community. In this country we have no doubt they will prove as profitable and popular.

THE WORLD'S CHANCES.

Today is ours, yesterday is past, and tomorrow may never come. I wonder that people can so much as forget death, when all we see before us is but succession; summer dies and winter comes; the dial marks the change of hours, every night brings death-like sleep, and morning seems a resurrection; yet while all changes and decays, we expect no alteration; unapt to live, unready to die; we lose the present and seek the future, ask much for what we have not, thank Providence but little for what we have; our youth has no joy, our middle age no quiet, our old age no ease, no indulgence; ceremony is the tyrant of this day, fashion of the other, business of the next. Little is allowed to freedom, happiness and contemplation; the adoration of our Creator, the admiration of his works, and the inspection of ourselves.—*Mrs Elizabeth Montague.*

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Jan. 25, 1832.

WORKS OF A WOODPECKER.

JAMES VILA, Esq. of Bedford, Ms. has left in our office a sample of the labors of the *Red-headed Woodpecker*, (*Picus erythrocephalus*) which exhibits a curious specimen of the power and industry of that little animal. This consists of the branch of a young tough white oak, between 2 and 3 inches in diameter, perforated to its centre by the bill of the bird. The hole is as neat and well defined as could have been mortised by a mallet and chisel. The object of the woodpecker, in this performance, was, evidently, the attainment of a worm, probably one of the species of the Borer which so often attacks the apple tree. The worm had made a hole in the branch about the size of a goose quill, 4 or 5 inches below the place gouged out by the bird, and was proceeding upwards when the woodpecker broke in upon and devoured the depredator. That this little despised workman, viz. the red-headed woodpecker, with his head for a mallet and his bill for a chisel, should make such a perforation is more wonderful than the structure of the Pyramids or the Pantheon. Yet boys and other bipeds, who think they have some claims to respectability, are in the habit of murdering woodpeckers without provocation and without remorse!

Mr CORNELIUS COWING, of Roxbury, once informed us that he found in the stomach of a woodpecker no less than 23 borers, which had been recently extracted. The tongue of this bird is sharp pointed and bearded, on which he impales the insects which reward his labors. The efforts of the woodpecker, however, are often misunderstood, and they are stoned or shot for their good deeds by the stupid bipeds in whose service they are engaged. The perforations they make to extract insects are, by some, thought to injure the tree which they are ridding of the worm in its vitals, and death is the reward which ignorance inflicts on its benefactors.

Mr NUTTALL, in his *Ornithology*, in speaking of the habits of this bird, observes that 'The ancient live oak, his cradle and residence, is cherished as a domicile; he creeps around its ponderous withered arms, views the passing scene with complacency, turns every insect visit to his advantage, and for hours together, placidly reconnoitres the surrounding fields; at times, he leaves his lofty citadel to examine the rails of the fence, or the boards of the adjoining barn; striking terror into his lurking prey by the strident taps of his bill, he hearkens to their almost inaudible movements, and, discovering their retreat, dislodges them from their burrows by quickly and dexterously chiseling out the decaying wood in which they are hid, and transfixing them with his sharp and barbed tongue. But his favorite and most productive retreat is to the adjoining fields of dead and girdled trees; amidst whose bleaching trunks and crumbling branches, he long continues to find an ample repast of depredating and boring insects. When the cravings of appetite are satisfied, our busy hunter occasionally gives way to a frolicsome or quarrelsome disposition, and, with

shrill and lively vociferations, not unlike those of the neighboring tree frog, he pursues, in a graceful curving flight, his companions or rivals round the bare limbs of some dead tree to which they resort for combat or frolic.'

FEEDING CATTLE, CALVES, &c.

'Oil-cakes,' says the *Farmer's Guide*, 'are of great use for feeding cows before calving. Flax-seed broth or jelly is much recommended for fattening. It is made by putting about a quart of flax-seed to seven of water, and then let it stand about forty-eight hours; after which it is to be boiled gently for two hours, stirring it frequently, to prevent its burning. When cool, it is to be mixed with meal, bran, or cut straw, and fed out at the rate of about two quarts a day to each beast, and it is said to make a great saving in the article of food. It is also useful for fattening calves.'

Mr Young says, 'I have for some time entertained an idea, that skimmed milk might be prepared with proper ingredients, effectually to answer the purpose of feeding calves when the practice is to give new milk from the cow, and at about a third of the expense. The articles are treacle, [molasses] and the common linseed oil-cake, ground very fine, almost to an impalpable powder, and the quantities so small that, to make thirty-two gallons, would cost no more, exclusive of the milk, than about sixpence. It mixes very readily and almost intimately with the milk, making it more rich and mucilaginous, without giving it any disagreeable taste. Take one gallon of skimmed milk, and in about a pint of it add half an ounce of common treacle, stirring it till well mixed; then take one ounce of linseed oil-cake, finely pulverised, and with the hand let it fall gradually in very small quantities into the milk, stirring it in the mean time with a spoon or ladle, until it be thoroughly incorporated; then let the mixture be put into the other part of the milk; and the whole made nearly as warm as new milk from the cow. After a time, the quantity of oil-cake may be increased.'

PROPOSED IMPROVEMENTS IN THE NEW ENGLAND FARMER.

We take the liberty to announce to our friends and patrons that a solicitude to render our paper as useful as it is in our power has induced us to propose to publish, every week or two, short practical original essays of one, two, or three columns, on the best methods of cultivating many of the most useful articles of produce, both in Garden and Field Husbandry. By this means, we hope, in process of time, to furnish a Cultivator's Dictionary, *engrafted* on the *stock* of the New England Farmer. The Index, to be presented at the close of each volume, will furnish the reader with nearly all the facilities for turning to and re-perusing any article, which are represented by alphabetical arrangement.

☞ We earnestly solicit the assistance of our intelligent correspondents, farmers and gardeners, in carrying the above proposed plan into effect; and hope our esteemed friend and patron in Albany may approve of, and contribute his very efficient aid in enabling us to enrich our columns with the fruits of his extensive reading and results of that experience,

which, under the guidance of judgment and science, has placed him at the head of American cultivators.

Among other articles and subjects, we propose to include the following, viz.

Apple,	Meion,
Apricot,	Mulberry,
Asparagus,	Mustard,
Barley,	Nectarine,
Beans,	Nursery,
Bect,	Oats,
Brocoli,	Onion,
Buckwheat,	Orchard,
Butter,	Parsley,
Cabbage,	Parsnip,
Carrot,	Pea,
Cauliflower,	Pear,
Celery,	Peach,
Cherry,	Ploughing,
Clover,	Plum,
Compositions for trees,	Potato,
Cucumber,	Pumpkin,
Current,	Quince,
Divisions of a Farm,	Radish,
Fiz,	Rhubarb,
Flax,	Rose,
Flowers,	Rotation of Crops,
Forest Trees,	Ruta baga,
Gooseberry,	Rye,
Grafting,	Sea Kale,
Grape,	Selection of Fruits,
Grasses,	Selection and Cultivation
Hardy ornamental Shrubs,	of Annals, Biennials, &c.
Hedge,	Sheep,
Hemp,	Silk,
House Radish,	Squash,
Hot Bed,	Strawberry,
Hot House,	Teasel,
Indian Corn,	Thistle,
Lettuce,	Tomato,
Locust Tree,	Turnip,
Madder,	Vine,
Mangel Wurtzel,	Wheat,
	Woodland, &c. &c. &c.

From the *Genesee Farmer*.

Tomatoes.—As you have professed to be fond of Tomatoes, Mr Editor, I will tell you how to have them for use during the whole year. When ripe gather and throw them into a strong brine; and when wanted for use, soak them in fresh water, peel and stew them as if fresh picked, with holding salt.

J. B.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The Standing Committee on Ornamental Trees, Flowers, Green Houses, &c. award the following premiums for the year 1831:

For the five best varieties of Chinese Chrysanthemums, a premium of \$5 to Mr David Haggerston, of Charlestown.

For the best half dozen of Tulips, a premium of \$3 to Mr David Haggerston, of Charlestown.

For the best half dozen of Ranunculus, a premium of \$2 to Mr P. B. Hovey, of Cambridge.

For the finest varieties of Pinks, a premium of \$2 to Mr David Haggerston, of Charlestown.

For the best Carnations, a premium of \$3 to Mr John Lemist, of Roxbury.

For the finest specimens of Cultivated Native Flowers, to Messrs. F. & J. Winship, of Brighton, a premium of \$3.

For the finest Roses, (including sixty varieties of hardy Scotch Roses,) a premium of \$5 to Messrs. F. & J. Winship, of Brighton.

For the best Hyacinths, a premium of \$3 to Mr Augustus Aspinwall, of Brookline.

For the finest Dahlias, a premium of \$5 to Mr David Haggerston, of Charlestown.

Per order.

R. L. EMMONS, *Chairman*.

[Several communications are on file.

Farm for Sale.

FOR sale, an excellent farm in the town of Peterborough, N. H. Said farm is pleasantly situated about a mile from the village; formerly the residence of the late John Smith, Esq. and contains about sixty acres of good land, well walled, with a good house and barn, and other out-buildings. Terms reasonable, and possession to be given the first of April. For further particulars, inquire of Dea. JOHN FIELD, near the premises, or at No. 3, Rowe's Wharf, Boston. 31* Jan. 25.

Guide Boards.

JUST received at the Agricultural Warehouse, No. 51 and 52, North Market street, a few more boxes of Carter's patent Guide Boards. Members of the Legislature and others, are invited to examine them. Every town in the Commonwealth ought to possess a set of the above Boards, both for economy and convenience. Jan. 25.

Old Beans and Peas.

FOR sale at the Seed Store connected with the New England Farmer Office—
About 20 bushels of Peas and Beans of various sorts, of the growth of 1830—being a part of our stock for seed left over unsold, and are now offered at a low price as food for sheep. Jan. 18.

Nuttall's Ornithology.

JUST received by J. B. Russell, No. 50 1-2 North Market Street, Boston—
A Manual of the Ornithology of the United States and of Canada. By Thomas Nuttall, A. M., F. L. S.; with 53 engravings. Price \$3.50. Jan. 18.

Sweet Herbs, &c.

FOR sale at the New England Seed store, 52, North Market street—The following Sweet Herbs, pulverized, and packed in tin canisters for domestic use, viz: Sweet Marjoram, 37½ cts—Thyme, 33 cts—Summer Savory, 25 cts—Sage, 17 cts,—per canister. Also Black Currant Wine for medicinal purposes, 75 cts per bottle. Tomato Ketchup, 37½ cts per bottle. Jan 11.

Elegant Camellia Japonicas & Bouquets.

THE Subscriber, Gardener to John Prince, Esq. at Jamaica Plains, can furnish a constant supply of elegant Bouquets—also superb double flowers of white, and several other sorts of Camellia Japonicas, at prices lower than in former years. Also—very superior Mushrooms, and a great variety of Green-House plants.

THO'S MASON.

Jamaica Plains, Jan. 10, 1832.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Seeds for Country Dealers.

TRADERS in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed that can be furnished at the New England Farmer Office, No. 50, North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, or as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Wanted.

TWO or three copies of the 1st, 2d and 3d volumes of the New England Farmer, for which a fair price will be paid—Apply at this office. Jan 11.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr., 65, Broad street.

Black Currant Wine.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury: an account of its stringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'Its use has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever.' The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle.

Tea Wheat.

A FEW bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50, North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. x, page 105—and vol. vi. page 82. Dec. 14.

Cobbett's Advice to Young Men, &c.

JUST received and for sale at J. B. Russell's Seed Store, No. 50, North Market Street, Boston—

Advice to Young Men, and (incidentally) to Young Women, in the Middle and Higher Ranks of Life; in a series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a subject. By William Cobbett. Price 50 cents.

One copy only, just received from London, of London's Encyclopedia of Gardening, with many hundred wood engravings; new edition, greatly enlarged and improved. Price \$11.00. Dec. 23.

Knowledge for the People.

LILLY & WAIT and CARTER & HENDEE, have this day published, 'KNOWLEDGE FOR THE PEOPLE, No. 5—'or the plain Why and Because—on popular Chemistry.' Price 12½ cts. They also continue to republish the 'Library of Entertaining Knowledge,' a beautiful work, which grows rapidly in public favor—price 40 cts. each part. Published under the direction of the British Society for the Diffusion of Useful Knowledge,—and combining in a delightful manner, what should never be separately attempted, *Instruction and Amusement*.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WIGHT,

46, Milk street, opposite Federal-st., Apothecary.

BRIGHTON MARKET—Monday, Jan. 23.

[Reported for the Daily Advertiser and Patriot.]

At market this day 272 Beef Cattle, 92 Stores, 493 Sheep, and 80 Swine. The Swine are the same which we have several times before reported, but were today all sold.

PRICES.—Beef Cattle—The number of Beef Cattle at market today was quite limited as will be perceived above, and a small advance was effected. We quote extra at \$5 33 a 5 50; prime 5 a 5 25, good 4 67 a 4 84, thin 3 75 a 4 50. The number of extra Cattle was probably about 30—one or two yoke brought something more than 5 50.

Stores—But a few sales were effected.

Sheep—We noticed one lot taken at about 4 50; one lot at 4 00; one at 3 80; one at 8 60, and one at 3 00—all of which have been 'stall-fed.'

Cows and Calves—We noticed several prime at market, but no sales were effected.

Swine—One lot of Barrows was taken at 4c; the remainder Sows and Barrows to close, at 3c.

MISCELLANY.

From the Illinois Monthly Magazine.

THE PRAIRIE.

The prairie was clad in its richest array,
Its brightest of scarlet, and gayest of green,
And the sun seemed to pause in his luminous way,
And to sparkle with joy o'er the beautiful scene.

The flowers—though florists will hardly agree;
To a doctrine so strange and so novel to them—
Were blushing, and bowing, and making as free
As if each had a heart in its delicate stem.

Every gay little bud had a smile for her peers,
Though the violet certainly looked rather blue;
And the blush of the rose seemed to glow through her
tears,
But perhaps, as 't was early, the drops were of dew.

Had you seen them, dear Myra, you never again
Had been sceptic enough to deny that a flower
Has tender sensations and pleasure and pain,
And sweet recollections of sunshine and shower.

The wild deer was gracefully bounding along,
And tossing his antlers so proudly the while,
That the gay little blossoms he cantered among
Were restrained by good manners alone from a smile.

The prairie bird strutted about, with the air
Of a tragedy king, or a comely lover,
While a pair of foot turtles, an amorous pair,
Were quietly cooing a love-lecture over.

Add music—such music! the air bore along,
As it swept the green hillsides, and shook the lone tree;
The prairie bird's note, and the mocking bird's song,
And the hoot of the owl, and the hum of the bee,

And the cracking of twigs as the wolf trotted by,
And the bark of the hunter's dog, far o'er the plain.
The report of the rifle, and the fawn's plaintive cry,
And the dirge of the crow, and the shriek of the crane!

And the cattle-bell tinkling, just heard, far away,
And a farmer's boy whistling, the time to beguile,
And a voice in my heart—what it was I can't say,
That was warbling of Myra and love all the while.

And I thought how delightful a change it would be,
When disposed to forsake the clay form I inhabit,
To live upon dew like a delicate bee,
Or to gallop through grass like a deer—or a rabbit.

Or to a chaste bud with an aspect of snow:
Or a dandy of flowers, a gaudy gay fellow;
On the wide sunny prairie to dance and to bow,
With a mantle of green, with a tinting of yellow.

And I thought—but I happened just then to awake—
How the best settled intellects sometimes will rove,
And yet 't is a pleasant excursion to take,
With Mab, o'er the prairies, when one is in love!

OLD SETTLERS OF NOVA SCOTIA.

The following extract of a letter from Lord Edward Fitzgerald to his Mother is taken from Moore's life of that personage. Mr Moore says that this letter affords one of the instances where 'a writer may be said to be a poet without knowing it.'

'My dearest Mother,—Here I am, after a very long and fatiguing journey. I had no idea of what it was: it was more like a campaign than anything else, except in one material point, that of having no danger. I should have enjoyed it most completely but for the mosquitoes, but they took off a great deal of my pleasure: the millions of them are dreadful. If it had not been for this inconvenience, my journey would have been delightful. The country is almost in a state of nature, as well as its inhabitants. There are four sorts of these:

the Indians, the French, the old English settlers, and now the refugees from the other parts of America: the last seem the most civilized.

'The old settlers are almost as wild as Indians, but lead a very comfortable life: they are all farmers, and live entirely within themselves.—They supply all their own wants by their contrivances, so that they seldom buy anything. They ought to be the happiest people in the world, but they do not seem to know it. They imagine themselves poor because they have no money, without considering they do not want it: everything is done by barter, and you will often find a farmer well supplied with everything, and yet not have a shilling in money. Any man that will work is sure, in a few years, to have a comfortable farm: the first eighteen months is the only hard time, and that in most places is avoided, particularly near the rivers, for in every one of them a man will catch in a day enough to feed him for the year. In the winter, with very little trouble, he supplies himself with meat by killing moose-deer: and in summer with pigeons, of which the woods are full. These he must subsist on till he has cleared ground enough to raise a little grain, which a hard-working man will do in the course of a few months. By selling his moose skins, making sugar out of the maple-tree, and by a few days' work for other people, for which he gets great wages, he soon acquires enough to purchase a cow. This, then, sets him up, and he is sure, in a few years, to have a comfortable supply of every necessary of life. I came through a whole tract of country peopled by Irish, who came out not worth a shilling, and have all now farms, worth (according to the value of money in this country), from £1000 to £3000.

'The equality of everybody, and of their manner of life, I like very much. There are no gentlemen; everybody is on a footing, provided he works and wants nothing: every man is exactly what he can make himself, or has made himself by industry. The more children a man has the better: his wife being brought to bed is as joyful news as his cow calving; the father has no uneasiness about providing for them, as this is done by the profit of their work. By the time they are fit to settle, he can always afford them two oxen, a cow, a gun, and an axe, and in a few years, if they work, they will thrive.

'I came by a settlement along one of the rivers, which was all the work of one pair: the old man was seventy-two, the old lady seventy; they had been there thirty years; they came there with one cow, three children, and one servant: there was not a living being within sixty miles of them. The first year they lived mostly on milk and marsh leaves; the second year they contrived to purchase a bull, by the produce of their moose-skins and fish: from this time they got on very well; and there are now five sons and a daughter all settled in different farms along the river for the space of twenty miles, and all living comfortably and at ease. The old pair live alone in the little log cabin they first settled in, two miles from any of their children; their little spot of ground is cultivated by these children, and they are supplied with so much butter, grain, meat, &c, from each child, according to the share he got of the land; so that the old folks have nothing to do but to mind their house, which is a kind of inn they keep, more for the sake of the company of the few travellers there than for gain.

'I was obliged to stay a day with the old people on account of the tides, which did not answer for going up the river till next morning: it was, I think, as odd and as pleasant a day (in its way) as ever I passed. I wish I could describe it to you, but I cannot, you must only help it out with your own imagination. Conceive, dearest mother, arriving about twelve o'clock in a hot day at a little cabin upon the side of a rapid river, the banks all covered with woods, not a house in sight,—and there finding a little old, clean, tidy woman spinning, with an old man of the same appearance weeding salad. We had come for ten miles up the river without seeing anything but woods. The old pair, on our arrival, got as active as if only five-and-twenty, the gentleman getting wood and water, the lady frying mutton and eggs, and both talking a great deal, telling their story, as I mentioned before, how they had been there thirty years, and how their children were settled, and when either's back was turned, remarking how old the other had grown: at the same time all kindness, cheerfulness, and love to each other.

'The contrast of all this, which had passed during the day, with the quietness of the evening, when the spirits of the old people had a little subsided, and began to wear off with the day, and with the fatigue of their little work,—sitting quietly at their door, on the same spot they had lived in thirty years together, the contented thoughtfulness of their countenance, which was increased by their age and the solitary life they had led, the wild quietness of the place, not a living creature or habitation to be seen, and me, Tony, and our guide sitting with them, all on one log. The difference of the scene I had left,—the immense way I had to get from this little corner of the world, to see anything I loved,—the difference of the life I should lead from that of this old pair, perhaps at their age discontented, disappointed, and miserable, wishing for power, &c, &c,—my dearest mother, if it was not for you, I believe I never should go home, at least I thought so at that moment.'

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. ☐ Watches repaired and warranted.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

☐ No paper will be sent to a distance without payment, being made in advance.

FOR THE NEW ENGLAND FARMER.

BREEDS OF CATTLE.

SWINE, ACCIDENTS FROM FIRE ARMS, TREATMENT OF DISEASED HORSES, &c.

MR FESSENDEN—

DEAR SIR—In the last No. of your excellent periodical, I observed some remarks upon native stock, in which your correspondent 'A. R.' from very slight premises, jumps at a conclusion inconsistent with the experience of every breeder, who has had the good fortune to obtain stock of the really improved breeds;—and which conclusion it does appear to me from the trifling and insufficient proof adduced, is, to say the least, rather illiberal and far fetched.

The writer says that, a given pasture will feed the same weight of cattle whether large or small, that is, if a given pasture will feed 5 large cows, it will feed 10 smaller ones of the same weight. But, says he, 'these small cows eat but one half so much as the large, therefore you may double the number, you may keep 20.' But why stop there? the same reasoning would permit him to keep 40;—would permit him to double his number *ad infinitum*. Really this would be exceedingly comfortable logic for farmers if it would but hold good in practice.

What improved breed can it be which A. R. has found and which possess such long legs. The reverse of that is in accordance with my observation and experience.

The Holderness, short horned, Denton, and Ayrshire breeds are certainly not long in the leg; and are all of them superior to our native breeds as milkers. There may occasionally be found among the thousands of cows of our native breeds, here and there, one possessing remarkable properties as a milker. But every person who has given the breeds above referred to, a fair trial, will, I doubt not, agree with me that they are in general better milkers than our native cows; and that they are by no means so destructive to the contents of our barns as the remarks of A. R. would lead us to suppose.

A brother-in-law of mine, Mr W. J. Townsend, has on his farm in the vicinity of New Haven, a cow of the short horned breed which in size, form, and quality, is, I think I may safely say, second to no other cow in America, either of native or foreign breed. She was imported from London by Henry Degroot, Esq., was purchased for him there, by an eminent breeder and dealer in stock, as the best cow in England. She brought since she came into the possession of Mr Townsend three fine calves. For months after bringing each of her calves she has given 30 measured quarts of milk daily and is with difficulty prevented from continuing in milk to the day of her calving.

Mr Joseph Morgan, of Hartford, has four uncommonly fine cows possessing different degrees of the Ayrshire blood; one of them, a half blood Ayrshire, calved in the fall of 1830, and through the winter of 1830—31 gave regularly, 20 quarts and over of milk per day, and continued to do the same through the succeeding summer.

I have now four two years old heifers from native cows, by my full blooded Ayrshire bull, which are held to be very fine and are not accused of long legs. One only of them, (one of the most delicate and pretty animals I ever saw) brought me a calf last spring. She calved in June, and through the summer, in ordinary pasture, with my other cows gave me 12 quarts of milk per day and now gives eight quarts a day.

Other persons perhaps possess better cows, and better heifers, and I might mention many other instances, but I adduce these which are within my personal knowledge merely to show that my observation and experience lead to results opposite to those which in the cases mentioned by A. R. were so discouraging.

SWINE.

In December of 1830, I sold to my neighbor, Mr Zelah Barnes, two pigs out of a sow of native blood, by my imported boar of the 'Norfolk thin rind' breed. They then together weighed 45 lbs. In April last they were estimated to weigh 50 lbs. Mr Barnes is a person of undoubted veracity, and he assures me that these pigs had no extra food, or care, but mine were fed and treated in all respects as he has been accustomed to feed those which when killed at the same age usually weigh from 350 to 375 lbs. each. These two pigs were dressed on the 13th of Dec. last, then thirteen months old and together weighed 902 lbs. —The peculiarities of the breed are, a propensity to take on flesh, and to dispose of it upon the best points, small bone and light oil, *thin rind* and flesh of uncommon fineness of grain and delicacy of texture.

While the '*Cacothes scribendi*' is upon me I will add another to the thousand and one warnings which are annually given of the danger of trying fire-arms in the vicinity of dwelling-houses. A short time since I shot a hen in my barn yard, ten rods from my house, aiming at the head. The shot passed through the covering of the cow house, were deflected from the course by contact with a stick of timber, and entered the kitchen through two windows, lodging in the opposite side of the room. My wife and sister were both in the room at the time, and were both protected from injury by the wall 20 inches in width between the two windows.

HORSES.

A correspondent of yours some time since made, I think, some inquiries respecting a cure for *ring bone* in horses.—I am frequently called upon to prescribe for horses and colts so affected. In almost every instance blistering ointment, if perseveringly applied, will be of service and in some cases effect a complete cure. It stimulates the part so that the bony secretion is taken into the circulation and carried off.

The doctrine advanced by the writer in the American Farmer that bots are of no injury to a horse, is not a new theory; at least so far as he is concerned, as will appear by a reference to the 'Farmer's Series' where the same theory is broached.

So far as I am acquainted with the subject, horses taken suddenly ill, if doctored for the bots, will be sure to die. I will mention only one in-

stance of the many which have occurred within the course of my observation. A remarkably fine family horse belonging to a neighbor of mine, had as I should express it a violent attack of cholice. During the day, under the care of those who consider themselves skilful in the art, he was made to swallow immoderate doses of medicine, which had never failed to kill the bots, (horse?) In the evening a request was sent me, that I would see the horse. I found him in agony, covered with a cold sweat and apparently in his last struggle. His owner was persuaded that nothing could be done for him and had given him over. I directed emollients to be applied to counteract the effect of the medicine he had taken—that he should be carefully clothed, and be kept as quiet as possible. The next day the horse was nearly well.

For almost every sudden attack of disease to which horses are liable, bleeding, if immediately effected, is a most excellent remedy and the only one which in all cases can at once be employed. A very valuable horse which I have (worth 2000 dollars) although apparently in perfect health the preceding evening, was when led from the stable one morning, so affected by *antior* as to be unable to raise his feet from the ground.—I immediately opened a vein in the inside of each fore leg and in the course of the day took from him more than 12 quarts of blood. By dint of hand rubbing of the muscles and repeated bleeding, in three days the horse was well and he has never been in the least troubled with that disease, although more than a year has elapsed since that attack. Had I temporized and tried other things, without copious bleeding, the horse would have been ruined.

In the course of the last season my grooms bled by my direction from fifty to one hundred different horses, some of them repeatedly at different times until they *fainted*, taking from the jugular vein through a large orifice from 10 to 12 qts. of blood, and in no single instance have I known any accident or injury to arise from the practice.

A short time since I wrote a sketch of the course I have adopted with complete success in regard to my mowing land, which I intended at the time to send to you for insertion in your useful paper; thinking that as I had derived pleasure and profit from the statements there given by practical farmers of the results of their own experience, so others might be gratified and perhaps some might be excited to pay more attention to the subject by a description from me of the course I have found so successful. I also wrote several articles upon the subject of reclaiming land.—Doubts, however, whether these articles might not derive the interest, which in my view they possessed, from their relation to myself and whether, too, your paper might not be occupied by matter more useful, more instructive, and more entertaining to your numerous readers has hitherto prevented me from forwarding them to you; should they in your opinion be worthy an insertion in your columns they are at your service.

C. ROBINSON.

Southington, Conn. Jan. 9, 1832.

We should be happy to receive the above mentioned articles.—Editor.

AMERICAN FOREST TREES.

THOS. G. FESSENDEN, Esq.

DEAR SIR—Agreeably to the desire of the London Horticultural Society, I last month transmitted them a collection of our native productions comprising—32 varieties of Apples, 12 varieties of Pears, a number of varieties of Plums and Grapes and 6 very interesting new double varieties of Hibiscus Syriacus or Althea Frutex, having originated the latter from seed. In addition thereto, I presented them with the seeds of 50 species and varieties of Oak, 18 species of Hickory, and with several species of our most interesting Pines, and as productions indigenous to our forests, offer a proof so conclusive of the natural riches of our country, I hereto annex a list of them.—The number of varieties of the oak spread over the immense expanse of territory from Maine to Mexico is so great, that the collection of them might have been easily extended to one hundred varieties, without including above 20 evergreen species, natives of Mexico itself. Of the latter I have three splendid species now flourishing in our garden, in which are also concentrated the Spanish Oak, which yields the cork, universally in use, as well as the other European varieties; and also a most interesting evergreen species from the East Indies whose growth assimilates very much to that of our Holly. Wm. ROBERT PRICE.

Lin. Bot. Garden,
Flushing, N. Y. Jan. 1832. }

1. Quercus virens.

2. " v. diversifolia.

This is the species termed *Live Oak* and it affords the superior ship timber deemed equal to the Teak of India.

3. " tinctoria.

4. " " v. glauca oblonga.

5. " " v. glauca oblonga striata.

6. " " v. intermedia oblonga.

7. " " v. glauca ovata.

8. " " v. glauca ovata striata.

9. " " v. glauca depressa-globosa.

10. " triloba.

These species and varieties afford the finest Quercitron bark.

11. Quercus alba.

12. " " v. glauca minor.

13. " macrocarpa.

14. " bicolor.

15. " obtusiloba.

16. " v. glauca minima.

17. " oliviformis.

These species afford excellent timber—also posts for fencing, &c.

18. " rubra.

19. " " v. glauca oblongo-ovata.

20. " " v. glauca minor.

21. " " v. glauca maxima.

22. " " v. glauca oblonga.

The bark of these varieties is very extensively used in the tanneries.

23. " aquatica.

24. " " v. glauca minor.

25. " " v. heterophylla.

These are sub-evergreen, often holding their foliage during the whole winter.

26. " palustris.

27. " cinerea.

28. " " var.

This species affords a brilliant yellow dye.

29. " catesbeii—a beautiful evergreen.

30. " coccinea.

31. " " v. glauca oblonga.

32. " " v. glauca minima.

The bark of these is often used at the tanneries in lieu of the true Quercitron.

33. " hemispherica

34. " phellos.

The wood is used by wheelwrights and is remarkable for its strength and tenacity; the trees attain to the height of 50 feet or more.

35. " filenta.

The bark of this species in high estimation for tanning, and the wood is used by the wheelwrights.

36. " chinquapin.

37. " lyrata.

This species affords good timber.

38. " ambigua.

The bark is used in the tanneries and the timber for knees of ships, and also by the wheelwrights.

39. " nana.

40. " sericea.

41. " myrtilolia.

42. " laurifolia.

43. " castanea—forms a beautiful tree.

44. " maritima.

45. " ferruginea—affords excellent fuel.

46. " banisteri.

47. " imbricaria.

48. " " v. fol. serrata.

The wood of the two last is used for shingles, &c.

49. " discolor.

50. " " v. glauca oblonga.

51. Juglans myristiciformis.

This species it is believed does not at present exist in any European collection, the specimens called by the name being generally the *J. porcina* v. *ficiformis*. Although I have made the most particular inquiries and research for a period of twelve years, it was not until the present one that I succeeded in discovering its native locality and I have been often tempted to doubt its existence.

52. " porcina.

53. " " v. ficiformis.

54. " " v. subovata.

55. " cinerea.

56. " alba, vel. squamosa.

57. " suleata.

58. " tomentosa.

59. " v. nuce subovata.

60. " v. nuce maxima globosa.

61. " v. nuce maxima quadrangularis.

62. " v. nuce oblonga.

63. " v. nuce maxima ovata.

64. " v. nuce minima.

65. " nigra.

66. " amara.

67. " aquatica.

68. " oliviformis.

69. Pinus pungens.

I discovered some trees of this very rare species in 1829 occupying an insulated position, the locality of which is 400 miles north of the one recorded by Pursh and Michaux, and during the same year I transmitted a large number of the cones to Paris and London.

70. Pinus palustris—the most valuable of all our native species.

71. " rubra.

Michaux, though so estimable and accurate a botanist, doubts the existence of this species and notes it as a variety only, whereas no species is more distinctly marked.

72. Pinus alba.

This is the most beautiful tree of all the class of Abies, and seldom to be met with even in this, its native country.

BEES—INQUIRY.

MR FESSENDEN—About the 25th of last November, I placed four hives of bees on the same stand, with the places of entrance so far obstructed, that no one could escape from the hives. I also closed the doors of my apiary. Near the last of December, I examined my hives, and found the bees in three of them lively, and apparently

in good health, while the bees in the other were all dead, though there was a large supply of honey in the hive.—What was the cause of their death? If some one of your correspondents will furnish a satisfactory answer, through your paper, a particular favor will be conferred on,

OBSERVATOR.

From the Genesee Farmer.

EDUCATION OF FARMERS' SONS AND DAUGHTERS.

Let me entreat farmers and their wives to educate their sons and daughters for their own professions. All the idle and studious professions are crowded to overflowing. Go through our cities and resist, if you can, the rising sigh over human folly, when you see the streets lined with idle, beggarly Lawyers, Doctors, Merchants, unpaid or half paid Clerks, unemployed Schoolmasters, and Servitors, seeking for places, &c, &c. Or where you enter the dwellings, and examine the condition of families; without employment, without any of the fruits of industry, importuning half distracted fathers for finery and gewgaws, who are borrowing notes, and begging for delays for thirty days more, hanging about brokers, in order to wait for a few months, a threatened destruction. Bew that farmers and their wives will reflect a moment on the situation of our thousands of disappointed young men and women, whose parents' folly has thrown them upon the world, unqualified for any of those pursuits which will insure them a competency. The illiterate clerk is begging for a school, which he is not qualified to teach. The boarding school girl, who can tinkle the piano very well, and has said off set lessons in Stewart, Euclid, &c, so well as to procure newspaper pulp for her teacher, but is absolutely unqualified to teach an A-B-C-darian school, is also seeking a place as teacher without success.

How easy it would be for two or three wealthy farmers in one parish, to revolutionize the state of things in their vicinage; other parishes would witness their improvement and imitate their example.

As I have long since passed my half-century birth-day, have sons in several professions, and daughters advancing in life, have been bred to farming in the good old way, (which calling I foolishly abandoned for the law, one of the learned professions it is absurdly called) I ask for a bearing among the respectable farmers along the banks of the delightful Genesee. Should you succeed in reforming the taste, and improving the course of education there, so far as to become a pattern for imitation throughout our country, the waters of the Genesee would become as sacred in America, as the waters of the Ganges are in India. Future poets would refer to it as the sacred fountain, from which flowed the streams of true science, industry, and consequently the most perfect terrestrial happiness.

As soon as your sons and daughters are old enough to walk without tottering, put them to some one of the numerous employments which your situation will afford, where they may be able to see traces of their first labors for a long time. Sons may have small patches of ground assigned them as mimic farms. They may there raise their two feet fields of flax, oats, barley, &c; their currant orchards, their potato patches, their cabbage grounds, their wheat fields, and meadows, may all be laid out on a few rods of ground.

Your daughters may have their mimic cheese-presses and churns. Their eight ounce cheeses may be kept for their wedding tables; such exercises in mimic agriculture and house-keeping, will lead children to make profitable inquiries, and excite a love of labor which can never be extinguished.

When your children are sufficiently advanced in bodily strength, change their mimic labors to those of real gains. In addition to their labors in the service of their parents, let the sons always procure their own pocket money, by cultivating small portions of ground assigned to each; and while the daughters have an agency in the manufacture of their own homespun, in kitchen cooking, cleaning and regulating rooms and furniture, let them procure all their extra ornaments by the sale of stockings, mittens, &c, knit by themselves; by braids for hats, and other saleable articles, the produce of their own industry. Never fail to make every son and daughter intimately acquainted with all your views and calculations. Farmers should have no secrets in their business, for they never proceed on a false credit. The father should tell his sons how much he owes towards his farm, and all his prospects and all his fears.

The mother should instruct each daughter in all the details of her household management, with the precise value of whatever was consumed in food and clothing. Thus your sons and daughters are prepared to enter upon the theatre of life, with all the advantages of experienced actors.

Having said as much on the first, and infinitely the most important part of the education of your sons and daughters, as you may be disposed to read, I will give you a concise view of my opinion on the subject of their scientific and literary education.

Never send a son or daughter from home to be educated. If you expect to have your children make any improvement, you will probably calculate to be at the extra expense of board, dress, &c, for six months at least. Suppose you pay but \$150 per week for board and the extra expense for dress, travelling, &c, should amount to but fifty cents per week; the whole clear loss would be but \$52. In this case the tuition is supposed to be the same at home and abroad. If two of you unite and advance \$104, you can with this sum procure apparatus, books, &c; by means of which a competent teacher will readily be induced to come among you. The whole district may have their children much better educated at home after this preparatory expense, than they would be if sent abroad. Should there be any difficulty in obtaining a competent teacher, a few individuals may unite, and send any common school-master, to be taught at the nearest school of the kind required. On his return he would soon be able to repay the sums advanced for his instruction.

Much caution is required in the employment of a teacher, when the object is to improve the method of instruction. We have more than a hundred quack schoolmasters to one quack doctor—especially of those modern 'standard raising' schoolmasters. In selecting apparatus, good advice should be taken.

If prejudice in favor of one's own place of residence may be excused, I venture to say, that the most economical and useful suits of apparatus,

chemical and philosophical, may be procured in Troy, N. York, for a lower price than any other place on either continent. As I have no pecuniary interest in the sales, I hope I shall not be charged with partiality. I will give one example. A suit of mechanical powers sold at ten dollars, has been considered very cheap; here a suit upon a plan altogether more convenient, more perfect, and more clear in its application, may be had for three dollars, or any boy may be shown how to make it for himself. The scholars of the Rensselaer School make this and many other pieces of apparatus for themselves.

I saw a suit of chemical apparatus (and I believe there is now one of the kind in Rochester) which was considered very cheap at fifty dollars, (part of which was totally unnecessary) and all the useful part could be purchased in Troy for fifteen dollars. Almost all articles of apparatus, of chemical substances, &c, can now be purchased at two thirds the cost of the same articles three years ago. For example, the Dutch Prism of eight dollars, can be had in Troy for three dollars fifty cents—air pumps of forty dollars, can be had at twenty-eight dollars, &c.

I hope the farmers of the Genesee River, will permit me to give them a little unasked advice, in regard to the subject of learning most profitable for their sons and daughters. As this will depend much on the quantity of learning which the parent feels able to give, I will set down those subjects, according to their degrees of importance.

After the alphabet and four or five pages of spelling, just to learn the natural powers of letters, let them begin to read. Never purchase a spelling book. You will consider your own time lost, while confined to the unprofitable exercise of spelling, if you recollect you learned to spell by reading, not by spelling. Every child ought to read aloud full two hours each day, as soon as he can begin to read at all.

Next have your children taught to write as soon as possible—not in a painted school boy hand, but in his natural way without ornament. If he is to be a copy-writer, or a clerk, let him learn that kind of hand as he would learn the painter's trade. The whole business of your sons and daughters at school, and when not at work at home, should be reading good authors, and copying some of their best sentences, and composing essays, &c, until they can converse and write in good style, and with facility—then, and not before, they are prepared for further advances. But their reading should be judiciously directed—always intermixing the elegant with the instructive, and the fanciful with the profound. Elegant composition and conversation give man or woman, more especially woman, an ascendancy which can be attained to by no other qualification. Among their reading, let Geography and History constitute an important part.

In early youth, before your children's bodily strength enables them to be very profitable in the field or kitchen, let them learn the names and characters of natural bodies, from the mere dictation of a competent teacher. To collect, preserve, and label plants, at the age of six and seven years is an excellent and very healthful amusement. It disciplines the mind to habits of attention, and stores it with useful materials. Minerals should be collected, also; but the study of Geology is the best calculated to excite sublime emotions, and elevate the heart above all unworthy views.

I will not tire your patience with a detailed account of my views of education. But I must be permitted to give my opinions on the subject of a winter course for your sons and daughters, after they arrive at that knowledge of language (by the proposed exercise in reading and writing,) which shall enable them to understand scientific authors. Let a warm room with very high upper ceilings, and its floor near a level with the surface of the earth, be provided. Let a room be cut off from one end of it by a sliding, and two wide doors meet on a narrow middle post. This room should be accommodated with shelves for apparatus, specimens, &c. A stove so constructed that it might be used as a furnace occasionally, should be set up on a very broad hearth in the room.—This is always to be locked, excepting when the teacher is present. The outer part may be used for a day-school, for a town-house, or for any other purpose. In this room, an evening course of lectures should be given every year, from the middle of November to the middle of March. The subjects embraced in the course, should be Experimental Chemistry, Natural Philosophy, Technology, and Geology. Parents ought to attend with their children as much as possible. Four lectures in each week, in the proposed season of leisure among country farmers, would not impose a heavy burthen, while the advantages would be incalculable. A. PATON.

Rensselaer School, Troy, Dec. 15th, 1831.

Agriculture in England.—An American gentleman, a correspondent of the New York Observer, and now in England, thus speaks, in comparing English agriculture with that of this country.

From Manchester to Birmingham, with the exception of the coal regions of Wolverhampton, and another few miles of poor land, the whole country is a perfect garden. An American farmer knows nothing of English husbandry. The difference is too wide for him to be able to appreciate it. Select the most cultivated grounds of the rich on Manhattan Island, or behind Brooklyn, or in the immediate vicinity of Philadelphia, or of Boston—and they are only ordinary specimens of English farming. A poor English cottager displays a taste about his humble dwelling, and gets a product from his little patch, which might shame the wealthy farmers of the United States. I wish not to speak disrespectfully of my country, or countrymen—but I should like to provoke them by whatever means, to more rapid improvements, both in agriculture and horticulture.

Planting Corn.—I have for several years, been in the practice of sowing my wheat fields early in the spring with timothy and clover seed; and the next season I have ploughed the ground as late in the spring as would answer for planting corn.—By this time the grass would be like a meadow; and on examining the soil, I found it very much filled with the roots of the grass, which kept it unusually light and mellow, and always productive. The result of these experiments induced me to sow my cornfield with grass seed, the present season, after hoeing the last time. This does not appear to have injured the corn; and I have no doubt but the field will be well clothed with grass by the time for following next year. Having full confidence in the utility of these practices, I am induced to invite farmers to try the experiment.—*Skaneateles Columbian.*

* So called from their continually using the phrase, 'raise the Standard of Education,' though they are illiterate themselves.

From Nuttall's Manual of Ornithology of the U. States and Canada.

AMERICAN STARLING, OR MEADOW LARK.

(*Sturnus ludovicianus*, L. *Alauda magna*, Wilson, 3, p. 20, pl. 19, fig. 2. Philad. Museum, No. 5212.)

SP. CHARACTER.—Beneath and line over the eye bright yellow; a black crescent on the breast; and with the 4 lateral tail feathers white.

This well known harmless inhabitant of meadows and old fields is not only found in every part of the United States, but appears to be a resident in all the intermediate region, from the frigid latitude of 53°, to the mild table land of Mexico, and the tropical savannahs of Guiana. In the winter, they abound in Alabama and West Florida, so that in some degree, like the Jays, and the legitimate Starlings, they partially migrate in quest of food during the severity of the weather in the colder states. It is not how-ever improbable, but that most of the migrating families of this bird, which we find at this season, have merely travelled eastward from the cold western plains that are annually covered with snow. But although they are now seen in considerable numbers, any single flock is never greater than a pair and their attendant brood, or from 6 to a dozen, in the case of a second covey. The true Starlings, on the contrary, have all the habits of our common Blackbirds; they assemble in winter, like dark clouds, moving as one body, and when about to descend, perform progressive circular evolutions in the air like a phalanx in the order of battle; and when settled they blacken the earth with their numbers, as well as stun the ears with their chatter. Like crows also, they seek the shelter of reed marshes to pass the night, and in the day take the benefit of every sunny and sheltered covert.

Our Starling, like the American Quail, is sociable, but scarcely gregarious; and though many no doubt, wander some distance after food, yet a few, in Pennsylvania, as well as in this rigorous climate, may be seen in the market after the ground is covered with snow. Wilson even observed them in the month of February, during a deep snow, among the heights of the Alleghenies, gleaming their scanty pittance on the road, in company with the small snow birds.

The flesh of our bird is white, and for size and delicacy it is considered little inferior to the Partridge; but that of the European species is black and bitter.

The flight of the *Sturnella* is laborious and steady like that of the Quail, with the action of the wings renewed at short intervals. They often alight on trees, and select usually the main branch-

es or topmost twigs on which to perch, though their food is commonly collected from the ground. At various times of the day, and nearly through the winter in the milder states, their very peculiar hisping, long, and rather melancholy note is heard at short intervals; and, without the variations which are not inconsiderable, bears some resemblance to the slender singing and affected pronunciation of *ti sé dé ah*, and *psée dé stáíó*, or *taí sé dító* in a slow, wiry tone, and sometimes differently varied and shortened. The same simple ditty is repeated in the spring, when they associate in pairs; the female also, as she rises or descends, at this time, frequently gives a reiterated guttural chirp, or hurried twitter like that of the female Red-winged Blackbird. I have likewise at times heard them utter notes much more musical and vigorous, not very unlike the fine tones of the Sky-Lark, which

* Shril-voiced and loud, the messenger of morn,
Ere yet the shadows fly, [high] mounted sings
And the dawning clouds, and from their haunts
Calls up the taciturn nations.*

but I can by no means compare our hisping songster with that blithe charlinder of day.† There is monotonous affectation in the song of our Lark, which appears indeed somewhat allied to the jingling though not unpleasant tune of the Starling.† The Stare, moreover, has the faculty of imitating human speech, (which ours has not, as far as we yet know,) and could indifferently speak even French, English, German, Latin, and Greek, or any other language within his hearing, and repeat short phrases, so that “*I can't get out, I can't get out*,” says the Starling, which accidentally afforded Sterne such a beautiful and pathetic subject for his graphic pen, was probably no fiction.

At the time of pairing, our Lark exhibits a little of the jealous disposition of his tribe, and, having settled the dispute which decides his future condition, he retires from his fraternity, and, assisted by his mate, selects a thick tuft for the reception of his nest, which is pretty compact, made of dry, wiry grass, and lined with finer blades of the same. It is usually formed with a covered entrance in the surrounding withered grass, through which a hidden and almost winding path is made, generally so well concealed, that the nest is only to be found when the bird is flushed.

The eggs are 4 or 5, white, with a very faint tint of blue, almost round, and rather large for the size of the bird, marked with numerous small reddish brown spots more numerous at the greater end, blended with other lighter and darker points and small spots of the same. They probably often

raise 2 broods in the season. About the time of pairing, in the latter end of the month of April, they have a call like *Yship, twee*, the latter syllable in a fine and slender tone, something again allied to the occasional notes of the Red-winged Blackbird, to which genus, (*Icterus*) our *Sturnella* is not very remotely allied. Towards the close of June, little else is heard from the species, but the noisy twitter of the female, preceded by a hoarse and sonorous *Yimp* or *Yip*, accompanied by an impatient raising and lowering of the wings, and in short all the unpleasant and peevish actions of a brood hen, as she is now assiduously engaged in fostering and supporting her helpless and dependent offspring.

Their food consists of the larvae of various insects, as well as worms, beetles, and grass seeds; to assist the digestion of which they swallow a considerable portion of gravel. It does not appear that this species ever adds berries or fruits of any kind to its fare like the Starling, but usually remains the whole summer in moist meadows, and in winter retires to the open grassy woods, having no inclination to rob the orchard or garden, and, except in winter, is of a shy, timid, and retiring disposition.

The length of the *Sturnella* is 10½ inches, its extent 16½. Above, variegated with black, bright bay, and ochreous. Tail wedged, the feathers pointed, the 4 outer ones all white. Sides, thighs, and vent pale ochreous, spotted with black. Upper mandible brown, the lower bluish white. Iris hazel. Legs and feet large, pale flesh color. In the young bird the yellow is much fainter than in the adult. Another species of this subgenus is found at the Straits of Magellan, darker than ours, and beneath of a bright carmine red. They form truly a very distinct genus.

From the *Genesee Farmer*.

ON THE MEANS OF INDUCING FERTILITY IN FRUIT TREES.

From Lindley's 'Guide to the Orchard and Kitchen Garden.'

Some fruits of excellent quality are bad bearers: this defect is remedied by a variety of different methods, such as 1. *By ringing the bark*; 2. *by bending branches downwards*; 3. *by training*; and 4. *by the use of different kinds of stocks.* (a) All these practices are intended to produce exactly the same effect by different ways. Physiologists show that whatever tends to cause a rapid diffusion of sap and secretions of any plant, causes also the formation of leaf buds instead of flower-buds; and that whatever, on the contrary tends to cause an accumulation of sap and secretions, has the effect of producing flower buds in abundance. (b) This circumstance, which at first sight seems to be difficult to account for physiologically, is no doubt to be explained in the difference between leaf buds and fruit buds themselves. In a leaf bud, all the appendages or leaves are in a high state of development, and the central part or axis, around which they are arranged, has a tendency to extend itself in the form of a branch as soon as the necessary stimulus has been communicated to the system, by the light and warmth of spring. In a flower bud, the appendages or leaves are in that imperfectly formed, contracted state, which we name calyx, corolla, stamens and pistilla; and the central part around which they are arranged, has no tendency to elongate under the influence of the usual stimulus. Hence a flower bud, or a flower, is nothing but a contracted branch: as is proved by the occasional elongation of the axis in flowers that expand during unusually hot damp weather late in the spring, becoming branch-

* According to Richardson in Franklin's Journal.

† Bullock's Travels.

* *Sturnus pisitator* ore, *isitator*, *pisistrator*, was the cry of the Stare to the ears of the Romans.

es, bearing sepals and petals instead of leaves. It is, therefore, easily to be understood why, so long as all the motions and secretions of a tree go on rapidly, with vigor, and without interruption, only rudiments of branches, or leaf buds, should be formed; and why, on the other hand, when the former become languid, and the parts are formed slowly, bodies of a contracted nature, with no disposition to extension (or flower buds) should appear.

It will be found that the process of the practices above enumerated, to which the gardener has recourse, in order to increase the fertility of his fruit trees, is to be explained by what has just been said. In *ringing* fruit trees, a cylinder of bark is cut from the branch, by which means a return of the elaborated juices from the leaves down the bark is cut off, and all that would have been expended below the annular incision is confined to the branch above it. This produces an accumulation of proper juice; and flower buds or fertility, are the result. (c) But there is a defect in this practice, to which want of success in many cases is no doubt to be attributed. Although the returning fluid is found to accumulate above the annular incision, yet the ascending sap flows along the albumen into the buds with nearly as much rapidity as ever, so that the accumulation is but imperfectly produced.—On this account, the second practice of *bending branches downward*, is found to be attended with more certain consequences.—The effect of turning the branches of a tree from their natural position, to a pendulous or a horizontal one, is to impede both the ascent and descent of fluids, in a gradual but certain manner. The tissue of which branches is composed is certainly permeable to fluids in every direction; and there can be no doubt that the vital action of the vessels of a plant is performed both in the natural and in an inverted position. So long as that erect direction of the branches which is natural to them is exactly maintained, the flow of their fluids being subject to no interruptions, will take place in the freest possible manner; but the moment this natural direction is deviated from, the vessels become more or less compressed, their action is impeded, and finally, if the inversion is perfect, it becomes so slow that an accumulation of the profuse juices necessarily takes place through every part of the system. (d)

One of the objects of *training* is to produce the same effect. Branches are bent more or less from their natural erect position; their motion, in consequence of the action of wind upon them, which is known to facilitate the movement of the fluids, is totally destroyed; and hence arises the accumulation of proper juice which is necessary to their fertility. Nor is the influence of the stock, of an essentially different nature. In proportion as the scion and stock approach each other closely in constitution, the less effect is produced by the latter; and, on the contrary, in proportion to the constitutional difference between the stock and scion, is the effect of the former important.—Thus, when pears are grafted or budded on the wild species, apples upon crabs, plums upon plums, and peaches upon peaches, or almonds, the scion is, in regard to fertility, exactly in the same state as if it had not been grafted at all. While on the other hand, a great increase of fertility is the result of grafting pears upon quinces, peaches upon plums, apples upon white thorn, and the like. In these latter cases, the food absorbed from the earth by

the root of the stock, is communicated slowly and unwillingly to the scion; under no circumstances is the communication between the one and the other as free and perfect as if their natures had been more nearly the same; the sap is impeded in its ascent, and the proper juices are impeded in their descent, whence arises that accumulation of secretion which is sure to be attended by increased fertility. No other influence than this can be exercised by the scion upon the stock. Those who fancy that the contrary takes place—that the quince, for instance, communicates some portion of its austerity to the pear, can scarcely have considered the question physiologically, or they would have seen that the whole of the food communicated from the albumen of the quince to that of the pear, is in nearly the same state as when it entered the roots of the former. Whatever elaboration it undergoes must take place in the foliage of the pear; where, far from the influence of the quince, secretions natural to the variety go on with no more interruption than if the quince formed no part of the system of the individual. (e)

(a) Transplanting and diminishing the system of roots, have also, by lessening the flow of sap, a tendency to induce fruit buds. A sizeable tree often shows blossoms the second year after being transplanted, though subsequently it may not bear for some years. J. B.

(b) Knight's opinion in regard to the formation of wood and fruit buds, is this: That the natural efforts of the mother tree are directed, 1. to the nourishment and perfection of her progeny, the fruit; 2. to the production of new wood buds, essential to the elaboration of food the coming year; and (these labors being finished) 3. to the production of fruit buds for another crop. But as our seasons do not afford time to perfect all these labors, it happens that many varieties, particularly those which produce great crops, and carry their fruit late, produce fruit only every other year; and hence, too, varieties brought from a higher latitude, where the seasons are longer, as the Siberian crab, and the process of vegetable development more rapid, become in warmer climates, annual bearers. The varieties that ripen their fruits early, as most of the cherries, plums, &c. produce fruit every year: except that when the crop is heavy, a barren year, and often the death of the tree succeeds.

J. B.

(c) I dislike this method. It is robbing one part of the tree of its food to pamper a pet branch. Several branches of the plum, experimented upon, died the following year; and branches of the apple broke off with the weight of fruit. J. B.

(d) These axioms in vegetable physiology will find a confirmation in our orchards and gardens. The pendulous and horizontal branches, will be found to abound most in blossoms, and others much in the ratio of their departure from an upright position—those growing erect producing the least. Hence a crooked tree (particularly the apple) bears better than a straight tree; and a flat spreading top is more beautiful than a tall pyramidal one. Hence too the practice of nurserymen, of removing the centre shoot of the apple, when it has attained a sufficient height to form a head. J. B.

(e) In the cultivation of the pear in the London and Edinburgh Horticultural Gardens, advantage is taken of both of these last methods, for a threefold purpose, of inducing precocity and fruitfulness, and of saving ground. Such of this fruit as takes freely, is worked upon the quince, and trained *en quenotte*, that is, the branches which are suffered to grow low, are thinned out, and those left bent down so as to assume the form of a staff, and there fastened. Trained in this way trees are planted four feet apart; and the product of a given area of ground is said to be greater, from dwarfs, in this way, than from standards, at the usual distance of planting.

After all, it would seem to be a law of nature, that the food of the young plant as well as of the young animal, shall go exclusively to enlarge and develop the individual, until it has attained to natural puberty, and that the contrivances of art to counteract this law, in inducing precocity, or unnatural fruitfulness, shortens the period of their existence. This also seems to be the tendency of very high feeding and very rich manuring. Temperance is as essential to the vegetable as the animal. The great art of

managing plants is to conform them to their natural soil, temperature and habits. The practice which I would urge from the consideration of the preceding facts, is, that men should plant both dwarf and standard trees—the first for themselves and the last for their posterity.—J. B.

From Prince's Pomological Magazine.

VILLENNES. PR. CAT.

Cerise de Villennes. Guindour rouge, N. Duh. Ceriser à gros fruit rouge pale. N. Duh. Roz.

This tree is one of the very largest of its class of cherries; the shoots are twice the size of those of the preceding variety, and its leaves are terminated by a long acute point. The fruit is eleven lines in diameter, and ten in height, borne on a strong peduncle, from ten to sixteen lines in length; the skin is delicate, and of a light red color; the flesh white, succulent, slightly acid, and of a very pleasant flavor. This beautiful cherry is one of the best for the table; and Duhamel remarks that it ought to be preferred to all others for preserves. It ripens at the end of June or the beginning of July.

COMMON MORELLO. PR. CAT.

Black Morello. Pr. Cat. 26th ed.

This tree attains but moderate dimensions, and forms a round head, with innumerable small slender branches; the fruit is only of medium size, but its flavor, when fully ripe, is peculiarly sprightly, rich, and highly pleasant to the taste. It is one of the finest for drying, and also for tarts, preserves, and brandy, and when bottled may be preserved for a long period, without spirits or sugar. It attains its maturity late in July; is seldom attacked by insects or birds, and often becomes shrivelled and dry, while still hanging on the branches. It is unfortunate that this variety is more subject than any other cherry to the attacks of the same insect which so frequently stings certain varieties of the plum, and which often perforates the branches of this tree to such an extent that they are covered with the numerous knots and excrescences which arise therefrom. The only remedy is to prune off all branches thus attacked at the period when the insect or its eggs are concealed therein, and to burn them immediately, for if they are left to increase annually, they present a most disagreeable appearance, and in time entirely destroy the tree. The same course may be adopted with success for all other trees attacked in a similar manner; and if it was adopted generally throughout our country, it would in a few years nearly or quite annihilate this formidable depredator on our gardens and orchards. Formerly this variety of the Morello was very common in this vicinity, and frequently met with planted along the sides of the highway; but the depredations of the insect referred to, and a total inattention to all remedies have rendered it at the present period quite a rare tree.

LARGE MORELLO. AUTH.

English Morello. Pr. cat. 26th ed. | Merella. Law. Morella. Lang. | Morella. Mil. Lond. Hort. cat. Large English Morella. Milan. Griottier du nord. Dic. d'Agric.

This tree attains a moderate size, with a round compact head; its shoots are stronger than our common Morello, and the branches are never attacked by the insect which so often perforates the common variety, and causes large and numerous excrescences to be formed. The fruit is of large size, round, and of a dark red color, almost black, and when perfectly ripe is tender and juicy,

with a sprightly and pleasant acidity. In England they preserve the fruit on the trees till September and even October, and it is then highly esteemed for the dessert. It is not, however, properly speaking, a table fruit, but best suited for tarts, preserves and cherry brandy. It ripens among the latest varieties in July, and the tree is productive.

**PLUMSTONE MORELLO. PR. CAT.
LOND. HORT. CAT.**

This is the largest variety of the Morello, that I have yet seen, but it is stated that some of the kinds from the north of Europe exceed it in size. It is round in its diameter, somewhat pointed at the extremity, and has a long stone resembling that of a plum, on account of which circumstance it received the title here adopted. When perfectly ripe the skin is of a dark red color; the flesh very rich and high flavored, with a sprightly and agreeable acidity. It is a most excellent fruit for preserves, tarts, and brandy; and as it ripens late in July, after most other cherries are past, it also serves as a pleasing appendage to the dessert. The tree is thrifty, but, like the other varieties, attains only a moderate size, being seldom over twelve or fourteen feet in height, with a round well-formed head; it is quite productive, and I have never seen it attacked by the insect that depredates to such an extent on the common Morello, which circumstance, together with its great excellence, gives it high claims to that general estimation in which it is held.

Prepared by the Editor.

SHEEP FED WITH PEA STRAW.

Sir John Sinclair says 'there is no food of which Sheep are fonder than pea straw; and where circumstances are favorable to that crop, peas ought to be cultivated, merely for the straw, from the advantages that would thence be derived by the sheep farmer.' Mr Young also observes that 'the straw of early white peas, applied to sheep is the most valuable return made by straw.'

PREPARING STRAW FOR CATTLE FOOD.

The ancients were accustomed to prepare their straw for feeding stock, by keeping it for a considerable time sprinkled with brine; it was then dried, rolled up in bundles, and given oxen instead of hay.

MANAGEMENT OF GRASS LANDS.

Rolling was formerly considered to be indispensable in the management of grass lands, tending to smooth and consolidate the surface: to prevent the formation of ant-hills; to promote the growth of valuable herbage; and to render the effects of drought less pernicious. But scarifying the turf with a plough, consisting only of coulters, or harrow teeth, so that the whole surface may be cut or torn is to be recommended, *when the pastures are hide bound*. That tenacious state rolling tends to increase; whereas by scarifying, the surface is loosened, and the roots acquire new means of improved vegetation. This operation seems particularly useful, when it precedes the manuring of grass lands; for if well

scarified, the ground is so opened, that any manure spread on it, gets at once to the roots, consequently a small quantity thus applied, goes as far, as a larger one laid on in the old mode, and without such an operation. Thus the force of objections to the application of putrescent manure to grass lands is in some degree obviated.

PASTURE LAND.

Feeding sheep with oil cake and allowing them to pasture on land overgrown with mosses has been found to be effectual for the destruction of moss and the means of bringing up abundance of grass.

SOILING.

By soiling is meant the feeding of stock in a house, shed, or fold, with cut green food, instead of making the grass into hay or pasturing the field.

Working horses, or oxen, derive great advantage from soiling. They are saved the trouble of collecting their food, after their work is over; can fill themselves much sooner, and consequently have more time to rest; and can take their repose much better in a stable or shed, with plenty of litter, than in an open field, where there are so many things to annoy them.

The experiments of soiling cattle have likewise been successful. Young steers become more tractable for work; nor is there any risk of cattle being hoven, if their feed is moved two days in advance. For milch cows in particular, it is highly expedient to soil them, at least in the middle of the day, that they may not be tormented with flies in the field, nor induced to stand in brooks or ponds of water, nor in the shade of spreading trees or hedges, by which much valuable manure is lost. The stock are thus kept in a healthier state, and the milk is of a superior quality.

LUCERNE.

Sir John Sinclair says of lucerne, 'This valuable grass requires a dry and rich soil, which must be *thoroughly cleared of weeds by two or three previous hood crops*. It may be sown either broad cast, which is the usual method, or drilled nine inches apart, between rows of barley equally distant. It is better to sow it with barley or oats thinly seeded, both on account of the profit of the crop, and as the grain furnishes some protection to the plants from the attacks of the fly, which does great injury to it when very young. If drilled, from 12 to 15 lbs. of seed will do; if sown broad cast, not less than 20 lbs. It may often be cut four times a year. Lucerne is much superior to clover for soiling milch cows, giving no taste to the milk or butter, and one acre is sufficient for 3 or 4 cows during the soiling season. In rich land, a quarter of an acre will be sufficient for each of all sorts of large cattle taken one with another; but on moderate soils, half an acre per head is the proper allowance. *Lucerne requires to be kept thoroughly clean by hand hoeing and scarifying between the drills*. All other grasses, should be carefully plucked out.'

It appears from the above, as well as from the directions given by other writers on husbandry that weeding is as necessary for lucerne as for Indian corn, until the lucerne has obtained entire possession of the soil.

By some experiments made by the Hon. Robert

R. Livingston, it appears that with good cultivation and abundant manuring, from six to nine tons of hay may be obtained from an acre of this grass in a season. That gentleman asserts in substance, that the ground must be highly pulverized to insure a good crop. Twenty pounds of seed are required for an acre if sown broad cast. He advises as the result of his experiments; 1. Never to sow on ground that is not perfectly pulverized. 2. Not to sow till the ground has acquired a degree of warmth friendly to vegetation, viz. in May. 3. To sow with no crop that will probably lodge. 4. If sown with buck wheat to apply no gypsum or other manure till the buck wheat is off. 5. When the quantity sown is small and the farmer can afford to lose a crop, to give the ground one turn in the autumn, another in April, harrowing fine, and a third the beginning of May, and then if the weather be mild and warm sow, if the ground be in perfect tith, otherwise give it another ploughing.

'When lucerne turns yellow it should be mowed, and the plants will come up free from the disorder.'

CORRECTION.

In the list of the premiums that have been awarded on Butter by the Massachusetts Agricultural Society, and Bostonians, for the last ten years, the first premium of \$100, awarded Oct. 24, 1828, to John L. Boylston, Esq. of Princeton, Mass. was unintentionally omitted in the account published in the New England Farmer, Jan. 11th, 1832.

Baltimore Rail Road.—Within eleven days from the 3d of the present month, 3297 barrels of flour were transported from Fredericksburg, on the Rail Road to Baltimore, an average of 357 per day. The difference in favor of sending flour to market by the rail-road instead of by wagons, is about fifty cents per barrel, making in all a clear gain to the farmers of nearly \$2000. This is one of the happy results of cheapened transportation.

From the Genesee Farmer.

DETERIORATION OF SHEEP.

Philadelphia, Dec. 29, 1831.

During a recent visit to Baltimore and Washington, I had the pleasure to form an acquaintance with WILLIAM JARVIS, Esq. of Weathersfield, Vermont, a delegate to the National Republican Convention. Mr Jarvis is a very respectable and experienced wool-grower, and was indeed one of the first who introduced merino sheep into the United States. He stated to me, that he deemed the introduction of Saxony sheep into our merino flocks, as, on the whole, unfortunate; for though it had increased the fineness of the fleece, it had diminished the size and healthfulness of the animal, and materially impaired their annual reproductions. He said that from a given number of ewes, he had raised a much greater proportion of lambs before than since the intermingling of Saxon blood. His opinion is, that we should improve the quality of the fleece, by breeding from the first and best of our merinos, and avoiding the Saxons altogether. My own experience would seem to give sanction, in one particular, to Mr Jarvis' opinion. For, in proportion to my ewes, I have not succeeded in rearing an equal number of lambs for several years past, as I did before the intermingling of Saxon sheep. I had not, however, suspected the cause which he assigns.

His opinion on the matter is certainly entitled to great weight. And I take the liberty of communicating it for an early number of the second volume of your Journal, to the end, that it may lead to investigation and correspondence on a subject in which the agriculturists of western New York are deeply interested.

It is well known that some large flocks along the Genesee river, have, for some years past, deteriorated rapidly; and it is not unworthy of inquiry, how far the cause assigned, may have occasioned this deterioration. It will afford me pleasure, to communicate, occasionally, for the columns of the Genesee Farmer, any information which my rural pursuits may enable me to give and which may be deemed interesting to the public.

Z. BARTON STOUT.

To Correspondents.

"Rusticus" will appear next week—we shall be pleased to hear from him frequently.

ERRATA.—In N. E. Farmer, page 206, 1st column, for 'bushy' soils, read 'bushy' soils; for 'fine bark, read 'fine chopped' bark, i.e. broken and rough in fine pieces.

Grass Seeds.

For sale at the New England Seed Store, No. 52 North Market street—

GRASS SEEDS of all kinds.—Herds or Timothy, Red Top, Red and White Clover, Lucerne, Orchard Grass, Tall Meadow Oats Grass, &c, &c, at the lowest market prices, wholesale and retail. Feb. 1.

Farmer Wanted.

WANTED on a dairy Farm within thirty miles of Boston, a married man to take the same on shares. Good recommendations will be required for capacity, integrity and faithfulness, as also experience in making butter.—Inquire at this office. Feb. 1.

Take Notice.

At a meeting of the Blue Hill Turnpike Corporation, held at Randolph, January 24, 1832, on a motion to contract with some person to set up a wagon as a repairer of the road, of the following dimensions, viz: rims of the wheels not less than eight inches in width, one axle-tree sixteen inches longer than the other,—to pass from Boston to New-Bedford:

Noted, That the Directors contract with some person, or persons, to run such a wagon, on such terms as they may think reasonable; also, to correspond with towns or individuals, as they may think proper, to accomplish the object.

Any person disposed to contract as above, may apply to
NATH'L TUCKER, Milton,
JONA. WALES, Jr. Randolph, } Directors.
OTIS SPEAR, " }

Jan. 27, 1832.

The public are respectfully requested to give the above their attention, and reflect whether this subject might not be worthy the consideration of the Legislature at their present session—especially as so much is now doing throughout the United States to render travelling more comfortable and expeditious; and it is a known fact, that a large portion of our most public roads, although constructed and repaired with the best materials that can be obtained where said roads are located, are subject to the very great inconvenience of deep ruts. It is presumed if the General Court would offer a bounty to individuals, to establish a given number of the above described wagons, to travel on the most public roads throughout the Commonwealth, as repairers of the same, and for transportation of goods, it would be the means of filling the ruts, and save a large portion of the almost useless expense of repairing roads, and also reconcile the public to the utility of the broad wheel law. 2w

Old Beans and Peas.

FOR sale at the Seed Store connected with the New England Farmer Office—

About 20 bushels of Peas and Beans of various sorts, of the growth of 1830—being a part of our stock for seed left over unsold, and are now offered at a low price as seed for sheep. Jan. 18.

Sweet Herbs, &c.

FOR sale at the New England Seed Store, 52, North Market street—The following Sweet Herbs, pulverized, and packed in tin canisters for domestic use, viz: Sweet Majorana, 37½ cts.—Thyme, 33 cts.—Summer Savory, 25 cts.—Sage, 17 cts.—per canister. Also—Black Currant Wine for medicinal purposes, 75 cts per bottle. Tomato Ketchup, 37½ cts per bottle. Jan 11

Elegant Camellia Japonicae & Bouquets.

THE Subscriber, Gardener to John Prince, Esq. at Jamaica Plains, can furnish a constant supply of elegant Bouquets—also superb double flowers of white, and several other sorts of Camellia Japonicae, at prices lower than in former years. Also—very superior Mushrooms, and a great variety of Green-House plants.

THO'S MASON.

Jamaica Plains, Jan. 10, 1832.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Nuttall's Ornithology.

JUST received by J. B. Russell, No. 50 1-2 North Market Street, Boston—

A Manual of the Ornithology of the United States and of Canada. By Thomas Nuttall, A. M., F. L. S.; with 53 engravings. Price \$3.50. Jan. 18.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No. 110 State street, by
ALBERT FEARING & CO.
Jan. 31. eo6pm

Seeds for Country Dealers.

TRADERS in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c, of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Farm for Sale.

FOR sale, an excellent Farm in the town of Peterborough, N. H. Said Farm is pleasantly situated about a mile from the village; formerly the residence of the late John Smith, Esq. and contains about sixty acres of good land, well watered, with a good House and Barn, and other out-buildings. Terms reasonable, and possession to be given the first of April. For further particulars, inquire of Dea. JOHN FIELD, near the premises, or at No. 3, Rowe's Wharf, Boston. 3t Jan. 25

Guide Boards.

JUST received at the Agricultural Warehouse, No. 11 and 52, North Market street, a few more boxes of Carter's patent Guide Boards. Members of the Legislature and others, are invited to examine them. Every town in the Commonwealth ought to possess a set of the above Boards, both for economy and convenience. Jan. 25

Tea Wheat.

A FEW bushels of this very valuable variety of spring Wheat in this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1829, from which the present variety has been designated. See N. E. Farmer, vol. x, page 105—and vol. vi, page 82. Dec. 14.

BRIGHTON—Monday, Jan. 30.

[Reported for the Daily Advertiser and Patriot.]

At market this day, 419 Beef Cattle, 662 Sheep, and 37 Swine.

PRICES.—Beef Cattle—Sales did not vary much to-day from last week, extra should have been quoted last week at this week's price. We quote extra 5 50 a 5 75; prime, 5 a 5 25; good, 4 50 a 5; thin, 4 a 4 50—no yoke were taken at \$6.

Cows and Calves—Only one at market—sale \$23.

Sheep—The storm probably prevented several sales.—We noticed one lot at \$7 75, and one at \$4 84.

Swine—No sales.

New York Cattle Market, Jan. 27.—A very short supply of stock this week. Beef Cattle—about 500 head have arrived and all sold at an average of \$1 per hundred higher than last week; we quote \$5 a 7; a small lot by Daniel Toffey of Orange Co. at \$8. Sheep from \$3 a 5 per head.—Dairy Ads.

In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From the Salem Gazette.

A FINE YOUNG ELEPHANT, belonging to Pickering Dodge, Esq. came passenger in the ship Rome, which arrived at Boston two weeks since. We are informed that he has enjoyed uninterrupted health on the passage, always eating his allowance with a good appetite, although he suffered considerably from the cold, notwithstanding all the precautions taken by Captain Kennedy for his comfort. His daily rations were thirty pounds of hay, thirty pounds of straw and twenty-five pounds of rice, moistened with twelve gallons of water. On several occasions during the passage, he displayed the sagacity and gratitude for attention, for which the species is so remarkable.—Before he was put on board at Calcutta, a house was built for him, in the strongest manner, covered with thick teak-planks, which were fastened to the frame by stout iron spikes, clenched on the inside. The Elephant was swung into the ship by means of a crane, and straps around the body, as oxen are prepared for shoeing. His mahout guided him into the domicile prepared for him, without any trouble, but in that hot climate he soon found the exclusion of fresh air disagreeable, and did not cast about long for a remedy. In a playful manner, he applied his trunk to the stout and firmly secured planks, wrenched them off as if they had been straws, and dashed them away. No attempt was made at that time to replace them; but when the ship approached our coast, the Elephant began to suffer from the cold. To shelter him Captain Kennedy resolved to make another endeavor to close up this house. This time there was no attempt on the part of the Elephant to obstruct the process. He appeared perfectly to understand the object, and to feel grateful for it. Nothing but thin boards were used, fastened with common nails; the slightest blow of his trunk would have shivered them to atoms, but he cautiously abstained from touching them. The whole was made air tight, as the seamen thought, by filling the crevices with straw, but the quick eye of the Elephant discovered several small fissures, which he pointed out with his trunk, till they were successively filled. When the whole was completed, his satisfaction appeared to have no bounds.

Before the approach of cold weather, a coat had been made for him, composed of gunny-bags, stuffed with straw. He suffered this to be tried upon him and nicely fastened in every part; but no sooner was the fitting completed, than he stripped it off in a moment, and threw it aside. At length, however, the cold became extreme, and the Elephant evidently suffered exceedingly. Captain Kennedy then had a new dress made for him, and placed it on him in the same manner as before. In this case, as with respect to the covering of the house, the Elephant fully appreciated the kindness of the motive, and his gratitude and satisfaction were manifested in the most intelligible manner.

During the whole passage he was completely under the control of his mahout, or keeper, and would lie or kneel down whenever ordered by him; but always slept standing. He would brace his head firmly against one end of the house, and his side against the wall, and whenever the ship shifted her course

he altered his position to conform to it. He never left his inclosure during the whole passage of more than a hundred and sixty days.

Some difficulty was anticipated in landing him, but it was fortunately effected with ease and safety. A flooring of double plank was laid from the ship's deck to the wharf, and the Elephant, with the mahout on his back, was released from his long imprisonment and conducted to the gangway. He surveyed minutely the platform prepared for his egress, and placed his foot upon it to test its strength. He was not entirely satisfied, however of its capacity to endure his great weight, and returned to his house. After a while he was coaxed out again, and lines were attached to each of his fore-legs. Again he placed one of his feet upon the platform, and at that moment the men who were holding the line drew it tight and kept the leg stretched out. He then extended his other fore-leg, and that was immediately drawn out in the same manner. Finding there was compulsion in the case, and that he must go, and judging, like philosopher, that his weight was less likely to break through when spread over a large surface than when concentrated, he threw himself upon his belly and by a muscular movement worked his way from the ship to the wharf, to the great delight of thousands of people who covered the neighboring wharves, vessels and shores.

☞ It can do no harm to mention, that not a drop of ardent spirit was drunk on board Capt. Kennedy's ship from the day of her departure to her return.—Plenty of hot coffee and chocolate supplied its place in cold weather, and the yankee switchell preserved the health of the men in Calcutta, while half the rum drinking crews there were in the hospital.

The Chinese green tea plant (*camellia viridis*) has been successfully planted by Mr Rootsey, of Bristol, in a part of Brecknockshire, Wales, near the source of the Usk, about 1000 feet above the level of the sea, and higher than the limits of the native woods, consisting of alder and birch. It endured the winter, and was not affected by the late frosts of last May; and it has made several vigorous shoots.

Immense number of mice.—In a forest planted by Lord Glenbervie, the mice, threatened its entire destruction. The following is an extract from the Horticultural Register for August, 1831.

“In short, holes about two feet long and ten inches broad at top, and somewhat larger every way at the bottom, were made at twenty yards apart, over about 3200 acres of plantation; persons went round early in the morning, to destroy such mice as might be found in the holes. In this way, besides what the owls, hawks, magpies, and weasels took out of the holes (and several of these depredators lost their lives in attempting to seize their prey,) 30,000 mice were paid for by government, nor were they extirpated until they had destroyed, in four inclosures, amounting only to 1700 acres, the astonishing number of 200,000 five year old oaks, together with an immense number of acorns and young seedlings.”

“It is said by naturalists,” observes Mr Billington, “that the beaver will fell trees with his teeth, but I have never seen an account of mice felling oak trees; yet I have seen many trees 7 or 8 feet high, and an inch and a half in diameter, cut down by them. When examining for the thick part of

the root, below where it was bitten off, I could never find any part of it left, so that it is very probable it was eaten by them. I have by me several trees so cut down, for the inspection of any person who may be desirous of witnessing, with his own eyes, the wonderful powers of so diminutive a creature as the mouse in felling trees.”—*Im. Far.*

Planting Mulberry Trees.—We are frequently asked at what distance we would plant white mulberry trees, for the purpose of feeding silk worms. It is intended to form full grown trees, thirty feet apart each way, is probably the nearest that it would be advisable to plant them. Where land is abundant, forty feet would be preferable. The full grown tree generally covers a circle of twenty-five to forty feet diameter. If the hedge form be preferred, the young trees may be planted one to two feet apart; the tops to be cut off in the fall or winter of every year. In this mode the great advantage of gathering the leaves without climbing is secured. The hedges might be planted fifteen to twenty feet apart, and thus an acre would produce as much foliage as if occupied by large trees, and there would be a great saving of time in the production of the hedge, compared with that required to produce the large trees.—*Id.*

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, JR., 65, Broad street.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. LEUEZER WRIGHT,

46, Milk street, opposite Federal-st., Apothecary.

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays, of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. ☞ Watches repaired and warranted.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

☞ No paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE).—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, FEBRUARY 8, 1832.

NO. 30.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

HORTICULTURAL PREMIUMS, &c.

MR FESSENDEN—It was with much pleasure that I noticed in your last No. your intentions of inserting weekly in your valuable paper, original communications on the general growth, management, and cultivation of the different varieties of garden vegetables, and our most esteemed fruits. Undoubtedly with the knowledge and zeal with which some of our eminent and scientific men are possessed, you will have plenty of able, and intelligent contributors; and will be able to furnish much useful information, and add much more to the already well earned reputation of your paper. Of what advantage to the public is that which any scientific man discovers, new and interesting, unless it be widely, and extensively circulated? and through what medium can this be more properly done than through that of papers, or periodicals. Much has been, and much more can still be done; indeed, there is no end to the improvements which are yet to be made in practical, and experimental horticulture. Few if any of the pursuits which occupy the mind of man, have of late received more attention, (especially in England) than the study of this distinguished science. Look back to the time, when those houses called conservatories were heated by making large holes in the ground, and filling them with peat or ashes; and then look at the elegant, neat, and perfect system, now coming almost universally into use, the heating of the same, or similar houses by hot water; this is, however, but one, and almost the least of the many, and equally rapid, and useful improvements which are yearly and continually made.

I was led to make these remarks, on reading in one of your late numbers a communication respecting 'Agricultural Premiums.' I read it with extreme pleasure, as my views were in exact accordance with those of your correspondent. No pains should be spared that will give encouragement, and stimulate our intelligent and industrious farmers. Agriculture and Horticulture may be said to go hand in hand together; they both have alike received the attention of rich and poor. How often is it that we pass the humble cottager's little farm, and see his pastures clothed with green, his fields with the ripening corn, and the blushing grapes hanging in clusters from his little vineyard; and perhaps a little patch in front of his dwelling, blooming in nature's most vivid colors?

But I have digressed from the course in which I intended to have written at first. My attention is to speak a few words in relation to 'horticultural' premiums; not that I wish to dictate to any one how, or what should be done, but merely to offer a few suggestions with respect to the awarding of premiums, and to point out what I think, gross inequalities in the lists for the last two years. In the first place—take the list for garden vegetables, and what do we find. A prize of one dollar for a dozen Beets; a dozen Carrots, &c, &c, the same; Cucumbers raised in the open air, two dollars, and those forced but one? Is not here a great mistake? Why, does not almost every person who

knows anything of raising such vegetables, know that to grow a Beet, or Carrot, requires but little more than a mere novice—while to force a Cucumber is one of the first requisites of a perfect gardener? What kind of a gardener would he be thought (especially in England) who on inquiry whether he could force Cucumbers, Grapes, and Melons, what a one, I ask, would he be thought, should he say he could not? Why, no gardener at all, unless some jobbing one (and there are many here and there) as lets himself to dig, milk, bake, &c, (and as the phraseology goes) 'have no objection to take care of a horse or gig?' The same remarks will apply to the premiums on grapes raised in the open air, and those forced.

And again, the flower lists present the same mistakes; here we have five dollars for Chinese Chrysanthemums, and only three for Tulips, two for Hyacinths, and two for Ranunculus, that on Chrysanthemums as much as that on Tulip and Ranunculus together; those who are adepts in the art of raising these delightful flowers, those I ask, which requires the most care? Will a Tulip, or a Ranunculus grow from a mere cutting and perfect its flowers in one season? Certainly not! and does not the compost in which Chrysanthemums are grown, require at least to be mixed one year before it is used in order that it may become pure, and sweet, so as not to injure, or destroy their splendid and beautiful colors? Again I say, certainly not! All then must be aware that the prizes are here also very unequally distributed. Undoubtedly, with many, it is not so much the sum of the prizes, as the credit of being the most skilful grower; but there are many, especially those who make a business of raising these elegant plants, that like to be well paid for their trouble; and were they raised double and more equally adjusted, it might compensate them more fully for the care which is absolutely necessary, to procure a beautiful bloom; and would, I think, be the only means, by which the society's, show glasses will be filled so as to present any uncommon assemblage of those elegant, and truly styled queens of flowers.

There is also wanting a system in regard to awarding premiums, a system like, or similar to those now existing among the first horticultural societies in England; at least it is certain, that some new method should be adopted, different from that of the last two years; as it seems there has not been general satisfaction given; and unless there is one adopted we may soon despair of ever having but very few interesting or gratifying shows. Let us imagine a show of fifty glasses of Tulips, fifty of Hyacinths, and fifty of Ranunculus; all this I think we might have, if everything is managed as it should be; to be sure the society is yet but in its infancy, and will improve yearly.

The manner in which some of the Horticultural, and Floricultural societies in England award their premiums, (and this I have had from those who have been present) is as follows. The pots, glasses, or whatever the plants or flowers may be in, are arranged in rows, or on the stands, and every pot or glass is numbered as it is brought in; the committee then being absent, they afterwards

enter and make their selections, without the least knowledge of either the owner, or grower; and they hardly, if ever, fail to give the utmost satisfaction. And thus it frequently happens, that the poor and humble cottager, who can find an hour or two after his irksome day's work to spend in his little garden, and attend to the delightful task of raising a few Pinks, Carnations, Tulips, Ranunculus &c, is the successful competitor. But I am taking up too much room in your useful paper, to follow the subject any farther at present. For myself, I should like to hear the opinion of many gentlemen upon the same subject. And I again repeat that these are but mere suggestions, and are made with the only view of advancing the true interests of the important science of Horticulture and Floriculture.

Should I be able to contribute anything in the way of information through your paper, you may perhaps hear again from your friend,

Cambridge, Jan. 30, 1832.

RUSTICUS.

FOR THE NEW ENGLAND FARMER.

CULTURE OF RUTA BAGA.

MR EDITOR—I send you a few observations upon the culture of the Ruta Baga; if you consider them worth publishing they are at your service.

The way that I think best for raising this crop, is as follows. The year before, take a piece of green sward in the spring, give it a good manuring with green dung, spread it evenly over the ground and plough it under. At the proper time plant with corn, taking particular care to let no weeds go to seed during the whole season. After the corn is gathered, there is no more to be done to the ground, for I do by no means approve of fall ploughing, though I once had a different opinion, but now think it to be injurious to any soil suitable for turnips.

The next spring, as soon as the ground is sufficiently dry, it is ploughed; then let it remain a little more than three weeks longer, and plough again, and at the end of three weeks more plough the third time and give it a good harrowing. By this time, if the land is what it should be, it is in good condition to receive the plants, which should be set as soon as possible after the harrowings. The intermediate time between the ploughing will give nearly all the seeds of weeds a chance and time to sprout that may remain in the ground. These operations will bring it to about the first of July, which is not too early to insure a large crop. To procure the plants the seed should be sown on a separate piece of land in the early part of June, but I should recommend to not sow so thick as is generally practised. If the plants stand too thick before transplanting, they never take good roots but are sickly and tender, the turnips will have long slim necks and not grow near so large, round, or handsome.

The form of setting is in rows two feet apart, and the plants within a foot of each other in the rows. The most expeditious way of setting that I have ever seen practised, is for some person to go before and drop the plants singly at the distance above mentioned; he is followed by two others with very small wooden shovels or slices,—with

these they open a place sufficient to receive the roots, then with both hands press the soil round the plant so that it will stand erect. In this way, if the ground is mellow, they can be set very fast, and if the plants are good, there will not one out of a hundred die. I would recommend however never to transplant in wet weather, and when it is fair, the dew should be off some time before the plants are taken up.

The advantage of transplanting over planting the seed in the field where they are to grow, I think is considerable. In the first place, the ground is in better condition, and it will generally save two hoeings. The first time a turnip crop is hoed, when it is not transplanted, is a slow operation, and takes more time than it would to set it all out with plants after the ground has been prepared as before directed. With regard to the best mode of preserving them from the frost I think there is none so good or economical as a good cellar under the barn. I had a cellar made under my barn 7 feet deep, 26 wide, and 32 long, this, if I am right in my figures, will hold upwards of 4000 bushels. To dig and stone this cost me 46 dollars, digging and drawing the stone 20 more and 4 for pointing, making in all 70 dollars, the interest of which is \$4.20. Now I know of no other way that 1000 bushels of turnips can be secured for \$4.20, their bulk being 16 or 20 cords. There is another very important consideration, when they are in the cellar they are perfectly secure and can be had every day through the winter when they are most wanted, which is not the case if they are covered on the field. With regard to the value of the Ruta Baga for feeding stock or fating cattle, I think it is the most profitable crop the farmer can raise. I consider a ton to be worth more than a ton of potatoes, and the expense of raising them is less than one half of raising so many potatoes.

Respectfully yours, J. M.
Amesbury, Feb. 1, 1832.

Mr FESSENDEN—There appeared an unusual fall of Apples from the trees through the last summer, a season when they are comparatively of little value in market; observing my trees prematurely disburthened, I conceived that such time fruit might be profitably used in making a salutary beverage during the hot season.

Connected with this subject it might be thought a desideratum in rural economy to construct a portable apparatus, which would at once grind and express the juice from a single apple at a time.

The summer apples are generally large, and some of them very juicy; two of such fruit would yield a goblet of nectar which, while it slaked the thirst, would delight the palate not vitiated by alcohol.

This nectaren, as we may call it, need not much exceed the size of an ordinary coffee-mill, and like it might be secured to a post, or if more convenient to the dinner table of the husbandman, the maid in waiting having a basket of fruit at hand, might by the twirl of a handle fill a goblet as called for.

Should you think this subject worth notice I would premise that your Horticultural Society offer a premium for the best and cheapest apparatus in wood, for the above purpose; and as Massachusetts is preeminently happy in such inventions doubtless it would soon be forthcoming. I will

subscribe three dollars towards the premium, and take twenty of the nectarens approved of by the society, the price adjusted by them.

The fresh juice of an apple, having no taste of pounce, would be palatable to most persons, and having no intoxicating qualities the cause of temperance would be promoted by its use.—The temperance societies might then repeat their edicts to 'give the orchards to the axe.'

Your most obedient servant, L. B. G.
New York, Feb. 6, 1832.

COUGH IN HORSES.

MR FESSENDEN—I have seen several valuable communications in the New England Farmer, respecting diseases of horses—but have no recollection of seeing anything respecting coughs, which have been very prevalent among them the last summer and autumn.

I have a very valuable young horse, that has had a cough for nearly a year, and I have been unable to find a cure, though I have found that air slacked lime in small quantities, given with his grain, has been useful.—If any of your correspondents can throw any light on this important subject, I think it would be most thankfully received by many of your subscribers, and one in particular.

Boston, Feb. 7, 1832.

MR FESSENDEN—For more than twenty years past I have fattened my own pork; and have supposed that an increase of one, or one and a quarter pounds a day was as much as could be expected from good keeping. On the fourth day of July last I purchased two spring pigs, the joint weight of which was 108 lbs. On the fourth day of January they were killed, and weighed when dressed, five hundred and eighteen pounds—which is more than two pounds per day gain. These pigs were a small breed, had short legs, small head, and when we began to feed them with grain it was usually scalded.

New Haven, Feb. 1, 1832.

Profitable Onion Bed.—Mr Aldrich of Smithfield, R. I. has obtained from an onion bed 19 feet by 20, a crop of onions, which after being washed and tied up in bunches, sold for \$7.83, not including those used in his own family. The produce of an acre, at this rate would amount to upwards of \$400.—The onions were sown in drills 14 inches apart; the ground was often stirred shallow between the rows with an iron rake, and kept free from weeds. Mr A. has a large kitchen garden in a thriving manufacturing village, and is thus enabled to bring his onions to a good market.

First Daily Paper.—The first daily paper ever printed on the American Continent was 'The Pennsylvania Packet, or General Advertiser' published at Philadelphia, by Dunlap and Claypoole. The first number was issued on the 21st September, 1784. The title of the paper was soon after changed to its present designation of 'The American Daily Advertiser'—the present editor of which, (Mr Poulson) says he remembers the occurrence, (the commencement of the daily publication) perfectly well; it was noticed, at the time, in almost all the papers published in America, as a most enterprising and hazardous undertaking.

ADDRESS

Pronounced before the Massachusetts Horticultural Society, in commemoration of its third annual festival, September 21, 1831.

BY MALTHUS A. WARD, M. D.

Mr President, and Gentlemen of the Mass. Hort. Society:

It were strange, indeed, should one with my feeble abilities, on such an occasion as the present, attempt to address such an audience as that now before me, without experiencing some inward misgivings, and betraying some outward perturbation,—without feeling the immediate necessity of saying something to secure an interest in their favorable regard, and predispose them to look with somewhat more of lenient candor on his efforts to please, than belongs to a rigid though just criticism. I know too well the value of your time to imagine this may be done by a protracted exordium, however highly elaborated, or gracefully uttered; but I cannot forbear alluding, as among the disadvantages of my position, to the circumstance of its being but two years, since, in this place, we were instructed and delighted with whatever relating to the early history of our art, could be drawn from the stores of a mind imbued with all the knowledge which a profound investigation could bestow, and set forth by a taste formed on a familiarity with the purest models in the walks of polite literature; and at our last anniversary, which seems but as yesterday, the present state, and future prospects of Horticulture, particularly in our own country, were portrayed, in glowing colors, by one, whose ardent zeal whose energetic and successful researches, have made him a master of the subject he loves so well. Were I, therefore, to pursue the track of those who have preceded me, it would be the highest presumption to suppose that any observations I could make would deserve attention. It would be to offer the Society a few scanty gleanings, after the full harvest has been gathered in.

Other paths are indeed open, where clusters of the loveliest flowers and richest fruits are displayed in prodigal profusion on every side; but, to make a happy selection and profitable appropriation of them, requires the skill derived from a series of attentive observations which I have never made, and an inventive originality which I never possessed. I am aware of the severe sarcasms which are often, and, no doubt, in many instances, justly thrown upon 'closet naturalists.' I know the peculiar air of suspicion with which practical men and 'out of door students of nature,' regard all communications emanating from such a source; and I am not ignorant of the exulting exclamation so often and so triumphantly reiterated by Linnaeus, 'I care not how learned my adversaries are, if they be only so from books!' yet, from the manner of my life, it is to books and the observations of others, that I must be principally indebted for the entertainment, if any there be, in what I have prepared to offer you at this time.

It is admitted that among the various pursuits which occupy the attention of man at the present day, few hold a more distinguished place than Horticulture. Even in the primeval ages of the world, before luxury had established its control over every relation of human life, and the wants and the necessities of man were confined to the immediate productions of his native soil, we even then find that 'the garden' was one of the primary objects of his industry, and an important source on which he depended for subsistence. Now, if the culture of the kitchen garden, as a means of subsistence, be one of the first arts attempted by man

on emerging from barbarism, so is the flower, or at least the landscape garden, as an art of design, one of the *last* inventions for the display of wealth and taste in periods of luxury and refinement.

Lord Bacon observes that "when ages grow to civility and elegance, men come to build stately, sooner than to garden finely; as if gardening were the greater perfection."

I propose to make this sentence the theme of my discourse; and crave your indulgent attention while I attempt to investigate the *causes* of this tardy progress of horticultural improvement, and point out the way to obviate them.

Notwithstanding the aversion most savages manifest to working in the soil, and which in them is but the result of education, the sentiment of the love of a garden is indubitably natural to man. We see it developed in children at a very early age. Both boys and girls, almost so soon as they are masters of sufficient language to express such a want, desire a few square feet—some nook of the garden or courtyard, to be assigned them for their exclusive tillage; and they soon learn to emulate each other in the taste and neatness with which it is planted and kept. Often in the closest lanes of the city, we see children of a very tender age appear sedulously nursing their miserable little rose-bush, or sickly tuft of daisies. This cannot be altogether referred to the propensity for imitation, or to the love of property, but must be ascribed to another, equally innate, and far more amiable principle. It is that the human heart is prone to sympathy. It *must* have something,—some *sensative*, if possible, or at least some *animate* being, to cherish and look forward to with hope. "Even every Cockney," say the Scottish reviewers, "must have his *garden*, consisting of a pot of geranium and a box of mignonette."

Captain Lyon, after noticing a fact which might strike some as very extraordinary, viz. that on leaving his winter quarters in one of the most desolate, inhospitable regions on earth, where he had been imprisoned for nine dark and dreary months, his own sensations certainly bordered closely on regret;—and giving as a reason, that, miserable as it was, it had still afforded him a kind of home, and some spots there had from habit become possessed of many points of interest,—mentions 'the garden' of each ship, as having been, of all such places, the favorite lounge. These 'gardens' were two small hotbed frames, which had been brought out from England for the purpose, and set up on a sunny hill-side. 'The attempt,' says he, 'at rearing a variety of vegetables, succeeded to admiration; by dint of coaxing, mustard and cress—peas two inches high, and radishes the thickness of threads, crowned our endeavors in the Hecla, to the weight of three pounds when all mixed together. But the gardens, nevertheless, answered one excellent purpose, by making many of our people walk to observe their progress, who otherwise would have taken no exercise.' On their return to England the next year, they passed near Winter Island about the first of September, and Captain Parry could not resist the temptation, though attended with some risk, of sending a boat ashore to see what had become of their gardens; and on their return, they brought with them radishes, mustard and onions, which had survived the winter, and were still alive, seventeen months from the time they were planted.

If this sentiment was so strong in the breasts of

these sailors, where it scarcely could be the effect of education and habit, how powerful must it prove under more propitious circumstances! The enjoyment of a garden is, in truth, so congenial to our ideas of happiness, as to be desired by all men, of all ranks and professions. Those who toil hard in the pursuit of gain amid the dust and turmoil of cities, commonly salve themselves by hoping, with the poet Cowley, 'one day to retire to a small house and a large garden.' The care of a garden is a source of agreeable domestic recreation, especially to the female sex, whose sensibilities are keenly alive to the placid beauty of the objects it presents to the eye; and the air of retirement, tranquillity and repose which settles on such a scene, is favorable to contemplations full of tenderness and hope. 'Our first most endearing and sacred associations,' Mrs. Hoiland observes, 'are connected with gardens; our most simple and most refined perceptions of beauty are combined with them, and the very condition of our being compels us to the cares, and rewards us with the pleasures attached to them.'

To the valetudinarian the garden is a source of health, and to the aged a source of interest; for it has been remarked of a taste for gardening, that, unlike other tastes, it remains with us to the very close of life. Where this has been duly nurtured and suffered to produce its best effects, the grace of a refined and practical wisdom will prove an ample recompense for the loss of the livelier energies of youth; and one glimpse of nature will repay the mind for the failure of its early visions, and the destruction of the airy architecture of romance. What a redeeming, and, at the same time, beautiful touch of natural feeling may be discerned in Mistress Quickly's description of the death of the imitable philosopher, Falstaff—whom when all the glories of unequalled wit, and the raptures of a riotous sensuality were exhausted—we are told that the white-headed veteran of the world, even in the last moment of his life, 'played with flowers,' and 'babbled of green fields!'

Such, then, being the innate force and universality of this passion, we may well wonder at the apparently inadequate effects which it has produced. The deficiencies of the ancients are certainly very striking, if we compare their attempts in this department, with their glorious achievements in poetry, eloquence, history and morals,—in sculpture and architecture,—not only in those arts in which chiefly the taste and imagination are concerned, but also in those which demand a more vigorous exercise of the understanding, such as mathematics, logic and metaphysics. The writings of Cato and Varro, of Ælian and Columella, are now almost useless on account of the want of precision in their descriptions of the objects and the processes about which they treat; and it would seem that during the sad lapse of time, of more than fourteen hundred years which succeeded them, the class of men whose minds were not altogether occupied with rapine and bloodshed, scarcely ventured to see with their own eyes; or rather disdained to condescend to aught lower than the workings of their own fantastic imaginations. *Nature*,—the boundless exhibition of the ineffable power, wisdom, and beneficence of the Creator,—was almost totally neglected, except for purposes of poetic illustration; or if referred to with other views, it was rather to support some idol of the mind, than to discover the true character of her operations.

It is worthy of remark, however, that the early religious devotees, who austere seclusion themselves from nine tenths of the enjoyments of life, nevertheless permitted the pleasures of a garden; and we are constrained to admit that the Catholic clergy have in all ages rendered the most valuable services to Horticulture. They not only wrought with their own hands, but were the cause of industry in others. The monks of St Basil and St Benedict restored many extensive tracts to fertility in Italy, Spain and the south of France, which had lain in desolation and neglect ever since the first incursions of the Gauls and Saracens. No longer ago than in 1826, the Curate of Montagnano, in the kingdom of Naples, gave as a penance to the farmers who confessed to him, that they should plant so many vines, olives, or other trees in certain naked parts of the country; the consequence was, that, in a very short time, what before was a desert, had the appearance and productiveness of an orchard. A recent writer asserts that there probably would not have been a fruit-tree in Scotland till the sixteenth century, had it not been for the labors of the peaceful monks. 'Whoever,' says he, 'has seen an old abbey, where for generations, destruction only has been at work, must have, almost invariably, found it situated in one of the choicest spots, both as to soil and aspect;—and if the hand of injudicious improvement has not swept it away, there is still "the abbey garden." Even though it be wholly neglected—though its walls be in ruins, covered with stone-crop, and wall-flower, and its area produce but the rankest weeds,—there are still the remains of the aged fruit-trees, the venerable pears, the delicate little apples, and the luscious black cherries. The chestnuts and the walnuts may have yielded to the axe, and the vines and the fig-trees died away;—but sometimes the mulberry is left, and the strawberry and the raspberry will struggle among the ruins.'

The author of *Waverley* is allowed to be a faithful painter of the manners of the times, and of the scenes he represents in his novels; and he tells us, that an old monk, to beguile a tedious hour which the impatient Quentin Durward was obliged to wait at the palace of the Bishop of Liege, before he could be admitted to an audience, led him through the garden, where he was entertained with an enumeration of the plants, herbs, and shrubs pointed out to him by his venerable conductor,—of which, 'some were remarkable for the delicacy and brilliancy of their flowers,—some were choice, because of prime use in medicine,—others more choice, for yielding a rare flavor to pottage,—and others choicest of all—because they possessed no merit whatever, but their extreme scarcity.'

In comparatively modern times, according to Humboldt, the Jesuits, in an incredibly short period spread the knowledge and the enjoyment of all our common culinary vegetables from one end of the American continent to the other, and from the shore of either ocean to the foot of the Cordilleras. It seems but fair, therefore, to infer from these facts, that, although Horticulture may have languished in common with all those branches of knowledge which rest on the basis of experiment and observation, yet we cannot accuse the ecclesiastics of the middle ages with paralysing and suppressing it, as they undoubtedly did those sciences the extension of which would either directly or indirectly tend to the subversion of their power.

To be continued.

TREATMENT OF THE HORSE.

The harshness and abuse with which we see this noble animal, and useful servant of man, daily treated in our streets, give to the following remarks, on the education and treatment of the horse, much worth and interest:—They are by Thomas R. Yare, of London, and are copied, by "The Friend," (a paper published in Philadelphia,) from the "Sporting Magazine."

"Boulton says, 'horses in their natural state are by no means ferocious; they are only wild and fiery;' and it may be added with equal truth, that they are not naturally vicious: for their ill tempers, as well as manners, originate entirely from defective education, and rough handling."

"Harsh usage and punishment are of no avail as corrections: for, under cruel discipline, the horse becomes more obstinate, morose, and irritable, and is very soon rendered dangerous of approach. If, on the contrary, you use him kindly, and he finds that instead of a tyrant, he has a friend about him, he will be under your hands as tractable as a lamb; in fact so subservient that you may do anything with him—for it is well known to those acquainted with the nature of the horse, that no animal is more susceptible of soothing, nor more docile and grateful for gentle usage, as he invariably evinces cheerfulness on the approach of the person from whom he receives kind treatment."

"An occupation for which I have always felt a peculiar partiality, has been, the study of the temper and disposition of the horse; and, from the observations I have in consequence made, am convinced, that a multiplicity of errors are committed from ignorance of his true character in the rearing and tuition of that noble animal, which afterwards falls heavily and very unjustly on him."

"Many horses have been intrusted to my care for correction, under the supposition that they were bad tempered, or viciously disposed, which, in other hands, would, without doubt, have been acted upon accordingly—i. e. rendered more faulty by harsh proceedings. On acquaintance with them, I generally found the poor animals to be only nervous and irritable from ill treatment, rather than vicious by nature; in short, 'more sinned against than sinning;' for no sooner had I gained their confidence, than the tremulous awe and timidity they evinced on being approached, totally disappeared; and after a short trial, I have returned them to their owners, divested of the alleged complaints, with this simple injunction, or something tantamount to it, 'Use him kindly, for vicious conduct makes vicious horses;' at the same time urging them to bear in mind, 'that the horse is naturally of a gentle disposition, and much disposed to associate with man.'"

"This may be exemplified by any gentleman recollecting the pleasure a horse seems to feel when noticed and caressed by himself; yet, on scrutiny, the same demonstrations of joy will not take place on the approach of the attendant. Education generally imparts humanity and feeling to its possessor; and a gentleman enjoying these qualities more eminently than his domestics, the animal's discrimination causes him to recognise a difference in the behaviour of each towards him."

"Grooms are too prone to be harsh and hasty towards the horse; whereas, if they would only study to make a pleasure of their duty, they would considerably abbreviate the routine of their labor. In consequence of erroneous conduct, horses will occasionally acquire a character for viciousness among stable men, which cannot be substantiated on reasonable grounds, the presence of the owner

being frequently a complete refutation to the assertion."

"Horses usually evince attachment towards those who use them kindly. His late majesty, George III., had a favorite charger named Adonis. Whenever the king, on visiting his stables, chanced to pass near enough for Adonis to hear his voice, the animal would commence whining with joy, and his recognition of his master was always accompanied with so much noise, that to quiet him, his majesty would invariably command him to be saddled and led forth. Having rode him for a few minutes round the premises, the gratified animal would then return peacefully to his quarters; but had the king not humored his wish, the animal would have become uproarious."

"Till within a very short period, I was not aware any person had publicly treated on the subject of humanity to horses with the same views entertained by myself; but I perceive with pleasure, in a review of a work printed on the continent, that the author justifies my opinion, and corroborates the truth of my remarks. One extract I have preserved, which I cannot do better than quote."

"It is justly asserted, in the best works of rural economy and the veterinary art, that *no horses are naturally vicious*. When they become vicious the reason is, because we pay too little attention to the horse, and do not study his nature sufficiently; and hence rather resort to the whip and spur, to signify our wishes to this noble animal, than to kind and gentle treatment. In a word, we know not how to make ourselves intelligible to the horse. It seems truly astonishing, that horses in general are not more obstinate; and that, in the consciousness of their strength, they do not strive more to rid themselves of their slavery, when we consider how severely, cruelly, and barbarously, these generous beasts are treated. How often are they beaten and ill used, frequently without any cause! and how seldom, on the other hand, are they addressed in terms of commendation and encouragement, and still less rewarded! and yet attentive observers have ascertained, that the horse, like the elephant and dog, possesses a sensibility of the nerves which might be termed a sense of honor, and which is equally susceptible of praise and blame."

"Vicious habits may likewise be ascribed to imperfect training. For instance: a horse is entrusted for that purpose, to the care of a person totally unacquainted with the manner of treating him, consequently incapable of judging whether the horse be qualified by nature to fulfil the intentions of the owner. The age and strength of the animal have not been taken into consideration; and his incapacity to undergo the fatigue allotted to him, although proceeding from weakness, has very incorrectly been ascribed to stubbornness and obstinacy. Resistance, as may be expected, has been the natural consequence; harsher usage has followed; the temper of the animal has become soured; and he has really imbibed a vicious character, which, at the onset, was only imaginary. The result has been open warfare between him and his rider, in which the latter seldom gained an ascendancy; and the former has never been duly trained for the purpose for which he was destined; indeed he has frequently been rendered quite unserviceable, and become afterwards a drug in the market, though nature had intended him to be useful in many capacities;

which, under judicious management, would doubtless have been realized."

"For a long series of years I have been in the habit of making observations on the errors committed in the usual treatment and training of horses; and I am convinced, from experience deduced by long study of the nature of horses, and continual intercourse with them, that mild discipline is the *sine qua non* of stable-management, and it is the interest of every proprietor to see it enforced. Patience and good temper are cardinal requisites in a groom. Horses have very retentive memories, and seldom forget the unruly tricks or habits acquired from improper and hasty handlings."

From Sullivan's Moral Class Book.

I N T E M P E R A N C E .

Let us look in upon a gay company of young persons, around a table, and half concealed by tobacco smoke. What sort of air are they breathing; what sort of substances are they casting into their physical system, already bursting with excess; what sort of thoughts have they in their minds; and what sort of words is flowing from their lips? We could, but will not answer these questions for them. Let us pass by this revel, and go to the next day's morning. We might then propound some other questions. Are not their heads heavy, hot and throbbing? Are not their eyes thick and burning? Are not their tongues white and parched? Do not the nerves tremble? Is not the mind muddled and confused? In what condition are they to perform duties to themselves, to those they serve, to instructors, to affectionate parents? *Is not this dear bought pleasure? How long can nature bear to be pleased in this manner? This matter does not stop here. The same scene is repeated again and again. Soon, habit asserts its awful dominion; and then the scene must be repeated. The craving cannot be resisted. From social drinking, the step is an easy one to solitary drinking? These is no resting place for habit; everything in this system of being must keep on, or end.*

It is believed that the sort of criminal excesses to which we allude are not from the promptings of nature. We venture to assert that they are entirely artificial in the beginning. It seems irrational that any one should like to take more of anything than nature requires; and more so that one should naturally desire to take burning liquors, to the degree of intoxication, or perhaps to take them at all. It is believed there is no such natural propensity; but that such liquors when first taken afford less pleasure than pure water. The taste for these articles is created by association, by imitation, by fellowship; and above all, because there is a kind of tradition that it is *manly* to drink. Songs in praise of the juice of the grape, (we do not remember to have heard of any in praise of brandy or whiskey,) have some effect in the delusion of drinking. There is a fascination in combined poetry and melody. Such combinations are well known to have the most powerful influence in national associations. They inspire a feeling which bears men on to victory, or death. The songs of Bacchus do the same. They conquer the strength of those who sing, and of those who listen to them, and sometimes lay their admirers, not in the bed of honor, but of contempt. We have nothing to say against poetry and music; far otherwise. We believe this world was made for

human happiness. Poetry and music are means to that end. We condemn them not, as we shall hereafter show, but the use of them, as inducements to intemperate drinking.

If one could get the car of such a misguided youth, he would not do much by reasoning with him. He might do something by getting him to reason for himself. It would be necessary to bring to his view some facts from which he could reason. He must be made to know what a wonderful contrivance the digestive power is, and by whom it was contrived. That its purpose is to take the inanimate substances, which nature provides for it, and convert them into living, sensitive beings, and possibly into thinking power, and immortal spirit. He must be reminded how easily every human contrivance may be deranged, and the more so, and irreparably, in proportion to the minuteness and delicacy of construction. But as one might fail to make a thoughtless boy comprehend the nature of the principle of life which resides in his own bosom, because he cannot see it, some illustration must be made. Unhappily there is none which can be effective to this end. The nearest that occurs, is this. Let us suppose, then, one knows the use and the value of the human eye in its physical, intellectual and moral relations; that he knows he must take care of it, and frequently bathe it in cold water, as well to cleanse it, as to refresh and brace it, so that it may still be an eye to him when decline and old age shall come. Let us further suppose that instead of so using and so preserving this delicate organ he should, when he first rises in the morning, let fall into it a drop of burning spirit; and at eleven o'clock another, and so on, at the proper hours, until he sleeps again: How long would the power of vision remain to him, and how soon will this organ of delight become a source of insufferable pain? It must be much the same with the digestive organs as to the abuse of them.

If one could, in some such way, bring home to the perception of an erring youth, the grievous wrong which he is inflicting on himself, he might be prepared to reason on his own case, and might be asked some such questions as these: Is it of any consequence to you to be free from suffering and sorrow. As you must inevitably keep company with yourself as long as you live, is it of consequence to you to make of yourself, a pleasant and agreeable companion, and not one who will be continually complaining, and upbraiding? Is health of any value to you? can you use your limbs, and the faculties of your mind, as you would like to do, without it? Can you have health, if your habit is to throw into that delicate part of your system, whereon the action of life depends, substances, which excite it to an unnatural exertion, or deprive it of all power of exertion? Does not every part of your system sympathize with the injustice which you do to your digestive organs? Will not your brain, and consequently your mind, suffer by this violence? Do you expect to attain middle age, and old age? Will not the seeds you are now sowing come up, in that space of time? Will they come up in the form of enfeebled muscles; chronic aches, self-reproaching thoughts; the loss of the capacity to enjoy the bounties and beauties of creation? Will they grow up to overshadow your moral sense, and shut out the delights of intellectual power? Was life given to you for the few years in which you can sing, drink, and 'enjoy yourself,' or, that

you may enjoy life in every stage of it, as a rational being, and by rendering your homage to nature in obeying her laws, and your gratitude to Him, who ordained these laws, for your happiness? Do you not look forward yourself, to be at some time a parent? Have your own parents ever so conducted themselves towards you, that you have a right to punish and afflict them? Are you willing that your parents should see you, and know you, as you know yourself? If you should be a parent, are you willing that your children should be told with whom, and in what manner, you 'enjoy yourself?' Would you tell them how you spent your youthful days and nights, and recommend to them to take yourself as an example?

SNAKE FIGHT.

The late Major T. of the army, a gallant officer, who was severely wounded at the sortie of Fort Erie, and died afterwards from the effect of his wound, while a representative from his native state in Congress, used to relate the following account of a battle which he once witnessed between a black and a rattle snake.

He was riding on horseback, when he observed two snakes in the road, a short distance ahead of him. They were moving round in a circle, and apparently following each other. A gentleman who was with the Major, who had witnessed a similar scene before, remarked that it was a prelude to a fight, and worthy the loss of a little time to witness. They accordingly stopped their horses and watched the snakes. The cautious manoeuvre of following each other, in a kind of circle, was pursued for some time, closing at each round, until, when within a few feet, the black snake was observed to stop, coil, and place himself in an attitude to strike. The rattle snake now passed round his antagonist two or three times, lessening the distance at each round when he also stopped and began to coil. But before he was ready to strike, the black snake darted upon him. His evolutions were too rapid to be detected and when he was again distinctly observed, both snakes were stretched out at full length, the rattle snake enveloped in the folds of the black, which had also seized the rattle snake at the back of the head and held him there. After a short interval the black snake gradually unfolded himself, loosened the grip with his mouth from the rattle snake's head, and moved away.

On examination, the rattle snake was found to be dead, and apparently every bone in his body was crushed. The black snake is a constrictor, and usually destroys its prey by enfoldings and crushing it.—*Sporting Magazine.*

Agriculture.—The labor of the farmer gives employment to the manufacturer, and yields a support for the other parts of the community: it is the spring which sets the whole grand machine of commerce in motion; and the soil could not be spread without the assistance of the plough. Of nations, as of individuals, the first blessing is independence. Neither the man nor the people can be happy, to whom any human power can deny the necessities or conveniences of life. There is no way of living without the need of foreign assistance, but by the product of our own land, improved by our own labor. Every other source of plenty is perishable or casual. By agriculture only can commerce be perpetuated; and by agriculture alone can we live in plenty without

intercourse with other nations. This, therefore, is the great art, which every government ought to protect, every proprietor of lands to practise, and every inquirer into nature to improve.—*Dr Johnson.*

From the New York Farmer.

ON THE RIGHT TIME TO CUT WOOD FOR TIMBER.

MR. FLEET.—The right time, when known, may, in most cases, as well be attended to, as the *wrong time*, or *any time*—the latter often being equivalent to *no time*—but the main thing, is, to ascertain it.—In cutting timber for fence posts, and rails, and stakes, all Farmers agree that there is quite a wide distinction in time and season of the year,—and yet we are by no means well agreed, among ourselves, as to the proper time. One reason of this, may be, that the right time, for one kind of wood, may not be the right time for another kind; or, possibly, for the same kind, but growing in different soils, countries, climates, and situations, widely diverse. The trees of the mountain and the valley, of the dry land and the wet, the cold and the warm, the rich and the poor soil, though of the same name, are yet not exactly alike, in all their constituent parts and qualities, any more than men are all alike, or the mere animals. Of the extent of this broad diversity, few men are aware, and yet we all know something about it.

Not only are Farmers, deeply interested in knowing the right time to cut wood for timber, but mechanics, artizans, builders, architects of all classes, and governments, and hence much has been written on the subject. I am not prepared to discuss this matter, in relation to all sorts of uses of timber; such as in land and naval architecture; in fences, houses, and in dry and wet situations and structures, in shipping, because of having had no experience in the latter case, and but very little opportunity for observation. I know, however, and so do all observing men, that the durability of all kinds of timber, as well as its strength, depend much upon their preserving, in their dry state, or in that of their use when wrought, whether wet or dry, a *kind of life*, adapted to such a state. All men, of nice observation have noticed, that the wood of one tree, as soon as well seasoned, is *dead*, as to *uses for timber*; while that of another tree, perhaps of the same kind, is *not so dead*, but retains in its texture a *kind of life still in preservation, firm, fibrous elastic and ponderous*. Much of this, I think, depends on cutting at the right, or wrong time, and much, probably, on the local situations in which each was produced. There is hardly a greater difference, in the wood of trees of different kinds, as to toughness and brittleness, weight, elasticity, stiffness, firmness, strength, and durability, or in their value for timber, than in trees of the same kinds, growing on different soils, even in the same region, possibly on the same farm. These are important facts, though not new, certainly not among practical men, and yet few have given to them due consideration, and least of all, the writers on the subject, national instructors, those who mark out places for governments.

The great difficulty of adapting general principles or rules, to all the diversities of particular cases, is known to all men of sense, experience, and wisdom. As a general principle, applicable to the case under consideration, wood for timber, should probably be cut at such time, as will leave

in it the least aptitude to internal changes, such as fermentation, or any change or state of the sap or juices. My reasons for this remark, are, in short that every change of this sort is a step towards decomposition, the decay following death: that if this be prevented, the wood is in a state of absolute preservation, in which it retains all *possible life*, that is, *life as timber*, spoken of above. And these remarks are founded no less on experience, than on theory, general reasoning. Wood, in which acetic fermentation has once commenced, so as to give it a sour smell, loses much of its weight, strength of fibre, elasticity, and toughness; is even injured, very much for fuel; and is totally unfit for timber, in any case, or in any that has come under my observation. The time, then, to cut wood of all kinds, either for fuel or timber, is, when it will have the least liability to this destructive process, a direct step towards decomposition, absolute rotteness. And that time, I apprehend, will be found to be when there is not only the smallest possible quantity of sap in the wood, or juices of any sort, but when what there may be, is in its least degree of fluidity. This state of the sap occurs either when the new concentric ring of the year is about to be, or is just formed; or in the shortest days of winter, or in its greatest intensity of long continued cold. There is, in the sap of some kinds of trees, an abundance of saccharine matter, the main cause of fermentation, and of what is called 'powder post,' at some periods of each year, and almost none, or very little, at other periods. The common walnut abounds in this, while the sap is thin, and active, but has none in its juices just after the new ring of wood of the year is formed. If cut then, and stripped of its bark, it never ferments, or gives out a sour smell, and the wood never is assailed by the little worms that cause 'powder post,' a common disease of this invaluable wood, for many uses. In 1801, or 2, the writer of these Nos. directed a cooper who complained that his 'truss hoops' were all powder-post, worthless, to adopt this idea in the preparation of the walnut for that use; and he has repeatedly told me, years afterwards, that such timber remained perfectly sound, of uncommon firmness, and life, as he called it. I have had many such evidences, and all with like results.

We do not seem sufficiently aware of the range of expansion and contraction of green and growing wood, or the extent of variation in bulk, expanded and contracted by heat and cold. When occupying the least space, the wood is of course most dense and compact, and it has then its least possible quantity of sap in it. More than 50 years ago, my father had occasion for a barn floor, for use in the winter, the British having been so managed that the farmers of the north could return to their farms, on doing which his was destitute of a barn floor. In the depth of winter, as the only alternative, he cut down—felled, as the paper farmers say, large red oak trees, had them sawed into $2\frac{1}{2}$ inch planks, and laid his floor, perfectly green, expecting to lay them over again when they got seasoned and shrunk, as he supposed they would do. This was all done in the severest cold of a northern winter, and that floor has never yet been overhauled, nor have the planks ever opened a seam! The sap was all in its 'winter quarters,' in the roots, under the blanketing of the muck, and of course could not be in the tree which was then compacted into its smallest possible

space.—The hoops of winter, in those days, were driven with tremendous force.

From all these considerations, and facts,—I could cite multitudes of similar facts,—I come to the conclusion, that the proper time to cut wood, for timber, is when the sap is least in quantity in such wood, and when this is least likely to lead to fermentation. The more of saccharine matter it has in it, the more likely it is to lead to this process, as well as, generally, the more sap. The sugar maple, which abounds in this quality, if cut immediately after the growth of wood of the year and stripped of its bark, becomes even very durable as fence-posts, if not set till thoroughly seasoned. The same is true also of the hemlock, and several other kinds of wood, but they must be well seasoned, before being set in the ground as all fence posts should be. Charring is good, but perfect seasoning is better, though this is digestion. I should have said, also, that when wood occupies its least possible space, is a good time to cut it, both for fuel and timber, of which I have adduced, I think, pretty good evidence. My object, however, is more to call attention to observation, and thought, than to assume the office of a teacher, for which I have not the vanity to think myself qualified.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Feb. 8, 1832.

ITEMS OF HUSBANDRY FROM VARIOUS SOURCES.

Prepared by the Editor.

In account of a method of obtaining very early crops of green Peas. By THOMAS ANDREW KNIGHT, Esq. F. R. S. &c. Pres. of the Lond. Hort. Soc.

Mr Knight having a heap of oak leaves unemployed, which had been collected for the purpose of making hot-beds, for melons, had them formed into a bed in the middle of January, into which pots of about 9 inches in diameter, were placed, at the distance of about one foot from centre to centre. In each of these pots a couple of dozen peas were put in a circular row, and around them was planted a row of slender twigs, a foot above the surface of the mould. In the middle of March they had become 11 inches high, and nearly in contact with the glass roof, which had been previously raised a little. They were then transferred to the open border, leaving an interval of 9 inches between each pot of plants; some manure was given, and numerous sticks were employed to afford them some degree of shelter. This removal did not appear to injure them in any degree, and in the end of March many of their blossoms were so far advanced that they shed their pollen. On the second of April, a very severe frost occurred, with a considerable fall of snow, which however, did not seriously injure them, although in a high and cold situation; and on the 26th of April some of the pods were about an inch and a half long, and were at least three weeks earlier than any Mr Knight had ever been previously able to raise.

Packing Acorns for Transportation.—A writer for the American Farmer, with the signature 'N. H.' says that in order to secure the growing of acorns sent abroad, they ought to be packed in sand, moss, or any other substance likely to keep them

from drying, and this ought to be done very soon, say within two or three weeks at furthest after they have been gathered. Without this precaution not ten in a thousand will vegetate. This is the case with many other kinds of seed, such as chestnuts, walnuts, and other oily nuts. For want of attention to this object the kind intentions of many persons are frequently defeated.

Operations for accelerating vegetation.—Quickening vegetation by the form of surface consists in forming beds or banks in an east and west direction, and sloping to the south, forming an angle with the horizon, which, in garden soils, cannot well exceed 45 degrees, because if made more steep, the soil would be apt to crumble and roll down. On beds so formed early sown crops, such as radishes, peas, turnips, lettuce, broccoli, &c. will come much earlier, and suffer less from severe weather than those on a level surface. The north sides of such beds or ridges may be used for retarding vegetation, when it is wished to bring crops to maturity late in the season.

Hastening vegetation by shelter and exposure to the sun, is the quickest and probably only primitive mode of accelerating the vegetation of plants; and hence one of the objects for which walls and hedges are introduced in gardens. A May-Duke cherry, trained against a south wall, and another tree of the same species, in the open compartment of a sheltered garden were found on an average of years to differ a fortnight in the ripening of their fruit. In cold, damp, cloudy seasons, they were nearly on a par; but in dry warm seasons, those on the wall were sometimes fit to be gathered three weeks before the others. It may here be remarked that though in cloudy seasons those on the wall did not ripen before the others; yet their flavor was, in such seasons better than that of the others, probably from the comparative dryness of their situation.

Accelerating by soils is effected by manures of all sorts, especially by what are called hot and stimulating manures and composts, such as pigeons' dung for cucumbers, blood for vines; and in general as to soils, lime, rubbish, sand and gravel, seem to have the power of accelerating vegetation, to a much greater degree than rich clayey or loamy soils, or hog or peat earth.

Acceleration by previous preparation of the plant is a method of considerable importance, whether taken alone or in connexion with other modes of acceleration. It has long been observed by cultivators, that early ripened crops of onions and potatoes, sprout, or give signs of vegetation, more early next season than late ripened crops. The same has been observed of bulbs of flowers which have been forced, which will grow much earlier next season than those which have been grown in the open air. It was reserved to T. A. KNIGHT, however, to turn this to account in the forcing of fruit trees, as related in a paper, accompanied as usual by what renders all the papers of that eminent horticulturist so truly valuable, a rationale of the practice.

The period which any species or variety of fruit will require to attain maturity, under any given degrees of temperature, and exposure to the influence of light in the forcing-house will be regulated to a much greater extent than is generally imagined, by the previous management and consequent state of the tree, when that is first subjected to the operation of artificial heat. Every

gardener knows that when the previous season has been cold and cloudy, and wet, the wood of his fruit trees remains immature, and weak abortive blossoms only are produced. The advantages of having the wood well ripened are perfectly understood; but those which may be obtained whenever a very early crop of fruit is required by ripening the wood very early in the preceding summer, and putting the tree into a state of repose, as soon as possible after its wood has become perfectly mature, do not as far as my observation has extended, appear to be at all known to gardeners; though every one who has had in any degree the management of vines in a hot house, must have observed the different effects of the same degrees of temperature upon the same plant, in October and February. In the autumn the plants have just sunk into their winter sleep; in February they are refreshed and ready to awake again; and whenever it is intended prematurely to excite their powers of life into action, the expediency of putting those powers into a state of rest early in the preceding autumn appears obvious.

Early Asparagus.—We were presented on the 4th ult. with a bunch of Asparagus, forced, by Mr. Toohy, gardener to Mrs. GORE, Waltham. Mr. T. we believe, has generally brought the first Asparagus in the season, in this vicinity.

At the King's Dock, Kingston, U. C. the St. Lawrence, a government ship, which was built during the last war to cope with Com. CHANCEY, and which cost about 1,000,000, was sold at auction for 25; and the rigging, &c. for about 1375. No purchaser appeared for the other vessels put up.

To Correspondents.

Several communications are received, and will soon appear. We shall next week commence the publication of our series of original agricultural articles, with *Essays on Butter* on the culture of *Lima Beans*, *Horse Radish*, and *Turneps*, by Judge BURR, of Albany; to be followed by another on *Mixture of Soils*, by Rev. Mr. ALLEN of Pembroke, Mass., and another on *Ants* and other insects injurious in Agriculture, and the most effectual modes of destroying them. We invite further contributions from farmers and gardeners.

Take Notice.

At a meeting of the Blue Hill Turnpike Corporation, held at Randolph, January 21, 1832, on a motion to contract with some person to set up a wagon as a repaire of the road, of the following dimensions, viz: rims of the wheels not less than eight inches in width, one axle-tree sixteen inches longer than the other,—to pass from Boston to New-Bedford:

Noted, That the Directors contract with some person or persons, to run such a wagon, on such terms as they may think reasonable; also, to correspond with towns or individuals, as they may think proper, to accomplish the object.

Any person disposed to contract as above, may apply to
NATHL. TUCKER, Milton,
JONA. VALES, Jr. Randolph,
OTIS SPEAR, " } *Directors.*

Jan. 27, 1832.

The public are respectfully requested to give the above their attention, and reflect whether this subject might not be worthy the consideration of the Legislature, at their present session—especially as so much is now doing throughout the United States to render travelling more comfortable and expeditious; and it is a known fact, that a large portion of our most public roads, although constructed and repaired with the best materials that can be obtained where said roads are located, are subject to the very great inconvenience of deep ruts. It is presumed if the General Court would offer a bounty to individuals, to establish a given number of the above described wagons, to travel on the most public roads throughout the Commonwealth, as repaire of the same, and for transportation of goods, it would be the means of filling the ruts, and save a large portion of the almost useless expense of repairing roads, and also reconcile the public to the utility of the broad wheel law. 2w

Improved Stock.

THREE first-rate, English and Arabian Stallions; Ten Haddness, Ayrshire, Durham improved Short Horn, and North Devon-hire BULLS—for sale or to let. Also Cows and Heifers for sale—enquire of RALPH WATSON, East Windsor, Conn. Feb. 8, 1832.

Grass Seeds.

For sale at the New England Seed Store, No. 52 North Market street—

GRASS SEEDS of all kinds.—Herds or Timothy, Red Top, Red and White Clover, Lucerne, Orchard Grass, Fall Meadow Oats Grass, &c. &c. at the lowest market prices, wholesale and retail. Feb. 1.

Farmer Wanted.

WANTED on a dairy Farm within thirty miles of Boston, a married man to take the same on shares. Good recommendations will be required for capacity, integrity and faithfulness, as also experience in making butter.—Inquire at this office Feb. 1.

Seeds for Country Dealers.

TRADE in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer's office, No. 52 North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small packets, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ON A MENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Farm for Sale.

FOR sale, an excellent Farm in the town of Peterborough, N. H. Said Farm is pleasantly situated about a mile from the village; formerly the residence of the late John Smith, Esq. and contains about sixty acres of good land, well watered, with a good House and Barn, and other out-buildings. Terms reasonable, and possession to be given the first of April. For further particulars, inquire of Dea. JOHN FIELD, near the premises, or at No. 3, Rowe's Wharf, Boston. 3c Jan. 25

Guide Boards.

JUST received at the Agricultural Warehouse, No. 51 and 52, North Market street, a few more boxes of Carter's patent Guide Boards. Members of the Legislature and others, are invited to examine them. Every town in the Commonwealth ought to possess a set of the above Boards, both for economy and convenience. Jan. 25

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Jan. 25

Nuttall's Ornithology.

JUST received by J. B. Russell, No. 50 1-2 North Market Street, Boston—

A Manual of the Ornithology of the United States and of Canada. By Thomas Nuttall, A. M., F. L. S.; with 53 engravings. Price \$3.50. Jan. 18.

Sweet Herbs, &c.

FOR sale at the New England Seed store, 52, North Market street—The following Sweet Herbs, pulverized, and packed in tin canisters for domestic use, viz:

Sweet Majoram, 37½ cts—Thyme, 33 cts—Summer Savory, 25 cts—Sage, 17 cts,—per canister. Also—Black Currant Wine for medicinal purposes, 75 cts per bottle. Tomato Ketchup, 37½ cts per bottle. Jan. 11

Old Beans and Peas.

FOR sale at the Seed Store connected with the New England Farmer Office—

About 20 bushels of Peas and Beans of various sorts, of the growth of 1830—being a part of our stock for seed left over unsold, and are now offered at a low price as food for sheep. Jan. 18.

BRIGHTON MARKET.—Monday, Feb. 6.

[Reported for the Daily Advertiser and Patriot.]

At market this day, 294 Beef Cattle, 10 Cows and Calves, and 710 Sheep. About 12 Beef Cattle and 300 Sheep were reported last week.

PRICES.—Beef Cattle.—The market to-day was very lively and quick, and better prices were obtained. We quote 6 or 8 Cattle at \$6, extra at 5 62½ a 5 75, prime 5 25 a 5 50, good 4 75 a 5, thin 4 50.

Cows and Calves.—We noticed sales at \$19, 23, 27, 28, and 32 50.

Sheep.—Sales quick; we noticed one lot of last week's Sheep taken at 3 12½; one lot of Wethers at 4 25, one at 4 50, one of 119 at 4 92½, and one at 4 34.

Swine.—None at market, and none wanted.

New York Cattle Market, Feb. 3.—In market 750 head of Beef Cattle and in superior order, and about 600 Sheep. Beef Cattle, sales very brisk, and prices have advanced accordingly—average \$6; a few fine sold for \$8; we quote \$5 a 7. Sheep very inferior, very few good ones in; about 60 sold at \$7, with the exception of 10 lot, prices ranged from \$3 to 5 50.—*Da. Adv.*

NATURAL HISTORY.

THE SORA.

A question has lately been put in the papers—Whence cometh the Sora and whither goeth it? A writer in the Charleston Courier undertakes to answer it.

The *Rallus Virginianus*, a small bird of 9 inches in length, is in Virginia called the Sora, in Pennsylvania the Rail, in New York the Water Hen. During the whole of the summer, scarcely a bird of this description is seen in the Middle States, when early in the month of August, all of sudden the well known cackle of the Soras is heard along the reedy shores of the Delaware, Schuylkill, and James Rivers. So abundant are they that it is not uncommon for a single sportsman to bag upwards of a hundred that have been killed in one tide, during three hours. This war of extermination continues for several weeks, and the markets are abundantly supplied with these delicious birds, until about the middle of October, when in a single night, they all disappear as suddenly as they arrived. On the very marshes where the day before hundreds were killed, not a single bird is now to be found.

Many persons contend that they bury themselves in the mud, and remain inactive like amphibious animals, till the following spring. Others believe that they are changed into Frogs, and the skaters on the waters of Virginia, seem at last to have made the discovery, that they retreat under the ice, and thus become fishes, (at least in their habits) during a part of the year.

The *Rallus* family contains several species, of which the Sora is one, and our common Marsh Hen another, and there is a beautiful species in the interior of Carolina, that was overlooked by Wilson, and remains yet to be described. The land Rail and the water Crike of Britain, are of the same family, and the habits of all bear a very strong similarity.

The Sora seldom breeds in the Middle States.—The writer of this was shown some of the eggs of this bird, that were found in the meadows below Philadelphia, he once found a nest along the Hudson river, and saw two others along the marshes on Lake Champlain, but it generally breeds much farther North, as far as Hudson's Bay. He was informed by an intelligent Trader, that in collecting the eggs of the wild Goose (*Anser Canadensis*) he found a great number of the nests of the Sora. No sooner are these birds well grown and able to fly, than they migrate southerly. By the time they arrive in the Middle States, a species of reed (the *Zizania aquatica* of Elliott) begins to ripen its seeds. Of these the Sora is very fond—feeding on it greedily, and soon becoming fat. It is very susceptible of cold, and the very first frost drives it reluctantly from its favorite reedy marshes, to seek a warmer climate.—About the time these birds leave the rivers Delaware and Virginia, they make their appearance in the Carolinas in considerable numbers. They are scattered among our marshes and grassy fields. They are not easily made to rise on the wing, hence are not frequently seen, but they are heard in every direction, for several weeks. The writer of this saw six that had been killed in a couple of hours, in the

salt marshes near Charleston, by an individual while in pursuit of March hens; and in the present year, one was shot on James Island, near this city, as late as the 10th of November. Very few of these birds spend the winter in the territory of the United States. They no doubt follow in the train of many of our Swallows, Fly-catchers, and Sylviæ, and remain within or south of the Tropics, till the Spring invites their return. Certain it is, that about the beginning of March, and sometimes a little earlier, the Soras pass through our low country, on their way back to the North, and their well known notes are for a few weeks heard again in our low marshy grounds: they advance rapidly through the Middle and Northern States, are seen on the rivers that empty into the upper lakes, and retire still farther North, on their way to their annual breeding places.

The Sora appears to be a clumsy flyer, but this is merely a habit, which it has with many other birds; who see best in the evening or at night, and fly awkwardly and with seeming difficulty in the day. Let the observer only take his stand on the banks of the Delaware or Schuylkill, in the month of September, early in the morning or late in the evening, and he will see it dart across the river, with the ease and rapidity of the Snipe. It is as capable of migrating as any other bird. In the Autumn of 1819, we saw two that flew on board of a ship thirty miles from land, and it is mentioned by Bishop Madison, that several Soras came on board of a vessel, upwards of three hundred miles from the Capes of the Chesapeake. That this bird is not more frequently seen in its migrations, is owing to the circumstance of its flying by night, and of its being consequently never seen making long flights by day. This habit of migrating by night it possesses in common with the Woodcock, (Scelopax Minor) the Snipe, the Rice bird, and many others.

That a few of these birds may from some cause be overtaken by the winter in the North, and many under such circumstances, hide themselves from the severity of the cold, in hollow logs, drains, or even under broken pieces of ice, where there is but little water, is possible; but that they can under such circumstances, survive the winter, or even a few days, is highly improbable. If the writer in the Petersburg paper means to convey the idea that the birds he refers to come out of the water, from under the ice, where they had no access to the atmospheric air, he must have intended it as a hoax on the naturalists who are supposed to swallow but too greedily the marvellous tales of those who afterwards make themselves merry at their credulity. We might as soon expect to see the Whiting, the Mullet, the Perch, or others of the finny tribe, skipping out from beneath the furrows of the plough, as to see the Sora emerging from under the water, where it had quietly gone to spend the winter among the fishes and amphibious reptiles. Any one who will examine the internal structure of this bird, must be convinced that it is incapable of remaining under water beyond a very short time. The habits which it possesses, with several others of the same genus, of diving, and disappearing for a considerable length of time when wounded, has induced many persons to believe that it could not be drowned. This however is not the fact. When wounded, it sometimes clings to marshes and

weeds under water, and dies there, but it more frequently rises near the surface, and merely protrudes a sufficient portion of its bill out of the water to enable it to breathe. We once in company with some naturalists of Philadelphia, tried an experiment upon two Soras that had been slightly wounded in the wing, to ascertain how long they could live under the water. They were placed in a covered basket which was sunk in the river. One remained 15 minutes in the water, the other 8; on taking them out both were found dead; we placed them in the sun for several days, but they were never resuscitated.

The perplexities with regard to the migration of birds, are every day removing. Not many years ago it was supposed that the swallows retired into hollow trees, or under the water, and there remained dormant through the winter until the cheering sun of Spring revived them; but any careful observer who will place himself on the outskirts of our city from August to November, and will look about him, may easily unravel the mystery. There he will see the swallows, from the purple martin down to the minute bank swallow, sailing gaily through the air in pursuit of their favorite food, and winging their way from their breeding places in the North to the sunny south where abundance of insects and balmy skies welcome their annual return. And could he but have the faculty of seeing by night as well as by day, he would find the now mysterious Sora pursuing the same course, and with the rice bird, with which it has associated on the reeds of the rivers in the middle States, going to spend the winter in a climate more congenial to its tender frame.

A LOVER OF NATURAL HISTORY.

Charleston, Jan. 2.

AMMUNITION.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDERSTORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1.

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. [?] Watches repaired and warranted.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[?] No paper will be sent to a distance without payment being made in advance.

MAKING AND PRESERVING BUTTER.

BY J. FUEL, OF ALBANY.

Butter is an important article in household economy; and as upon its quality depends very much the profits of the farmer as well as the comfort of the consumer, I send you, Mr Editor, a few hints on the process of making and preserving it.

The art of making butter consists in separating, with skill and neatness, the oil from the serum and curd with which it is combined in the milk, and of seasoning it to suit the palate. The art of preserving good butter lies in so keeping it as to have it retain its rich, sweet flavor. The best method I know of effecting these objects, is embraced in the following rules:

1. In the first place see that your cows are supplied with a plenty of nutritious food. This is the raw material from which butter is made; and unless this is good and abundant, the manufactured article will be scanty and poor.

2. Let the milk be set in shallow broad pans, of wooden, tin or stone earthen ware, to facilitate the separation of the cream, in a cool, clean apartment.* Red glazed earthen is bad; and lead is often poisonous. I think the best temperature is about 50° of Fahrenheit.

3. Let the cream or milk be churned before it has become rancid or bitter; as at this stage it has lost its finest qualities for butter.

4. The operation of churning should be moderately and regularly performed. If too slow, and at intervals only, the separation is tedious and uncertain. If violent, the cream is too much heated, and yields a white insipid butter.

5. Put no water with your cream nor with your milk. The flavor, I may say aroma, which gives

* A good practice prevails in Pennsylvania, of building stone milk houses over or near springs, where a proper temperature is maintained during the heats of summer. This practice is worthy of imitation where springs are convenient; and where they are not, a substitute which I saw at Col. M'Allister's, at the Blue Ridge above Harrisburgh, may in many cases be adopted. The Colonel had built a neat underground room, in the side of the hill, near his well, handsomely plastered upon brick or stone walls, covered I think with earth, at all events with a luxuriant *Bignonia radicans*, which when I saw it was in full bloom. Around the sides were sinks or vats for setting in his milk pans, so constructed that the water passed off ere it reached the rims of the pans, with plugs in the bottom to let the whole off when desired. A spout led from this pump into these sinks, through which the water was conducted. By renewing this water occasionally, according to the weather, an equilibrium was easily maintained in the milk house at the desired temperature.

† In a great part of New York, the milk is churned; in New England generally only the cream. The Dutch method I think produces the most butter.

‡ The dog churn is in general use in many counties, particularly upon the borders of the Hudson. In Orange we hear this in operation in a summer morning at every farm house. It is a great saving of labor to the family, which has a barrel of milk to churn daily. In one place I saw a sheep treading the diagonal platform, and another tied at hand to relieve him.

to butter its high value is extremely volatile, is dissipated by heat, and materially dissipated by water. Work the butter thoroughly with the butter ladle, in a wooden bowl, which may be set in water to cool the mass; and while this operation is being completed, mix pure fine salt* enough with the butter to season it for the table, and set it by in the bowl in a cool cellar till next day—at which time the salt will be completely dissolved, when it is to be thoroughly incorporated by again working the butter with the wooden ladle until every particle of liquid is expelled.

The making process is now completed. To preserve the rich flavor which this process secures, pack the butter nicely down in a perfectly tight sweet vessel and none is better than a stone earthen jar, without a particle of additional salt; smooth the surface, and cover the top two inches with a strong cold brine, which has been made by boiling and skimming the materials. If a pellicle or scum is seen to rise upon the pickle, turn off the liquid, and replace it by fresh pickle.

I am accustomed to eat butter, of May, June and Oct. made and preserved in this way, when it is from six to twelve months old, without perceiving any material difference between it and that which is fresh made.

HORSE RADISH—*Cochlearia armoracea*.

This is a perennial plant, which is worthy a place in every garden. The young leaves are used for greens in the spring, and the roots, scraped into shreds or grated, are very fine with boiled as well as roast meats, in winter and spring, and it is believed are, in moderate quantities, conducive to health.

For the ordinary uses of a family, no directions are necessary for the cultivation of this plant; for it will grow without care, in any garden soil; and all that is requisite is to plant the crowns or pieces of the root, where you wish them to grow, and keep down the weeds. But as it forms a profitable crop for the market garden, it will not be amiss to suggest a proper method of culture.

The soil should be a deep, rich, moist loam, but neither wet nor stiff. In my sand soil, it grows well on the north side of the garden fence, and in the shade of trees, where, however, the ground is rich and loose.

The preparation of the ground consists in digging, or otherwise loosening, and mixing it with a good dressing of dung, to the depth of two feet.

The planting consists in placing the sets, twelve inches apart, in the prepared ground, ten or twelve inches below the surface. If too low, the sets often will not grow, or grow feebly but; if near the surface, the roots become too fibrous. The

* Liverpool blown salt will not keep butter sweet and is besides deleterious to health, when used for culinary purposes. See the analysis of this salt in an early No. of the New York Medical Journal, by Drs Miller and Mitchell. They ascribe to its use much of the sickness which afflicts parts of our country. Pure alum salt should alone be used, after it is ground or well pounded. The salt made at Onondaga, by solar evaporation, and sold in casks, for table use, is perhaps as pure muriate of soda as comes into the market.

sets are the crown of an old plant, two or three inches long, slit longitudinally into slips of the size of one's thumb. This may be done either in the autumn or the spring. My practice is to plant the sets when I take up the roots for use, and in the same ground.

The after culture consists in keeping the ground free from weeds.

The crop is taken when the plant has grown two seasons. The roots intended for the winter market, should be taken up in November and packed in earth, either in a cellar or in a pit, that they may be had at all times. Those intended for the spring market may be taken up as they are wanted. Families who are fond of horse radish, generally lay in a stock for winter use.

Albany Nursery.

THE LIMA BEAN—*Phaseolus limensis*.

Is unquestionably the best bean, if not the best of the legumes, that is grown in our gardens, with the further recommendation that it may be kept for the table, in tolerable perfection, during the whole year. As it is rather tender for our climate, considerable care is requisite to grow it with success.

The soil should be rich, mellow, warm, and rather dry. The situation open and fully exposed to the sun. The time of planting, May, when the ground and weather are sufficiently warm to insure a quick germination of the seed, as this is very liable to rot in a cold or moist temperature. The manner of planting may be either that of ordinary pole beans, in hills two and a half to three feet deep, or as follows: Dig holes three feet in circumference and eighteen inches deep, and put into each the best part of a barrow load of dung or compost; cover this with six or eight inches of mould, plant the beans near the rim, and insert four or five poles, retaining the branches, round the hill. In either way, it is best to set the poles when the seed is planted. Cover the seed half an inch with mould, and if the weather is dry when you plant, an occasional watering will be serviceable. The seed may be soaked a few hours, with advantage, in tepid water or milk and water, previous to planting.

The product is very abundant; though the entire crop seldom comes to maturity in ordinary situations. To make the most of it, however, it has been my practice, on the first indications of frost, to pick off all that have acquired a mature size, and to have them shelled and dried. I generally reserve this bean for winter use, and sixty hills have yielded four and five pecks of shelled beans. Those that are ripe are separated for seed, and to be used last. They lose very little of their richness or flavor; and both the ripe and unripe may be cooked in the same way that they are when taken from the vines, taking the precaution to put them in cold water over night, previous to cooking. They are particularly fine, with dried green corn, in the Indian dish which we denominate *succash*.

There are two varieties of this bean, which differ in size nearly one half, of like habits, and both very abundant bearers.

LOVE APPLE—TOMATTO, Fr.

Solanum lycopersicum.

This is an annual, a native of South America, the vines of which grow to the length of four and six feet, and produce great quantities of fruit. When once introduced into the garden, it propagates itself by the seeds which are scattered upon the ground. The tomato is used as a pickle when green, and in its ripe state, in confectionary, as a preserve, in soups, and for a pleasant ketchup. It is also eaten raw, when sliced and seasoned, like cucumbers. But for the most extensive use of this article is in the form of sauce, to be eaten with meats. In the south of Europe, and in the southern and middle States, its cultivation and consumption are very great; and its medicinal properties are deemed highly salutary to persons of dyspeptic habits, as well as to the sedentary and studious. There are seven varieties enumerated, differing from each other in size, shape, or color. Of these, the large red is considered best for culinary purposes. A single plant will often produce a peck of fruit. Few persons at first like the tomato; but use soon renders it agreeable, and in time, very desirable.

The tomato will grow in any soil, but thrives best in tolerably stiff loam. Although the self-sown plants which spring up, will ripen their fruit in part, yet as it is desirable to have an early crop for summer use, the seed may be sown in a hot bed in April, and the plants put in the open ground when the season is so advanced as to have them thrive. They may be readily transplanted with the dibble. If the soil is rich, set the plants three feet apart, keep the ground about them loose and free from weeds, and support the vines as they extend, in an upright or sloping position, by stakes, frames, or brush wood. In this way the fruit comes to earlier maturity and is more abundant.

To make tomato sauce. Take half a peck or more of ripe fruit, dip them separately in boiling water, and divest them of the outer skin, which separates then readily; then slice the fruit, put it into a sauce pan with salt enough to season, but without any water or other liquid, cover the sauce pan, and set it on embers to stew gradually. When it has become a mass, take off the cover, that it may be reduced, by evaporation, to a proper consistence for the table. Thus prepared, it is said the tomato may be kept in tight bottles, for winter use. J. B.

N. B. — Last season I put a quantity of the ripe fruit into strong brine; and from partial experiments made in soups, I judged and so published in the Genesee Farmer, that it might be freshened and used for sauce. But on having the experiment made, I find I was mistaken: it retained the appearance, but had wholly lost the flavor of the fresh gathered fruit.

Albany Nurse, &c.

Effects of whiskey in the Army &c. — The following appalling statement was recently made at Washington, by the Hon. Mr. Wayne, member of Congress from Georgia.

In our little army of 5642 men there have been it is stated, 5832 courts martial within five years, of which five sixths are chargeable to intemperance. And also 4049 desertions, of which almost all are chargeable to intemperance. Desertion alone has cost the United States \$336,616, in five years. Add to this the deceleration of moral feeling, the disease and premature deaths produced, and what a hide-

ous aggregate does it give of the ravages of intemperance.

The British government, ever attentive to the true interests of their soldiery, and sensible of the debasing and ruinous effects of ardent spirits in the army and navy have lately issued a warrant annulling the spirit ration which contains the following memorable words:

‘Instead of the wine or spirits hitherto granted as a component part of the daily ration of provisions, an equivalent in money to be styled liquor money, shall in future be given on all foreign stations where rations of provisions are issued under the authority of this warrant.’

Great efforts have been made to effect a reformation among the navigators of the great canals in New York. Mr T. Joy gives the following as the result of his investigation as to the effects the last season.

‘While I acknowledge there is yet much room for improvement among our canal navigators, I am happy to say the past season has been one of wonderful reform. Formerly it was the practice of almost every “line” boat, to keep a bar on board and the sale of liquor to passengers, was calculated upon by the captain as a source of pecuniary profit. Now I believe I may say with certainty, that these bars have been entirely abandoned, and no liquor is now carried on board any of the freight boats, for the supply of either the passengers or crews; hands are now hired with an understanding that no liquor is to be furnished them. Drivers are now bound in the written contracts which are made with them when hired, to abstain entirely from the use of ardent spirits, and a violation of this condition is a forfeiture of a month’s wages, and a liability to be forthwith discharged. That these rules are fully and strictly complied with in all cases, I do not pretend, but I trust, that the time is not far distant, when a departure from them in the least degree, will be looked upon as both dishonorable and disgraceful.

‘It has been a subject of common remark, by all who have had intercourse with our canals during the past season, that more courtesy, quietness, harmony and good feeling prevailed among canal boatmen, than was ever before displayed.

‘For one, I am confident that a more perceptible improvement cannot be named, than that which has taken place upon our canals during the past season. Kindness and civility towards each other among boatmen, has taken the place of quarrels and contentions. Amicable and friendly adjustment among themselves of disputed rights and other grievances, has taken the place of petty law suits and expensive litigation. And I am told by the most respectable captains upon the canals, that these improvements are attributed, almost if not entirely, to the cause of temperance. With such encouragements before us, I trust that this society will not relax its exertions in the good cause, till the use of ardent spirits shall be exterminated from among our canal navigators.’

Carrots.—There is reason to believe that carrots will answer on ten or mossy land, if a sufficient quantity of ashes be spread on the ground where they are sown; and it is probable that lime and other manures may raise that valuable crop on peaty soils.—*Farmers’ Magazine, (Scotland).*

Grasshoppers were seen in abundance at Dennis, Cape Cod, 15th and 16th ult. as active as in summer.

ADDRESS

PRONOUNCED BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY, IN COMMEMORATION OF ITS THIRD ANNUAL FESTIVAL, SEPTEMBER 25, 1831.

BY MATHIAS A. WARD, M. D.

Continued from page 235.

The term ‘Science of Horticulture,’ as I understand it, implies little else than a systematic arrangement and application to horticultural purposes of the knowledge derived from various other sciences; in other words, he is to be esteemed the most scientific gardener, other things being equal, who is the most profoundly versed in all those sciences which throw light upon the various processes of his art. Now these include not merely the different departments of general physics, but, in an especial manner, the whole circle of Natural History; those causes, therefore, which retarded the progress of Natural History, are, to a great extent the same to which must be ascribed the slow advancement of Horticulture. These are in general all those grand sources of prejudice and error, to which the mind of man was subject, before released from its thralldom, by the introduction of the inductive philosophy of Bacon, and many of which are but too prevalent even at the present day; such as those arising from the infirmities and waywardness of human nature itself;—the tendencies of the judgment to be biased and corrupted by particular courses of study or habits of life; the imperfection of language; a blind reverence for antiquity; the influence of the visionary theories and romantic philosophies which prevail in the world; and last, though not least, a slavish prostration to the authority of great names.

But Natural History was not one of the favorite pursuits of the revivers of literature; and it was not till long after the effects of Bacon’s method of investigation had been felt in other sciences, that any very sensible improvement took place in those whose object is to make us acquainted with the works of nature. And yet the scholars of that period displayed a degree of industry in collecting facts, or rather stories, (for a small part only of them were true) which appears almost incredible. Conrad Gesner, the most considerable of them, is styled by Haller a monster of erudition. Some other cause must therefore be sought to account for the phenomenon; and the grand secret which explains the whole is the want of system. It is system in the application of powers which were before often antagonising or inert, and in the arrangement of facts and fragments of knowledge, which, like the scattered sybilian leaves, were without meaning or use, that has been the grand engine of advancement in the sciences, arts and literature of modern times. But as we understand the term, neither the ancients nor moderns, till towards the close of the seventeenth century, had any system in their study of nature.

It is for this reason, that of all the plants described by Theophrastus and Dioscorides, not a single one can now be satisfactorily identified. Pliny’s work is valuable, as collecting all that had been done by the authors before him; but his descriptions are so vague, taken from such uncertain marks, and from comparison with other plants of which we know nothing, that, as a system of plants, it is perfectly useless. And in this same way, Botany, which has perhaps always been in advance of the other departments of Natural History, went on for fifteen hundred years, till Lobel shadowed out something like a system of classes, which was afterwards improved upon by the two Banks. But

the first really systematic writer is Ray, whose synopsis was published in 1677, and is, strictly speaking, a systematic work, having an arrangement into classes, genera, and species,—though in this respect still very imperfect. His classes are founded on such indefinite distinctions as trees and shrubs; his genera are formed upon such characters as the shape of the leaf, color, taste, smell, and even size. His nomenclature is of such a formidable and repulsive character that none but the most studious and laborious would ever undertake to master it. It seems incredible to a young botanist, accustomed to the concise precision of the present day, which renders his study inviting even to the careless, the indolent, and the fashionable, that a pupil of Ray, when he mentioned a plant, was obliged to repeat, often, a line and a half of Latin description,—which, as Miss Kent observes, would sound much more like an incantation than a name. We can imagine the overwhelming astonishment, with which the vulgar and the genteel ignorant must have listened, when he was pouring out these '*sessquipedalia verba*,' to designate a common weed. Well may we excuse them for replying, when urged to partake of the pleasures of such a study, 'The kernel of your nut, for aught we know, may be very sweet, but the shell is too hard for us to crack.'

Again, so long as the mind remained occupied in no other manner than the acquisition of new plants, without knowing in what way to appreciate their respective peculiarities, discoveries continued to be made slowly, and to be of little value when made. As soon, however, as botanists arrived at the art of arranging upon philosophical principles, the materials they possessed, their attention was strongly directed towards supporting their respective systems by the addition of new objects and new facts; and the strenuous investigations, instituted on this account, naturally brought them acquainted with an abundance of subjects, the existence of which the imperfection of their previous knowledge could not have led them to suspect.

The following statistics will place this in a strong light. The entire Flora of Homer amounts to less than thirty species. In the Holy Bible, according to Sprengel, seventyone plants are noticed by name; and two hundred and seventyfour are spoken of by Hippocrates, who was born four hundred and fifty years before Christ. Theophrastus, of about the same period, whose work is the first expressly devoted to plants of which we have any knowledge, enumerates somewhat less than five hundred. Three hundred years later, or about the time of Cleopatra, Dioscorides notices nearly seven hundred; and Pliny, in the first Christian century, gives an account, collected, as he says, from more than two thousand Greek and Roman writers, of about one thousand species,—the results of the investigations of *forty centuries*! For fourteen hundred years after Pliny, an increase of only five hundred new species is allowed; but in the next two centuries, when the knowledge of plants was assuming a scientific form, upwards of four thousand five hundred new plants were added to the catalogue;—a number four times greater than had been ascertained in all the preceding ages of the world. So extraordinary was the advance of botany under the auspices of Linnæus, that, in a few years, fifteen hundred other plants were added to the list; and the whole number, actually described at the time of his death in 1778, was between eleven and twelve thousand. But since

that period, the increase has been so prodigious, that the number of species of all descriptions now known, according to an estimate given in a late journal, is not less than one hundred thousand!

Such has been the effect of system on Botany—or, at least, such an effect never could have been produced without it. The mere Linnæan nomenclature is a gigantic effort, and itself a wonderful instrument of order and perspicuity. In Chemistry, where there is not a tenth part of the individual objects to be specified that there is in Botany, the advantages of nomenclature have been most remarkable in promoting facility of investigation and clearness of description; and we find, that not only all the divisions of Natural History, but several other sciences, to which the system of arrangement and designation established by Linnæus have been applied, advanced with a rapidity and extent, irresistibly conclusive as to its power and efficacy. It therefore only remains for me to demonstrate the dependence of Horticulture, scientifically pursued, upon Natural History, and I trust I shall have acquitted myself of the first part of my engagement; as to the second part, if the causes which obstruct the progress of gardening are once well understood, the way to obviate them will be too plain to require expatiating upon.

Natural History, in its broadest acceptation, embraces a knowledge and description of all the objects in the material universe. In this sense it will include the heavenly bodies and their phenomena. These, however, though in some respects matters of observation, are yet so completely subservient to the laws of mechanics, and the mode of studying them is so different from what he is usually accustomed to, that the naturalist long ago abandoned them to the astronomer. And since the abolition of the laws of judicial astrology, the gardener is content with knowing the cause of the seasons, and of day and night; resting satisfied in their being immutable, and that the devices of man can never vary their order or their influence.

Meteorology, for somewhat similar reasons, has also been commonly excluded from the pale of Natural History. But this science, in its whole extent, has a most important bearing upon vegetable culture. Water and air are the very blood and breath of life to plants. The different states of the atmosphere as indicated by the barometer, thermometer, hygrometer and electrometer;—the action of light and heat, whether solar or artificial, whether accumulated or diminished, whether applied after long or short intervals;—the influence of the different winds, and the effects of exposure to or protection from them;—the phenomena of clouds, fog, dew, frost, rain, snow, and hail, are among the subjects which, most nearly affect the operations of the gardener, and whose nature and powers it behooves him thoroughly to understand.

But some of the first considerations demanding his attention relate to the materials of which the surface of the earth, on which he operates, is composed. The necessity of an acquaintance with *Minerology* is here manifest;—preparatory for which a knowledge of *Chemistry* is requisite, as well as for the analysis and composition of soils, and also of vegetable products. Next, it will soon be found that the properties of soils vary not only with the elevation and aspect of the surface, but are also greatly modified by the nature of the rocky or other strata on which they rest, or with which

they are in any way associated. Hence, he, who would most successfully cultivate them, must know something of *Geology*, a vast and exceedingly interesting field of inquiry, as yet but imperfectly explored, and the importance of which to agriculture and arboriculture is but beginning to be properly appreciated. To know the kind of plant which can be most profitably cultivated on a given soil, is one thing; but to prepare a soil for the best culture of a given kind of plant, demands other and much more complicated considerations. Indeed two of the chief points in the gardener's art consist in the accommodation of the soil to the nature of the plant, and in teaching the plant to accommodate itself to the soil and climate.

So numerous and intimate are the reciprocal relations between the animal and the vegetable kingdom, that no one of them can be thoroughly understood without a pretty full acquaintance with the other. Hence, a knowledge of *Zoology*, *Ornithology*, and *Entomology* must prove of high utility to the gardener; enabling him to distinguish those quadrupeds, birds, and insects, which are friendly, from those which are inimical to his interests; for it is only by accurately discriminating their kinds, and by studying their natures and habits, that he can avail himself of the services of one, or protect himself from the depredations of the other.

There is no one class, in whose success the interests of mankind are so much involved, as in that of the cultivators of the soil. By this I mean, that, as food is the first necessary of life, and fine fruit one of its greatest luxuries, every question which concerns their production deserves serious attention.

Now it is well known that, every year, some unexpected failure of crops, originating in the ravages of the insect world, takes place;—that the labors of the farmer, and the hopes of the orchardist and florist are continually destroyed by these minute and subtle enemies; and that, often, local scarcity, and sometimes individual ruin, is the result. With these evils upon record, and continually coming under our notice in one form or another, any one would fancy that *this portion* of Natural History, at least, had been well studied;—that the forms and appearances, the habits and economy of all these scourges of vegetation had been well investigated and distinctly described. But, incredible as it may appear, no work professing to give the horticulturist a right knowledge of the animals, birds, insects, reptiles or worms, useful or injurious to his labors, exists in our language!

It mostly happens, when a naturalist is applied to for information on such points, by those who are the immediate sufferers, and he begins to put the question which alone can enable him to form an opinion, he can seldom make out whether the thing complained of is a beetle, a fly, or a moth. He is told that 'it may have only two wings, though possibly it has more'; 'it may have very short wings, but perhaps none at all'; and generally the sum total that can be positively ascertained is that 'the creature looks very much like a grub.'

To be continued.

Sir Astley Cooper's Chilblain Ointment.—Take one ounce of camphorated spirit of wine; half an ounce of the liquor of subacetate of lead.—Mix and apply in the usual way three or four times a day. It is very efficacious.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

INFLUENCE OF CLIMATE ON THE FRUITFULNESS OF PLANTS.

MR FESSENDEN—In your paper of the 3d of August last is an article extracted from the Monthly Journal of Geology and Natural Science concerning the influence of climate on the fruitfulness of plants. The proposition which the writer attempts to establish is, that the cultivated plants yield the greatest and most valuable products near the northernmost limits in which they grow. The author is evidently a man of talents and much observation, and has collected many important facts and observations upon the subject on which he treats; and I was much pleased and instructed with some of his remarks. I apprehend, however, that a disposition to generalize has led him into some material errors. It having been circulated in your widely extended periodical and having seen it commented upon with much approbation by the editor of another, it cannot be altogether unimportant to point out (though late) the errors, if such exist.

Without any claim to the talents exhibited by the writer of the article in question, I shall address some facts and statements from various authors, which I think will make it appear that the writer has evidently been carried too far by a favorite theory, however flattering it may be to us, who live in a northern clime to be taught to believe that we are the favored sons of earth in physical advantages (as we doubtless are in moral) yet we should be careful not to adopt such opinions contrary to evidence, as they will lead to unhappy results. That the proposition in question is correct with regard to some and probably many plants I am not disposed to question but that it is not universally true, and that it is not true with regard to some vegetables mentioned by the writer, I think equally evident.

In the first place, it may be noticed that the adaptation of many plants to different climates depends not merely on the mean temperature, but likewise much, and in some cases, mainly, on the variation of temperature. Indian Corn, for instance, being an annual plant and depending mostly on the temperature of the summer months, grows freely in Canada, but will hardly come to perfection in the south of England; while other perennial plants are raised with much less difficulty in England than in New England. Of many vegetables likewise it is difficult to assign any natural limits, owing to the capacity they possess (so to speak) of acclimating themselves in almost any latitude.

Cotton, the first production adduced by the writer aforesaid, his proposition may be mainly true, as I am not possessed of information sufficient to determine whether it is owing to the poorer quality, that cotton is not cultivated in the tropical regions, or to some other cause. One or two facts, however, would lead us to believe that the quality does not degenerate until we go much south of the cotton region of the United States. The first is that of the upland cottons; the New Orleans, or that raised in the most southern limit of this country is the finest. Another is that the Egyptian cotton, raised probably in latitude from 30 to 31° is believed to be superior to any except the Sea Island. Whether the protection of the seed from the

cold is any part of the design of the cotton wool, may perhaps be questionable. The undoubted object of it in common with the adaptation of the appendages of many other seeds, as the down of the thistle, the wings of the maple, burrs and hooks of various seeds, is the dispersion of them abroad.

Of Flax and Hemp I think the writer may be correct in his remarks.

With regard to Indian Corn; in the first place, Mr Editor, I am slow to believe that one hundred and fifty bushels have ever been raised upon an acre of ground. The assumption that the produce of the lands in the northern states is greater than those of the middle and western states is contrary to almost all the statements of those well informed of the facts. The soil of Kentucky is proverbially fertile in Indian Corn. It is also said on good authority, contrary to the statement of the writer in question, that maize is extensively raised for food in the West Indies. That the Indian Corn of northern climates is heavier than that of southern is a well known fact; but that upon soils of equal fertility the produce is greater in the northern than in the middle and southern parts of the United States, until further evidence is shown, I must be permitted to doubt. In other countries, of much less latitude and warmer climate, Indian Corn is a very productive crop. In Mexico, a writer in the London Quarterly Review, vol. iii. p. 160, says 'the indigenous inhabitants who are satisfied with the different preparations of maize can supply the demands of a family during a whole year by the labor of a single individual for a day.'

Of Wheat, Woodbridge's Isothermal chart, constructed principally from the authority of Baron Humboldt, gives the southern limit in north latitudes, as ranging in different longitudes from 36 to 37 degrees and the northern from 50 to 64 degrees. Suppose then it were true, as stated by the writer, that the latitude of Pennsylvania and New York produces the finest and most abundant crops, it would still be nearer the southern than the northern limit according to Humboldt and his authority will be admitted to be far from disreputable.

But how does the writer's position with regard to the wheat of Europe bear the test of facts. Sicily, in latitude 37° was formerly the granary of the Roman Empire, and according to Doct. Morse it produces of some kinds of wheat 20 and 30 fold and of one variety 60 fold! According to the same authority the vale of Valencia in Spain in latitude 39° to 40° produces of wheat from 20 to 40 fold.

In some parts of Mexico likewise wheat is a very exuberant crop. Says the writer in the Quarterly Review, before quoted, 'We have been assured by some who have been engaged in their cultivation, that in the vicinity of the city of Guanaxarato, there are large plains, where, with a single ploughing, without manure, and aided only by an irrigation which in the rainy season is easily effected, the increase of wheat is rarely less than fifty for one, and more frequently is eighty for one.'

Of Grasses, especially of some kinds, the observations of the author appear to me to be correct and judicious. It is however contrary to my preconceived notions that the juices of the Sugar Cane are either more abundant or richer near the northern limits of its production than in the tropical climates.

Tobacco, the writer brings forward as an instance in support of his doctrine, on account of

the strength of the narcotic quality; but the superiority of the flavor of that grown in the warmer climates, is familiar to every one.

'The delicious and pulpy fruits,' says this writer 'are in a still more striking way illustrative of our principle,' &c. In this paragraph are classed together fruits congenial to climates of very different temperatures. The Peach, although it certainly does well in our latitude, yet is hardly in perfection north of New York, without the aid of the artificial warmth produced by the congregated buildings of cities; and it is probably in its highest perfection somewhat south, at least as near the southern as the northern limit of its growth, according to the authority of Humboldt, who fixes the southern limits, varying from 29° to 35° and the northern from 40° to 53°. The apple, which the writer classes with the peach, and states to have originated near the tropics, is a native of north latitudes, and is now found wild in England. It grows in perfection in our latitude in this country. In Europe as well as in this country it produces well, nearer its southern than its northern limit. Dr Morse says that Biscay and Asturia, in Spain, abound in orchards and produce the finest cider in great abundance.

With regard to Apricots, Nectarines and the more delicate kinds of foreign Grapes, it would be a source of much gratification to me, could I be satisfied that the climate in which our lot has been cast, by a wise Providence, is well adapted to the perfection of these delicious fruits. But unhappily, the evidence to the contrary is so convincing, that I am compelled to be satisfied with the expectation of a merely precarious enjoyment of them. It is a matter of notoriety, that although in New England the trees grow well, the fruits of the apricot and nectarine are rarely perfected, except in cities where a factitious temperature is excited.

The apricot, it is well known, derives its name from its adaptation to a warm climate ('apricus' 'sunny'). If the juices of the grape are best matured for wine near the northern limits of their growth, as this writer affirms, it is certainly otherwise with the flavor of the fruit for the table. The appellation of 'vine clad,' bestowed on Italy, is very much at variance with the writer's assertion, that 'in no southern country of Europe, except Madeira, where elevation makes the difference, is the vine in much repute.'

It might also be shown, did the limits of this communication permit, that there is equal reason to doubt the correctness of the writer's remarks on the Melon and the Orange.

It is also proper to notice here, (as tending to show the incorrectness of so general a proposition as that maintained by the writer referred to,) the variety in the parts of vegetables appropriated to use, and likewise the various qualities constituting their value. Thus, while many are cultivated for the seed, others are raised for the herbage, and others, still, for their outer covering. It may, therefore, very naturally be the consequence, that while some are more productive of seed in a warm climate, others used for the herbage may be most productive in a climate farther north. As regards the qualities, also, of plants, one is valued for its productiveness, another for its flavor, &c.

All will, however, agree with the writer, that proper attention should be paid to the influence of climate on the productiveness of plants, in all the operations of agricultural pursuit, and that much time and expense might be saved, and much great

er profits realized if these were more generally understood. But it is to be feared that he, who assuming the doctrine advocated by the writer whose remarks have been examined, to the full extent maintained by him, shall attempt on an extensive scale, to cultivate the more delicate vegetables, near the most northern limit of their growth, will prepare for himself much disappointment and vexation. I apprehend it will be found, upon a full examination of this interesting subject, that no general theory can be formed from the facts as they exist, but that it will appear that the wisdom of Providence has been exhibited in adapting vegetables to their respective climates, and that while some of them appear to flourish best toward their most northern limit, others, on the contrary, will be found in the highest perfection towards the southern; and that in determining the fitness of places for the production of different kinds of plants, we should take into consideration the various circumstances of soil, climate, &c., without regard to any particular theory. M.

Berlin, Ct. Feb. 2, 1832.

DWARF TREES.

MR FESSENDEN.—I have derived from your paper so much valuable information, on all subjects connected with horticulture, that I know not where better to apply than to you for any information on this interesting subject. I find frequent mention made, in works on gardening, of dwarf trees; but I have not been able to find any account of the process by which these trees are produced, either in the American Gardener or in any other work which I have consulted. In the New England Farmer for February 1st, there are some incidental hints on this subject, written, I presume, by Judge Buel of Albany, but no direct or detailed account. The author concludes by advising his readers to plant dwarf pear trees for themselves, and standards for their posterity. As I have already done the latter to a considerable extent, I should be glad, if I knew how, to follow his advice in the former respect, also. If the art of dwarfing trees be not among the mysteries of the nursery, known only to the initiated, I would respectfully request Mr Buel or some other person acquainted with the subject, to describe the process in your paper; as I doubt not it would be interesting to many of your readers. Perhaps you can yourself furnish the information desired, and thus oblige

A SUBSCRIBER.

Portsmouth, N. H. Feb. 1832.

By the Editor.—We have seen no directions for causing trees to remain of a small size, or become dwarfs, more explicit than the following from London:

'The dwarfing of trees is a kind of artificial beauty, much practised by the Chinese; and though the habit be kept up chiefly by withholding nourishment, yet the dwarf may be produced by ringing a branch, enveloping it in a ball of loam; amputating it when it has made roots; and then pinching off all exuberance of growth, so as to keep it in shape.'

Pear scions may be rendered dwarfs by grafting them on quince stocks, and all the larger kinds of fruit trees by inserting them in stocks of a smaller variety of the same species. Perhaps cutting in or clipping off the leading shoots, as in trimming hedges, may generally answer the purpose desired. We should, however, be happy to learn the opin-

ion of Mr Buel and other scientific horticulturists on this subject.

DETERIORATION OF SHEEP.

MR FESSENDEN.—I noticed in the New England Farmer, No. 29, of the current volume, a communication under this head from Z. Barton Stout, of the opinion of William Jarvis, Esq. of Weathersfield, Vt. that the progeny of the Saxony and Merino were diminished in size and healthfulness; to which opinion I fully subscribe. The lambs are less rugged and more tender. These which are dropped in the winter mostly die. I have calculated to have nine come in April, but some had taken the luck before they were separated, and out of twenty dropped I have only four or five survivors; and those which come so late in April and May, do not get sufficiently grown to stand the winter much better. But there is another failure as bad, the fleece is much drier and of course much lighter, and indeed there is a less quantity of wool, and the additional price will not produce so much in value. I consider the most hardy race of sheep to be those which are just half merino and half native, and carry the largest fleeces, and such wool as that would suit our flannel manufacturers. Bridgeport, Ct. Feb. 6, 1832. B.

HORTICULTURAL PREMIUMS—CULTURE OF PLANTS.

MR FESSENDEN.—In your last No. I noticed a communication signed 'Rusticus,' regarding the 'gross inequalities' of the premiums awarded by the Massachusetts Horticultural Society, and though my usual avocations will not allow me to devote much time to newspaper controversy, I beg leave to offer a few remarks in reply.

As regards cucumbers, forced and grown out of doors, I most cordially agree with your correspondent; but that the same remarks are applicable to grapes grown in the open air and 'forced,' (from this term I presume he means grapes grown under glass,) is by no means, so apparent. For my part, I have never seen what is considered a forced grape, by gardeners, in America, excepting the fine specimens of White Sweet Water grape from Jamaica Plains, last season, and those were not exhibited until July. What are termed forced grapes in England, are those grown by artificial heat and ripened out of season. The vines are broke in November or December, and the fruit ripened in May or June, and in some gardens much earlier. The grapes grown under glass, which obtained the Society's premium last season, I did not see; but the fine specimens of Black Hamburgs, for which the grower received the premium in 1830, were not shown until the middle of September, and even those were not considered by judges as fully ripe, and could not therefore be denominated 'forced.' The only use I have ever seen made of glass for raising grapes in the vicinity of Boston is in creating an artificial climate more congenial to the vine's tender habit, not by any means to force them; and I know from practical experience that it requires more skill and attention to grow specimens of Black Hamburg grapes, such as most justly obtained the premiums last season, in our very precarious climate, out of doors, than it does under glass, unless the grapes under glass are ripened in May or June; therefore in my opinion, the committee on Fruits would be justified in offering a higher premium for superior specimens of grapes grown out of doors than under glass, unless as before

stated, the grapes under glass are ripened by the first of June.

Your correspondent's remarks on the premiums awarded for flowers are equally erroneous. I do not think he is much of a florist, at least I am confident that he knows nothing of growing Chrysanthemums. It is very well known to every good grower of that most beautiful flower that the compost, to grow them well, requires as much care and time in the preparation as the compost for Tulips or Ranunculus; and allowing that they are struck from mere cuttings, (as he says,) in the spring, say the 1st of April, he must be completely ignorant of the treatment of the plant not to be aware that it requires ten times more trouble and expense to bring them to perfection than it does either of the other mentioned flowers. If it will not occupy too much of your valuable paper I will endeavor for the information of your correspondent to point out the method with which I have treated Chrysanthemums and Tulips for some years, I flatter myself with a good deal of success, and leave him to judge which gives the most trouble. Chrysanthemums, when the cuttings are rooted, I put into one cent pots—shade them for a few days, until the roots get hold of the soil,—then plunge the pots in the open ground in a sheltered situation; water them every day in dry weather,—and if very dry, twice a day. They stand in this manner until about the last of June when I re-pot them into a pot one size larger; they then undergo the same process of shading and re-plunging. The daily watering is continued. In this manner they stand until the last of August, with the exception of being necessary to tie them to neat sticks to prevent the winds from breaking them. At that time I re-pot them into the pots to flower, (the size of the pots in which I flower them are generally 4 cents.) They have to be shaded again for a few days, then set in some sheltered situation upon boards, to prevent the worms from getting into the pots. They must now be very copiously watered every dry day, as they are now forming their flower-buds. If they are not well watered at this time, they are sure to flower small—manure water once or twice a week, will much increase the size of the flower. They stand in this situation until the second or third week in September, when I move them into the greenhouse to flower.

I generally plant my Tulip bulbs in November. I have varied the time from the first to the last of the month, without perceiving the least difference in the result. The soil in which I grow them, I do not take nearly the same pains with as I have always done with the compost for Chrysanthemums. After planting, I let the bed lie until the first appearance of a severe frost, when I cover it with litter, or (as I think the best covering,) with the coarse grass, called sedge, from the marshes. I have no more trouble with the bed until spring. As soon as the frost leaves the ground I take off the covering; reserving a little on each side of the bed, if possible dry and light, and in case there appears likely to be a recurrence of frost, shake a little over the plants, which are generally at this time, an inch or two above ground; taking care to remove it next morning. By the second week in April all danger is over from cold. I take away all covering, clean the bed neatly, and after this I have no more trouble until the time of flowering, with the exception of once or twice going over the bed with a trowel or small hand fork, to destroy the weeds and loosen the soil. When in

flower I shade them, with a thin coarse tow cloth, from the sun, from about 10 A. M. till 1 P. M.

The above is a just and correct statement of my management of the plants I have mentioned, and must convince every candid mind, whether conversant with the culture of plants or not, how much more difficult and expensive is the one case from the other. There is another thing which Rusticus seems either to have overlooked or to be totally unacquainted with—the merits of the two flowers. When in bloom, the Tulip must be allowed to be a rich and beautiful flower, varying almost without parallel from one splendid color to another; but it is of very short duration, seldom remaining with us in perfection for three weeks. Tulips also flower at a time when we have an abundance of Roses, in every respect a fair competitor for beauty, with the advantage of fragrance. Our gardens are likewise full of beautiful perennial herbaceous plants.—This is not the case with Chrysanthemums—they flower at a time when there is no other to be seen, and continue in perfection for six or seven weeks. With, in my opinion, equal beauty to the Tulip. I would ask your correspondent if he ever attentively examined a Golden Lotus Chrysanthemum, and found in any other flower the same surpassing beauty of color and delicacy of texture.

I think from what I have said, that the gross inequalities of which Rusticus complains, will be found to have existed only in his own imagination, and that a further acquaintance with the subject will induce him to acknowledge his mistake.

I should like to see the time when Horticultural Premiums will be ten times their present value? but that we can hardly expect for some years, and for my own part I have as much pleasure in competing for two, three, or five dollars, as I would have for a larger amount; still I make a business of raising these elegant plants. If your correspondent can be patient for a year or two, I am confident that he will not resort to his imagination for a display of fifty glasses of different flowers, but that, even under the system of which he complains, we may be enabled to present him the reality.

The system of numbering the glasses or pots containing the different flowers for premiums, is universally practised at horticultural and floricultural exhibitions in England, and I think it an excellent plan, particularly where competitors are numerous; but I regret that your friend Rusticus should be deceived in the idea that this is the cause why the 'humble cottager' is so frequently the successful claimant. We will be charitable enough to believe that the judges chosen by the members, are skillful and honorable men, and not likely to be biased by a silver cup or a copper teakettle, or whatever happens to be the premium on the occasion. The reason why the 'humble cottager' of England is so frequently successful, generally proceeds from the unwearied care and attention he bestows upon whatever flower his fancy leads him to cultivate. Many of them are weavers, tailors or shoemakers, who have their little gardens, immediately under the windows of their workshops, and when any favorite flower is about to burst its bud, it is tended with incessant care and anxiety, and defended from the storm or any other accidental misfortune, as if the welfare of the family depended on its safety. And where the occupation of the men has led them from

home, I have often known the same interest and anxiety manifested by the wives and children. This, and this alone, has given the cottager the advantage of the practical gardener in England. The various departments assigned to a gardener, in a large establishment, prevent him from devoting such particular attention to individual plants, and it consequently follows that the competition does not generally result in his favor.

In concluding, let me hope that nothing I have said may be mistaken for an intention or wish to offend. Your intelligent correspondent has said so much to please, that I could not possibly allow a few trifling inaccuracies to betray me into any feeling of which I should hereafter be ashamed.

A PRACTICAL HORTICULTURIST.

Charlestown, Feb. 13, 1832.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Feb. 15, 1832.

ON THE IMPORTANCE OF CULTIVATING GOOD FRUIT.

Farmers in general are too apt to consider fruit as a mere luxury, and therefore pay but little attention to its cultivation. But, though fruit is not absolutely indispensable to the support of human existence, it is a very useful article, and may be ranked among the best gifts of Providence. Mr. Knight, in one of his publications, has observed that, 'The palate which relishes fruit is seldom pleased with strong fermented liquors, and as feeble causes, continually acting, ultimately produce extensive effects, the supplying the public with fruit, at a cheap rate, would have a tendency to operate favorably, both on the physical and moral health of the people.' This view of the subject gives an importance to the pursuits of the orchardist, and elevates him to the rank of a public benefactor.

It is as easy to cultivate the best kinds of fruits as those which are of an inferior quality, and the former are no doubt more wholesome, as well as more palatable, than the latter. Besides, by introducing fruits of different kinds into our markets and furnishing them in plenty for the domestic boards, we render their consumption more common, and cause the most pleasant and most wholesome articles of aliment to be those of most general use. The philanthropist, therefore, can in no way better make known his good will to the human species than by using his best efforts to cause the fruit to be cheap, plentiful, and of an excellent quality.

Attend to your Cattle, and see that your barn-hold economy goes on like clock work; and even be more regular as respects real time, than the sun, which is sometimes fast and sometimes slow of the clock. You will, however, do well to be punctual to a punctilio in feeding those animals, which depend on you for their daily food. If they miss their accustomed meals, they will fret off more flesh in half an hour, than you can lay on in a week.

Good shelter is also necessary as well as good and regular feeding. If a cow, a sheep, or a pig is uncomfortable, from cold, wet, or any other cause, you cannot make it thrive on the richest diet. Yet, some permit their cattle to lie down in heaps of their own manure; and they suffer from

filth, even when they escape cold and hunger. 'Cleanliness,' says a celebrated agricultural writer, 'is a principal requisite in the feeding of cattle; hence not only the mangers, but also the stalls ought to be kept as clean as possible; and the former should be cleared from dirt and dust, with a blunt pointed trowel, every morning. After cleansing their stalls, a sufficient quantity of fresh litter should be strewed over, which will invite them to lie down. Rest greatly contributes to fatten cattle; and rousing and carding their hides every day, promotes their thriving more than equal to the small portion of time thus consumed.

Every farmer had better visit his barn in person, and superintend, himself, the feeding and management of his stock, without trusting to domestics or hired help, who have little interest and responsibility attached to their employments.

Lambs.—The Farmer's Manual says, it will be needless to give any directions for the preservation and management of weak and feeble lambs; the best nursing for such lambs is, by keeping the ewes well, either upon your best English hay, particularly rowen, with potatoes, carrots, or white beans; these will insure you strong lambs, with a plenty of milk, and save all the trouble of nursing. Should any one be so unfortunate as to want the proper means of insuring strong lambs, as above, or neglect a proper use of such as he may have, (for even barley, oats and corn will answer as substitutes for the potatoes, carrots, or white beans, if given in small quantities, so as not to excite fever, and thereby cause ticks and the shedding of the wool,) let him remember that such weak lambs should be treated, in all respects, as if they had been drowned, and you would restore them to life. Apply gentle and regular warmth; give warm milk frequently, in small quantities, (the milk of the sheep is best,) and if the ewe has milk sufficient for its support, you may generally raise them; but if not, they generally die. It is more work to save one such lamb for twentyfour hours, than to feed regularly 100 sheep for the same time—take your choice.

The great amount of our capital and labor employed in the tanning business in this town, and its consequent value in many respects, are generally understood; but we doubt whether its utility in affording a very large and cheap supply of good fuel is as highly appreciated as it deserves. Thousands of loads of the ground bark which has been used in tanning, are procured every year from the yards, at no other cost we believe, than the expense of carting, and furnishing a species of fuel scarcely inferior, for some purposes, to the best wood. We do not know whether the tan can be procured as plentifully and cheaply now as in the summer; if it can, much comfort may be dispensed at small cost.—*Salem (Mass.) Gazette.*

A case has been decided at Meadville, Pa. involving the value of a sow and eight pigs, in which \$10 damages were recovered, while the costs amounted to over \$100.

TO CORRESPONDENTS.—Several communications are deferred this week, among which are one from Portsmouth, N. H. on the culture of Ruta Baga, &c.—one from Theodore Sedgewick, Esq. comprising a horticultural diary for the past season—and one from Albany, on the cultivation of the Hop; we shall be glad to receive the remainder of this latter article.

The Horticultural Garden of the late Andrew Parmentier, is offered for Sale.

THE reputation of this establishment is not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyn, Long Island, at the junction of the Jamaica and Flatbush Roads, and contains 21 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed by a pointed stone fence, and inside of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; also, a splendid collection of Roses and Herbaceous Plants, — the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers' Houses, seven Cisterns, and a never-failing Pump of excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any person who wishes to engage in the occupation of Gardening, by the purchase of this property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such as to warrant the belief that the purchase of the property will amply repay the enterprise of the one who may engage in the business.

Terms will be made known by applying to Mrs. PARMENTIER, on the premises.

N. B. — Any orders sent to Mrs. P. will be promptly and carefully executed.

Situation Wanted.

A Gardener, who considers himself thoroughly acquainted with his business, in all its branches, is familiar with forcing fruits and vegetables, is desirous of a good situation. He has a wife and two children; has lived upwards of seven years at his last place, and can produce satisfactory recommendations from his last and all his other employers. Inquire at the Farmer office.

A Farmer Wanted.

WANTED to hire, in the vicinity of Boston, a man of middle age, who is thoroughly acquainted with farming in all its branches. Inquire at this office.

Bremen Geese.

FOR Sale, 3 or 4 pair of large Bremen Geese, of undoubted purity of blood. Inquire at the N. E. Farmer office.

Farm for Sale.

ON the road leading from Newton, west parish Meetinghouse, to Waltham Factory, containing from 50 to 75 acres of Land, well proportioned into mowing and tillage — also, House, Barn and Outhouses with the same. Said farm is well watered, and has a valuable fruit Orchard. Apply to EPH. McNAMARA.

Seeds for Hot Beds.

JUST received at the Seed Store connected with the New England Farmer Office, Nos. 51 & 52 North Market Street, Boston.

The greatest variety of Early Vegetable and Flower Seeds to be found in New England, many of which will be soon wanted for Hot Bed sowing. We have this week received from Europe per the Janus, the finest assortment of Cabbage, Cauliflower, Broccoli, Sweet Potatoes, Marjoram, and Early deep Scarlet Short Top Radish Seeds, &c. &c. Among the European Cabbage Seeds are the true Early May Cabbage, (very dwarf and early) also Early York, Early London Battersea, Savoy, and other Cabbages — Early Curled Silesia, Tennisball, and Royal Cape Head Lettices, Mignonette, Long Turkey Cucumbers for forcing, (white and green) — Early White Dutch Turnips, Tomatos, Lima Beans, Early Peas, Beans, &c. comprising every kind of seeds wanted in New England — warranted of the very first quality.

— ALSO —

GRASS SEEDS of all kinds, — Herds or Timothy, Red Top, Red and White Clover, Lucerne, Orchard Grass, Tall Meadow Oats Grass, &c. &c. at the lowest market prices, wholesale and retail.

Valuable Work.

G. THORBURN & SONS have in press for publication, the PLANTER'S GUIDE, or a practical essay on the best method of giving immediate effect to wood, by the removal of large trees and underwood; being an attempt to place the art and that of general arboriculture, on physiological and fixed principles; interspersed with observations on general planting and the improvement of rural landscape. By Sir Henry Stuart, Bart. LL.D. F. R. S. From the second English edition; greatly enlarged and improved.

The work will be printed on fine paper, with new type will form a handsome octavo volume of upwards of 400 pages; the price will be \$3, cloth bds. The work will be illustrated with beautiful engravings: the frontispiece, view of the park at Allanton House, from a superb engraving, view of the park at Allanton House, representing the improvements and scenery as called into existence by means of the transplanting machine. — There will be also several wood cuts by Mason, one of which is a plan of the machine.

The successful removing of large trees, of thirty or forty feet height, and four or five girth, without mutilation, or lopping the root or branches, and setting them out without support of any kind, so that in one season they possess all the beauty and vigor of trees raised from seed, or of those planted out when young, may be considered as one of the greatest achievements of modern times. With a knowledge of this art, how many of our laid and scorching streets and public places, could be immediately clothed and ornamented, which would at once yield us refreshing and grateful shade. The effect of country residences and farm houses, which are in exposed and unfavorable situations, can be inconceivably improved by means of wood, which is so beautiful in itself, and which throws its own glacial character over everything which it touches. In the language of the author — "If the ground be high it will give it shelter; if tame and flat, variety of elevation; and if it be irregular and deformed, it will sometimes convert those seeming obstructions into playful intricacy and unexpected beauty."

The subject excited so much attention in Scotland, that the Highland Society appointed a committee of scientific gentlemen to inspect the operation of Sir Henry Stuart at Allanton Park, in transporting large trees and underwood, and to report thereon. In consequence, live of the committee, consisting of Sir Walter Scott, Lord B. Thaven, Lord Succoth, Lord Corehouse, and Alex. Young, Esq. assembled at Allanton House, and after devoting some time to the various objects submitted to their examination, came to the following conclusion: — "We conceive it to be clearly made out, from what Sir Henry has done, that all objects for gardening for picturesque effect, and for making as it is termed a place, whether on the foreground, or the middle distance of the landscape, may be effected at once, or at least within a very short period; thus, a man possessing the means, and having within a reasonable distance the command of a stock of trees fit for removal, may, in some sort, create what it used to take a life time, and sometimes two lives to obtain, namely, a park richly clothed and sheltered; and thus the superlative luxury of well grown woods which was supposed unattainable unless by the slow effects of time, is brought within the reach of science and industry."

Feb. 15. 2t

Improved Stock.

THREE first rate, English and Arabian STALLIONS; Ten Holsteiner, Ayrshire, Durham Improved Short Horn, and North Devonshire BULLS — for sale or to let. Also Cows and Heifers for sale — Inquire of RALPH WATSON, East Windsor, Conn. Feb. 8, 1852.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street.

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Nuttall's Ornithology.

JUST received by J. B. Russell, No. 50 1-2 North Market Street, Boston.

A Manual of the Ornithology of the United States and of Canada. By Thomas Nuttall, A. M., F. L. S.; with 53 engravings. Price \$3.50. Jan. 18.

BRIGHTON MARKET—Monday, Feb. 13.

(Reported for the Daily Advertiser and Patriot.)

At market this day, 497 Beef Cattle, 10 Cows and Calves, and 117 Sheep.

Prices. — Beef Cattle. — It was expected in the morning that the large number at market would have caused considerable reduction in the price, but being short last week, a large number of buyers appeared; for the best qualities former prices were well supported, poorer qualities some reduction. We quote 3 or 4 yoke at \$6, extra at 5 62 1/2 a 5 75, prime 5 25 a 5 50, good 4 50 a 5, thin 4 25 a 4 50.

Cows and Calves. — We noticed one sale at \$20, and one at 30. Several other sales, of which we did not obtain the price.

Sheep. — The sale of only one lot was effected at about \$4.75 each.

New York Cattle Market, Feb. 10. — This week's supply of stock unusually small, though very good in quality, and an advance on ordinary prices has been paid — 500 head of fresh Cattle in, all sold at an average of 6 25 per hundred. Beef Cattle — for a few extra fine \$8 have been paid, but sales in general have ranged from 5 50 a 7 50. Sheep — owing to the small number in market, prices have been very high; for some first rate \$8 have been paid, sales averaged \$5; we quote \$3 a 7.

MISCELLANY.

From the New Monthly Magazine.

THE PRAYER IN THE WILDERNESS.

BY MRS. REMANS.

Soul of our soul, and safeguard of the world!
 Sustain—Thine only care,—the sick of heart;
 Restore their languid spirits and revell
 Their lost affections unto Thee and Thine.

WORDSWORTH.

In the deep wilderness, unseen, she prayed,
 The daughter of Jerusalem:—alone,
 With all the still small whispers of the night,
 And with the searching glances of the stars,
 And with her God, alone! She lifted up
 Her sad, sweet voice, while trembling o'er her head
 The dark leaves thrill'd with prayer; the tearful prayer
 Of woman's guiltless, yet repentant love.

'Father of spirits, hear!
 Look on the lowliest soul, to Thee revealed;
 Look on the fountain of the burning tear,
 Before thy sight, in solitude unsealed!

'Hear Father! hear and aid!
 If I have loved too well, if I have shed
 In my vain fondness, o'er a mortal head,
 Gifts, on thy shrine, my God, more fitly laid.

'If I have sought to live
 But in one light, and made a mortal eye
 The lonely star of my idolatry,
 —Thou that art love! Oh, pity and forgive!

'Chastened and school'd at last,
 No more, no more my struggling spirit burns,
 But fix'd on Thee, from that one worship turn!
 —What have I said?—the deep dream is not past!

'Yet hear! if still I love,
 Oh! still too fondly—let it ever seen,
 An earthly image comes my soul between,
 And Thy calm glory, Father, throned above:

'If still a voice is near,
 (Even while I strive these wand'ring to control),
 An earthly voice, disquieting my soul,
 With its deep music, too intensely dear:

'O Father, draw to thee
 My lost affections back! the dreaming eyes
 Clear from their mist—sustain the heart that dies;
 Give the worn soul once more its pinions free!

'I must love on! O God!
 This bosom must love on!—but let thy breath
 Touch and make pure the flame that knows no death,
 Bearing it up to Heaven, Love's own abode!"

Ages and ages past, the wilderness
 With its dark cedars; and the thrilling night
 With her pole stars; and the mysterious winds,
 Fraught with all sound, were conscious of those prayers.
*How many such hush women's bursting heart
 Since then in silence and in darkness breath'd,
 Like a dim night flower's odor up to God!*

THE HORSE AND VIPER.

By a report read before the Royal Institute of France in 1830, it appears that the great viper called *Per de lance* is one of the most dreadful scourges of the West Indies, but is found only in Martinique, St. Lucia and another small island. The viper is so savage that the moment it sees any person, it immediately erects itself and springs upon him. In raising itself it rests upon four equal circles, formed by the lower part of the body; when it springs these circles are suddenly dissolved. After the spring if it should miss its object, it may be attacked with advantage, but this requires considerable courage; for as soon as it erects itself again, the assailant runs the greater risk of being bitten. Often, too, it is so bold, as to follow its enemy by leaps and bounds instead of fleeing from him; and it does not cease the pursuit till its revenge is glutted. In its erect position it is so much the more formidable, because

it is as high as a man, and can even bite a man on horseback. Mr. Morreau de Jognes was once riding through a wood, when his horse reared; and when the rider looked around to discover the cause of the animal's terror, he perceived a *Per de lance* viper standing quite erect in a bush of bamboo; and heard it hiss several times. He would have fired at it with his pistol; but the affrighted horse drew back so ungovernably, that he was obliged to look about for somebody to hold him. He now espied at some distance a negro upon the ground wallowing in his blood, and cutting with a blunt knife, the flesh from the wound occasioned by the bite of the same viper. When the author acquainted him with his intention of killing the serpent, he earnestly opposed it, as he wished to take it alive and make use of it for his cure, according to the superstitious notion of the negroes accordingly.

He soon rose, cut some *lianes*, made a snare with them, and then concealing himself behind a bush, near the viper, he attracted his attention by a low whistling noise, and suddenly throwing a noose over the animal, drew it tight, and secured his enemy. Mr. Morreau saw this negro twelve months afterwards, but he had not perfectly recovered the use of his limbs bitten by the viper. The negroes persecute these vipers with the greatest acrimony. When they have killed one, they cut off his head, and bury it deep in the earth, that no mischief may be done with their fangs, which are dangerous after the death of the animal. Men and beasts shun this formidable reptile; the birds manifest the same antipathy for that, as they do for owls in Europe, and a small one of the *loria* kind, even gives warning by its cry that a viper is at hand.

We give the annexed extracts from the letter of J. J. Audubon, Esq. the Ornithologist, which were omitted on Saturday. The amphibious habits of the rattlesnakes at the South, are certainly novelties in the history of that species of serpent.—*Philadelph. Gaz.*

I have discovered a most extraordinary fact in the habits of the rattlesnake which abounds in this country—it is no less than the reptiles swim across the salt rivers which divide in a continued line the main from the sea islands;—swimming in some instances, fully one mile. I have indeed heard the dubious assertion that they coiled themselves on the water, on being approached by a man, as they do on the land, without sinking. This I prefer to see before I can believe.

When we leave this, I proceed to Indian River, the whole of which, with its tributaries, I must explore. I intend to be employed thus, about two months.

I design, if possible, to go in the U. S. schooner now at St. Augustine, up to the head waters of the St. John River, and afterwards to Cape Florida and Key West. If I should be disappointed in this, I shall probably be forced to return to Charleston, and charter a small vessel for that purpose."

A newspaper published in Indiana contains the following notice from a candidate for office:

'MR. SEMANS: You are authorised to announce Reuben Putnam, as a ——— candidate for County Recorder. And, moreover, that I will roll out a barrel of RUM on the day of election.

Lafayette, Dec. 13. REUBEN PUTNAM.'

Seeds for Country Dealers.

TRADERS in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer's office, No. 53, North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, nearly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and LATE CORN, &c. of different sorts.

The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves.

Nov. 12.

Farm for Sale.

FOR sale an excellent Farm in the town of Peterborough, N. H. Said Farm is pleasantly situated about a mile from the village; formerly the residence of the late John Smith, Esq. and contains about sixty acres of good land, well walled, with a good House and Barn, and other out-buildings. Terms reasonable, and possession to be given the first of April. For further particulars, inquire of Dea. JOHN FIELD, near the premises, or at No. 3, Rowe's Wharf, Boston. 3d Jan. 25

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr. 65, Broad street.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WIGHT,

16, Milk street, opposite Federal-st. Apothecary.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6, Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c. &c. which he will dispose of at as low a rate as can be purchased in the city. Watches repaired and warranted.

Farmer Wanted.

WANTED on a dairy Farm within thirty miles of Boston, a married man to take the same on shares. Good recommendations will be required for capacity, integrity and industriousness, as also experience in making butter.—Inquire at this office. Feb. 1.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

ORIGINAL AGRICULTURAL ESSAYS.

The following is the successful Dissertation, for which our author, the Rev. MORRELL ALLEN of Pembroke, Ms. was awarded a premium by the Plymouth County Agricultural Society, at their late anniversary at Bridgewater.

DISSERTATION ON THE MIXTURE OF SOILS.

THE Author of nature constructed the earth to produce, spontaneously, a vast variety of plants and trees. Uninhabited regions, with a few exceptions, are found covered with a vigorous growth of some sort of vegetable substances.

When the hand of cultivation is first applied, and the natural growth subdued to make room for such plants as are esteemed more useful, the soil is always found in a state of great richness to produce cultivated plants. It is in a course of imprudent cultivation, soils are ever rendered unproductive; by what is called severe cropping in taking away the produce, and not returning a just compensation. The art of successful agriculture chiefly consists in devising and applying the most effectual means of restoring to soils, those qualities which are taken from them in the removal of crops. The perfection of this art is not to be attained without very deep research in some of the most intricate branches of philosophy.

It is necessary to analyze both plants and soil, to discover, with minute accuracy, what qualities are best adapted to the vigorous growth of certain plants; but the art may be acquired in sufficient measure, for the most useful purposes of life, by observation and a course of experiments within the reach of every practical man.

Diligent attention to the designs and operations of nature, in the vegetable world, will qualify us to make, in many cases, certain returns to the soil of properties which we shall perceive has been taken from it, in a course of cropping. The vegetable substances which abound in newly cleared lands, in different degrees of decomposition, and cause the soil at first to yield crops in great abundance, are in a few years exhausted; after which, some soils, especially those that are warm, loose and naturally favorable for grain, become extremely barren. Here it seems scarcely possible for any man to mistake the cause, or err in his judgment of the most efficacious application, to restore energy to the soil. It wants nothing but the stimulus of decayed vegetables. This stimulus can be applied in various ways. It is applied with the greatest immediate influence, in the form of excrementitious manures, but these are not attainable in the ordinary situations of farmers, to an extent sufficient for all the purposes of an improving cultivation. It is also applied in mixing plants, in the most vigorous state of their growth, with the soil, and it is applied in mixing one kind of soil with another. The mixture of soils, even when there is very little apparent difference in the qualities, is always attended with some good effects.

Particles in a soil, which had long been in contact, and, in consequence of long connexion, lost much of the energy of their action on plants, are separated in mixing soils, placed in new connexions and act with renewed vigor. But the most

permanent and best effects are always to be expected from the mixture of soils of different qualities. When the object is to produce as much immediate influence as possible, merely to assist one short rotation of crops, to have the application we make, act chiefly as manure, then we may take our materials from any situation, where we know vegetable substances have fallen and decayed.

We may go into forests, and, in certain stages of the growth of the wood, without any perceptible injury, skin the surface of the whole lot.—This soil of the woods, carried in sufficiently large quantities on to old fields, will restore them to original productiveness. And this will sometimes prove an inexhaustible resource for renewing old fields; for as often as the fields decline, the soil in the wood-plot will be again renewed and fit to remove. For the same purposes, the earth should be carried from the sides of walls and fences, where the leaves have been lodged from the forests. It should also be carried from hollows and temporary ponds, which, in certain seasons of the year, become dry and afford immense quantities of vegetable matters, in different stages of decomposition, and suitable to apply to any kind of soil.

Where streams of water occasionally overflow the banks, an abundance of vegetable and earthy matter is lodged on the meadows, which in many cases, especially where there is not much extent of meadow to receive the substances conveyed by the stream, it is prudent to remove on to higher land. It will there act as manure and at the same time gradually alter the texture of the soil, rendering it more retentive of dew and rain, and easily penetrated by the fibrous roots of plants. Of the value of those substances which are carried in streams of water, to enrich soils, we have most convincing proof in the unexampled productiveness of interval lands. It is not exclusively the vegetable substances carried onto these lands, that makes them so astonishingly productive; there is a portion of every kind of soil existing in the surrounding country, annually carried on with the vegetable substances. Intervals are composed of every sort of earth the water can reach and remove. This circumstance may properly encourage the mixture of many kinds of earth, even when there is no particular evidence that each kind is especially adapted to remedy any deficiency in the soil, which we would improve. There is less hazard in administering medicines in great profusion to cure the diseases in the soil, than in the human body. What is always disgraceful in the physician, viz. to boast the number of his applications and the judgment with which they have been made, as it is impossible for them to do any harm, if they do no good, may in the farmer, often be a course worthy of praise. In stepping out of the beaten path of habitual practice, and calling attention to experiments, which to some may look very simple and to others very absurd, we may become instrumental in the discovery of highly important truths.

Accidental occurrences often produce results, which show us that much useful knowledge might be obtained in a course of new experiments. A

load of coarse sand, removed merely for the purpose of clearing away an incumbrance and placed in some hollow on the farm, will often show how much that kind of soil can be improved by the application of materials, which seem to be wholly inactive and destitute of the food of plants. Many other applications of accidental origin, may lead attentive observers into new discoveries in the true philosophy, in relation to the mixture of soils.

But we should not think the knowledge that has been acquired through accidental occurrences, or the speculations of theorists, which we have perused, can ever justify our neglect of other means of increasing and applying knowledge. New trials and experiments are necessary, to carry forward every important branch of agricultural knowledge with the most speedy and certain success. Theory may satisfy the speculatist, but practical men want ocular evidence; they are not easily persuaded to desert an old for a new path, till the obstacles are manifestly well cleared away. By attention to the constituent parts of soils through which streams of water pass, and the kinds of plants which grow most luxuriantly on the banks of them, we can discover the causes of the extraordinary richness of intervals and learn to imitate the operations of nature. In the removal of alluvion, to mix with other soils, the most important thing to be observed is, always to place it where the soil is somewhat different in texture from the soils through which the stream of water had passed.

This is a rule easy to understand and apply, and the observance of it will insure success to this sort of labor. The maxim of Kligg, a famous philosophical farmer of Switzerland, will prove true in every region and climate: that every species of earth may be instrumental to the improvement of another of opposite qualities.

When alluvion is placed on a soil, different in quality from that through which the stream passes, as far as composed of earth, it forms a proper and useful addition to the soil, and as much of it as consists of vegetable matters acts with as much energy in that situation, as it could in any other. The same rule is important to be observed in the application of materials taken from hollows and the bottoms of temporary ponds. We should consider what sort of earth has been washed into them, and endeavor to incorporate it with that of different texture. In this course, permanent improvements are constantly made in the soil, while every possible advantage is derived from the vegetable matters applied and acting as manures.

When soils are mixed, with a view both to permanent improvement and immediate influence on crops, it is also important to attend to the natural growth in the vicinity where our materials are collected, and apply them where our purpose is to cultivate plants, bearing some affinity to those which nature had planted in the soil removed.—‘If we examine,’ says the Farmers’ Magazine, ‘tracts of land, which have not been cultivated, we find nature has adapted different kinds of plants to most of the distinguishable varieties of soils; and although some belonging to one, may from some cause or other, be found on lands of a different quality, they seldom thrive or perfect their seed so as to become general.

The great care of the farmer ought, therefore, to be, by proper mixtures to reduce his lands to that state and temperance in which the extremes of hot and cold, wet and dry, are best corrected by each other, to give them every possible advantage flowing from the benign influences of the sun and air; to adopt such kinds of plants as they afford, in this state, the greatest nourishment to, and to renew their fertility by a judicious allowance of the most proper manures. Where these things are done, there are few spots so unfriendly to cultivation, as not to repay his expenses and labor with a plentiful increase. But without these, the best tracts of land will in time become a barren waste, or produce little but weeds.

Alluvion, as it is composed of earthy and vegetable matters, easy of access, and found in plenty on almost every farm, may justly be considered as our first and best resource in the admixture and improvement of soils. But without any great difficulty we can obtain access to many other materials, which will produce very permanent, if not so immediate and perceivable good effects. We need not confine our researches to the surface of the earth; a vegetative principle is found in every stratum of it to the lowest depth penetrated by man. In digging far into the earth for materials to mix with the soil, we find those which, if properly applied, will produce very lasting good effects. We thus obtain a virgin mould, soon to become the parent of a vigorous and numerous progeny. Earth taken at some distance below the surface, can be incorporated with any sort of soil with some beneficial results,—because the influence of the air upon the new earth will occasion so active an operation of the vegetative principle, that any kind of soil will be stimulated and assisted in that operation. It is, however, advisable, even in the application of pit earth, to regard the Swiss maxim and place it on a soil of different quality. The different qualities of the pit earth and the soil where we would place it, can be ascertained with accuracy enough by inspection. It is necessary to penetrate considerably below the surface of the earth to find several substances, which become active and powerful, when mixed with suitable soils.

To be continued.

HORTICULTURAL PREMIUMS.

MR FESSENDEN—A writer in your paper of the 8th instant, under the signature of 'Rusticus,' has pointed out, what he considers to be gross inequalities in the list of Premiums for Vegetables, Fruits, and Flowers, proposed by the different committees of the Horticultural Society, for the two past years. As I dissent from him in some points of fact, as well as the inferences to be deduced therefrom, I propose to examine his objections.

Commencing with the list of Garden Vegetables, he enquires, 'what do we find, a prize of one dollar for a dozen beets; a dozen carrots, &c, &c, the same; cucumbers raised in the open air, two dollars,—and those forced, but one. Is not here a great mistake? Why, does not every person who knows anything of raising such vegetables, know that to grow a beet or a carrot, requires but little more than a mere novice,—while to force a cucumber, is one of the first requisites of a perfect gardener? What kind of a gardener would he be thought (especially in England), who, on inquiry whether he could force cucumbers, grapes, and melons, should say he could not? Why no gardener at all, &c.

All premiums, I take it, are but means to an end: first, to create, or increase certain skill in the competitors, tending to produce some desirable ultimate result: the object with these roots, as well as other articles on the premium list, is precocity of growth; and whoever can cause a supply of them to be had for three or four weeks earlier than it otherwise would be,—as a substitute for the wilted, decaying and unhealthy things of the same kinds, which have been housed through the winter,—renders an important service to the community; and, although it is no very difficult matter to grow a beet or a carrot, yet, a novice would find something to do to insure the most successful cultivation of an early crop,—or, if he pursued it as an object of field culture, our Agricultural Societies have, and no doubt with great propriety, offered liberal premiums for them. And now, Sir, I should be glad to learn of what value to us here, is the skill used in forcing melons, that a high premium should be offered for it? In England, where, as Cobbett tells you, a melon is a *melon*,—and where they are carried, by twos and threes, and with as much care as a new-born baby is carried, and sold at a dollar to four dollars a-piece,—it is, no doubt, of great importance; but in a country where they are grown in such perfection in the open air, and in such profusion too, that the whole community are satiated with them during their natural season, it is absolutely of no utility. Who would attempt to force melons for the market; or for any purpose, other than to please the taste of an amateur cultivator?

The same remarks will apply to cucumbers. Many of our market gardeners understand the simple method of bringing them forward under what are termed hand lights, (not forcing them,) with no other heat than that of the sun; so as to have them in so early, that the weather is sometimes cold enough to give one a chill to think of such a thing.

As to grapes, if it is contended that it requires less skill to cultivate them, successfully, in the open air, than in green-houses, I have a different opinion;—and I will adduce, as evidence of the fact that it does not, what it is no uncommon thing to see, that is,—while the grapes in the green-house are in fine condition, those on the open trellices are languishing,—and all under the management of the same cultivator; the reverse of this I have never seen.

The importance, too, of growing grapes in open air, should it ever be the case that it may be more constantly certain in the result,—I conceive to be infinitely greater than that of forcing them; and if ever they should be so abundant as to become an article of common indulgence as table fruit, it will be by open culture; and I have arrived at this conclusion, partly from the relative prices which this fruit bears in the London and Paris markets. In England, where the art of forcing fruit has reached a greater degree of perfection than in any other country,—with their infinite number of forcing-houses, cheapness of fuel, and cheapness of labor, we find the prices extremely high. In the reports of the Covent Garden market, hot-house grapes are quoted at 2s. a 3s. 6d., 4s. a 6s.; and in March, when they are said to be just coming in, as high as 30s. to 40s. sterling, or \$6 67 to \$10 a pound. While in the reports of the fruit-market of Paris, the *Chasselas de Fontainebleau*, a leading popular variety, is quoted in some months at 13fr. 50c. per basket of ten and a half pounds, about 24 cents per pound; in others at 25 cents per pound.

The premium list for flowers is said, too, to be out of joint; but I doubt much, whether, if it were arranged in accordance with the views taken of it, it would make much practical difference in the result; for the truth is, the competitors have been much more numerous for the premiums which it is recommended to have increased, than they have for those which it is recommended to lower.

It is said, too, a *system* is wanted in awarding premiums; and that general satisfaction has not been given; and you are told,—what may have been considered a piece of very interesting intelligence to the benighted gentlemen who have acted as adjudicators of premiums,—that, sometimes in awarding premiums for flowers in England, the pots, &c, are arranged in rows, and numbered; and that, without the least knowledge of the growers of a single article, the persons, whose duty it is, step in, and decide at once who are entitled to the prizes, to the entire satisfaction of all concerned. And is this the *system* which it is intended to be understood that we want? Surely, Sir, those who award prizes in future, must be incorrigibly stupid, if they do not go right with this ludicrous system before them. I had previously thought, that in England, it was considered rather difficult, always to decide correctly on horticultural premiums; and I had thought so because I find it so stated to be the fact, by those who have most ably treated the subject in their periodical journals;—and as an apology for such an opinion, I beg leave to subjoin some of the general rules laid down by them for the adjudication of prizes. In the first place, they say, 'Horticultural Societies would do well to decide as much as possible, between the result of chance and the result of skill; for it should ever be borne in mind, that the merit for which a prize ought to be awarded, exists not in the production, but in the producer; and therefore the merit of the exhibitor is to be estimated by the degree of science, care and skill exhibited in the cultivator.' There is considerable difficulty in ascertaining these qualities, because in very many cases, they can only be inferred from the productions themselves. The best dish of cherries gathered in July, perhaps, from standard trees planted twenty years ago, may imply but slender merit in the person who produced them. The following good qualities inherent in fruits are to be considered, as a means of arriving at a correct result, viz:

- Rarity of sort;
- Precocity of season;
- Magnificence of size and weight;
- Finesse of color;
- Excellence of quality;
- Extent of quantity sent for exhibition;
- Ingenuity of culture; and
- Cheapness of production.

But of how little use are these considerations, when you are at once provided with a *system* which obviates the necessity of attending to the most important of them at all. And now, sir, while I am entirely willing to admit that your correspondent 'Rusticus,' was influenced by the best motives in producing the essay which has occasioned these remarks, yet I must take occasion to say, that such sweeping censure is not particularly acceptable to those upon whom it directly reflects; and the more so in a writer, who fails, not only to propose any remedies for the defects he discovers, but who sees defects where in fact there are none.

Yours with great respect,
Dorchester, Feb. 11. A CULTIVATOR.

FOR THE NEW ENGLAND FARMER.

REMEDY

FOR AN OX OR COW, WHEN CHOKED BY A POTATO.

MR FESSENDEN—Perhaps the following remedy for a creature choked with a potato, has long since been noticed and extensively known.

Instead of breaking the potato with a mallet, or ramming it down the throat with a wound rope or beapole,—which I have known to be practised, to the no small danger and cruel pain of the animal,—take common soft soap, made with leached ashes, mixed with warm water, and pour the same down the throat; probably a part will pass the potato, sufficient, that in case the potato is not immediately cast out of the mouth, to provide for it a slippery passage downwards.

A neighbor of mine, a practical farmer in the best sense, a few evenings since told me had known the above practice successful in a great many instances, and had never known it to fail.

Yours very respectfully, L. M.

Maine, Jan. 1832.

ADDRESS

PRONOUNCED BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY, IN COMMEMORATION OF ITS THIRD ANNUAL FESTIVAL, SEPTEMBER 22, 1835.

BY MALTHEUS A. WARD, M. D.

Continued from page 233.

If we turn to books on gardening, even by respectable writers, how vague, and sometimes how absurd, are the general directions for preserving fruit trees 'from the slug,' and 'from the caterpillar,' as if all slugs and all caterpillars were alike, infested the same trees, appeared at the same time, and were to be destroyed by the same means. In this, as in medicine, the disease must be sedulously watched from its commencement through all its stages;—accurate observations must be noted down even on the most trivial points;—and finally, *if the injury does really originate in an insect*, specimens of that insect in all its stages must be preserved. With such materials the naturalist's advice may be asked with some prospect of advantage. How this subject has been so unaccountably overlooked I know not; but I do know that it deserves the immediate attention of this Society, and might well be entitled to its highest premium.

The science, however, which sheds the strongest and most widely diffused radiance upon the labors of the Horticulturist, is *Botany*, in all its branches, but more especially that of *Physiology*, which teaches the structure of plants, and the functions of their several organs; for the gardener, like the physician, has to deal with the vital principle;—and, like him, should understand the anatomy and physiology of the subjects that come under his care. This is essential, in order to enable him, in any other than the hazardous manner of an empiric, to promote their health, to recognise their diseases, and to apply the appropriate remedies.

This, as a distinct branch of botanical science, is not of a very remote date, and, notwithstanding the immense force of talent which has been made to bear upon it, is still in an imperfect state. The principal English writers in this department are Grew and Hales, who treated of the solids and fluids of plants; Dr Priestley, who brought in the aid of Pneumatic Chemistry; and Dr Darwin, whose 'Physiologia,' notwithstanding the unpleasant coloring, which his peculiar philosophical notions concerning vitality, has thrown over it,

ought to be carefully studied by every one who would manage his garden well himself, or know when it is well managed for him by others;—and lastly, Mr Knight, of the extent and utility of whose labors, it would be impertinent in me to think I could inform this audience. The principal European laborers in this field, are Malpighi, Bonnet, DuRoi, Desfontaines and DeCandolle; and particularly the late French writers, Mirbel, Turpin, Poiteau and Dutrochet, who, in this path, are far in advance of their English brethren. Indeed, the latter advanced so far that he has been obliged to retrace at last some of his steps, though his merits on the whole are unquestionably very high.

It is probable that many, though perhaps not all, in this assembly, are aware that to Monsieur Dutrochet was awarded the medal of the French Academy, for his researches on the *Motilité*, or cause of motion in plants,—particularly with regard to the flow of sap. This he ascribed to a sort of galvanism, or intracapillary electricity: to the two currents of which, or more properly, to the motions produced by them, he gave the melodious epithets of *endosmose* and *exosmose*. His experiments and his reasonings were, however, afterwards shown to be fallacious; and, with a degree of candor and love of truth, more honorable to him than many golden medals, he retracted his opinions.

Another gentleman has still more recently come forth with the publication of a series of experiments and inferences, which are said to prove satisfactorily, at least to himself, that *caloric*, in its annual and diurnal fluctuations, is alone the cause of movement in the sap. It were well, perhaps, if both these gentlemen had been satisfied with attributing the phenomenon to an inherent vital action, without puzzling themselves with a vain search after first causes,—which always leaves the most successful inquirer exactly where he set out.

Although observation is the faculty principally employed, in the study of Natural History, and should always be on the alert to surprise Nature in the midst of her operations, and thus detect her secrets; yet, in some cases, and to a limited extent, experiments may be employed to extort them from her. But the Naturalist cannot, like the Chemist, regulate the conditions of the phenomena he studies; nor can he separate the elementary parts from each other, in the objects he examines. Such objects usually come under his view in a complex form; and he can decompose them and analyze their component parts only in *thought*.

What a variety of conditions, for example, are necessary to vegetable life! If, in attempting to analyze the nature of life, we were to separate from it any of those requisite conditions, its duration must instantly cease, and the object of our researches be frustrated; so that, in matters like this, the utmost we can ever expect to attain is but an approximation to the truth.

More observation will, however, avail but little without comparison. We must observe attentively the same body in the various positions in which it is placed at different times by Nature; and we must compare different bodies with each other until we can recognise any invariable relations, which may exist between their structure and the phenomena they exhibit. Thus may such bodies, when diligently observed and carefully compared with each other, be considered as experiments ready prepared by the hand of Nature; who may

be supposed to add to, or subtract from each, in the manner the Chemist does in his laboratory with the inert materials subject to his control,—and herself to present us with the result of such additions and subtractions. In this way we may arrive at some knowledge of the laws which regulate the phenomena of Natural History, strictly speaking, subject to our observation; and which are employed by the great Governor of the universe with the same determinate precision, as those which are opened to our view by the general sciences.

The reproduction of vegetable forms is unquestionably a vital process, but there is no reason to believe that more may not be known respecting it, than has yet been developed; and it is possible future researches may throw such light upon its different modes, and the modifications of which it is susceptible from the varied conditions under which it may take place, as will enable art to effect a proposed end, by supplying and arranging those conditions. The whole surface of the globe has now been so thoroughly explored, that we can scarcely expect the *discovery* of any very important addition to our kitchen, fruit, or even flower garden; our principal resource, therefore, for improvement in this respect, lies in the production of new varieties. To avail ourselves of this, with any determinate degree of success, requires that knowledge to which I have just alluded. This field is still open to the enterprising physiologist, and promises a rich reward to him whose industry and skill shall compel it to yield a harvest.

With regard to the other departments of botanical science, viz. Glossology, which teaches the names of the different parts of plants; Phytography, which treats of nomenclature, and the art of describing plants, so that they may be easily recognised; Taxonomy, or the theory of classification and arrangement, applied to plants; Botanical Geography, which teaches the natural distribution of plants over the earth's surface, showing their relations to temperature, elevation, soil, &c., as well as the several minor divisions adopted by modern writers, such as Historical, Agricultural, Medical and Economical Botany,—they may all be studied with an advantage, often essential, and always important, by every one who would have his ground or his intellect cultivated in the most pleasant and useful manner. Picturesque or Landscape Gardening, the period for the study of which is now dawning upon our country, is a subject involving principles profoundly and intricately connected with the most refined and with the most recondite speculations, which have occupied the human mind. Conscious that no notice I could now make of it, or of the studies connected with it, would convey any adequate or satisfactory exposition of the subject, I leave it entire, for a more convenient time and a more able hand.

To be concluded next week.

DOCTOR ELMER'S GREAT OX.

The great ox, Leopard, owned by Dr William Elmer of Bridgeton, N. J. was recently weighed alive, by a patent balance made expressly for that purpose, and his weight found to be three thousand and two hundred and eighty six pounds.

A large placard was hawked about in London, recently, as follows:—

'Dram-drinkers must expect to be the first victims of the Cholera!'

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

Dedham, Ms. Feb. 17th, 1832.

DEAR SIR.—Inclosed is a letter to me from Wm. Robert Prince, Esq., and my reply, which I send you for publication in your valuable paper. Should you, upon perusal, think them worth spreading before the public, you will much oblige your humble servant, by letting them appear in your next paper.

Very respectfully,

Your obliged friend and servant, J. H. COBB.
To the Editor of *N. E. Farmer*.

Lan. Bot. Garden, Dec. 15, 1831.

J. H. COBB, Esq.

SIR.—Your favor of 20th October, in reply to mine of 15th, came to hand on 13th ult. and I am pleased to find that the explanation made and your subsequent examinations, have produced such conviction on your mind, as to authorize the remark therein, that you are satisfied that we 'have the real *Morus multicaulis* and were the first persons who sent it into Massachusetts.' The cause of your misapprehension we now fully understand, and we feel also assured that you will render justice to our exertions to preserve an undeviating accuracy.

As we have been co-laborers in the same cause with yourself, I avail myself of the present occasion to make some comments on the subject. In the years 1787 and 88, the present Wm. Prince, sen. raised an immense number of silk worms and made various experiments in regard thereto, and in 1789 he had silk gloves manufactured at Philadelphia. The worms being well fed and attended to, spun their cocoons in twenty-two days and they were of the largest size. The silk, when prepared for the loom and boiled in soap-suds made from the white soap, was perfectly white and glossy, and proved very strong. He constructed a reel of pasteboard, to wind two skeins on at a time: twelve of the silk worms threads formed one thread of silk for each skein, which passing through a wire with two holes or rings, the wire being connected with the axle of the wheel, causes the thread to be wound in a zigzag manner upon the reel. The silk, after being doubled and twisted, contained 144 of the natural threads; that number being requisite to form a thread coarse enough to be woven by the finest loom for stockings and gloves, then in Philadelphia, according to a sample sent by the weaver.

In the spring of 1826, when the subject of silk culture created an universal interest among our citizens, being myself desirous to concentrate every information possible, relative thereto, I sent to France for every publication connected with the subject; and in return, received *eighteen* distinct works. The Hon. Richard Rush, then Secretary of the Treasury, being called upon about that period by Congress, to prepare a complete Manual upon that subject—my father, Mr Wm. Prince, had the satisfaction of replying to a number of communications from him and Dr Menze, and of imparting the information desired from him in the progress of that work; and some of the publications which I had imported, were also loaned them at their particular request, they not being obtainable elsewhere. I am happy also to add that our intelligent fellow citizen, Dr Felix Pascalis, has

found them useful to him in the course of his scientific elucidations, and even at the present day I believe duplicates of some of them are not to be found in our country.

The same sentiment which dictated the importation of books, influenced me to import all the requisite trees; and I forthwith ordered from France, Italy and elsewhere, every variety of the Mulberry, used for feeding silk worms. The result was, that the *Morus multicaulis*, *now so called*, was comprised in those importations under *another name*, and its culture had already been considerably extended in our nurseries, before it had received its present title or its superiority had been made known.

Wishing to disseminate these new varieties, I freely presented them to those interested in the silk culture, and among others, to Gideon B. Smith, Esq. editor of the *American Farmer*, and if I mistake not, his tree of the *Morus multicaulis*, which is only one of the *progeny* from my original trees, was sent him before the same kind had been imported by any other person. That gentleman recently stated to me, that he had near 150 fine trees which he had raised from the single one of the *M. multicaulis*, which I had sent him, and that he had also reared a number from the other varieties. I mention these facts merely to show that we have not been guilty of culpable indifference to the great national object.

Supposing it may also be satisfactory to you to test the respective merits of the new varieties, I herewith transmit you six trees, each one of a distinct kind, as per invoice annexed; and as no one can feel a more ardent desire for the development of our country's resources, and for the attainment of a *perfect* national independence, than my father and self, no one will exert more at that ample success, which we feel confident will consummate the exertions which you and others are making, to advance the silk culture.

Very respectfully,

WM. ROBERT PRINCE.

Dedham, Ms. Dec. 28, 1831.

Wm. R. PRINCE, Esq.

SIR.—Yours of the 15th inst. was received several days since and is now before me; various engagements have prevented me from giving a more prompt reply. I have received, with great satisfaction and pleasure, the trees which you have sent, consisting of six different varieties of the Mulberry, according to the invoice, viz.

- 1 *Morus multicaulis*.
- 2 " *constantinopolitana rozea*.
- 3 " *tartarica*.
- 4 " *lucida lobata*.
- 5 " *laciniata*.
- 6 " *macrophylla*.

I have no doubt that upon further acquaintance with them, important advantages will result. It is by no means yet fully ascertained, what variety of the white mulberry will best suit the different parts of our extensive country, and it is only from repeated experiments and careful observations, that the most useful knowledge in the arts is to be obtained. I know of but few to whom greater credit than yourself is due, for early attention and accurate observation in the important departments of botany and horticulture.

I am satisfied that the mistake, as regards the trees sent me and mentioned in my Manual, page

22, arose from misapprehension and from the species not being sufficiently designated among the great variety in your catalogue; and on reference to the invoice sent me, I find that the trees sent are not therein designated as the *Morus multicaulis*, but as the *Broad leaved Chinese Mulberry*, by which I understood to be meant the *Morus multicaulis*, but it appears that there are more varieties of the broad leaved Chinese mulberry, than I was acquainted with. I saw the trees from your original stock, in the garden of Gideon B. Smith, Esq. of Baltimore, during the last summer. I also saw, as I suppose, some of the books which you had the liberality to import and put into the hands of the most eminent and respectable Dr Pascalis. The instructions contained in them for rearing silk insects, are not well calculated for our country, though they furnish much valuable information.

I regret that Mr Wm. Prince, senior, your respected father, did not persevere in his patriotic labors in the culture of silk; although for his actual efforts he must be considered a benefactor to his country. I fear it will be a great while before we shall raise silk enough for home consumption. I am obliged to use the China silk chiefly in my manufactory: it is running on my spindles now. Instead of pursuing the old fashioned way, of twisting one thread at a time, I have a *throwing mill* of 164 spindles, and am now throwing silk off from 16 to 20 cocoons.

I hope to be able to supply my mill altogether from American silk in a few years, but the art of filature is so imperfect at present that I cannot depend upon it, but use chiefly foreign raw silk.

Wishing you all success in the development of horticultural resources, and particularly in the culture of the vine and mulberry,

I remain, respectfully,

Your friend and servant, J. H. COBB.

CULTURE OF RUTA BAGA, &c.

Portsmouth, N. H. Feb. 10th, 1832.

To the Editor of the *N. E. Farmer*.

SIR.—Observing in your paper some remarks upon the culture of Ruta Baga, and having made an experiment in a small way upon it myself, the past summer, I will give you the results of my experience, and some of my ideas upon the subject. I most earnestly hope that nothing which I say, will occasion an unfriendly feeling on the part of any one; it being my disposition and determination to consider every one engaged in increasing the extent and precision of our agricultural knowledge, as a fellow-laborer in the cause of truth.

The autumn before last, I took up, amongst others, a piece of land that had not been ploughed for some years, and was covered in some places with a strong red-top sward, in others with a beggarly growth of clover, and in some places with almost nothing; chiefly awarn, dry and rather good gravelly loam than otherwise, and the rest of a soft, reddish sandy one; like most of the land cultivated at present, of very bad reputation. The current in this quarter is in favor, either of the deep, strong clays, which are not uncommon in this vicinity, and which grow for several years, with very high manuring, fair crops of timothy; but neither potatoes, Indian corn, nor anything else we grow, which is adapted to the really rich land, of which there is also abundance.

This patch I ploughed in autumn to get it out

of the way. I am not a particular advocate for ploughing at that season. It made about five and a half acres, out of upwards thirtyfive which I ploughed, chiefly myself, that year. I hauled upon four and a quarter acres of it, thirtythree large cart-loads of sea-weed and rock-weed. I learn from your paper, (to show the difference of non-melature at so short a distance,) that sea-weed in the vicinity of Boston, means eel-grass,—here, it means kelp. This shows the importance of *ternas*, to understand one another. Most of this was put on before ploughing. I was unable to discover much difference in the crop of corn, where it was laid on, afterwards. I say this as an acknowledgment to be fair with every body; as I am an advocate for all manures being ploughed in at all times. This patch was ploughed nearly as I should wish to break up gravelly loam, but not quite; it just touched the sub-soil; I should prefer turning a little of it on the top, if ploughed in the autumn. I intended to have laid on eight loads of sea-manure to each acre; but had no time to haul more; and one and a quarter acres was left, on which I laid large loads of slaughter-house manure in the spring. I planted the sea-weed part with Indian corn, which I also dunged in the holes. On this subject I have this opinion. The season of 1830 I believe corn was the better for it. That of 1831, I am inclined to believe it really did as much harm as good, and was a total loss of labor and manure; forcing the ears forward before their time. The remaining one acre and a quarter I sowed with mangel wurtzel seed, the beginning of May, in rows, and it was done with extreme rapidity. I have always had a high opinion of this root, and have now; and it is stated by all writers, to be less liable to the fly than the Swedish turnip. But now for the facts:—The whole of them were destroyed, totally, by some fly or bug, except a few plants, which did not do extraordinarily well after all; and on the 1st of July, I ploughed it lightly over again, with its weeds, and sowed it to the turnip, broad-cast, as a waste crop. The turnips came up beautifully, but the weeds still better; and being determined to see the issue, I set one of the men to weed it by hand. He began at one end and went on to the other; but by the time he had got a third part of the way, it was too late. When I sowed the turnip again, I shall sow it the 1st of June and hoe it regularly. From the one-third of an acre which was sowed, though sowed broadcast, I got at least, two hundred bushels; and I do not believe that the same land, with the same culture, would have produced more than fifty of potatoes. It had out rather more than one load of slaughter-house stuff, and no other manure.

As to the value of the turnip, as a crop, I agree with Mr J. B. as to his inference; so far as that, I think it deserves a place as our third crop, with Indian corn and potatoes. But I wholly differ from him as to his premises. I do not think a ton of turnips contains half the nutriment of a ton of potatoes; nor a bushel, a third part of a bushel of potatoes. But now for other considerations:—The seed costs but little; it is, however, said to be of the highest importance that it should be of the best sort, (I believe the seed I obtained of Mr Russell, to be of that character.) The sowing costs much less time at an important season; the hoeings, the same. It will grow much better than the potato on sandy land; but do not let me be understood to say that it requires land less rich

than the potato; or that the potato will grow best on still land. It produces a great deal of top, which may be fed in the field, and of which all animals appear to be outrageously fond; and sheep are to an immense extent, I am told, fattened on the turnip in the field, without much trouble, in various parts of England, and you get an immensely large crop of the turnip then. To be fair, again, however, I will state that my colts did not like them; and that though the cows gave a great increase of milk, it was injured in taste; as also the butter, though of a beautiful color. The turnip-lushandry, however, I take to rest on another foundation, on which I shall explain my notions.

The true *intrinsic* value of a crop to a farmer, is in the nutriment it contains, and in the proportion between the *exhaustion of the soil and what it returns to it*. For instance, on good land, when it does not blight, you may get twenty bushels of wheat off of an acre. We hear of much larger crops, but this is a good crop, on any but the very richest land, or with high cultivation. You get, then, perhaps, two thousand pounds of grain and straw off an acre, which can be returned to the soil. This is the smallest proportion of manure to exhaustion, we know of; and wheat is of little *intrinsic* value to the farmer. The price has nothing to do with its intrinsic value; wheat will always command the best price for bread, and in a new country it best bears transportation, from the proportion of its price to its bulk.

On the same land, generally, you will get forty bushels of Indian corn; except, perhaps, that there may be some difference in the kind of land which wheat prefers. On the sea-board, the proportion of Indian corn to wheat, is greater; even when the wheat does not blight, you get then forty bushels of grain, nearly as nourishing as wheat and an abundance of fodder; say 4500 lbs. of crop in all off an acre, which is to go back; the soil being no more exhausted than by the wheat, if it is as much. Indian corn is then of far higher *intrinsic* value to a farmer, as a crop, than wheat is.

On the same land with the various deviations from this rule, from the crops preferring particular kinds of soils, you will get two hundred bushels of potatoes. You will, here, get generally more in proportion. The two hundred bushels of potatoes will contain about as much nutriment, as the forty of Indian corn with the fodder; but not so good in its nature for stock. There is *no substitute* for grain. That the crop of potatoes will weigh on the ground 14,000 lbs. or nearly that, the roots alone, which is to go back; and though it is *my* belief that they exhaust the land rather more than the Indian corn, and that they are not so good for stock, (for horses, though I have frequently fed them on them, I do not like them for continuance,) yet the return to the soil is so vastly greater, as to more than bring up the difference.

On the same land, you will get, barring the fly, (of which I know nothing; it is seen they let my turnips go, and killed the beets, and which I forgot to mention, for there was some turnip seed among the beet seed, the fly or bug left the turnip *when* he took the beet;) at least, 400 or 600 bushels of turnips. This crop with the tops, will not more than equal the crop of potatoes or the Indian corn in nourishment. I take care to claim no more than I think the turnip deserves; but I think it better food than potatoes for them. But now there is a great superiority in the return to

the soil of the turnip, over the other crops. The crop of turnips, all told, will weigh from 22,000 to 34,000 lbs. all of which is to go back, and though it may exhaust the soil more than either of the others, yet the manure brings up the difference; and they reduce the soil to a great state of fineness. I do not pretend that there may not be a great difference in the quality of the manure, but to take the extreme cases, it seems impossible that the 30,000 lbs. of turnip crop should not return more to the soil, than the 2000 lbs. of wheat crop.

The best use of the turnip crop seems to be the feeding them off in the field, with fitting sheep; huddling them on what they can eat at a time. This system, I am told, I read, I am led to believe, for I know nothing of English farming, is practised to an immense extent in England; the next crop in rotation being clover. No doubt some of our readers are able to inform us about it. Our climate prevents this being done to the same extent as it is there done, in the winter. The turnip may stand slight frosts, but it will not stand hard ones; as I know by experience. It is notorious that the county of Norfolk, with the poorest and generally sandiest and marshiest soil in England, has been said to owe its great agricultural prosperity for the last half century, to the turnip-lushandry; perhaps the claying of land and general intelligence helped the matter. This was before the Swedish turnip made its appearance in England, whether it now supersedes the English there, I do not know; but I understand the Swedish turnip has the very highest reputation in England.

DISEASES IN HORSES.

As to coughs in horses, though I earnestly beg not to be understood to affect an extraordinary knowledge of the subject, though I once made a good deal of study of horses, and have always endeavored to expose the system of quackery which infects the United States, as well as other countries on this subject, I can state that there are no safe remedies for common coughs, but those used for human subjects; that for the distemper the horse should neither be worked nor fed; that for chronic coughs there is no cure, only palliatives, of which bleeding is *not* one; and that young horses sometimes have coughs for a year, and yet entirely recover from them. JOHN L. ELWYN.

PRODUCTIVE PUMPKIN VINE.

MR FESSENDEN—After seeing your account of Mr Whiting's Squash Vine, of Lancaster, Mass., which produced 228 lbs. I endeavored to persuade Mr J. Cook of this place, to report his crop of pumpkins, but he declines, as I presume from modesty, or from an apprehension that it would not be credited. I am therefore induced to give the information, as I received it from himself and the members of his family.

The plant came up single, accidentally, among his early potatoes, and as the potatoes were gathered, occupied the whole space and continued to extend itself until the frost checked its growth, when it contained, from the largest down to the size of a lenon, upwards of one hundred and forty, (and there were many more just set, with the blossom unshed,) seventy-two of which were of good size for use; and twenty-two which were selected for culinary purposes, weighed from 28 to 48 pounds. It is to be regretted that they were not all weighed and the length of the vine and branches measured, which ran to an incredible length, and were producing new sets faster and thicker, when the frost

checked the plant, than at any other previous time. This pumpkin is different from any which Mr Cook had ever before cultivated or seen. Its shape was, generally, like that of a cheese-pumpkin, but the ribs were much more broad and deeply scoriated; when growing, of a lighter or duller green; and when ripe, of a nankin color, or rather darker, heavy for their size, fine grain and small cavity for seeds. The one which he was so obliging as to send me, though of a medium size, with reference to the crop, is as much as I can well lift with one hand, by the stem. The flesh through the ribs, is three and a half inches thick.

Bridgeport, Ct.

B.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, Feb. 22, 1832.

INJURIOUS EFFECTS OF LIVERPOOL SALT.

An article was published in the *New York Medical Repository*, vol. 1, p. 211, new series, (an able work, formerly conducted by Dr Miller and Dr Mitchell,) on the subject of 'the spoiling of beef, pork, and butter, when cured by Liverpool salt, &c.' In a letter from Dr Mitchell to Charles Caldwell, M. D. from which the following is abridged and extracted; the bad qualities of that substance are forcibly represented.

In the course of trade between America and Great Britain, it has become the misfortune of the United States to be visited with frequent cargoes of salt from Liverpool. This article is prepared on the western coast of England, where coal can be bought at a low price, by boiling ocean-water, saturated with the rock-salt of Norwich, in large and shallow pans of iron. The salt which remains, after the water has been evaporated by force of fire, is called *pan-salt*, and is a medley of saline substances. It is very different in its qualities from the pure muriate of soda.

The loss of property and life consequent upon the employment of this salt, is prodigious. Experience, year after year, has proved it to be incapable of preserving our beef from corruption. Often has this important article of food been found to be tainted, the very autumn in which it has been packed in barrels. Besides the sacrifice of property, we find that the employment of Liverpool salt in the packing of beef and pork, leaves them liable to corrupt; and the consequences of this corruption are pestilential exhalations, stirring up yellow fevers and other malignant distempers in the neighborhoods, cities and vessels, where the bodies of those slaughtered animals are deposited.

The butter of New York market has also been rendered worse, if not absolutely spoiled, by the same kind of salt. Beguiled by its fine and showy exterior, the citizens have used it extensively in our counties famous for grazing and dairies. In many cases it has supplanted the old fashioned coarse or sun-made salt. Wherever the substitution has been made, it has been with a pernicious effect. The butter so salted, does not keep so well, loses its agreeable flavor, and acquires rather a disagreeable scent. The difference between butter put up with this salt, and with natural crystallized salt, is so great that our wholesale and retail grocers can distinguish it at once, by the smell, on piercing or opening a firkin. The sweet flavor and nice odor, which pure sea salt

gives, is altogether wanting in that which is seasoned with the other.

And thus as Liverpool salt is the remote agent of so much loss, damage and misery in the United States, it is high time to cease both to buy and consume it. In its stead, salt from the Bay of Biscay, Portugal, Isle of May, or the Bahamas, may be employed with perfect safety.

The fault of Liverpool salt, and of all other salt obtained from sea water, by force of fire or by boiling, is its admixture with foreign ingredients, known by the technical names of *slack* and *bittern*. These usually adhere to the salt in considerable quantities. They have no antiseptic virtues, but possess a directly contrary effect. Sea salt, formed by natural evaporation and crystallization, has very little mixture with these foul and foreign ingredients.

¶ The Trustees of the Massachusetts Society for promoting Agriculture, intending to publish another No. of the Repository which will contain their full Reports, have given below only the names and sums to notify the successful competitors.

PREMIUMS AWARDED BY THE SEVERAL COMMITTEES OF THE MASSACHUSETTS SOCIETY FOR PROMOTING AGRICULTURE.

The Committee on vegetable and grain crops award

To Mr PAYSON WILLIAMS of Fitchburg, *Twenty* dollars for the greatest crop of potatoes, being 584 bushels on an acre.

To Mr JOSEPH PERKINS of Newbury, *Twenty* dollars for the greatest crop of onions, being 646½ bushels on an acre.

To Mr JOHN WILSON of Deerfield, *Twenty* dollars for the greatest crop of winter rye, being 342 bushels on an acre.

To Mr HENRY SPRAGUE of Princeton, for the greatest crop of Indian corn, being 109 bushels on an acre, the mode in which the quantity was estimated differing from the mode required in the offer of premiums—a gratuity of *Ten* dollars.

P. C. BROOKS, *Chairman*.

The Committee on Farms,

Report a gratuity to the Rev. MORELL ALLEN of Pembroke, of *Fifty* dollars, for the example he has set of skillful and judicious husbandry. They also report a gratuity to JONATHAN ALLEN, Esq. of Pittsfield, of *Thirty* dollars, for the care he has taken to introduce upon his farm, vegetable products and choice fruits, and especially his attention in the cultivation of potatoes. Mention is also made of the great merit of PETER THACHER, Esq. of Attleborough, in subdividing and bringing to a state of good cultivation a farm, which a few years since consisted of rough, exhausted and profitless land. WM. PRESCOTT, *Chairman*.

The Committee on Inventions, Experiments, Trees, &c. report, though none of the claimants are strictly entitled to a premium,

To JAMES THACHER, Esq. M. D. of Plymouth, a gratuity of *Ten* dollars, for the communication of his interesting researches, with a view of preventing the ravages of the bee moth.

To the Rev. M. BARBOUR of Byfield, Mass. a gratuity of *Ten* dollars, (who has deposited at the Agricultural Warehouse his ingenious apparatus,) for the more easy and effectual acquisition of the labor of the bees without their extermination.

To the same gentleman a gratuity of *Ten* dollars

for his mode of preventing the ravages of the bee moth.

JOHN WELLES, *Chairman*.

¶ Models of Thacher's, Barbour's, and Beard's new Bee Hives, may be seen at the Agricultural Warehouse, North Market Street.

AGRICULTURAL STATE CONVENTION.

A convention of the delegates and other citizens from the several counties in this state, met yesterday afternoon, in the Assembly Chamber, to take into consideration the propriety of establishing a State Agricultural Society. J. LE RAY DE CHAMPEMONT, of the County of Jefferson, was appointed Chairman, and JESSE BULL and AMOS BRIGGS Secretaries. One hundred and four delegates were present, representing the Counties of Albany, Columbia, Clinton, Dutchess, Essex, Jefferson, Monroe, Montgomery, Oswego, Otsego, Rensselaer, Saratoga, Steuben, Schenectady and Yates.

Various propositions were submitted; and the convention adjourned until to-day.

Albany, N.Y. *Argus*, of 15th inst.

Salem Lyceum.—During the present week, the lecture before this institution was delivered by the Rev. Mr Colman. The subject was Eloquence, which was happily and forcibly illustrated by the speaker. Mr Colman being about to leave us as a citizen, very properly took the occasion to address to his fellow townsmen present there, a few parting and pertinent words. We, and we believe in common with all, sincerely regret the occasion that takes from us, one who has bound himself to us by some of the most useful and most endearing qualities of human nature.—*Salem Observer*.

Preserved Apples.—Mr Alexander Walsh, of Lansingburgh, has presented the Editor of the N. Y. Farmer some apples, the growth of 1830—the russet grown by Mr Walsh, preserved in brand and in sand. Those in the latter were in the finest state. Also a moderate sized red and white apple, raised by a farmer east of Lansingburgh, and preserved in sand by Mr F. Fordham, of the same place. This was as fair, and in as sound a condition as though the growth of last season.

Rail Roads in France.—The *Messenger des Chambres* says, 'We are much occupied at Paris with rail-roads.— Besides the road from Paris to Pontoise, the contract for which has just been granted to Messrs Henry, Maffet, and De Rushby, the companies have projected the making rail roads from Paris to Lyons, and from Strasburg to Paris. It is said that Sir Henry Parnell has proposed a railway from Calais to Paris. Should a similar communication be established between London and Dover, from sixteen to seventeen hours would then suffice for the journey from Paris to London.'

The best oak wood could be bought at three dollars per cord in Baltimore on Friday last. So much for the rail-road.

TO CORRESPONDENTS.—"Rusticus" in reply to "A Practical Horticulturist" was received too late for insertion this week—an article from Doct. Green on Bots in Horses, will soon appear—many other communications are in the printer's hands.

¶ We would inform our facetious *legal* friend, who displays much acumen without acerbity, 'for that whereas' we lately *republished* the following sentence from a useful and much read volume, 'It is cheaper to buy a large mackerel for nine-pence than two for four pence-halfpenny.' (the words, *small ones* after two, being omitted in the original,) that the error complained of is a *small* one. And should he meet us with a 'demurrer,' and not permit us to 'amend the declaration,' we will 'plead to the jurisdiction of the Court;' and prove that his action was brought *coram non Judge*, of course *Piff* will be 'unsuited and taxed with costs.'

New Work on Fruits, &c.

JOHN B. RUSSELL and CARTER & HENIFF, Boston; G. THOMER & SONS, New York; GREGG & ELIOTT, and CART & HART, Philadelphia; S. C. PARKHURST, Cincinnati, and WM. THORNTON, Albany, have in press, and will publish in a few weeks,

THE

NEW AMERICAN ORCHARDIST,

OR AN ACCOUNT OF THE

MOST VALUABLE FRUITS AND VEGETABLES

ADAPTED TO CULTIVATION

IN THE

CLIMATE OF THE UNITED STATES,

WITH THEIR

MODES OF CULTURE AND MANAGEMENT; REMEDIES FOR THE MYRIADS TO WHICH THEY ARE SUBJECT TO FROM CANKER WORMS, BORERS, &c.

BY WM. KENRICK.

This work will contain particular descriptions of from 700 to 800 select varieties of fruit, adapted to our varied climate, and will include the Olive and some most useful tropical fruits which may be successfully cultivated in our Southern territories.

The different modes by which the new varieties of fruit have been obtained, will be described; modes of pruning and training, by which trees, &c. are rendered fruitful; of grafting and inoculation; and of the modes of propagating usually adopted.

It will contain descriptions (besides old sorts) of from 100 to 120 new varieties of Pears of UNDOUBTED EXCELLENCE; from 60 to 20 of which are not particularly described and condensed in any one European volume which has hitherto reached us; some American, but chiefly the new and most approved Flemish varieties.

The descriptions are partly from personal observation, and from assistance received from some of the most intelligent horticulturists of New England; from the best writers of America, and the best foreign productions; the descriptions of Van Mons, the splendid edition of New Duhamel, the Pomological Magazine, the superb *Pyrus Malus* Breitenfordensis of Ronald, and Lindley's Guide to the Orchard and Kitchen Garden. From these it has been the constant aim, to cull from their *extremely varied and select lists*, all that was *beautiful, excellent, productive and profitable*.

From these will be formed *another select list*, of those sorts already approved with us, as the best and most productive.

In regard to the *new varieties* of fruits of America and of Europe, it will be the aim of the writer, to render this work particularly interesting, and adapted to the different sections of our highly favored country.

The very best of late English works, we refer to those just named, those celebrated works which are beyond all doubt so admirably adapted to the climate and country for which they were principally designed, and as auxiliaries to us, are extremely deficient in regard to those native fruits which are with us so highly esteemed. We will instance some; with others it is even still worse.

In their description of apples we find very few, scarce half a dozen, of our fine native varieties described or even named: those fruits which agree so well with us—the selections from the innumerable native orchards of our country during two centuries.

They describe but *one variety* of our native pears, and in the place of those not described, they recommend to us other varieties, the *very sorts we have long since rejected*.

They describe but two varieties of our native peaches, so much admired by travellers; some, the finest of the South of Europe are equally unnoticed,—the fine selections from the vast native orchards of this fruit at the South, for distillation,—all these, the productions of our own and other equally favored climates, are rejected from their lists as

'worthless,' not being adapted to their hostile seasons and latitude, and not coming to full maturity and excellence, even on the walls to which their cultivation is confined.

A few engravings may be furnished, such as a plan of the Thomery mode of training Grape Vines; the quenouille mode of training trees, &c.

It will be comprised in one volume of about 300 pages, and will be furnished for about \$1 per copy. Feb. 22.

Hemp and Flax Seed.

CASH will be paid by the subscriber for a few bushels of fresh HEMP and FLAX SEED, well cleaned, of American growth, for sowing; to be delivered immediately. J. B. RUSSELL, No. 52 North Market st. Feb. 22.

The Horticultural Garden of the late Andrew Parmenter, is offered for Sale.

THE reputation of this establishment is not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyn, Long Island, at the junction of the Jamaica and Flatbush Roads, and contains 24 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed by a pointed stone fence, and made up of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; also, a splendid collection of Roses and Herbaceous Plants,—the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers' Houses, seven Cisterns, and a never-failing Pump of excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any person who wishes to engage in the occupation of Gardening, by the purchase of this property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such as to warrant the belief that the purchase of the property will amply repay the enterprise of the one who may engage in the business.

Terms will be made known by applying to Mrs. PARMENTER, on the premises.

N. B.—Any orders sent to Miss P. will be promptly and carefully executed. 6t

Situation Wanted.

A Gardener, who considers himself thoroughly acquainted with his business, in all its branches, is familiar with forcing fruits and vegetables, is desirous of a good situation. He has a wife and two children; has lived upwards of seven years at his last place, and can produce satisfactory recommendations from his last and all his other employers. Inquire at the Farmer office.

A Farmer Wanted.

WANTED to hire, in the vicinity of Boston, a man of middle age, who is thoroughly acquainted with farming in all its branches. Inquire at this office.

Bremen Geese.

FOR Sale, 3 or 4 pair of large Bremen Geese, of undoubted purity of blood. Inquire at the N. E. Farmer office. 4t Feb. 15.

Farm for Sale.

ON the road leading from Newton, west parish Meeting-house, to Waltham Factory, containing from 50 to 75 acres of Land, well proportioned into mowing and tillage—also, House, Barn and Out-houses with the same. Said farm is well watered, and has a valuable fruit Orchard. Apply to EPH. MCNAMARA. Feb. 15. 6t

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the past season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Seeds for Country Dealers.

TRADERS in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 50 1/2 North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves.

— ALSO —

GRASS SEEDS of all kinds,—Hemlock, Timothy, Red Top, Red and White Clover, Lucerne, Orchard Grass, Fall Meadow Oats Grass, &c. &c. at the lowest market prices, wholesale and retail. Feb. 15.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No 110 State street, by ALBERT FEARING & CO.

MISCELLANY.

From a late London paper.

COURT OF REQUESTS: GUILDHALL.—*A Horse Shaved.*—A gentleman, named Wells, was summoned before the Commissioners by Thomas Field, a hair-dresser, for the sum of thirty shillings, the price demanded by the plaintiff for shaving a horse.

The plaintiff swore that the defendant brought to him a horse to be shaved, for the purpose of 'showing a new coat' upon the animal. The horse had been attempted to be shaved by the defendant, on part of the stern, but for want of skill in the art, the poor beast was most miserably notched. The defendant got tired after four hours' work, and then handed over the job to the plaintiff. The razors of the shop were in great requisition for ten days, during which time the shaving was going forward, and the plaintiff was obliged, as he proceeded, to wrap up the bald part to protect the horse from cold. The Commissioners, he said, could not possibly judge the difficulty of shaving a horse, from themselves. [A laugh.] It is quite a different sort of business, and he decided any man to 'go over' such a sized animal, for less than three shillings a day, and to go over the chins of his usual customers at the same time.

Mr Meyers (one of the Commissioners) asked what objection was made to the charge?

The defendant said that he considered the sum of thirty shillings, for merely taking the hair off a horse, entirely too much, especially as he (the defendant) had done a good deal of the job himself.

The hair-dresser declared that the part upon which the defendant had operated, was so badly done, that if he had not been shaved again, the coat would have been as rough as a hedgehog, while all the rest was as smooth as a new born baby. [Laughter.]

The defendant said that any horse clipper would have completed the business for a great deal less money.

The hair-dresser said that it was quite impossible. He had never shaved a horse before, but he was a regular sweater.

Mr Meyers asked the defendant what he generally paid for a shave, himself.

The defendant, (feeling his chin,) why two pence I think, is generally the price.

Mr Meyers. Ay, a penny a cheek. Now, how many of your jaws would make up the size of a horse? [A laugh.]

The defendant said that there was less delicacy necessary in shaving a horse than a man.

Mr Meyers. Not a bit more than shaving an ass.

The hair-dresser. Look at the leather and the chance of a kick! [Laughter.] Besides, I went over the beast as clean as possible. I turned him out as smooth as my hand, down to the fetlock.

Mr Meyers said that he was surprised at the refusal to pay 30s. for the job. Indeed, he always thought it impossible to perform a thing of the kind, and he believed that to be the general belief: for was it not unusual for people to say, when they heard a bouncing fib, 'Next comes a horse to be shaved!' [Loud laughter.]

The hair-dresser said that it was a hard matter to shave some parts of the horse, because the skin here and there hitched very much. For his part, he'd rather 'go over' a whole regiment of soldiers.

The defendant was then ordered to pay the hair-dresser the 30s. and costs.

CHOLERA.—It seems unaccountable that the Cholera spreads such terror before it, when both in this country and in England there are many evils existing, which are far more formidable. The Cholera is a mere bagatelle, compared with intemperance. Consumption, which is chiefly the result of improper dress and unreasonable exposures, is really more dreadful in this country than half a dozen choleras. If even tight lacing, alone, could enter the lists with the Cholera, and if we were in the habit of betting, we would lay two to one that the Cholera would be worsted. Tight lacing usually does its work under cover of convulsions, consumption, &c.—*American Spectator.*

Count Abensburg, who in Henry II's progress through Germany, while the other courtiers came with their treasures, brought his thirty-two children, and presented them to his sovereign, as the most valuable offerings he had to bestow.

The recorder in London, at a city dinner, having been called upon for a song, regretted that it was not in his power to gratify the wishes of the company: a worthy alderman, who was present, observed, that he was much surprised at the refusal of the learned person, as it was notorious that numbers had been transported by his voice.

Tom Browne, having once asked a man how he contrived to live so well in these hard times, was answered, 'I live, as I suppose you do, by my wits.' 'Faith,' answered Browne, 'I have not the time to do a great business on so very small a capital.'

Dr Robertson observed that Dr Johnson's jokes were like the rebukes of the righteous, compared in scripture, to excellent oil: 'Yes,' answered Edmund Burke, 'but they are like the oil of vitriol.'

Henry VIII. having a quarrel with Francis I. resolved to send an ambassador to deliver an angry message to the French monarch. Bishop Bonner, being chosen for this office, told Henry that the mission would cost him his life. 'Should Francis dare to sacrifice you,' replied the enraged king, 'I will immediately cut off the heads of all the Frenchmen in my dominions.' 'So you may,' answered Bonner, 'but will any of them fit my shoulders?'

A good bread.—A mixture of two parts flour, and one potato, makes an agreeable bread, which cannot be distinguished from wheaten bread. It is said that not less than 300 tons of potatoes are consumed for this purpose in London every week.

It is a truth, that the observation of all business men will confirm, that generally a young man of steady habits, of a right education, of industry, prudence and economy, is as certain of becoming rich, as is a stream of water of flowing to an outlet. We except, of course, the intervention of circumstances not to be controlled, long sickness or death, reflected misfortunes, &c. Why, then, it may be asked, are so many truly worthy, and remarkably industrious men, destitute of competency? We reply, that they may not have had a good education; that they may have started wrong; they may have been less provident than their circumstances demanded; their first earnings may have taken a wrong course; single disap-

pointments may have been too severely felt; opportunities may have been neglected; and the great maxim of business men forgotten, 'TRY AGAIN.'—*U. S. Gazette.*

A bon vivant of fashion, brought to his death by an immoderate use of wine, after having been seriously taken leave of by Dr Piteairn, and ingeniously told that he could not in all probability survive 12 hours, and would die by eight o'clock next morning, exerted the small remains of his strength to call the Dr back, which having accomplished, with difficulty, his loudest effort not exceeding a whisper, he said with the true spirit of a gambler, 'Doctor, I'll bet you a bottle I live till nine.'

Farm for Sale.

FOR sale, an excellent Farm in the town of Peterborough, N. H. Said Farm is pleasantly situated about a mile from the village: formerly the residence of the late John Smith, Esq. and contains about sixty acres of good land, well watered, with a good House and Barn, and other out-buildings. Terms reasonable, and possession to be given the first of April. For further particulars, inquire of Dea. JOHN FIELD, near the premises, or at No. 3, Kowe's Wharf, Boston. 31 Jan. 25

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued and grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr., 65, Broad street.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WRIGHT,

46, Milk street, opposite Federal-st., Apothecary.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDERSTORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1

Jewelry, Watches, and Fancy Goods.

WM. AL. WESSON, No. 103 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c., &c., which he will dispose of at as low a rate as can be purchased in the city. [?] Watches repaired and warranted.

Farmer Wanted.

WANTED on a dairy Farm within thirty miles of Boston, a married man to take the same on shares. Good recommendations will be required for capacity, integrity and faithfulness, as also experience in making butter.—Inquire at this office. Feb. 1.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year; but those who pay six months in advance, are entitled to a deduction of fifty cents.

[?] No paper will be sent to a distance without payment being made in advance.

ORIGINAL AGRICULTURAL ESSAYS.

DISSERTATION ON THE MIXTURE OF SOILS.

Concluded from page 250.

Beds of the most valuable peat often lie several feet below the surface. When this substance is removed from its bed and exposed to the action of the atmosphere, it readily yields to a fermenting influence, the first requisite to its becoming a useful constituent part of soil. Peat should always be applied to soils, which tend to an excess in fermentation. At the same time that it opposes the progress of that disease in a soil, it is gradually reduced to a state of decomposition, in which it contains much food of plants. Marl, which is a very rich ingredient in a judicious application of it to soils, is also found at various distances from the surface in the sub-soil. Marl is a composition of several substances, and the nature of those substances must be carefully examined to discover on what sort of soil, a particular bed of it can be applied with the greatest effect. There is what agricultural writers call shell marl. This is a suitable application for almost any soil. It is composed chiefly of animal substances and lime, and therefore will act in any situation as a powerful stimulant. Mr Brown, in his treatise on agriculture, says, 'It would seem that shell marl, from the qualities it possesses, promotes vegetation in all the different ways. It increases the food of plants; it communicates to the soil a power of attracting this food from the air; it enlarges the pasture of plants; and it prepares the vegetable food for entering their roots.

Shell marl is easily distinguished by the shells which always appear in it; but the similarity between earth marl and many other fossil substances, renders it difficult to distinguish them. The common test, however, will be sufficiently certain for all the purposes of the farmer. Earth, that effervesces in acids, partakes of the character of marl, and the degree of effervescence will pretty accurately show to what extent it partakes of that character. But we must not be governed exclusively by the strength and richness of marl, in our selection of situations to apply it; we should also attend to its natural tenacity and the character of the earth about the beds which contain it. If it be silicious earth or coarse gravel, then the marl belongs to cold and clayey soils. If it be a compact and clayey substance, then the marl should be placed on loose and warm soils. When marl is properly applied, almost any desired degree of richness can be produced by it. No other manure will be necessary in the first rotation of crops. But the same cautions are important in the use of this substance, which are so necessary to be observed in the application of lime. Both marl and lime stimulate the soil to unusual exertion, and if nothing else for a long succession of years be applied, there will follow debility, and the land will be reduced to barrenness. This effect is to be feared only in the imprudent and exclusive use of these substances; under prudent management they are powerful and highly important agents. In a correct rotation of cropping and

with occasional supplies of other manures, neither marl nor lime will ever prove injurious.

By digging deep into the earth, all the mineral substances are found which may impart a new texture to soils, or by acting on the animal and vegetable matter contained in them, in the decomposition and solution of it, will assist in furnishing food for plants. The fossils, which, mixed with soils, will increase the richness and fertility of them, are very numerous and no more than imperfectly understood. Every extended advance of the farmer towards the interior regions of the earth, tends to increase our knowledge of the mineral kingdom; as it is likely to furnish the chemist with some new subject of analysis. Excavations may sometimes be profitably made in the earth, for the sole purpose, of mixing the materials obtained, with the different soils on the farm. Experiments of this sort, if they should not result in any addition to the stock of general knowledge, would certainly increase local knowledge, and would impart more correct ideas of the constituent parts of that portion of the earth in our possession and under our immediate control. The substances taken out of the earth in the various operations of society, should always be carefully examined and experiments made with them. In deep recesses of the earth are hidden many precious treasures, and every generation of men have a part to perform in the development of them.

We descend far into the earth for the fossil which now warms so many of our houses, and on which we depend for heat in so many of our works of art. There, also, we can find the choicest substances to enrich our land. All former researches of this nature have been followed with great reward, and there can be no want of motives to perseverance in the work. The preceding remarks have been chiefly confined to substances, which, at the same time they improve the texture of the soils, act on them as manures, either by their stimulating influences or by imparting the food of plants. Such substances form the principal resources for enriching land, in the progress of improvement on a farm. But there is also a mixture necessary as the foundation of improvement in many situations. There are sand barrens and pure clays which produce nothing, and manures applied in the common form and measure will have scarcely any influence. A radical defect exists and a remedy must first be provided for that, or all our applications will be as ineffectual and useless, as the administration of the most nourishing food to a sick man. A soil chiefly composed of sand is too porous; it does not retain enough of moisture; it admits light and heat so freely as to cause a very rapid dissolution of all the vegetable matters that happen to be incorporated with it. We call it hungry soil and say manure does it no good. We conclude manure does no good because it never lasts till any crop is matured. Its force is all expended, like that of a prodigal son, before the highest energies have ever been demanded.

This soil we should not attempt to cure with mere palliatives; we should engage at once in the work of changing, totally changing, the texture of

it. Many of the substances already enumerated can be applied in such portions, as will greatly alter the character of a sandy soil. Alluvion, that has been collected by streams passing over long beds of tenacious earth, with a portion of peat and other vegetable matters, may possibly prove sufficient to remedy all the defects of it. But there is a more expeditious and much cheaper method of accomplishing the object. Clay, extensive beds of which are generally found in the neighborhood of sandy soils, if mixed with them in large quantities will immediately and permanently change their character. The particles of these opposite sorts of earth will mingle in such a manner, that dews and rain will be well retained in the soil, and light and heat will be admitted in degrees sufficient to decompose vegetable substances, as fast as the growing plants will require nourishment from them; but not so fast as before, when there was so rapid a solution that plants were always left destitute of food in an unimproved state.

The clay pit should always be the first resort in the preparation of sandy barrens, to become fruitful fields. No definite rules are necessary in relation to the quantity of clay that should be applied; the eye and the hand will determine with sufficient accuracy enough, when the clay is laid on in sufficient portions to retain moisture, which is the first and principal object to be accomplished. Clay, in an unmixed state, is represented as the most unfriendly to vegetation of any of the primitive earths. All the properties of it, with the exception of its power to retain moisture, are said to counteract the vegetative principle. And some writers have endeavored to discourage, wholly, the use and application of it as an ingredient in soils. In poetic style it has been said,

'He that carts sand makes land,
He that carts clay flings his land away.'

This idea must have been originated in abstract views of the properties of clay, and without any attention to the defects of soils composed chiefly of the opposite earth. Clay, in its natural state, retains too much water for the health and vigor of vegetation; it is too compact for the roots of plants to extend themselves and collect nourishment; it powerfully counteracts the process of fermentation, and plants growing in it often suffer in want of the necessary and proper food. Now all these qualities render it a highly important application on sand. Water passes too soon through sand, and it is not compact enough to give shelter, firmness, and the necessary protection to the roots of plants. Sand powerfully promotes the putrefactive process and often completes it in all the vegetable matter it contains, long before the time of maturity in plants.

In the language of Agricola, 'sand suffers water to filter easily through its pores; clay is highly retentive of water; sand promotes putrefaction, clay delays it; sand suffers the gases set at liberty in putrefaction to escape; clay absorbs the gases; sand opens an unobstructed path for the extension of the roots of vegetables, clay gives them firmness in their course and supplies the moisture, which sustains them. In fine, the two may be classed among the contending elements, of which a union

heightens their common virtues and subdues their defects.'

Clay and sand are the principal earthy ingredients in all soils. The operations of nature have combined the opposite qualities of them in such a variety of ways, as to produce that diversified texture of soil which is found in every country. It must be absurd for us to think the course of nature, in this respect, cannot be usefully imitated by art; that where sand is found in its simple state, it cannot be reduced by the admixture of clay to a good vegetable mould. We cannot easily engage in any work more certainly useful, or that will ultimately prove more productive. The uphill to be encountered in this sort of labor should discourage no man; every step brings gain and brightens the prospect. In these operations the valleys are raised and the hills are beautified. It is work not necessary to be repeated every year or in any short succession of years, but when once well done it is done for ages.

The utility of mixing sand with clayey soil is seldom questioned. This is generally down-hill work, and sand is carried in much larger portions on to clay, than clay is ever carried on to sand. Hence, probably the notion that it is good to cart sand, but bad to cart clay. The effects must be reciprocal and would always so appear, if the work in both cases were equally well performed. Doctrines which demand few laborious duties gain an easy currency, whether they relate to philosophy, morals, or religion; they are likely to grow too popular and to be carried into great extremes. This has been the fact in the estimates made of the uses and in the application of sand; the results have been so manifestly and greatly beneficial, when properly used, the conclusion has been too hastily drawn that its influence must everywhere be salutary, and sometimes it has been used like the good woman's 'sugar, in everything.' The common notion that sand is a suitable application for low and moist lands, is correct only in relation to soils of a particular texture. Many of the low lands have a very loose and spongy soil; there may be defects in them, but sand cannot be the proper remedy. Some low and moist lands will be found, on examination, composed chiefly of sand to the depth of several feet. Mix sand with sand to any extent and the product can be only sand. Sand-hills are treasures, but like every other sort of earthly treasure, valuable only in the proper use of them. There can be no more tendency in sand to stimulate a soil of similar quality to renewed exertion, than there is in increasing wealth to stimulate the miser to deeds of generosity. The proper uses of sand in agriculture are its application to tenacious soils, for the purpose of opening and destroying the rigidity of them; and to clay, for the purpose of reducing it to a state in which the roots of plants can travel and find nourishment. Sand should always be used in compliance with the rule of mixing different qualities.

In closing a discussion of this sort, it may not be deemed strictly proper to present even a summary view of arguments, which, on a different occasion, might be used in persuading farmers to an early and persevering engagement in the work of mixing soils. It seems to be the business of this discourse to describe useful courses, rather than urge the pursuit. It may, however, be allowable to direct attention to the growing importance of the subject we have been considering, in language

used about forty years ago, by the late lamented Dr. Mitchell:

'Hitherto,' said that accurate observer and enlightened friend of progressive improvement, 'hitherto the American husbandman has cultivated a soil, enriched for ages by the yearly addition of a fresh stratum of mould. From the first existence of vegetation upon the dry land, decayed plants have continually furnished a supply of manure, which the winds and the rains have liberally spread abroad. As the supply was annually greater than the consumption, the earth, unexhausted by its productions, increased in fertility. The thick layer of vegetable mould which covered the face of the earth, was a storehouse of food for plants, and their quantity was greatly increased by the conversion of wood into ashes, by clearing. It is not wonderful then, that for some years, newly cleared settlements should abound in produce and require little more labor, than that of ploughing and reaping; for during this period, the provision is wasting which for centuries had been accumulating. But the time will come, and indeed in many places now is, when the land, repeatedly wounded by the ploughshare and exhausted of its richness, shall be too weak of itself to make plants grow with their former luxuriance.'

'This may be called the ERA of SYSTEMATIC AGRICULTURE, when man, taking the earth from nature's hand, bare of manure, is so to manage and dispose it artificially, that it shall yield first a subsistence and then an overplus to grow wealthy upon. How far art may go in this species of improvement is yet unknown, as the *ultimatum of fertility* has never yet been reached. As far as experiments have been made, we find the earth liberally affording its produce in proportion to the labor and skill bestowed in its tillage; and as the ingenuity and invention of man may increase to an unknown and incredible degree, so may the improvements and management of husbandry keep pace therewith, until the most fruitful spot that now exists may produce a ten-fold quantity, and the land which now supports an hundred men, give equal enjoyment to a thousand.'

TEMPERANCE.

There is one subject, closely connected with the interests of every farmer, on which I feel fully competent to advise; without, however, arrogating to myself any merit for having made any important discovery or improvement, I can only respond the sentiments of thousands of others, familiar to all, but unheeded by many; sentiments which should be reiterated again and again from one end of our continent to the other, till all, of every class, are constrained to see their importance.

It is not my design to write a formal essay on temperance and its blessings, or to trace the frightful progress and delineate the baneful effects of intemperance; but let me be permitted to add my veto to the yet too common practice with farmers, to resort to the bottle for a spur, when the labors of an oppressive day are drawing hard upon their strength. I can speak with confidence on this subject, as my knowledge is the result of experience. I assert then, without fear of contradiction, that ardent spirits do not add permanently to the strength or vigor of the laboring man, but their exhilarating effects are sure to be followed by a corresponding languor or depression. Without some very powerful and conclusive reason, the farmer should be

teach last man to countenance or support a practice which he sees is making such ravages. Let him look around him and inquire for the cause why so many farms are so badly managed; why so many buildings are going to decay; why there are so many dilapidated walls and fences, and unruly cattle; why so many uneducated and ragged children, and why so many estates are mortgaged to merchants, lawyers and doctors? he will generally find the cause to be, not that their daughters are more fond of extravagance and fiery than of labor, but that the occupants cannot labor in their fields without the stimulating, deleterious and disarranging aid of a bottle of rum. This is the canker which is gnawing at the vital interests, not only of the farmer, but of our common country.

And now, brother farmers, permit me to direct your attention to a few of the primary reasons, why this practice ought, in my opinion, to receive your unqualified disapprobation. 1st. No satisfactory reason can be given why it ought not to be discontinued. 2d. It has been discovered that the idea that ardent spirits are necessary for persons in health, or as a remedy for exhaustion or fatigue, is a fatal delusion, which has caused the ruin of thousands. 3d. That they possess no one good quality which ought to redeem them from the execration of every virtuous member of society. 4th. That the good they ever have done or ever can do, is infinitely insufficient to counterbalance the evil. 5th. That they are entailing on our posterity a curse, which has nothing but its own shocking deformity to recommend it, as it is totally incapable of being compensated by any substantial good. 6th. They certainly impair the physical, the moral, and the intellectual faculties, and produce premature imbecility and old age. 7th. They effectually eradicate the finer sensibilities of our nature, love, benevolence, cheerfulness, &c. and make us susceptible of the grosser passions, such as anger, hatred, revenge, cruelty, &c. 8th. They drive reason from her throne, prostitute the dignity of intelligent man and transform him into a brute. 9th. They fill our penitentiaries with convicts, our jails with criminals and debtors, our infirmaries with invalids and lunatics, our streets with vagabonds, our country with drunkards, our grave yards with premature victims, and our world with wretchedness and woe. And to balance this dark account, what good do they do? You who yet advocate their use will say, perhaps, that they are necessary for the laboring man in hot weather, when the system is highly excited by heat, to drive it out and cause a grateful and free perspiration, as well as to prevent the dangerous effects of cold water. But I believe you would suspect the man a fool, or beside himself, or trifling at least, who should go into a tavern on a day like some we had in December, rubbing his ears, kicking his boots, and calling for a glass of spirits to drive the heat out! Nor would you think much more favorably of him who, in perfect health, in the dog-days, should wrap himself in his great-coat and swallow a dose of brandy and pepper, to keep him warm or prevent his catching cold! The ridiculous notion that the nature of spirits changes with the season, that they cool in summer and warm in winter, is too absurd to be cherished by the enlightened farmers of New England.

But the most dangerous opinion, and which should be received with extreme distrust, is that which attributes to them the power of defending the system from the injurious effects of cold water;

as no impression can be more fatally false than this. The united testimony of many able and distinguished physicians, who could have no party or sinister objects to promote, corroborate those views. We have the opinions of Doctors Rush, Johnson, Bradford, and a host of others, on the subject, long before Temperance Societies were thought of. I beg leave to quote a single sentence from Doct. Johnson's '*Essay on the Influence of Tropical Climates*':

'The same principles (that is, principles which he applied to tropicals) will apply to our own climate in the summer, and to an error in this particular is to be ascribed a large portion of the sudden deaths, which occur at this period and which are usually ascribed to the effects of an agent, which often plays but a second part in this operation, that is, *cold water*. I do not mean to deny (he continues) that death occasionally happens from drinking water, when the system is in a state of high excitation—but this very state is the dangerous one, and this, in *ninety-nine cases out of a hundred, is produced by spirits*.'

Setting aside, then, the gratification of a vitiated and depraved appetite, I would ask, what apology remains for their use? The answer, if unswayed by the love of rum, must be, none.

As to an article of diet, they are no longer to be tolerated; as an article of luxury, if there is any pleasure in their use, let it be enjoyed by the idle voluptuary, whose time or continuance in life is of but little consequence; but the time and life of so useful a member of society as the industrious farmer, are too precious to be thus trifled with, at least so thinks your humble servant,

JNO. TOWNSEND.

Andover, Con. Feb. 18, 1832.

DISEASE IN HORSES.

MR FESSENDEN,

SIR—We deem it a privilege of the greatest public utility, that we are permitted to exchange sentiments through the medium of your interesting paper; especially when conflicting opinions are expressed in a friendly and charitable manner. We were much gratified by Dr Peck's statement, relative to the late sickness of his horse. We have experienced something of the kind amongst us; though our cases carried the appearance of a putrid type, rather than that of an inflammatory one; and the result of practice was correspondent. For those that were bled died, and those that were not generally recovered.

Dr Peck informs, that History furnishes us with the accounts of severe epidemics, in which several domestic animals were simultaneously affected? Which is really true. Witness the year 1711, when there was such a sweeping mortality among the black cattle of Europe. The writer says it appeared like 'a malignant fatal fever,' and there was a plague among the people at the same time. Also in the year 1714, the plague raged in Holland among the cattle, till 300,000 died; and the spotted fever prevailed among the people, and many died in the streets, until the magistrates interfered and gave them assistance.

Also in 1734, when horses were said to be taken with a fever, and on the fifth day they had twitchings, and on the seventh and ninth they had deliriums, and on the ninth and twelfth they died raging. After the first two patients, I began (saith the writer), the cure of the rest with weak diluents, then gave them mild laxatives, and repeated

this course for the first 5 days. When the *subtusultus tendinum* and light headiness appeared, they had the following powder: *contrayerva*, one scruple; *ratie serpentaria* six grains, and camphor three grains M. By which, convulsions, delirium, and all dangers were off. The fever went off the thirteenth or fifteenth day—no more died if this course was taken. This was a fatal time among aged people, and immediately after set in the cholera morbus, with convulsions, &c.

Undoubtedly the case of Dr Peck's horse was epidemic, or rather epipical, if we may be allowed the expression. We are told that the horse had 'an obstinate and constant tendency to the left, which might have been owing to unequal affections of the two hemispheres of the brain,' which we have no disposition to dispute, but permit us to say in our opinion, it may proceed from a spasmodic affection on the left side, or greater on the left side at least, which may be demonstrated by a pair of wheels and axle-tree; if the wheels are of equal diameter, give them a propelling force, they will move in a right line; but should they be of unequal diameter, they would move in circular lines. In like manner, should the muscles of the legs and neck, on the left side of the horse be contracted, there must of course be an obstinate inclination to the left, in proportion as the locomotive faculty on that side was impaired. The Dr observes, it might be well to start a little blood to relieve the congested organs, which we believe is generally approved of by our best physicians. But permit me to inquire if that does not depend on the cause?—We recollect but three cases, viz. inflammation, inaction, and lenter. Inaction may depend on atony or spasm, and they, on a paucity of blood. Would not bleeding, in this case, increase the cause rather than remove it? Should the inaction depend on plethora, undoubtedly bleeding is indicated. In case of lenter, would taking a part of the best blood have a tendency to remove the congestion? Would not diluents (which our author made use of in 1734.) do better? The Dr observes, the vessels of the brain were very turgid. May not this proceed from a spasm compressing the other part of the vessels as the application of a ligature?

The consideration of congested vessels, calls to mind the anecdote of a man's curing a patient of an obstinate headache, after several bleedings by his attending physician had failed. The physician asked him what he did to cure him? Why, said he, what do you do when your ink is so thick that it will not run? Put in water and make it more thin, said the physician. So did I give the patient much water and diluents to drink, to thin the blood to make it circulate, said he.

We have had frequent cases of typhus fever, cholera morbus, &c, the season past; and the physician's bleeding had the same effect as the farrier's. Of the persons who were let blood, a great proportion of them died; and those who were not let blood, generally recovered. This leads us to suppose that the diseases of man and beast were simultaneous and typhus. Some say, to assert that pains proceed from inflammation in typhus fever, would be a contradiction in terms, according to the common import of the word typhus, which is derived from the Greek word *typhos*, signifying ostentation, or smoke without fire—so that *typhus* signifies the appearance of fever, without fever or heat. It appears to be a

general practice in *post mortem* examinations, on whatever parts are to be found traces of the disease, to pronounce them the effect of an inflammation, —but why, we are not able to say. Those dark spots which appear on persons before death, called *ribbies*, are not said to be the effects of inflammation. But, should they be found on any internal parts after death, they would be pronounced the effects of inflammation.

We presume it is very difficult to distinguish the effects of inflammation, from the effects of spasms and contusions, in *post mortem* examinations. Again, are not physicians too prone to attribute all pains to the effects of inflammation, which may produce pain, so will spasms without inflammation? Therefore pain, simply considered, does not indicate one more than the other, and we deem it impossible to know which, without taking under consideration the concomitant symptoms; and likewise regard being had to the effects of practice, for letting blood will relieve inflammatory cases, and stimulants will aggravate them. Stimulants will relieve spasmodic cases, but blood letting will aggravate them. MEDICUS.

Minot, Me. Feb. 15, 1832.

SUGAR FROM POTATOES.

I am informed that in the neighborhood of Jaffrey, N. H. there is now preparing an establishment for the manufacture of Sugar and Molasses, on a large scale, from Potatoes. It is calculated to pay for the potatoes their cash value there, 17 cents per bushel, and net a profit, above all costs and expenses, of 30 cents per bushel. From each bushel of potatoes, 7 pounds of sugar are made.

Let the friends of the abolition of slavery and the amelioration of the condition of negroes, throughout the world, consider well, and proclaim everywhere, what would be the *happy result* of supplanting or diminishing the consumption of West India sugar, which would be in some measure effected, if every large agricultural town in New England had its sugar works. Attentive observers have noticed that when prices of West India produce are low, their negroes are not over worked and fare better. R. P. WILLIAMS.

Boston, Feb. 1832.

A detail of the process of making sugar from potatoes, is given in Stillman's Journal of Jan. 1832. It is there said that

'A bushel of potatoes weighs about sixty pounds, and gives eight pounds of pure, fine, dry starch. This amount of starch will make five pints of sugar, of the weight of nearly twelve pounds to the gallon, equal to seven pounds and a half to the bushel of potatoes, or a little less than a pound of sugar to the pound of starch. The sugar is not as sweet as the Muscovado sugar, nor is it actually as sweet as its taste would indicate.

'This sugar may be used for all kinds of domestic purposes. It ferments with great liveliness and spirit, when made into beer, yielding a healthful and delicious beverage, and on distillation, a fine cider-brandy flavored spirit. It would however be most useful in making sweetmeats, and may be used upon the table in lieu of honey, for which it is a good substitute. It has already become a favorite with most people who have become acquainted with it. Its taste is that of a delicious sweet, and as an article of diet is unquestionably more healthful and less oppressive to the stomach, than any other sweet ever used.'

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

ON RAISING OATS AND POTATOES.

MR. FESSENDEN—It is not with the vain expectation of contributing anything, that will be either very interesting or profitable to your numerous readers, that I comply with the invitation in the 30th No. of your useful paper. Should you deem the few hasty remarks I propose to offer, of sufficient consequence to occupy a place in your columns, (a presumption which a censurable remissness on the part of your more scientific and enlightened correspondents and readers, will alone justify,) I hope my contribution, like the widow's mite, will not be appreciated according to its intrinsic value, but from the motive which induces it.

Should every practical farmer who reads your paper, obey your request by communicating from time to time, the results of his experiments, experience and practice, whether successful or adverse, they would amount, in the aggregate, to a fund of useful information which would be of incalculable worth to that numerous class of your readers, to whose interest your columns are chiefly devoted; and whose object is to profit by the experience of practical farmers, communicated through them.

As the sowing and planting season is rapidly approaching, and as I have sometimes been accused of raising better oats and potatoes than some of my neighbors, I propose to inform such of your readers who know no better way, my method of cultivating these particular crops; or rather, the method which, after various experiments, I intend to pursue in future, till I learn some more excellent way, which if known to any of your readers, they will confer a favor by communicating.

First then as to oats, I shall sow them as early in the spring as the state of the ground will admit, on land which the year before was planted with corn and potatoes; that planted with corn first, received from twenty to twenty-five cart loads of stable and barnyard manure to the acre, which was spread and ploughed in five or six inches deep. The crop of corn was good, but I am satisfied it would have been better had the ground been ploughed more shallow, or first ploughed and the manure harrowed in; the ground not being drawn into hills, is now level; I shall plough it evenly to the same depth as before and sow it with a little more than two bushels of oats to an acre, recollecting that "he that soweth sparingly shall also reap sparingly," (which those must do, if any were so unfortunate, who followed the mistaken directions in a former communication of mine respecting wheat; I said *five* pecks instead of three as it was printed;) I shall plough them in with a very light plough, or harrow them in. I have practised both ways and have never discovered any essential difference in the crop; in either case the roller is not to be omitted. The ground from which a crop of potatoes was taken will be managed the same. It may not be improper to remark here, that the potato crop in this section was uncommonly light, generally. Several who saw my crop while gathering, pronounced it much the best they had seen. I impute the difference principally to manuring and seeding. I select the finest potatoes for seed while gathering the crop; choose to plant them the latter part of May or early in June, on greensward ploughed once shallow, and

apply from twenty to thirty loads of manure from the hoggard, spread and harrowed in. The potatoes are cut into pieces, having two or three eyes in each piece, and placed three in a hill. I choose to plant shallow and near the surface. When they are all well up I hoe them well, and before they begin to top and fall down I hoe them again, forming a round, handsome hill, which by fall is generally well filled with fair, handsome potatoes.

I obtained some (as I esteem them) very valuable hints on the management of plough land, from an address published in your paper, some four or five years ago, (before I was a subscriber,) delivered before the Saratoga County Agricultural Society, by Earl Stinson, Esq.* I take the liberty to suggest the propriety of republishing it. An intelligent and successful farmer in a neighboring town, who obligingly lent me the papers containing the address, assured me that he had been guided, and much to his advantage, by the directions contained therein.

It has been the practice of many farmers in this and many other sections of Connecticut, to manure both corn and potatoes in the hill, drawing the earth into hills around the plants, and to split the corn hills by striking one or two furrows lengthwise with the rows, (instead of harrowing them down,) and then to sow oats and plough them in, leaving the rest to nature, which must struggle hard to bring forward a very abundant crop from the cold depth where the seed lies buried.

I offer these brief remarks, not so much with a view to instruct as to elicit instruction from others, who have the advantage of more extensive information and experience, and a more happy talent to communicate than I pretend to claim.

JNO. TOWNSEND.

Andover, Con. Feb. 18, 1832.

TRAINING CATTLE.

There is one subject connected with husbandry which is of considerable importance, and which I do not recollect to have seen noticed by any of your correspondents. I mean the best method of training cattle for labor. To be sure, every farmer's boy who is capable of handling a whip or goad, imagines himself competent to break a pair of steers. On this subject I confess myself wholly unable to impart any instruction or advice, having had but very little experience. I have generally purchased my working oxen ready broke, of different persons, and have never bought two pair which were alike with respect to their propensities for work; I have found the difference to vary and range from very good to good for nothing; some have been kind and docile, while others have been timorous, or vicious and stubborn. What is the cause of this wide difference? Has nature established it? Is it to be found in their natural dispositions, or is it the result of education? The latter I am inclined to believe, and the more so from my observations within two weeks.

Having often been unfortunate in purchasing I resolved to train my own, and commenced last week with a pair of steers coming three years old, which from habit had become rather wild. Having had, as I before observed, little or no experience of my own, yet common sense taught me to avoid the practice of some others, who profess to understand the art and mystery of subduing the most stubborn animal almost in an instant; instead,

therefore, of confining one of them till the yoke, ring, staple and all are fastened to his neck, and then setting him loose with this frightful appendage rattling and dlying about his head, till the poor animal, 'frightened out of his wits' and exhausted with running, stops and stands still for his mate to be served in the same way, by which time having recovered his breath, both are again set loose, tied tail to tail, to perform their very interesting and amusing evolutions; they are now half subdued and the whip soon accomplishes the rest, and teaches them to lead a team. Will not cattle managed in this way, frightened, lacerated, abused and provoked, be likely to remember it, and ever after to be timorous or stubborn? Right or wrong, I managed differently. My first care was to make fast a chain to a post, having ready two pair of steady oxen near by. The yoke was then put on to the first steer, to which the chain was immediately fastened; he made one or two efforts to get away, but finding them unavailing soon desisted; the other was then yoked, and they were led off quietly between the oxen into the woods; they were used in this manner three days in succession, they were not yoked again for several days on account of bad weather, when I directed my boys to yoke them and put them forward in the team, merely to exercise them; this was done then and several times since without the least difficulty—they have neither desisted nor received a stroke of the whip to hurt them.

I am confident that our domestic animals may be so taught, as to make the inhuman and abusive use of the lash, so often witnessed, altogether unnecessary. Is not this a subject worthy of the pen of some one of your humane correspondents, whose practical knowledge enables him minutely to point out the proper course to obtain the desired result?

JNO. TOWNSEND.

Andover, Con. Feb. 18, 1832.

GRAPE VINES.

Grafting grape vines is a new thing in this section. But few have heard of it or tried the experiment. The stock of the common wild grape, numerous in Massachusetts and New Hampshire, will answer for grafting almost any of the varieties of the grape. A publication in a southern paper induced me, the last spring, to try the experiment of grafting at the surface, denuding the stock three inches below the surface. The scions of the Isabella grape, cut the fall previous and kept buried in the cellar, were inserted at the surface, leaving one eye above, tying a string round the stock and drawing the earth to the stock. The scions sprouted, but grew but little. It is said they will grow over twenty feet the first year and bear the second. But my scions were probably injured by being shaded, and by neglecting to cut off frequently the sprouts from the old and other contiguous stocks. I cut off another stock about three feet above the ground, and grafted with composition, (one part of tallow, two of bees-wax,) and three of resin, prepared like shoemakers' wax,) in the same manner that apple trees are generally grafted. This Isabella scion succeeded well. In the fall I measured as accurately as I could, with a ten foot pole, the main and lateral branches, and the length of each being added together amounted to sixty feet, the main stock was twelve feet. From this vine I anticipate this year a fine parcel of grapes. The tops of the old stocks I cut into more than fifty pieces, and planted them perpen-

*See New England Farmer, vol. v. page 244, 256.

dicularly and horizontally, by the side of a stone wall in rich soil. Most of them took root and sent forth branches, and will serve for stocks to graft. I have more than a hundred old stocks which I intend to graft in the spring. It is said that the grafted vines will partake of the hardiness of the native stock. No doubt many of the varieties will endure our frosty climate. Should farmers in Massachusetts and New Hampshire cultivate vineyards of hardy grapes, no reason can be assigned to prove that they cannot make good wine for domestic purposes.

Respectfully yours,

WILLIAM CLAGGETT.

Portsmouth, N. H. Feb. 13, 1832.

WOOD SNAPPING ON THE FIRE.

MR FESSENDEN—Is it not a fact, that such wood as hemlock, chestnut, &c, which grows in great abundance in many parts of the United States and Canada, would be more used for fuel if it were not for its disagreeable and perhaps dangerous quality, of snapping or throwing coals out of the fire? If such be the case, it may be well to make it generally known that this quality, so far as regards split wood, may be in a great measure overcome by placing it properly on the fire; that is to say, by laying the inner side or that part which was nearest the heart, towards the fire, for the coals actually fly in that direction. A slight inspection of the grain at the end of the wood, will show the side which grew nearest to the centre, and this side should never be turned in any direction by which coals thrown from it can fall into the room. A little attention to this circumstance will enable many a thrifty housewife, to have a hot fire made in an open fire-place, of wood which is now considered almost detestable for that purpose; and perhaps she may learn, in time, to relish the snapping sound, as Goldsmith seems to have done that of the 'crackling fagot,' which he associates in his ballad with the cheerful chirrup of the cricket.

Yours,

C.

ASSOCIATIONS TO PROMOTE THE CULTURE OF SILK.

To J. H. Conn, Esq. of Dedham, Mass.

I would beg leave to make to you a few observations, without signing my name.

I have seen your work, published by order of the Massachusetts Legislature, and satisfactorily it is proved to my mind, that the results of this branch of industry may be of incalculable benefit to the whole country, in time equalling, if not surpassing, any other branch of our manufactures. But, however much individual enterprise may do, I cannot think its growth will equal its importance, without associations formed in each county for the raising of mulberry trees. I would suggest that a paper be drawn up, setting forth the object and giving to each signer half an ounce of the Mulberry seed. And every person thus a member to pay some small sum (so as to admit all gratis in agricultural pursuits,) yearly, merely sufficient to defray the expenses of the society; this would excite each and every one who has land, and would make it one of the leading objects in the country towns. Now is the time, while our legislature are together, to endeavor by some means to bring about a State Association, with the influence of the members of each county, who now more than ever, are looking at the subject. In the county of Norfolk there would be no delay in

forming a society, each pledging himself to plant half an ounce of Mulberry seed and raise an orchard of trees. For myself and others, I can say you shall not want our assistance; but it is necessary that the project should be started by yourself, who have a theoretical and practical knowledge of the subject.

Your obedient servant.

HOP BEER.

For one barrel, boil $1\frac{1}{2}$ lbs. of good hops and $1\frac{1}{2}$ lbs. of ginger in 10 gallons of water, one hour. Put 10 quarts of molasses into a barrel, to which add the liquor hot, shake it well; then add some cold water and a pint of yeast, shake and stir it again; then add the whites of a dozen eggs finely beaten and cold water sufficient to fill the cask, give it another stirring with a stick, bung it close and let it stand one month. It should be made in June or July—instead of half a pint or more of rum per day, a moderate quantity of it should be drank by the laborer, who will find it to add to his strength and vigor, allay his thirst, and prolong his life and consequently his usefulness. Try it and see.

J. T.

Andover, Con. Feb. 1832.

HORTICULTURAL PREMIUMS.

THOMAS G. FESSENDEN, Esq.

DEAR SIR—I did not intend when I wrote to you a few days since, giving out a few hints and suggestions in respect to horticultural premiums, &c, to have troubled you again; at least so early. The purpose for which I wrote has been fully answered. That is, to call forth the opinions of some of the most experienced and scientific gentlemen, as well as 'practical horticulturists.' It is a maxim of J. C. Loudon, Esq. (a gentleman who has undoubtedly done more for the education, information, and instruction of gardeners, than any other,) that all gardeners should be readers and writers as well as practitioners; that they may readily and plainly communicate their thoughts to paper. For what can we learn from those who have studied the theory only? But I am occupying too much room in your useful paper, to indulge in any speculations. I am much gratified to find that my communication has drawn forth the opinions of a 'Practical Horticulturist,' and although he says his 'avocations' are such as will not allow him to devote much time to 'controversy,' yet I am highly pleased to find he is disposed to pay some little attention to the subject.

I think your correspondent has furnished us with quite a treatise and one which may be very valuable to some of your readers. But to come more immediately to the subject, I shall begin and substantiate what I said respecting the 'gross inequalities' which I spoke of in my communication. As regards the remark I made in relation to cucumbers, he cordially agrees with me; but then says the same remarks will not apply to grapes. He says he has never seen, what is considered by gardeners a forced grape, in America, excepting some specimens from Jamaica Plains last season; and those not exhibited until July. I am sorry that your correspondent and myself, did not alike understand the word *forced*. What he terms, or says are termed, forced grapes, are those grown by artificial heat and ripened out of season. But look a little further and what do we find? he says all the use he has seen made of glass, is to create

an 'artificial' climate, &c, and does not this look a little like a contradiction? The usual season for grapes to ripen in the open air in this climate, is generally in September or the early part of October; and therefore if grapes under glass, are matured by the first of August, as many were last season in the vicinity of Boston, they must have been forced: for to cut ripe grapes by the first of August, will require the space of five months to bring them to perfection, and accordingly the vines must be broke by the first of March. Now, if the vine will not break until May in the open air, it follows of course, that they must be forced to break, by making or anticipating an artificial climate of the temperature of May, in March. At two or three different places last season, I tasted ripe Hamburg grapes in the early part of August, and if he will take the opportunity to visit the same places at the present time, (at least soon,) he will find that the vines are already broken and artificial heat applied. Can he then say grapes ripened at that season are not forced? Not having the premium list before me when I wrote, I inferred it read forced; but have since looked and found it read 'grown under glass'; it however makes no material difference; the analogy is the same. He says, from experience, he knows it requires more skill to grow grapes in our precarious climate in the open air, than under glass, unless ripened in June. But I still think not; in fact, I know from experience that it does not. Speaking with the gentleman who obtained one of the premiums last season, for the fine specimens of Hamburg, grown out, he said he bestowed hardly any care upon them, not even to prevent the approach of mildew. I exceedingly regret that our opinions are so far at variance.

My remarks on the premiums for flowers, he thinks equally erroneous; and thinks, or knows, I am no florist; at least, is confident I know nothing of growing Chrysanthemums. We will see how his arguments prove. He has told us, what almost every one knows, how to pot and water them; but has said very little on the particular point where we differ. I spoke of the time, and preparation of the compost. And I am sure he has never read Maddock's Hogg's, or any other good florist's directions, if he insists upon his point. I have grown and have seen them grown, with as much success as he flatters himself he has had in growing them, and have never myself, nor ever have seen any one who thought of preparing the compost to put them in, until the moment they are ready to pot off. No one the least initiated, would think of bestowing that care upon chrysanthemums which the first sight of a tulip would denote. Any who wish to have them can, and to great perfection, with no other care or trouble than to put them, as he says, in any good loam, or loam and vegetable mould, and keep them well watered. As to watering them once a day and sometimes twice, it is unnecessary; for they are generally plunged in the ground in some rather shady place, and twice or thrice a week is generally enough, unless you wish to have them as large as berberry bushes.

Let us now see if it is ten times more trouble to raise chrysanthemums, than tulips, ranunculuses, or hyacinths. I hope your correspondent has had observation enough of animal nature, to know that what is life to one is death to another; and the same may be said of vegetables and plants. That

which is life and health to plants in general, is deadly poison to almost all bulbs. If he has ever studied into the analysis of earths, he will be immediately convinced of this. How many people there are, who buy bulbs, with the idea that they shall have a show of beautiful flowers; they go to work, prepare a bed, perhaps throw in five or six, or more, barrows of fresh manure, to have them grow large and thrifty. But alas! they come up, flower very weak and before another season, rot and decay almost every one, as if they were attacked with an epidemic disease. He has told us only of tulips, and has said nothing of hyacinths, or ranunculus. Tulips, he says, he sets out in November, covers the bed on the approach of frost, uncovers in April, forks over the bed with a trowel, shades the flowers, &c. This is very true, but is it all? has he given the depth or distance, and a hundred other minute particulars? can the treatment of such elegant plants be detailed in thirty or forty lines, occupying in most florists' directions as many pages? More has been written upon the growth and cultivation of tulips, and other choice bulbs, than has, or I think ever will be, upon chrysanthemums; there are but very few people who think it requires at least twelve months, for the compost to lay exposed to the sun and air, previously to using. So particular were many of the great Dutch florists, upon the preparation of their composts, that it was kept almost a profound secret.

How many have tried to cultivate tulips, ranunculus and hyacinths, to perfection, and how few have succeeded. While almost every individual, who is a lover of flowers, has chrysanthemums. How many thousand roots of ranunculus have been bought and planted, and come to nought. And what care has been taken to raise them with success. I even heard a gentleman say last season, he was told in New York, they should be planted with the forks of the root up! As much might be said of hyacinths; but I will not take the room, to enlarge upon them at this time. Enough I hope has been said, to show that instead of chrysanthemums being 'ten times' the trouble of tulips, &c, they are a hundred the reverse.

Again, your correspondent seems to think, I am no judge of flowers. I have not the vanity to say my judgment is better than others; but I cannot yield to him. He says tulips last but three weeks, and flower at a time when we have plenty of roses, and perennial herbaceous plants. I think he is here mistaken; certainly he cannot have a very retentive memory! I will but refer him to the last volume of your paper, where he will find that the show of tulips was on the 14th and 21st of May, and roses on the 15th and 22d of June. Indeed, here is a vast difference! Not a rose, I think, was seen in bloom before the first of June, (unless Scotch,) nor a tulip in perfection after the 23d of May. As to the perennial plants he speaks of, I really cannot recollect any of great beauty which flower so early. True there may be some lilacs, &c, but few others.

I agree with him, that there is a delicacy of texture, a soft and satin-like appearance in the lotus chrysanthemum; although I cannot think of comparing it to a tulip. I have examined a tulip, a hyacinth, and a ranunculus, and have almost been enraptured in viewing such elegant plants, hardly knowing which to admire most. A bed of tulips with their endless variety of colors, so evenly shaded together, may almost be contrast-

ed with the brilliant colors of the rainbow, so finely blended. I cannot say the same of ranunculus, as I never had an opportunity of viewing a bed. But taking a single flower, that surpasses all others, both in vividness of color and fineness of texture, and in fact all that belongs to a perfect flower.

I cannot yet (and I hope no one can, who is at all acquainted with flowers,) be induced to acknowledge, what your correspondent thinks existed only in my 'imagination,' or retract any from what I first stated. He hopes to see the time when Horticultural Premiums will be 'ten times' their present value; and I am glad to find that he can take the same pleasure in competing for two, or five dollars, as he can for a larger amount; if he will cultivate to perfection, it is all we wish; he thinks we can have what my imagination pictures if we will only wait a year or two. I hope I shall be blessed with patience.

In regard to the system of awarding premiums, I spoke of he readily agrees with me, as an excellent plan. But I am sorry he should so misunderstand me, as to convey the idea that I should cast any reproaches upon the gentlemen, who compose the committee. The thought did not enter my mind—yet too many are always ready to find fault and not be content, if there is a doubt of the least partiality. Undoubtedly he is right, in speaking of the care which the 'humble cottager' takes of his few plants; and so far, it goes against the florist. He will, if he is a skillful man, see that his hundred plants are as well nurtured, as the cottager's few; many, however, work only for the interest of their employer, and frequently let their best varieties dwindle away in growth, till they are completely ruined. A real florist and admirer watches them with as much care as the cottager, who only takes that peculiar care for competing for the prize, while the admirer cultivates for his pleasure only.

I have written more than I intended at first, but as your correspondent has found so many faults with my communication, and yet called them 'trifling inaccuracies,' I felt it a duty to fully substantiate all doubts. With the hope that I have not said anything that will be viewed as ungenerous, I remain yours, respectfully,
Cambridge, Feb. 20, 1832. RUSTICES.

ERRATA.—In the former article of Rustices, first column, 12th line, for "intention" read "intention." 2d column, 39th line from the top, the word "not" should be omitted.

ADDRESS

PRONOUNCED BEFORE THE MARSHBURY, HORTICULTURAL SOCIETY, IN COMMEMORATION OF ITS THIRD ANNUAL FESTIVAL, SEPTEMBER 21, 1831.

BY MALTHUS A. WARD, M. D.

Continued from page 251.

Such then, gentlemen, are some of the most prominent features in the science of Horticulture,—and such its associated and auxiliary studies. It is unnecessary to expatiate upon the peculiar interest that is attached to such pursuits, even when followed merely as a recreation; on the pleasant excitement which they kindle in the youthful mind, or the expansion they give to the heart in more mature life; on the advantages they possess in an eminent degree, of disciplining the intellectual powers,—training us to habits of quick observation, accurate discrimination, and methodical distribution of ideas; or on the benign influence which they are calculated to have upon the moral sentiments and conduct; which I believe to be far greater than is commonly suspected; for the more

we trace design and purpose in the works of Nature, shall we not sympathise the more with the fitness of means to end in human conduct? The more we enter into the details of natural operations, shall we not increase our taste for facts;—which is, in other words, the love of truth—the very foundation of justice and honesty? The venerable Bewick boldly asserts that 'a good naturalist cannot be a bad man!'

It has been said that ignorance in philosophy is preferable to superficial knowledge; but it is otherwise in the study of Nature; where every acquisition is useful, from the simplest perception to the deepest researches; from the minutest detail to the most general views; where there are problems to be solved which may gently exercise the weakest or severely task the strongest, intellectual powers. Indeed, it frequently happens, that the most ingenious and apparently incontrovertible reasoning in Natural History is overturned or confirmed by facts accidentally observed by the feeble and unscientific. Fortunately, a profound knowledge of all, or even of any of its branches is not essential to the horticulturist, however desirable it may be; and although a slight acquaintance may not enable him to make many very valuable reprisals from the dark abyss of Nature's mysteries, or add much to the advancement of science for the good of mankind, it certainly will do what is perhaps the next best thing in the world,—it will inculcably promote his own enjoyments.

The prosperity of this Society hitherto, is, I believe, altogether unexampled; and its future prospects are bright and exhilarating in the extreme. Warned by the deplorable embarrassments of some and guided by the happy example of other Horticultural establishments, the strong and sagacious minds which have conducted the affairs of ours so faithfully, to the present moment, will not be likely to err greatly in their management of them hereafter. Should heaven intercept some of them from seeing all their wise and tasteful plans perfectly accomplished, they may at least enjoy the present confident assurance, that posterity will appreciate and be grateful for their labors. The amazing power of combinations is well known; but has seldom been more agreeably illustrated, than in the formation of associations where the results of individual exertions, experiments and opinions are collected and compared, corrected and concentrated, and the knowledge, thus acquired and prepared, diffused in an attractive form among the mass of mankind by periodical publications. It has been, and I think may again be confidently asserted, that 'more real, useful improvements have been made in gardening since the formation of the London Horticultural Society, than have been made in China within the last thousand years.'

To be concluded next week.

A beautiful specimen of the *Magnolia conspicua*, a native of China, is now in blossom at the Botanic Garden at Cambridge.—It is but two feet high, has nine flowers, the petals of which are four inches long, perfectly white and very fragrant; and is well worth the observation of amateurs.

TO CORRESPONDENTS.—We shall next week insert a valuable article from Judge BULL on Dwarfing Trees.—also one from JOHN PRICE, Esq. on the properties of Liverpool and other Salts, and several others which we have been obliged to omit this week.

CORRECTION.—The premium of \$20 awarded to Col. JOHN WILSON of Deerfield, as mentioned in our last paper for Winter Rye, should have been for Winter Wheat.

NEW YORK AGRICULTURAL SOCIETY.

The following gentlemen were on the 16th inst. elected officers of this society for the ensuing year:—

J. LE RAY DE CHAUMONT, of Jefferson, President.	
EDWARD P. LIVINGSTON, of Columbia, 1st V. P.	
AMERSE SPENCER, of Albany, 2d do.	
JACOB MORRIS, of Otsego, 3d do.	
ROBERT S. ROSE, of Seneca, 4th do.	
P. S. VAN RENSSLAER, of Albany, R. Sec'y.	
JESSE BULL, of do. C. Sec'y.	
CHARLES R. WEAVER, of do. Treasurer.	
HENRY W. DELAVAN, of Saratoga, } Executive	
JOHN TOWNSEND, of Albany, } Committee	
HORATIO HICOCK, of Rensselaer, }	

Committees of correspondence were also appointed in each county in the State, corresponding with the number of representatives in the assembly.

FARM SCHOOL.

A Committee consisting of Charles Jackson, chairman, W. Prescott, J. Tuckerman, P. T. Jackson, J. Tappan, S. T. Armstrong, Moses Grant, George Bond, George Ticknor, James Bowdoin, W. C. Woodbridge, and E. M. P. Wells, have submitted to the public a report relative to establishing a Farm School in the country, for the purpose of giving a good moral and physical education to the idle and needy children, exposed to temptation and acquiring bad habits in this city. Every friend to his country and to humanity, will wish success to the efforts of the public spirited gentlemen associated for the above mentioned benevolent purpose.

Notice.

A STATED MEETING of the Massachusetts Horticultural Society will be held at the Hall of the Society, on Saturday March 3d, 1832 at 11 o'clock.

Feb. 28. R. L. EMMONS, Rec. Sec'y.

A Farm for Sale.

ONE of the best Farms in West Newbury, pleasantly situated near the Merrimack river, on the stage road from Newburyport to Haverhill and Lowell, containing about one hundred and fifteen acres, well divided into Pasture, Pasturing and Tillage. An excellent Farm for Hay, having a large proportion of natural Mowing, and a fine young Orchard. The Farm is composed of three separate lots, and will be sold together or in lots to suit the purchaser. There is on the north side of the road about sixty-six acres, with a large two story House, a Barn, 104 feet by 30, Granary, Chaise-House, Sheds, &c. convenient, and all in good repair. One lot on the south side of the road, opposite the House, containing eighteen acres.

Also, another Lot on the same side of the road, about 40 rods distant, containing about thirty acres, having a good barn on the same, 51 by 28.

Also, a Lot of SALT MARSH, about ten acres, very handy to boat, and of the first quality.

If said Farm is not disposed of at private sale, before Monday the 26th March next, it will be sold on the Wednesday following, at Public Auction, together with the Stock of Cattle, Farming Utensils, about fifty Tons of English Hay, 20 Tons Salt Hay, 60 bushels of Red Top Seed, lot of Potatoes, and sundry other articles.

Sale will be positive. For further particulars inquire of the subscriber on the premises, or at No. 12 Essex street, Boston.

PAUL BAYLEY.

West Newbury, Feb. 28, 1832.

Farm for Sale or to Let.

WILL be sold or let, and possession given immediately, the Waterhill Farm, (so called), situated in Lynn, consisting of between 70 and 80 acres of as good Land as can be found in the County of Essex, with between 2 and 300 large Apple, Pear, and Peach Trees, two good Dwelling Houses, with ample Barns and out-buildings. Said Farm is most pleasantly located, between the Boston old road and terrace, and only ten minutes' walk from the Hotel, affording an excellent opportunity for a Milk Farm or a Gardener.

For further particulars inquire of Mr Wiley, near the Lynn Hotel, or of the subscriber.

WM. B. BREED.

Lynn, Feb. 16, 1832.

White Mulberry Trees.

WANTED, a few thousand of White Mulberry Trees, two or three years old. Any persons having them are requested to forward the necessary information, with the prices, to the New-England Farmer Office, post paid.

Wool.

JAMES VILA, Wool Broker and Commission Merchant, Nos. 3 and 4, Phillips' Buildings, has for sale a general assortment of

Russian, Saxony Lambs,
Smyrna, do. Sheep,
Jutland, Buenos Ayres,

Also, a large assortment of Domestic Fleece, Sorted and Pulled Wool.

Feb. 28.

New Publications.

LILLY & WAIT are preparing for publication, a Practical Treatise on Breeding, Rearing, and Fattening all kinds of Domestic Poultry, Pigeons, and Rabbits; also the management of Swine, Milch Cows and Bees, by B. Moubay, Esq. From the sixth London edition, adapted to general use in this country.

Library of Travels.—To appear in vols of about 300 pages each, comprising the most authentic and interesting travels, into every quarter of the Globe, with accurate and useful maps.

They have just published, Knowledge for the People, price 12 1/2 cents.

Part VI. Sports, Pastimes, and Superstitions.

Also, the Library of Entertaining Knowledge, just published, vol. 7, Part 2.—Menageries: the Elephant. The publication of this beautiful work, which grows rapidly in public favor, continued. Price 40 cents each part.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than can be elsewhere had.

Apply to E. COPELAND, JR., 63, Broad street.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 63 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. [Watches repaired and warranted.

Situation Wanted.

A Gardener, who considers himself thoroughly acquainted with his business, in all its branches, is familiar with forcing fruits and vegetables, is desirous of a good situation. He has a wife and two children; has lived upwards of seven years at his last place, and can produce satisfactory recommendations from his last and all his other employers. Inquire at the Farmer office.

A Farmer Wanted.

WANTED to hire, in the vicinity of Boston, a man of middle age, who is thoroughly acquainted with farming in all its branches. Inquire at this office.

Bremen Geese.

FOR Sale, 3 or 4 pair of large Bremen Geese, of undoubted purity of blood. Inquire at the N. E. Farmer office.

4t

Farm for Sale.

ON the road leading from Newton, west parish Meeting-house, to Waltham Factory, containing from 50 to 75 acres of Land, well proportioned into mowing and tillage—also, House, Barn and Out-houses with the same. Said farm is well watered, and has a valuable fruit Orchard. Apply to EPH. McNAMARA.

Feb. 15.

BRIGHTON MARKET.—MONDAY, FEB. 27, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 358 Beef Cattle, 292 Sheep, and 9 Cows and Calves.

PRICES. Beef Cattle.—Sales quick and prices advanced. We quote a few yoko at \$6.25, extra at 5.75 a 6, prime 5.62 a 5.75, good 5.25 a 5.50, thin 4.75 a 5.

Cows and Calves. We noticed the sale of two at \$35 each, two at 30 each, one at 26, and one at 24.

Sheep. We noticed an extraordinary lot of 106, driven by E. Hastings, Esq. of Heath, and fed by Col. Anderson of Shelburne, which attracted much attention; they exceeded any lot we ever saw so large, probably any lot ever driven to this market, sale not effected. We also noticed a lot of 26, driven by Mr T. Rice and fed by Col. Newell of Conway, taken at \$9 each—also sales at 6, at 4.75 and 4.50.

New York Cattle Market, Feb. 24.—About 700 head at Market, generally good, sales quick at an average of \$6.50—some very fine cattle sold at 7.50—we quote 5.50 a 7. Sheep—a very short supply this week, only about 200; they were all sold at 4 1/7.—Daily Adr.

[In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From the Boston Centinel.

Meers Editors.—Among my many scraps, I lately found some lines of poetry by a Philadelphian, occasioned on the adoption of the Federal Constitution in 1787. The "Venture" met in a wooden meeting house, where now stands Dr Channing's. If your views of re-nascition are in unison with mine, the subsequent will find a place in the Centinel.

11570 MEMO.

THE 'VENTION did in Boston meet,
But State House could not hold 'em;
So then they went to Fed'ral street,
And there the truth was told 'em.

Yankee doodle, keep it up,
Yankee doodle dandy,
Mind the music and the step
And with the girls be handy.

They every morning went to prayer.
And then began disputing,
'Till opposition silenced were
By arguments refuting.

The 'quire HANCOCK like a man
Who dearly loves the nation,
By a conciliatory plan
Prevented much vexation.

He made a woundy Federal Speech
With sense and elocution;
And then the 'Vention did beseech
T' adopt the Constitution.

The question being outright put,
(Each voter Independent.)
The Federalists agreed t' adopt,
And then propose amendment.

The other party seeing then
The People were against 'em,
Agreed like honest, faithful men
To mix in peace amongst 'em.

The Boston folks are deuced lads,
And always full of notions;
The Boys, the Girls, their Mams and Dads
Were filled with joy's commotions.

So straightway they procession made,
Lord! how a nation fine, Sir!
For every man of every trade
Went with his tools—to dine, Sir.

JOHN FOSTER WILLIAMS in a Ship
Join'd in the social band, Sir,
And made the lasses dance and skip,
To see him sail on land, Sir.

Oh then a *rehepping* feast began,
And all hands went to eating;
They drank their toasts, shook hand and sang,
Huzza! for 'Venture meeting.

Now Politicians of all kinds,
Who are not yet decided,
May see how Yankees speak their minds;
Are yet are not divided.

Then from this sample let 'em cease
Inflammatory writings,
For FREEDOM, HAPPINESS and PEACE,
Is better far than fighting.

So here I end my Fed'ral Song,
Composed of thirteen verses,
May Agriculture flourish long,
And Commerce fill our purses!

Rattle Snake adventure in Oregon.—A curious incident occurred to one of our men, named La Course, which was near proving fatal. This man had stretched himself on the ground, after the fatigue of the day, with his head resting on a small package of goods, and quietly fell asleep. While in this situation I passed him, and was almost petrified at seeing a large rattle snake move from his side to his left breast. My first impulse was to alarm La Course; but an old Canadian whom I had beckoned to the spot, requested me to make no noise, alleging it would merely cross the body and go away. He was mistaken; for on reaching the man's left shoulder, the serpent coiled itself but did not appear to meditate an attack. Having made signs to several others, who joined us, it was determined that two men should advance a little in front, to divert the attention of the snake, while one should approach La Course behind and with a long stick endeavor to remove it from the body. The snake on observing the men advance in front instantly raised its head, darted its forked tongue, and shook its rattles—all indications of anger. Every one was now in a feverish state of agitation as to the fate of poor La Course, who still lay slumbering, unconscious of his danger; when the man behind, who had procured a stick seven feet in length, suddenly placed one end of it under the reptile, and succeeded in pitching it upwards of ten feet from the man's body. A shout of joy was the first intimation La Course received of his wonderful escape; while in the meantime the man with the stick pursued the snake, which he killed. A general search was then commenced about the encampment, and under several rocks we found fifty of them, all of which we destroyed. They have a strong repugnance to the smell of tobacco, in consequence of which we opened a bale of it, and strewed a quantity of loose leaves about the tents, by which means we avoided their visits during the night.—*Adven. on Columbia river.*

Mr Girard used to say that a man who would leave off business because he thought himself rich enough, had very erroneous views—that he attached no more importance to wealth, than he did to his old shoes, but that he looked upon active employment, as one of the greatest duties of life. He used to say that he would plant a tree today, if he thought he should die tomorrow.

A powerful argument in favor of Temperance.—The Medical Intelligencer states, that from Registers of Societies of Friends or Quakers, it appears as a consequence of their temperate habits, that one half of those that are born, live to the age of 47 years; whereas, says Dr Price, that of the general society of London, one half live only 23 years! Among the quakers, one in ten arrive at 70 years of age; of the general population of London, only one in 40. Never did a more powerful argument support the practice of temperance and a virtuous life.

The following charade is said to be from the pen of a worthy Alderman of the city of London:

My first is a little thing what hops,
My second gives us good hay crops,
My whole I eat with nutt'n chap's.

Solution.—Sparrow-grass.

It is an honor to their (the Spaniards) laws, that a man loses his testimony who can be proved once to have been drunk.—*Sir William Temple.*

New Work on Fruits, &c.

JOHN B. RUSSELL and CARTER & HENDEEF. BOSTON: G. THORNBURN & SONS, New York; GLEGG & ELLIOTT and CARY & HART, Philadelphia; S. C. PARKHURST, Cincinnati, and WM. THORNTON, Albany, have in press, and will publish in a few weeks,

THE NEW AMERICAN ORCHARDIST,

OR AN ACCOUNT OF THE MOST VALUABLE FRUITS AND VEGETABLES ADAPTED TO CULTIVATION

IN THE CLIMATE OF THE UNITED STATES, WITH THEIR

MODES OF CULTURE AND MANAGEMENT; REMEDIES FOR THE MALADIES TO WHICH THEY ARE SUBJECT FROM CANKER WORMS, FROSTS, &c.

BY WM. KENRICK.

This work will contain particular descriptions of from 700 to 800 select varieties of fruit, adapted to our varied climate, and will include the Olive and some most useful tropical fruits which may be successfully cultivated in our Southern territories.

The different modes by which the new varieties of fruit have been obtained, will be described; modes of pruning and training, by which trees, &c, are rendered fruitful; of grafting and inoculation; and of the modes of propagating usually adopted.

It will contain descriptions (besides old sorts) of from 100 to 120 new varieties of Pears of UNDOUBTED EXCELLENCE; from 60 to 80 of which are not particularly described and condensed in any one European volume which has hitherto reached us; some American, but chiefly the new and most approved Flemish varieties.

The descriptions are partly from personal observation, and from assistance received from some of the most intelligent horticulturists of New England; from the best writers of America, and the best foreign productions; the descriptions of Van Mons, the splendid edition of *New DuRoi*, the Pomological Magazine, the superb *Penny* Mahs Brentfordensis of Ronald, and Lindley's Guide to the Orchard and Kitchen Garden. From these it has been the constant aim, to cull from their *extremely varied and select lists*, all that was *beautiful, excellent, productive and profitable*.

From these will be formed another select list, of those sorts already approved with us, as the *best and most productive*.

In regard to the new varieties of fruits of America and of Europe, it will be the aim of the writer, to render this work particularly interesting, and adapted to the different sections of our highly favored country.

The very best of late English works, we refer to those just named, those celebrated works which are beyond all doubt so admirably adapted to the climate and country for which they were principally designed, and as auxiliaries to us, are extremely deficient in regard to those native fruits which are with us so highly esteemed. We will instance some; with others it is even still worse.

In their description of apples we find very few, scarce half a dozen, of our fine native varieties described or even named; those fruits which agree so well with us—the selections from the innumerable native orchards of our country during two centuries.

They describe but one variety of our native pears, and in the place of those not described, they recommend to us other varieties, the very sorts we have long since rejected.

They describe but two varieties of our native peaches, so much admired by travellers; some, the finest of the South of Europe are equally unnoticed—the fine selections from the vast native orchards of this fruit at the South, for distillation,—all these, the productions of our own and other equally favored climates, are rejected from their lists as 'worthless,' not being adapted to their hostile seasons and latitude, and not coming to full maturity and excellence, even on the walls to which their cultivation is confined.

A few engravings may be furnished, such as a plan of the Thomey mode of training Grape Vines; the quonillo mode of training trees, &c.

It will be comprised in one volume of about 300 pages, and will be furnished for about \$1 per copy. Feb. 22.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If No paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

ORIGINAL AGRICULTURAL ESSAYS.

DWARFING TREES.

The art of dwarfing trees, consists in grafting or budding the desired fruit, upon dwarf varieties of the same genera. Thus the apple is dwarfed by putting it on the paradise stock, and partially by working it on the wild crab; the pear is dwarfed by working it on the quince, or the hawthorn, or wild thorn; the cherry, by grafting on a dwarf variety termed the beach or sand cherry. Fruit trees are also rendered comparatively dwarf and early bearers, by permitting the first side shoots to remain at proper distances to become bearing wood. By annually cutting off the lower branches, to produce standards or high tops, we proportionally delay the season of fruiting. Van Mons, in his successful experiments in producing new varieties of the pear, left the first branches to grow, and thus often obtained fruit in from four to six years from the seed. In this way dwarf plums, peaches, and nectarines, are produced on the stock of the muscle plum. Whatever retards the growth of wood, in a tree of bearing age, induces the production of fruit; and a tree seldom makes much new wood while sustaining a heavy crop of fruit. The precocity of dwarfs is owing to the diminished circulation of sap, consequent upon the sap vessels of the stock being more limited or contracted than those of the graft; or by the maturity of the branches which are suffered to remain near the ground.

It is proper to remark, that all pears shall not take or do well upon the quince. The words pear, quince, and quince, in the table you published, although not understood, and sent to you by mistake, indicate the stock upon which the kinds may be worked with advantage. Those with quince, in the column of ripening, produce better on the quince than on the pear. The breaking pears are generally best on the pear stock. I have become so sensible of the advantage of dwarfs for early bearing, that we have sent an order to France for three or four hundred of the best varieties of the pear upon the quince, to supply customers to our nursery. It should also be borne in mind, that in dwarfs, the scion overgrows the stock; and that hence it is necessary to graft near the surface of the ground, or under it. I have several pears now growing upon the hawthorn, which were grafted in 1827; but they have not produced, nor do they promise much. Dwarfs upon the quince should be planted in a quince soil; that is, one that is moist, and rather stiff than sandy.

Albany Nursery, Feb. 21, 1832.

MANURES

Manures are to the vegetable, what grain and forage are to the animal products of the farm—the food which sustains and brings them to perfection. I do not see, therefore, why Swift's commendation will not apply as well to him, who increases the food of vegetables, as to him who increases the food of animals, by causing a new blade of grass to grow. Without, however, meaning to raise a question upon this point, I am anxious to communicate to your readers, one of the best contrivances for saving manure, and all

the manure, that I have anywhere witnessed. I saw it at the farm of Dr Hosack, at Hyde Park. The Doctor is nice in everything he undertakes; and my only fear is, that farmers will be deterred from imitating his example, from a fear that they cannot equal it.

The Doctor's cattle yard is nearly a square, surrounded by an extensive barn on the north, cattle sheds on the east and west, the two latter terminating on the south in two more elevated structures, which serve for farm carriages, implements and work-shops. The whole has a gentle slope to the centre, which is puddled and gravelled so as to become impervious and firm. Over this he has a cheap octagon cover erected, about forty-five feet in diameter, supported by the central and exterior parts and covered with boards. Poles extending under this roof, constitute a comfortable roost for his fowls. This centre forms a reservoir, protected from the storms and the sun, for all the manure of the yard and stables, including urine and hending, into which it is daily collected, when practicable. His stables are double, that is, they admit two rows of cattle, their heads turned from each other; they are paved and sloped to the centre, from whence a paved gutter leads to the stercorary, or central deposit. At a proper elevation in the stercorary, a grate is fixed, opening into a drain, into which the liquids of the stercorary pass, and by which they are conducted to a large-tank or cistern in the kitchen garden, which is lower than the cattle yards. This cistern is furnished with a pump, by which this liquid manure is afterwards raised into spouts which conduct it through the garden, or it is taken from the cistern to other grounds. In this way, the Doctor has increased, probably one third, the quantity of his vegetable food.

Albany Nursery, Feb. 23, 1832.

AGRICULTURE, HARVESTING CORN, &c.

MR. EDITOR—The science of agriculture is not yet well understood in New England; although many intelligent farmers are beginning to devote much of their attention to it; and many valuable improvements and discoveries have been made. Farmers have much to learn, and much more than they are generally willing to admit. To advance this most important science and spread light among farmers, the publication of the "New England Farmer" has already exerted the most salutary influence, and we trust that the great variety of theories, experiments, and useful remarks which enlightened agriculturists may communicate to your paper, will have a certain tendency to dissipate the clouds of mental darkness, which still hang over the prospects of the most useful class of citizens in the community. After the lapse of half a century, those who may then till the soil, will probably look back with deep regret and astonishment, at the gross ignorance under which we now labor, in our agricultural pursuits.

Those who have had an opportunity to examine the fertile, fruitful fields in England, France, and some other countries, will not feel disposed to take offence at my remarks. There the state of agriculture is, perhaps, half a century in advance of its state in this country. The science of agricul-

ture is not of easy attainment—it embraces much practical and theoretical knowledge, and the knowledge of a great variety of subjects having an intimate connexion with it; and much study, close reflection, and long experience are necessary to its acquisition. In respect to myself, Sir, I am ready to confess my ignorance of this science; and the few years in which I have been engaged in agricultural pursuits, and the information acquired in professional studies, tend to force upon my mind the conviction of this ignorance; and at the same time I must admit that I can acquire but very limited information, from more practical farmers, who are resolved to follow the old beaten path in which their fathers trod. New experiments, the best kinds of seeds, improved breeds of cattle, new methods of obtaining manures, &c., they generally consider *silly notions* of mere theorists, and some even ridicule Agricultural Societies which have been attended with the most auspicious results, in this as well as in other countries.

Those, however, who make useful experiments may, possibly, by giving the same publicity, do some benefit even to that class of farmers.

I therefore, at this time, communicate to you but two experiments (new in this quarter, but not so in some of the southern and middle States,) made on my farm in this vicinity.

I noticed a statement in the N. E. Farmer, by which it appeared that the early topping or cutting corn &c. &c., proved, upon fair experiment, to be injurious to the ears of corn, and that the corn not topped at all was heavier than that which was topped. All the farmers in New Hampshire, I believe, are in the habit of cutting the stalks while the corn is in the milk, or before the inner part of the kernel is hard. A little reflection convinced me that this practice is wrong. I this year raised between two and three hundred bushels, and suffered no part of the corn to be topped. After the corn was fully ripe, I commenced by having the corn cut close to the ground, tied in small bundles and put into small shocks by the side of the corn field, to dry, and thence conveyed to the barn; a practice which in common seasons will be beneficial—but afterwards I found the corn so fully ripe and dry, standing in the field, that I had it cut close to the ground and conveyed in small loads to the barn, husked immediately and put into a granary made for the purpose, standing on posts, properly ventilated. The result was that my corn was very heavy, large, perfectly sound, and "as sweet as a nut." Many ears were found from twelve to fourteen inches in length. But I planted a large kind of yellow corn; the kernel is very large. Many have expressed an opinion that they never tasted bread, made of it, so sweet and of such fine flavor. I have never known any corn equal to it, although it is well known that we never had a season more favorable to corn. The cattle appear to relish the stalks as well as those cut green—there is no loss in this particular—but a gain, in respect to the under stalks, often left exposed in the field after the corn is gathered.

There can scarcely be a doubt but that the corn will ripen earlier and be heavier, by suffering the tops to remain until the corn is *fully ripe*. It

is not fully ripe until the inner part of the kernel becomes rather hard, or is "out of the milk," as farmers say. Then the corn may be topped without injury. Nature does nothing in vain. It is idle to say that the ear of corn derives no nourishment, while green, from the top stalks. Every part of the stalk, leaves and all, are necessary to the growth and maturity of the ear, and the saccharine juice gently oozes into the cob, and from the cob into the kernel until fully ripe. It would be as rational to contend, that the amputation of an arm would not injure a man, as that the cutting the green stalk would not tend to wither the green ear of corn. I am aware, Mr Editor, that this doctrine stands opposed to the prejudices of farmers generally, yet I fully believe that fair experiments will, not many years hence, induce them to support it.

Another practice among farmers deserves censure. They often pile up their corn in large heaps in the barn, in order to have what is called "hushings." In this pile there are green materials, green stalks, green ears, and foul matter, which, after laying a short time, produce fermentation, the whole heap becomes warm, and tainted with the noxious gases or effluvia that penetrate every part. The corn is afterwards husked, and often placed in rooms not well ventilated. The corn may be sound and look finely — the bread palatable and called good, very good. But the question whether it might not have been rendered *far better and sweeter* with proper management, seldom, perhaps, enters the farmer's mind.

One of your correspondents, an enlightened practical farmer, informed me that he was fully convinced, that corn would not ripen so soon by topping it while green. This is also against the general opinion, but not, therefore, incorrect. — He also stated that he topped a portion of a corn-field, before the corn was out of the milk, in order to feed his oxen, a practice very common; and that where he gathered his corn, that portion so topped, was inferior to his other corn in the same piece, the soil being equal.

WM. CLAGGETT.

Portsmouth, N. H. Feb. 13, 1832.

ADDRESS

PROMOUCED BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY, IN COMMEMORATION OF ITS THIRD ANNUAL FESTIVAL, SEPTEMBER 21, 1831.

BY MALTHUS A. WARD, M. D.

Concluded from page 262.

Even in the short space since the foundation of this Society, its influence has become strongly marked, not only around the residences of its members, but throughout this section of the country. Never before was there so much inquiry for ornamental trees and for the choicer kinds of fruits, among people of all classes. Never before did gardening and rural affairs engross so large a share of common conversation, — often entirely excluding those unprofitable and acrimonious discussions on politics, and those religious controversies, which are so apt to terminate only in uncharitableness and ill will. Never before was there an opportunity for the interchange of such cheap but acceptable civilities, as the offer of desirable plants, seeds, and scions of favorite fruits, or the timely donation of a delicious melon or basket of grapes. By these means, harmony of neighborhoods has been preserved, valuable acquaintances acquired, unpleasant feuds have been suppressed, and many petty jealousies, which secretly rankled in the bosom,

have been allayed, and may soon be forgotten. If, within the last three years, there is a decided improvement in the grounds of men of wealth and leisure, it is still more conspicuous in the gardens and court-yards of the middling class of citizens; and even the home of the laboring poor has, in not a few instances, acquired an additional point of interest, to attract him from the haunts of dissipation; his leisure hours are pleasantly occupied; his mind expanded, and his heart warmed and softened.

All this, it must be admitted, is more than well. It is excellent. Had no higher benefits accrued from the expenditure of the time, the labors, and the funds of this society, the speculation must have been accounted most fortunate. It is not, however, the simple, the rude and unmediated, who derive the most exquisite gratification from a contemplation of the works of Nature. It is the mind, which, in addition to refined literary accomplishments, an intimacy with the fine arts and the cultivated sensibilities of polite society, has added a considerable attainment in those scientific pursuits which I have been striving to recommend. The uniform testimony of all who have walked in these paths is, that they are ways of pleasantness. Dr Elliott, to whom the Botany of this country is so much indebted, says, "It has been for many years, the occupation of my leisure moments; and it is a merited tribute so say, that it has lightened for me many a heavy and smoothed many a rugged hour; that, beguiled by its charms, I have found no road rough or difficult, no journey tedious, no country desolate or barren. In solitude never solitary, in a desert never without employment, I have found it a relief from the languor of idleness, the pressure of business and the unavoidable calamities of life." "I have travelled throughout America," says Mr Nuttall, "principally with a view to becoming acquainted with some favorite branches of Natural History. I had no other end in view but personal gratification; and in this, I have not been disappointed; for innocent amusement can never leave room for regret. To converse, as it were, with Nature, to admire the wisdom and beauty of creation, has been, and I hope ever will be, a favorite pursuit. To communicate to others a portion of the same amusement and gratification, has been the only object of my botanical publications."

There is not, in fact, a flower in the garden, or by the way-side, but has some beauty only unveiled to the minute inquirer; — some peculiarity in structure, fitting it for its destined place and purpose, and yet not obvious to a casual glance. — Many are full of remembrances and associations, in which it is good for us to indulge. To the enlightened student, "a yellow primrose on the brim" is something more than a yellow primrose. He is, to borrow the words of the author of the Sketch Book, "continually coming upon some little document of poetry in the blossomed hawthorn, the daisy, the cowslip, or some other simple object that has received a supernatural value from the muse." And as his pursuits lead him into the most wild and beautiful scenes of Nature, so his knowledge enables him to enjoy them with a higher relish than others. They are "full of his familiar friends," with whom he holds a kind of intellectual communion, and finds from experience that

"The mearest flower that blows can give
Thoughts that oft lie too deep for tears."

In a spirit of that pure natural religion, and full of those ennobling sentiments which such contemplations always awaken, he is ready to exclaim in the language of the poet,

Nature in every form is lovely still;
Nothing in her is mean, nothing superfluous.
How wondrous is this scene! where all is form'd
With number, weight, and measure! — all design'd
For some great end! — where not alone the plant
Of stately growth; the herb of glorious hue,
Or food-fell substance; not the labouring steed;
The bird and flock that feed us; not the mine
That yields us stores of elegance and use;
The sea that loads our tables, and conveys
The wanderer man from clime to clime, with all
Those edifying spheres, that, from on high, shed down
Their kindly influence; — not these alone,
Which strike even eyes incurious, but each moss,
Each shell, each crawling insect holds a rank,
Important in the plan of Him, who form'd
This scale of beings:

A blade of silver hair-grass, nodding slowly
To the soft wind; — the thistle's purple crown,
The fern, the rushes tall, and fungus lowly, —
A thorn, a weed, an insect, or a stone,
Can thrill us with sensations exquisite;
For all is exquisite; — and every part
Points to the mighty hand that fashion'd it.

Then, as we look doth with yearning heart,
The trees and mountains, like conductors, raise
Our spirits upward on their flight sublime,
And clouds, and sun, and Heaven's marmoreal floor,
Are but the stepping-stones by which we climb
Up to the dread INVISIBLE, to pour
Our grateful feelings out in silent praise.

From the New York Farmer.

ON THE CULTURE AND VALUE OF LOCUST.

Among the great variety of subjects discussed in your valuable publication, connected with agricultural pursuits, I have not seen any notices of that most valuable of all the different kinds of wood known to our country, the common yellow locust. The most valuable, because of all the varied productions of our forests, no one species of wood is in so many ways preferable to all others.

In ship-building, and house-building; for fences and for fuel, the locust is in almost all respects as good as any other, and in many particulars so decidedly superior, as scarcely to admit of comparison.

The value of this wood not being generally known, as it is rarely found among our primitive forests, and the cultivation of it but little attended to in the new and recently settled parts of our state, is probably the cause why it has attracted so little of general interest. The soil in which the locust appears to thrive best, is of the kind which is generally found upon the necks and promontories on the north shore of Long Island — a light and somewhat sandy loam. It thrives best in the deepest and richest soils of this description, but grows very well in those that are so gravelly and uneven as to be of little or no value for the plough.

It may be grown from the seed, first subjected to the action of boiling water, and planted in nurseries, to remain two or more years previous to transplanting; or when fallen, after having attained some size, numerous sprouts may be obtained by wounding or separating the roots with a plough, which extend for a considerable distance from the body, and run near the surface. In this way an acre may be covered with more than will arrive at maturity, from a dozen well grown trees scattered over that surface.

In the older parts of the state, where the quantity of woodland is reduced to the desirable limits, this wood may be advantageously substituted for other kinds, by introducing it among the sprouts, on woodland recently cut off, in which way, five and twenty trees on an acre, and in a soil adapted to their growth, would, at the expiration of as many years, when the wood was again subjected to the axe, take the place of the other timber, if care were taken to destroy or retard the growth of the sprouts.

For fence posts, the locust is invaluable, it being durable beyond any other kind of wood. How long it will last, using in this way, is perhaps somewhat uncertain; but it does not admit of a doubt, that an originally sound post, of five inches in diameter, will be good at the expiration of fifty years.

For sills, posts, and those parts of the frame of a building that are subjected to dampness, or exposure to the weather, it is perhaps as durable as iron similarly exposed; and if it should ever become so plentiful, as to admit of being used for the outside covering of buildings, as well as for frames, stone itself would have but few advantages over it.

In ship-building, its value is well known, for certain parts of the frame, and for trunnels, it being incomparably of more value than any other kind of wood used.

For fuel, it is of equal value in all respects, with walnut, or the best white oak.

In a kindly soil, there are but few kinds of wood that grow more rapidly than the locust. The walnut, oak, elm, and other kinds of hard wood, are decidedly inferior to it in that respect; but the chestnut and tulip tree, (the common white wood,) particularly the last, will overtop it. Great care, consequently, is required when it is young, and growing among sprouts of this last description, to prevent them from destroying it. In good soils, in twenty years from the seed, and fifteen years from good roots, it will attain a liberal size for fencing uses.

The money value of the locust depends, like all other productions of the soil, upon its proximity to a market. On this island, a post five inches in diameter, and six and a half or seven feet long, which divided, will make two five-rail fence posts, is worth at least fifty cents; ten and twelve feet long, for yard posts, seventy-five cents. Trees from twelve to eighteen inches in diameter, are worth from fifty to seventy-five cents per cubic foot; and it is no unusual circumstance for the standing wood on an acre of fair growth, to sell for two hundred and fifty and three hundred dollars.

The leaf of the locust possesses an eminently enriching quality, as is evinced by the improved state of the pasture on worn out soils, where this tree is planted. When planted out at regular distances, like a fruit orchard, the grass under and around them on the most infertile soils, is improved rapidly, and converted into a beautifully green turf, a favorite walk with cattle.

Among the various subjects which address themselves to the attention of our enterprising countrymen, but few are more deserving the interest of farmers and capitalists, than the cultivation of the locust. What better method of investing money, than placing fifty dollars where, in fifty years, it would be worth five hundred dollars? What better inheritance could a farmer provide for his children, than a property of this description? Stick a tree in the ground now and then, was the advice of an old Scotch Laird in one of the Wa-

verly novels, for, said he, "it will grow while ye are asleep."

Queen's Co. Jan. 30, 1832.

From the Transcript.

SUPERIOR QUALITIES OF THE BLOOD HORSE.

MR. EDITOR—Permit me to call the attention of breeders of horses, to a subject in which they are directly interested. I allude to the superiority of the Blood Horse over all others. Very few persons in New England possess any knowledge of the power and ability of the blood, or race horse, to perform a given service; and, consequently, conclude that race horses produce race horses, and not workers. Nothing is more remote from the truth, nor more easily disproved.

The strength of the race horse and his ability to carry high weights, arise from the solidity of his bones, the close texture of his fibres, the bulk and substance of his tendons, and from his whole peculiar conformation. His superior speed and endurance originate from his obliquely placed shoulders, depth in the girth, deep oval quarters, broad fillets, pliable sinews, and from the superior ductility and elasticity of his muscular appendages. It is also from the blood horse that we acquire fineness of skin and hair, symmetry and regularity of proportions, elegance and grandeur. As a proof of the latter qualities, the highest dressed horses of the ancient emperors, were invariably of the highest cast of Arabian or southern blood.

The value of the racing blood, when crossed upon the common cart breed, is also apparent in making him superior in the plough and wagon; arising from quicker action and better wind, particularly in the long hot days of summer. There is the same difference of motion between the racer and the common bred horse, as between a coach and a cart. It is, moreover, a fact, although not generally known, that no other horses are capable of carrying with expedition such heavy weights; and were "a thirty stone plate (420 lbs.) to be given, and the distance made fifty miles, it would be everlastingly won by the thorough bred horse. There is but one way in which a bred horse would be beat at high weights; it would be, (to use a queer phrase,) to make it a stand-still race. In that case, I would back a cart horse; I think he would beat a racer by hours."

Is not a cross of the blood horse on the common stock, indispensable to produce light footed and quick moving saddle horses?

In former times in England their hunters were only half-bred horses; but later observation and experience have fully convinced them that only those that are thorough bred (notwithstanding the popular clamor of their deficiency in bone,) are adequate in speed, strength and durability, to long and severe chases with fleet hounds, particularly over a deep country, and that they will always break down any horses of an opposite description that may be brought into the field.

There can be no better test of ability to perform hard service, than the race course and chase. Almost all the fast trotters that have and still figure in the country, are high bred horses. As roadsters, they are decidedly superior, for reasons already stated; and when we remember the symmetry of their proportions, and the elegance of their movements, their irrepresible spirits and perfect docility, we wonder that any one can be

so blind to his interest, or so obstinately determined in pursuing old customs, and adhering to exploded opinions, as to prefer the degenerate stock of the common hack, to the noble blood of the high bred courser.

GODOLPHIN.

CULTURE OF SILK.

The following statement appears in the last number of the American (Philad.) Quarterly Review, and conveys information which we presume will be new to most of our readers. The subject of the culture of silk, is one which heretofore attracted the attention of Congress and will probably again come up this session, when the facts stated in the American Quarterly, will be of value to its advocates. This periodical says:—The silk of the United States has been judged by experienced manufacturers in England, to be equal in quality to that of Bengal. In France it has been found equal to some of their best silks. We have seen samples of gros de Naples, manufactured this year at Manchester, in England, out of raw silk sent from the States in Philadelphia. It yields to none in beauty and lustre. The great characteristics of the American silk, like that of Bengal, are nerve and strength, in consequence of which it produces less waste in reeling and throwing, and the stuffs made of it will exceed all others in durability.

The National Intelligencer of Monday remarks:—A measure of great consequence in our national economy, stands for consideration in the House of Representatives today; we allude to the bill for promoting the growth and preparation of silk in the United States. England imports from abroad, annually, five millions of pounds of raw and thrown silk for the use of her factories; and one third of the vast amount annually used up in the factories of France, she also obtains from other countries. With a climate so well adapted to the cultivation of silk, as that of the United States, we might in a few years supply a great portion of the immense consumption of the French and English looms. A vast field, therefore, of domestic industry and wealth, opens itself to our country, if we improve the opportunity. Shall we embrace it, or neglect it?

A bill has been reported in the Pennsylvania Legislature, to promote the culture of silk.

The committee on agriculture, of the Massachusetts Legislature, have been directed to consider the expediency of exempting from taxation, lands hereafter made nurseries of forest trees.

Curing of Hams.—In Spain and Portugal and France, where the hams are remarkably fine flavored, a large quantity of sugar is used along with the saltpetre in curing them. It assists materially in the conservation of the flesh, and renders it peculiarly mellow. Sugar is there also very generally put into the water in which they are boiled, and is found to render them tender. Though not quite relevant to the subject of curing, it may also be remarked that hams are much improved in the dressing, by being only first half-boiled and then baked.

The Baltimore Patriot, of Wednesday, says—"three hundred cars for the transportation of goods, wares and merchandise, &c. are now engaged on the Baltimore and Ohio railroad. At the opening of the spring trade the number will be much increased."

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER

SALT AND SHEEP.

Jamaica Plain, Feb. 27, 1832.

T. G. FESSENDEN, Esq.

DEAR SIR—In your New England Farmer of 22d inst. is an abridged article from the New York Medical Repository, of a letter from Dr Mitchell, on (as he styles it) *the destructive qualities of Liverpool salt*. This charge is a very heavy one, and I suspect not sufficiently well founded. I have been looking into "Holland's Views of Cheshire," published in London, in 1813—in that County almost all the salt which is exported from Liverpool, is produced or manufactured—and in which, is a very long article on the subject of their mineral salt, salt springs, the manufacture of salt, and an analysis of all the sorts made there. Extracts from which, I should recommend your publishing. Great pains seems to be taken to make it as pure as possible, and when we know from the published accounts, the great length of time, and the immense quantity manufactured and exported from that county, it seems almost impossible that it can possess the injurious qualities attributed to it by Dr M.* We know that the Liverpool salt weighs but 56 lbs. per bushel, and that from the Bahamas 84 lbs. per bushel—therefore in many instances I doubt not damage may have taken place, from using it by *measure* when *weight* would have been more correct.

I intend to collect samples of the different sorts of Liverpool salt, also of Spain, Portugal, the Mediterranean and the West Indies, as well as our own sea-bred; and if I can procure any from the interior of New York, shall add it—and I have the expectation that an eminent chemist will analyze them all; in which case I hope to furnish you the result for publication.

You will recollect, it is not long since I noticed in your paper the losses I had sustained in a valuable flock of sheep, which I thought might have been produced by their eating the leaves of the wild-cherry. I begin now to suspect it may have been caused by a *too free use of salt*. Last May I put into the care of the Society of Shakers, at Canterbury, New Hampshire, a small flock of New Leicester sheep, which I had kept at Jamaica Plain for two years, and were in perfect health. Here, we have never given any salt to our animals. In December last, one of their people came to me to ask what could be the matter with these sheep, as some of the last spring lambs had died and they feared the loss of more, as they *scoured* very much, and they could not prevent it. Two days past, one of their people came again to say they believed they had discovered the cause, and the sheep were now doing very well. On opening the last one that died, they found nothing but very thin slimy matter in the intestines. They had had salt *at all times* to go to; and by watching, they found as soon as they had eaten salt they immediately went to drink; they then took away the salt, and give it now but sparingly, say once in ten or fifteen days, and since then there has been no sickness among them; they

doubtless were weakened by so much drink, (though of pure water.)

For about six years, I have furnished the mineral rock salt to my sheep in New Hampshire, being more convenient and economical—they have had it at all times to go to, in winter and summer, and plenty of water at hand. But although for several years past we have lost a great many, (lambs more particularly under one year old,) we had never thought of salt injuring them, which I now believe must have been the cause; and in future shall allow only a small quantity, and not oftener than once in ten or fifteen days. Previous to procuring the mineral salt, the sheep had common Liverpool salt once a fortnight; at that time our losses were not many.

Yours truly,

JOHN PRINCE.

P. S.—Since writing the preceding, a gentleman has loaned me "Ure's Dictionary of Chemistry, 4th edition, 1831," in which I find a very particular analysis of the different salts of England, and some foreign ones; it will therefore be unnecessary to have it again done here, but I shall hope to obtain it of some others, particularly the American sorts. I enclose you the analysis, with Mr Ure's note appended. I have no doubt of the correctness of his remark, that large grained salt is important in salting meats and fish, in keeping the pieces separated by being longer in dissolving, so as more thoroughly to penetrate the meat. I can have no doubt that the English salt for every purpose, is as good as any other, *if the same state of fineness and weight is used*.

On my farm, where my own family butter for winter use is made, I have always used the Liverpool bag or table salt, and it has always kept perfectly well, and in May we think it better than *new* butter, (before grass-fed.) I am well convinced that the badness of butter is more owing to the want of proper care of the milk, and in not thoroughly *creaking* the butter-milk, than in the salt; for we know the Dutch are famous for their butter keeping well, even when sent to the East Indies, and they use *very little* salt.

From Ure's of Chemistry, 4th edition, London, 1831.
ANALYSIS OF SALT, BY DR FOSTER—
ON 1000 PARTS.

KIND OF SALT.	Impurities.	Mg. base.	Mg. base.	Total early imp.	Sulph. base.	Sulph. base.	Total impurities.	Pure amount of salt.
FOREIGN BAY SALT.

Stored,	1	0.1	0.1	1	113	—	114	103

That kind of salt, then, says this able chemist, which possesses most eminently the combined properties of hardness, compactness, and perfection of crystals, will be best adapted to the purpose of packing fish and other provisions, because it will remain permanently between the different layers, or will be gradually dissolved by the fluids that exude from the provisions; thus furnishing a slow but constant supply of saturated brine. On the other hand, for the purpose of preparing the pickle or the striking for the meat, which is done by immersion in a saturated solution of salt, the smaller grained varieties answer equally well; or, on ac-

count of their greater solubility, even better, provided they be equally pure. His experiments show that in compactness of texture, the large grained British salt is equal to the foreign bay salt; their antiseptic qualities are also the same.

ON MANURES.

MR FESSENDEN—Will you or some of your correspondents, inform whether in all cases it is necessary to put dung under a roof or in a cellar, as it is cleared out from the stall; and if anything should be done with it while under the roof or in the cellar; and if it should be put immediately from thence on the land and ploughed in, or made first into compost. And if while under cover and while kept from the rain, there is any moisture added to assist its putrefaction?

I know that Arthur Young says, that they who spread their dung on the top of their ground and let it remain there, and those who leave their dung heaps uncovered in the open air, do little more than manure the atmosphere. And, if I understand Sir Humphry Davy, he says, that after dung has gone through the putrescent fermentation, it is no longer manure, which I for one do not exactly believe.

Is it yet a question whether the strength of dung, or that part of it which is food for plants, is in the exhalations or decoctions, or in both? Some say that "a very considerable quantity of moisture is necessary in a dung heap, to excite fermentation, to qualify it for a proper state as a manure, and that what is not absorbed and retained in it, is exhaled in as pure a state as when it descended from the clouds; and although that which is spread on the top of the ground has become dry and hard some days after rain, yet it retains all the strength, which has not drained through it into the ground, when it was soaking wet with rain, and will continue to do so again whenever it is thus wet, until it has gone to decay; and I am sure I cannot dispute the position. We know that spirit is the product of fermented sub-

*Notes by the Editor. We believe there is no principle in agriculture better established, than that dung should be exposed as little as possible to sun, rain, and air, before its application to the soil. A slight degree of fermentation may be of use, by assisting to break down and decompose the woody fibre, but too much fermentation dissipates and destroys the most useful part of manure, and in its effects resembles combustion. You may as well suffer your hay to be now burnt, as your dung to be in put consumed by fermentation.

Sir Humphry Davy says, "In the writings of scientific agriculturists, a great mass of facts may be found, in favor of the application of dung in its recent state. Mr Young, in his Essay on Manures, adduces a number of excellent authorities to support the plan. Many who have doubted, have lately been convinced; and perhaps there is no subject of investigation, in which there is such a union of theoretical and practical evidence.

Mr Coke has entirely given up the system formerly adopted on his farm, of applying fermented dung; and he informs me that his crops have been since as good as they ever were, and that his manure goes nearly twice as far.

When dung is to be preserved for some time, the situation in which it is kept is of importance. It should, if possible, be defended from the sun. To preserve it under sheds would be of great use; or to make the site of a dung-heap on the north side of a wall. The floor on which the dung is heaped should, if possible, be paved with flat stones; and there should be a little inclination from each side towards the centre, in which there should be drains connected with a small well, furnished with a pump, by which the fluid matter may be collected for the use of the land. It too often happens that a dense mucilaginous and extractive fluid, is suffered to drain away from the dung-hill, so as to be entirely lost to the farm."

*In the year 1805, upwards of 56,000 tons of rock or mineral salt were sent down the river Weaver, to Liverpool; the principal part of it was exported to Ireland and the north of Europe, and ports in the Baltic, and in the same year 178,000 tons of white or manufactured salt.

stances; but then the question is whether if there be spirit produced from fermenting manure, that spirit would be necessary to the production of plants? or whether there be spirit or any other valuable property produced by fermentation, which the atmosphere or the fermenting substance is warm enough to exhale? We know that distillers put their syrup into a high state of fermentation, and yet they save none of the exhalation before it is put into the still and a greater heat applied.*

It seems that Sir Humphry Davy, himself, ascertained the quantity of nutritive matter contained in each of two hundred kinds of grasses, by boiling down the decoctions; and I do not recollect that he took the exhalation into account in any instance.† I am not, however, arguing against housing or covering manure, for I cover mine with black mould, or turf scraped from the roadside, whenever I make a compost heap, but in the hope of having the matter generally known, when the truth has been ascertained. And I hope, Sir, besides your own information on this interesting subject, you will invite further inquiries and obtain more information. For since our most respected friend, Gen. Dearborn, has accepted the presidency of our sister society, his attention has been so much engaged for their interests, that we fear he has forgotten us farmers altogether.

It is a common practice with our neighbors of Milford, who are said at this day to adhere to their agricultural operations implicitly to the practice of their British ancestors, never to carry the manure out of their yards, until they have done sowing or planting in the spring; and then it is dropped in a thin bed, in a hollow, a short distance

* There are three sorts or stages of fermentation: the vinous or spiritous, (which is the distiller's fermentation); the acid or acetous, producing vinegar; and the putrid fermentation, producing certain gases, principally ammonia, which are food for plants, but injurious to animals. The fermentation of farm-yard dung is almost exclusively of the putrid kind. You can neither make spirit nor vinegar from the exhalations of a dunghill; but you may manure plants with such exhalations. Sir H. Davy, in his lecture on manures, says that he introduced the book of a retort filled with fermenting dung, very hot at the time, in the soil amongst the roots of some grass, in the borders of a garden; in less than a week, a very distinct effect was produced on the grass; upon the spot exposed to the influence of the matter disengaged in fermentation, it grew with much more luxuriance than the grass in any other part of the garden.

† The experiments alluded to by our correspondent were, probably, those which are entitled "Details of Experiments on Grasses," by George Sinclair, gardener to his Grace the Duke of Bedford, &c. and printed in the Appendix to Sir Humphry Davy's Agricultural Chemistry. The experiments extended to a number of different sorts of grasses only, though the introduction to the account given by Sir Humphry states, that there are "two hundred and fifteen proper grasses, capable of being cultivated in the climate of Great Britain."

With regard to the "boiling down the decoctions," and the "exhalations," care was taken to avoid losing nutritive matter by such destructive modes of analysis. The account states that "for the purpose of obtaining as far as possible, the nutritive powers of the different species, equal weights of the dry grasses or vegetable substances, were acted upon by hot water till all their soluble parts were dissolved; the solution was then evaporated to dryness by a gentle heat in a proper stove." &c. If, however, extracts of the gases had been made by boiling, the steam would have been a very different substance from the gases arising from a dunghill. Steam as well as water, may combine with and conduct off other substances; and so may the different sorts of gases, but steam and gas are as different, the one from the other, as oil is different from vinegar. When steam is cooled it returns to the state of water, but gas cannot be rendered solid nor liquid by any degree of cold.

from the barn door; where the hogs in the street root it and the fowls scratch it all summer, entirely uncovered until fall sowing, and what is not then used, remaining until the next spring to dung corn in the hill, which is their general practice; and the dung is not then fit for the purpose unless it is fine enough to measure in a peck, and yet they have good corn, although in the estimation of many the dung in this state would be destroyed. Bridgeport, Conn. Feb. 1832.

SQUASHES.

To raise winter squashes, the following method is recommended:—Select a rich piece of ground, rather moist, not much exposed to the wind and free from shade. At the proper season, plough it well three times; dig holes in the earth about eight feet distant, sufficiently large to contain more than one bushel; put into each, a shovel three times full of strong manure and one pint of dry ashes or slacked lime. The compost taken from the hog-yard or slaughterhouse cellar, is preferable. Cover this composition slightly with dirt; after a few days, take a hoe, chop it over, and mix with it a sufficient quantity of earth to fill the holes nearly. Let this exercise be repeated two or three times in the course of ten, twelve, or fourteen days, as the weather may be; and plant the seeds taken from large ripe squashes. The plants will soon spring up, and then the enemy will appear in great armies—I mean, small striped and large black bugs; anything that is offensive to the olfactory nerves of a human being, will retard their operations, but the only sovereign remedy is to take life. The plants, therefore, should be critically examined at least twice each day, and the bugs destroyed. Hoe them frequently, make the top of the ground in the form of a concave lens, and leave only three or four thrifty plants in each hill. The squash, like other vines, especially of the genus *cucurbita*, receives much of its nutriment directly from the rain, the air, and the dew; of course the leaves should be sustained in their natural position. To effect this object, place brush between the hills in every direction, just before the vines begin to spread; and, with the blessing of heaven, a large crop may be expected.

I am aware that this method of raising squashes

* It is not uncommon for some folks to be a century, more or less, behind the age they live in, as regards improvements in the useful arts. Exposing dung to rain and sunshine is as decidedly a wasteful practice, as it would be to expose hay, intended for fodder for cattle, to the same agents. It is well remarked in Loxin's Husbandry, "Fresh dung, applied in the usual way, for the growth of plants, affords double the quantity of nutriment for plants, that is obtained from it after it has been rotted or decomposed. It is to grow a wicker crop of maize, or any other plant that is not readily injured by a powerful application of manure, dung in a very high state of fermentation and partially decomposed, would be preferred by me. It would act more powerfully than fresh manure in the beginning, and enough of it would protect the crop. This is, however, no reason why a farmer (who ought to have a succession of crops and the improvements of his land in view) should adopt this wasteful practice, or that of decomposing his dung, until the greater part of its nutritive properties is scattered in the air." To these and many other authorities, may be added that of Robert Smith, Esq. president of the Maryland Agricultural Society, who in an address to that society, observed, "With respect to stable dung, I shall for the present content myself by barely suggesting that my experience strongly inclines me to the opinion, that, however long, it ought to be ploughed into the ground without any previous stirring, and as soon as practicable after taken from the farm yard."

See *N. E. Farmer*, vol. i, p. 55, 62, 86, 110, 174.

requires much labor and persevering attention; but the cultivator will be amply compensated.—Last season I planted one hundred hills, and raised between 4000 and 5000 pounds, which, at the rate they are usually sold, would amount to more than sixty dollars. My yard was about eighty feet square.

Andover, Ms. Feb. 20, 1832.

PRUNING TREES.

MR FESSENDEN—Reading lately some remarks on trimming trees, I was happy to see it recommended to have trees trimmed early in the season. Some fifteen or eighteen years since, when I first began to cultivate trees, I was very much taken up with the recommendations of some scientific horticulturists, on June trimming. As I am not in the habit of carrying the stone to mill because my father and grandfather did; but, unlike many other farmers, rather apt to err on the other extreme; and as the argument in favor of trimming in June was rather a plausible one, (I say argument, for I do not recollect but one in favor of it,) viz. that the wounds heal over sooner when the sap flows freely, than if cut in the fall or winter. This is undoubtedly true, if left bare to the influence of the sun and winds; but if covered over by some kind of composition, as recommended in the remarks above named, the evil is removed at once. If we reflect on the subject, reason will teach us that any considerable number of branches cut from a tree, when they are full of sap, destroys so much of the nourishment of the tree. The sap of trees is drawn from the ground by the fibres of the roots, and ascends to the extremities of every twig, a part of which contributes to the growth of the leaves, blossoms and fruit—the remainder returns between the bark and the trunk, and forms a new growth around every branch, trunk, and likewise the roots. And if the limbs are removed when they are full of sap, we destroy so much of the nourishment.

I will agree that when a person pays proper attention to his trees, from the time they are planted, he can remove the small branches at any season of the year, without any perceptible injury; but this is very different from the common practice in this country, for many of our farmers do not trim their trees often than once in five or ten years, and when they do trim them they make a business of it, and cut off a large quantity of wood. The old adage is, that "an ounce of experience is better than a pound of theory." Sad experience compelled me to abandon the practice.

When I first began to graft, I employed a man who used to cut the whole of the top off and all the limbs; as this was commonly done at the season after the trees had put out, the consequence was the death of one half of my trees; and those that did live, many of them might as well have been dead. The next thing I observed, was some young trees which were set out where I pastured a cow, and which were boxed up; but occasionally the cow would reach up and break off a limb. Notwithstanding I cut them off smooth and covered the wound, I lost many of the trees and might as well have lost the whole, for what did live were so checked in their growth, that they have not recovered to this day, but remain stunted things. Not so, when, by any accident, they are broken in winter, for if the whole top was removed in the winter, they would give out new branches in the spring, and grow the better for it.

Another objection is, the farmer is always busy in May or June, and if the trees are neglected at a leisure time in the year, they will probably not be trimmed at all. A third and last objection that I shall make is, that without great care in cutting the branches, the bark will be started and many of the buds and blossoms injured.

The composition which I used last spring, to cover the end where the limbs were cut, was made of the following ingredients, viz. one quart of linseed; half pint of japan; one pound and a half of Spanish brown; quarter of a pound of bees-wax; half pound of resin; and two pounds of tallow. The three last mentioned simmered together, and mixed with the paint, when hot, and put on with a painter's brush, when warm. Where wounds were covered last spring with this composition, it remains on, and has, so far, proved a complete preventive from check or rot, and the wounds, without exception, are healing over.

I have frequently observed that it was the practice of grafters to cut off too much of the tree, when the scions are put in, and to set the grafts too high the centre of the tree. My practice is, when I wish to engraft a tree, to select out from four to six or eight outside branches, the number varying according to the size of the tree, which are cut off at some distance from the body, according to discretion; leaving this in view, however, to save as much of the old wood as possible, so as to save time in forming the new top, which is engrafted; and the remainder of the tree is left untouched until the next spring. Then the branches are removed around the scions, and more sap flows into the grafts; which practice is continued from year to year until the old wood is all removed, and the whole top formed anew. This commonly takes place from two to four years, according to the size of the tree. By this management you have an entire new head to your tree, open in the centre, which answers two valuable purposes, one to let in the sun, which gives health and vigor to your trees, the other convenience in picking the fruit. Yours, with respect,

B. WHEELER.

Framingham, March 2, 1832.

N. B. The composition mentioned above, I have found excellent to paint all kinds of agricultural implements. It fills up the joints and pores of the wood much better than common paint, and is a complete preventive to rot.

B. W.

QUERIES RELATIVE TO STONE BUILDINGS.

MR EDITOR.—At the instance and request of several friends, I have taken the liberty to address you the following queries, concerning stone dwelling-houses. If agreeable and convenient to publish and answer them in your useful publication, you will, by so doing, render a very acceptable service to the public and confer a special favor on many of your patrons, besides obliging your friend and humble servant,

ADIN BALLOU.

Mendon, Ms. March, 1832.

QUERIES.

1. Are stone dwelling-houses more or less healthful than wooden ones?
2. Where stone is plentiful, are they more or less expensive?
3. How much less of wood and timber, finishes a stone dwelling-house than a wooden one of the same general size and style?

1. What kinds of stone—of what shape and size—are most suitable for the erection of stone dwelling-houses?

5. How much hewing and hammering would comfort and decency require that split blocks of stone should undergo?

6. What are the most important advantages or disadvantages of building with stone in New England?

By the Editor. In the New England Farmer, vol. vi. p. 269, may be found some excellent remarks relative to the subject of the above queries, by our able correspondent, J. M. Gougas, Esq. of Weston, Mass. It would add to our numerous obligations to Mr Gougas, if he would resume this topic with particular reference to the above queries.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, March 7, 1832.

FARMERS' WORK FOR MARCH.

Take opportunity before the hurrying season comes on, to select and purchase such neat cattle, sheep, pigs, seed-wheat, potatoes for planting, &c. as will be likely to prove most valuable on your farm, having in mind the following maxim, viz.—Choose those animals and vegetables to propagate from, that possess the qualities which you wish might distinguish their offspring in the greatest perfection. Farmers are too apt to sell off their best stock to the butchers, and keep the poorest to breed from; and to gather their seeds from vegetables, which were permitted to go to seed merely because they were worth but little for consumption. But we believe that more pains have been taken to improve their breeds of animals among those who are men of skill and science in the arts of cultivation, than to improve their sorts of vegetables. Still it is of quite as much importance to introduce on a farm or in a garden, the best kinds of plants, seeds, roots, &c. as it is to keep the best breeds of animals.

Look to your water courses, clear out obstructions, and change their directions if necessary, so as to distribute their contents to the best advantage over your mowing lands. By a little attention in this particular you may oftentimes derive great advantage from the wash of the highway, barn-yard, and other receptacles of manure.

PRUNING FRUIT TREES.

According to the opinion of some able and experienced cultivators it is quite time to trim your trees of all superfluous shoots, branches, &c. But care should be taken not to cut away too many of the branches of a tree at a time. Mr Wheeler's article, page 269, in this day's paper, appears to us very correct and judicious on this topic. His opinions are coincident with those of a writer in the Genesee Farmer, who states, "It has been my practice for several years past to prune in autumn and winter, applying a coat of boiled tar and brick dust, or of common paint immediately to the naked wood; and I have been led to believe that no time is more favorable."

FENCES

Should be surveyed with a critical eye, and all defects rectified before your cattle take advantage of anything out of joint in that department of the cultivator's province. "A stitch in time saves nine," and a little seasonable fence mending may save more loss and trouble than

could be calculated by the most able Professor of Mathematics that ever made a figure. Train your domestic animals in the spring in the way they should go, and in summer and autumn they will not depart from it. But if they are once suffered to commit *Trespasses on the Fences*, trying to correct their waywardness will be "taking the bull by the horns."

Post and rail fences are, probably, more used in New England than any other; and are, perhaps, in many cases justly preferred. Mr Preston, of Storkeport, Penn., recommends to set posts with the top part in the ground; and asserts, that they will, in that position, last three or four times as long as when they are set with the butt ends down. He also advises, in making post and rail fences always to place the rails with the heart side up. Some farmers cut their posts so long, and mortise them in such a manner that when the lower ends have become rotten they can turn them upside down, and it is said that they will last nearly as long again, when managed in that manner.

OWTS

Cannot be sown too early in the spring, after the ground is thawed and become dry enough for sowing. Three bushels of seed, according to Deane, is the usual quantity sown on an acre. This quantity will be rather more than enough on a rich soil; if the soil be poor the quantity of seed should be greater.

Oats have strong piercing roots, and are called hearty feeders, so that they can find their nourishment in stiff soils; and for the same reason they sometimes produce great crops, when sown after one ploughing. Some recommend cross ploughing and harrowing for oats, but when sward land is well turned over, the soil ought not to be disturbed until at least two crops have been taken from the field. Gypsum is said to be an excellent manure for oats.

A very fine specimen of the *Rhododendron arboreum*, a native of India, is in flower at the Greenhouse, Charlestown Vineyard. It is considered the most beautiful of the genus; and it is believed this is the first time it has flowered in this vicinity. It is well worth the observation of amateurs.

The committee of the Massachusetts Horticultural Society, on the products of the kitchen garden, have awarded the following premiums for the past season:—

For the best early Peas, to N. DAVENPORT of Milton,	\$2.00
For the best early Potatoes, to SANUEL FORD of Cambridgeport,	\$2.00
For the best Lima Beans, to RICHARD WARD of Roxbury,	\$2.00
For the best Mushrooms, to N. DAVENPORT of Milton,	\$2.00

By order of the committee,

DANIEL CHANDLER, Chairman.

His Excellency LEVI LINCOLN, Governor of this Commonwealth, has, with the advice of the Council, set apart Thursday, the fifth day of April next, for Fasting and Prayer, throughout this State.

The Hereford (Eng.) Journal mentions that 18,000 tons of iron in rails, are being made in Monmouthshire, for the United States.

TO CORRESPONDENTS. Several able and useful articles written for the New England Farmer, unavoidably postponed.

Subscription

FOR IMPORTING GRAPE VINE ROOTS FROM FRANCE, AT A MODERATE PRICE, AND ENCOURAGING THE INTRODUCTION OF THAT CULTURE INTO THE UNITED STATES.

MR ALPHONSE LOUBAT, having considerably enlarged his Vineyard on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots, of which 22,000 are for his subscribers; having also the peculiar advantage of being enabled to procure the best species of Roots from his Father's extensive Vineyards and Nurseries, in the districts of *Bordeaux, Clerac, and Ruzet*, departments of Gironde and Lot and Garonne, in France, (15th N. Lat.) proposes to the numerous friends to the cultivation of the Grape Vine in the United States, a subscription, which was opened on the first of August, 1828.

Mr A. L. will engage to furnish subscribers with their Grape Vine Roots, in the course of March, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the Grape Vine Roots they wish to have. They will engage to pay, for 1000 roots, or more, at the rate of 12½ cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50. *Roots only two years old*, shall be paid for at the rate of 9 cents each, for 1000 or more; 12½ cents for less than 1000; and 18 cents for less than 50 roots.

Payment to be made on delivery of the roots. *Letters not received, unless Post Paid.*

SUBSCRIPTION LISTS ARE OPENED AT New York, with Alphonse Loubat, 55 Wall street; Boston, J. B. Russell; Albany, R. M'Michael; Philadelphia, Van Amringe; Baltimore, Willard Rhoads; Washington City, Wm Pairo; Richmond, Davenport, Allen, & Co.; Savannah, Hall, Shapter & Tupper; New-Orleans, Foster & Hutton; Charleston, T. & T. Street & Co.

Mr A. Loubat's Book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal Booksellers of the United States; and his Agents will furnish them, gratis, to subscribers.

Catalogue of Grape Vine Roots that Mr Loubat proposes to Import. The following Species are selected as the best, the choice of which is left to Subscribers:

TABLE GRAPES, OR FOR MAKING STRONG WINE.	
White.	
1. Alicante.	9. Tokay.
2. Robin Eyes, with big clusters; or, <i>Œuil de Tour</i> , grograin.	10. Syrian.
3. Do. <i>Melting</i> , (or <i>fondant</i>).	11. Constantia.
4. Sweet Guillat.	12. Malaga.
5. Muscat.	13. Large Muscat.
6. Do. Frontignan.	14. Malvoisie.
7. Muscadelle, from the river Lot.	15. Red Foot, (Pied Rouge.)
	16. Black Hambourg.
	17. Constantia.

FOR WINE.

White.	
18. Auvergnat.	31. Panse.
19. Blanquette.	32. Clare.
20. Doucinelle.	33. Auvergnat.
21. Plant de Dame	34. St Jean.
22. Olivette.	35. Jacobin.
23. Doucette.	36. Mennier.
24. Plant de Reine.	37. Pineau.
25. Burgundy.	38. Primitif.
26. Maillon.	39. Teinturier.
27. Madere.	40. Bourguignon.
28. Bourgas.	41. Bouilliant.
29. Picard.	42. Suisse.
30. Chaloise.	43. St Antoine.

FOR THE TABLE ONLY.

White.	
44. Chasselas, (from Fontainebleau.)	51. Muscat (from Jura)
45. Do. Golden.	52. Sauvignon.
46. Do. Cracking.	53. Chasselas.
47. Do. Musk.	54. Muscat Rouge.
48. Muscat Lezarde.	55. Muscat Grey.
49. Do. Small Berries.	56. Damas Violet.
50. Do. (from Jerusalem)	57. Damas of Poquet.
	58. Early Magdelen.

Assorted Seeds for Kitchen Gardens.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market street.

Small boxes of assorted Seeds for Kitchen Gardens.— Each box contains a package of the following seeds:—
Early Washington Peas
Dwarf Blue Imperial Peas
Late Marrowfat Peas
Early Mohawk Dwarf string Beans
Early Dwarf White Case-knife Beans
Lima, or Saba Pole Beans
Long Blood Beet (*true sort*)
Early Turnip-rooted Beet
Early York Cabbage
Large Cape Savoy do (*fine*)
Red Dutch do (*for pickling*)
Early Dutch Cauliflower
Early Horn Carrot (*very fine*)
Long Orange Carrot
White Solid Celery
Curled Cress or Peppergrass
Early Cucumber
Long Green Turkey do.

Price \$3 per Box.

At this Seed Store can be found the greatest variety of Field, Grass, Garden, Herb and Flower Seeds, to be found in New England, of the very best quality, and at low prices, wholesale and retail.

Also, Fruit and Forest Trees, Grape Vines, (of both native and European origin,) and Ornamental Shrubs at Nurserymen's prices.

White Clover Seed.

JUST received at the Seed Store connected with the New England Farmer, 50½ North Market street, Boston, 1000 lbs. finest White Dutch Honey-suckle Clover Seed, imported from Rotterdam by the Janus.

The quality of this seed is considered superior to any that has been offered in this city for many years, being remarkably bright, pure, and free from that great pest, Canada thistle, which is frequently found in white clover seed of American growth. Farmers are requested to call and examine it.

Flower Seeds.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market street, Boston:

A large collection of the most showy and choice annual, biennial and perennial Flower Seeds, collected from every quarter of the globe. Many of the kinds are new sorts and extremely beautiful, as the Great Mexican Flowering Argemone, Blue Camellina from Trinidad, Beautiful Clarkea from Columbia river, Scarlet Malope from Barbary, (continues in flower till freezing weather); Azure Blue Gilia from Colombia, Great African Hibiscus, Winged Thunbergia from the East Indies, Mountain Fringe, a beautiful hardy indigenous climber, grows 20 feet in a season, (annual); Mexican Blue Ageratum, Siberian Spiraea, Oriental Poppy, &c. Price of these new varieties 12½ cents a paper—all other kinds 6½ cents a paper—\$5 for a hundred varieties, to comprise one of each of the new sorts.—\$1 for 18 varieties, to comprise three of the new sorts.—Each paper is labelled with its common and botanical name, its native country, and directions for its culture.

Prince's Pomological Manual.

The second volume of this work is now ready for delivery, and the third volume is nearly completed.

These three volumes contain all the Orchard and Garden Fruits described by DuRoi, and other French writers of high authority, and also all that are described in the transactions of the London Horticultural Society, the Pomological Magazine, the Pyrus Malus Benthoniensis, and Lindley's Guide to the Orchard and Kitchen Garden, as well as the numerous choice varieties which have originated in our own country. In the preface to Vol. II. the "Introduction" given by Mr Lindley has been inserted entire, and great care has been taken, in republishing his descriptions of Fruits, to extend the synonymy, and to correct the errors which exist.

WILLIAM PRINCE & SONS.

Flushing, Feb. 21, 1832.

Situation Wanted.

A Man who is pretty well acquainted with gardening, and is willing to make himself useful in taking care of horses, driving a coach, &c. is desirous of getting a situation. He will show the best recommendations for honesty and diligence.

Valuable Farm for Sale.

THAT valuable Farm, pleasantly situated in the North Parish of Andover, one mile from the Rev. Mr Loring's meeting-house and Mr Putnam's academy, on the road leading from said meeting-house to Andover bridge, and within half a mile of good Saw and Grist Mills, and Blacksmith's Shop—3 miles from the Theological Seminary, 4 miles from Methuen meeting-house and factories, and 12 miles from Lowell—all which places, together with a number of factories in the vicinity, afford a good market for produce as may be found in Boston.

There is on said Farm rising 300 Fruit Trees, half of which are young, thrifty and grafted with the best kind of winter apples, and fall and summer pears—the residue furnishes a plentiful crop of fall and winter apples. The farm consists of 110 acres, more or less, of excellent land, conveniently divided into lots of tillage, mowing, pasture, hay-land and meadow, and well watered. The road passes through the centre of the farm, and is fenced on both sides with firm stone wall, most of the Farm being fenced with the same material. The buildings are convenient and in good repair—the house is nearly new.

The whole offers a desirable residence for a farmer, or a summer retreat for a gentleman who wishes to retire in that season of the year.

Purchasers are invited to call and view the premises. The terms will be made known by the occupant.

JOHN ENDICOTT,
or Dr J. KITTREDGE.

The above Farm, if not sold before the 25th inst. will be offered at Public Auction on Tuesday, the 27th inst. at 12 o'clock.

Andover, (North Parish) March 6, 1832. 31*

To Let.

THE Farm on which the subscriber resides in Dracut, within about three miles of the Lowell market, containing about three hundred acres of cultivated land of various descriptions, and all fenced with a stone wall. The buildings are a good dwelling house, shed, cider mill, (two barns 174 feet long, grain and ice house, and are all in perfect repair. The farm is productive, and will summer and winter 50 cows, and offers the best encouragement for carrying on the milk and vegetable business at Lowell. It will be let from one to five years, with the stock and tools, and immediate possession given.

B. F. VARNUM.

March 2, 1832. 41*

Early Potatoes.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street:

A few bushels of the prime, early Potatoes, which have taken the premium at the Massachusetts Horticultural Society's Shows the two last seasons; and are considered the earliest variety in this vicinity. March 7.

Hemp and Flax Seed.

CASH will be paid by the subscriber for a few bushels of fresh HEMP and FLAX SEED, well cleaned, of American growth, for sowing; to be delivered immediately. J. B. RUSSELL, No. 50½ North Market st. Feb. 22.

BRIGHTON MARKET.—MONDAY, MARCH 5, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 268 Beef Cattle, 184 Sheep, and 6 Cows and Calves.

PRICES. *Beef Cattle*—The Cattle today were of a much better quality than is usual, and higher prices were obtained, say 17 c. a 25 c. per hundred. We shall quote as follows, viz. 4 or 5 cattle at 650, extra at 600 a 625, prime 575 a 600, good 550, thin 500 a 525. The large cattle from Northampton were purchased by Mr T. W. Bennett of Brighton, price not known to us.

Cows and Calves. Sales were effected at \$25 and \$30. *Sheep.* A part only of those at market were sold at about 5 10 each.

New York Cattle Market, March 2—In market 750 beef Cattle. 400 a 500 Sheep. Demand for stock of every description, very good, and prices much higher than the general average. Beef Cattle on Monday last, 5 50 a 750—since which time they have advanced 50 c. per hundred; best \$8, middling \$7 a 7 50, common \$6. *Sheep*—no sales less than 3 50, and from this price to \$7 50.—*Daily Ad.*

At the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

LINES

TO THE MEMORY OF THE GRANDSON OF SIR
WALTER SCOTT:

Known to the public as Hugh Littlejohn,—for whose
use were written the Tales of a Grandfather. He was a
child of great mental promise, but afflicted from an early
age with the disease of the spine.—*New York Atlas.*

Boy of the laurel!—go!

This earth was not for thee!

The vulgar cares, that fret mankind,

Had grieved and galled thy gentler mind—

Thy feater foam. No, not!—be free!

Boy of the laurel!—go!

Thou worm-nipp'd bud,—thou blighted flower,

Is it a general doom

That to the gifted ones is given,*

With niggard hand, the boon of Heaven,

A blessing birth-marked for the tomb,

A worm-nipp'd bud,—a blighted flower?

Babe as thou wert—thy name

Is constellated here

With those to whom our language clings,

As glorious and immortal things,

Things worthy of the nation's tear,

Now following thy name!

Ray of a mighty star!

Which cheer'dst the heart we loved,

The mind we venerated! Thou

Couldst chase those care-shades from his brow,

By the world's worship unremoved,—

Ray of our setting star!

Ah! hover near him still!

Still whispering peace and love!

Thy feeble accents lov'd in life,

Shall woo him from a world of strife,

To gentler, holier realms above,

Where thou wilt sooth him still.

Child of the laurel!—go!

Heed not the tears we shed,

Thine was the best of destinies;

Affliction trained thee for the skies,

While Love upheld thy fainting head!

Go!—gentle martyr,—go!

*The eldest son of Mr Canning was afflicted in a similar manner.—*Court Journal.*

From the Boston Courier.

BREAD.

Silman's Journal has, among many scientific articles, a paper on the various saline materials used in making bread. It is the worst of treasons and conspiracies to poison a man at his own table—the very wildest Arab would not do it, so abhorrent is it to nature to inflict death with the staff of life. Yet there are heavy suspicions resting on the corporation of bakers, and "it will go high to be thought," that if they can produce a loaf light and fair, they care little for the digestions of the consumers. In Belgium and the North of France, the men of dough have mixed with their other deleterious ingredients, the sulphate of copper. This, it seems, was begun in seasons when the flour was of a bad quality!—With the flour they mixed pulverized beans, or saw-dust, and commuted their atrocity by throwing in blue vitriol. This was to diminish the labor of knead-

ing, and to produce a better looking bread from defective materials.

The whole operation is as horrid as the cauldron scene in Macbeth. The edgel of the law should fall heavily on the shoulders of such miscreants. It is too true, however, that in barbarous countries they administer the most complete and immediate justice. In Turkey, such bakers would be lucky to escape roasting in their own ovens. A quack there, who has killed a believer, is pounded to death in a huge mortar; and a baker, whose loaves are less than the standard weight, is nailed by his ear to a post. A similar custom in some civilized countries would raise the price of nails.

The bakers very early found out the abuse of alum, and have used it for eggs; it disguises the quality of bad flower, so that flower of beans, peas and potatoes can hardly be detected in that of wheat. Alum, to be sure, does not kill so fast as the sulphate of copper—nevertheless, it is not so good for the stomach. Chalk, pipe-clay, and plaster, enter largely into the composition of a loaf, but these are tolerable. Good white pine saw-dust also makes a saleable loaf. The effect of alum on "panification" is to make it, as the bakers say, (and be hanged to them!) swell large. It would hardly be too great a punishment for those offenders to make them eat their own loaves.

Luckily there is a ready test that will detect the presence of the sulphate of copper. Apply to the bread a drop of *prussiate of potash*, and it will produce a rose color, even though the sulphate be only part in nine thousand.—The bread, therefore, will blush, although the baker has no shame.

Tobacco and the Cholera.—The continent is poisoned with tobacco-smoke from one end of the land to the other, and every hour of the twenty-four. That tobacco may kill insects on shrubs, and that one stench may overpower another, is all possible enough; but that thousands and tens of thousands die of diseases of the lungs, generally brought on by tobacco smoking, is a fact as well known as any in the whole history of diseases. How is it possible to be otherwise? Tobacco is a poison! A man will die of an infusion of tobacco as soon as of a shot in the head. Can inhaling this powerful narcotic, in however small portions, be good for man? Its operation in these small portions is to produce a sensation of giddiness and drowsiness. It inflames the mouth, and requires a perpetual flow of the saliva, a fluid known to be among the most important of the whole economy of digestion; it irritates the eye, corrupts the breath, and excites the throat to perpetual stult. No doubt the human frame may grow so accustomed to this drain, that the smoker may go on from year to year, making himself a nuisance to society; yet there can be no doubt whatever, that the custom is as deleterious in general as it is filthy and un-English. A great portion of it has arisen among us from the puppyish affectation of our shopkeepers' boys and city dandies, for being thought foreign Field Marshals. Every handkerchief of tapes and ribbons turns a hussar, the moment he sallies forth from behind the counter; the easily applied moustache, the fur cloak, and the cigar, furnish the hero; and England rejoices in her Count Calico and her General Gingham.

Monthly Magazine.

Truth.—In all sciences the errors precede the truths; and it is better they should go first than last.

The Horticultural Garden of the late Andrew Parmenter, is offered for Sale.

THE reputation of this establishment is not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyn, Long Island, at the junction of the Jamaica and Flatbush Roads, and contains 24 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed by a pointed stone fence, and made of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; also, a splendid collection of Roses and Herbaceous Plants,—the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers' Houses, seven Cisterns, and a never-failing Pump of excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any person who wishes to engage in the occupation of Gardening, by the purchase of this property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such, as to warrant the belief that the purchase of the property will amply repay the enterprise of the one who may engage in the business.

Terms will be made known by applying to Mrs PARMENTER, on the premises.

N. B.—Any orders sent to Mrs P. will be promptly and carefully executed. 61
Feb. 16.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the *genuine medical Leech*. All orders will receive prompt attention. EBENEZER WIGHT,
46, Milk street, opposite Federal-st., Apothecary.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jun., 63, Broad street.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6, Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan. 1

Jewelry, Watches, and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c., &c., which he will dispose of at as low a rate as can be purchased in the city. [?] Watches repaired and warranted.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[?] No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RISSELL, by J. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RISSELL, at the Agricultural Warehouse, No. 52, North Market Street.

ORIGINAL AGRICULTURAL ESSAYS.

REMARKS ON THE "NEW THEORY OF BOTS."

By R. GREEN, Mansfield, Ms.

Many species of insects, by their depredations, force themselves into notice. Not a plant, however noxious, nor shrub, nor tree, nor any animal of the higher classes, but probably has, like Jonah's gourd, an assailant. Such are their numbers and their destruction of property, that anything respecting them, especially whatever tends to lessen their increase or prevent their injurious effects, is interesting.

In the 23d number, vol. 10, of the New England Farmer, I observed a piece called, "New Theory of Bots in Horses." To this, I paid particular attention—but, I saw nothing in it to alter my former opinion, which was founded on observation, experiments, analogy and facts. I did not doubt the good intentions of the author; but, to use his own words, I thought that "prejudice had, in spite of himself, got the better of his judgment." I presumed that probably some, who are unacquainted with the general history of insects and had paid little or no attention to the subject before us, might draw wrong conclusions from the statements there made. But when I saw the remarks of your intelligent correspondent of South Boston, I thought further reply was unnecessary.

Since which, however, I have been desirous to make some further observations on the "New Theory," by a friend, Mr Russell, whose request I could not well refuse. The few remarks which shall be made, will be merely an appendix to those made by your aforesaid correspondent.

It is not necessary to go into every particular contained in that paper—such a course would swell this to some considerable length, and be of little use to the public. The whole sum and substance of the "new theory," are simply these positions:—

1. That bots are bred in the horse. This, however, is not exactly said, but I consider it implied, therefore requires a passing notice. 2. That the insects "never kill the horse." That "the bots never injure him," but are "harmless insects,—doubtless necessary to his health." That they never prey upon the horse while living. 3. That "so soon as the horse dies," they "knowing the animal to be dead, endeavor to make their escape, by eating a passage out, or eat a last meal from choice," of course many perforations are made in the stomach.

Now all these positions are either contrary to reason, to analogy, or to fact, or to all of them.

1. That bots are bred in the horse, is contrary to fact. It is well known by naturalists, that insects do not breed in the larva state. It is also well known, that the insects in question, inhabit the horse's stomach *only* in that state; therefore they are not bred in the horse.

2. That the insects "never kill the horse, never injure him," but are "harmless." That they never prey upon the horse "while living." All these are contrary to reason, to analogy, and I believe, to fact. We admit, for a moment, that the

bots do not prey upon the horse "while living." But in this case, we contend that they are essentially injurious to him. Can any one think that the plunging of their tentacula or hooks, into the inner and sensible membrane of one of the most important organs of the horse, the stomach, is no injury? Undoubtedly the morbid stimulus, caused by their hooks, is amply sufficient to account for many diseases. Although this morbid stimulus should not directly destroy life, yet it may bring on diseases which end in death. The morbid stimulus of ardent spirit on the human stomach, does not at first destroy, but it introduces a great variety of diseases, which terminate in death.—Comparatively, very few die of intoxication, to the great numbers which are carried out of time, by diseases caused by the morbid stimulus of rum on the stomach. And probably few horses die directly from bots, to the number which die of diseases caused by the morbid stimulus, produced by the action of the insects. I have seen an adult person greatly distressed at the stomach, with constant nausea and frequent attempts to vomit, but nothing was brought up but a little frothy matter—on taking warm water largely, several worms (*Ascaris lumbricoides*) were washed from the stomach and brought up in the current. On which the vomiting and nausea ceased, and the stomach became immediately tranquil. Will any one deny that this disease was the effects of the morbid stimulus, occasioned by the worms in the stomach? That the worms were the cause, there is no positive evidence; but there is the strongest presumptive evidence—the very best evidence that the case admits: perfectly satisfactory and conclusive. We ought ever to be satisfied with the best evidence that can be in the case.

What shall we say, when a horse moderately used, well fed, with no apparent obstruction in the intestinal canal, and in a season when no external insect can annoy him, loses flesh, fails in courage, now and then coughs, frequently turning his head and with an expressive look views his sides, occasionally biting or snapping as though an insect was stinging him; and thus continues to do, more or less, day after day and week after week, gradually growing worse? I ask again, what shall we say? Shall we call it a cholera? a disease which the author of the "new theory" tells us, kills suddenly. What stronger evidence can be had, that the cause is the morbid stimulus of the bots? It is the best evidence that the case admits. If the horse could be made to vomit, (a thing impossible) and the bots be made to relinquish their hold, the insects might be brought up to ocular demonstration. In man, the placing the hand on the stomach, is an expression of distress in the organ; and the motions of the horse are not less expressive. This case is not a solitary one. The writer never practised, nor studied the veterinary art, but a number of such cases have fallen under his observation.

But we do contend, that the bots do prey on the stomach and perforate that organ, and frequently in many places, and this while the horse is living. Undoubtedly the insects are carnivorous, and subsist entirely on the horse. What has been said respecting the morbid stimulus, applies here with

still greater force. In many cases, if not in all, that I have seen, the destruction of the stomach most evidently appeared to be the work of time. It is naturally impossible that the destruction which is often seen on dissection, could be done by the number of insects found in one hour, nor in one day, nor in one week. The membranes about the perforations, in some cases, had become hard and callous, which could not have happened had the injury been done within twentyfour hours of death, much less after that event had taken place. This alone, I consider, is conclusive. It shows most clearly, that bots prey on the stomach while the animal is living.

Horses are endowed with instinct which directs them to pursue a certain course, without the intervention of reason; or in other words, it directs them to avoid natural evils to which they are exposed. They manifest a great dislike to the insect in its perfect state, especially the smaller kind, although no pain is caused by it. They will often leave their food and run from place to place, to avoid a single bot-fly. The horse which I now own, often when a bot-fly is buzzing about him, becomes so turbulent that I am obliged, when on business, to stop and kill the insect before I can farther proceed—he then is perfectly docile. By this it seems that they, by instinct, are aware of the fatal consequences of the insect. If nature had designed these insects for the health of the horse, we should not expect to see so much antipathy to them, as is exhibited by the animal.

Were bots necessary to the health of the horse, then by analogy, we might conclude that worms are necessary to the health of man; that the borer is necessary for the growth and fertility of our fruit trees; and that the curculio is necessary for the perfection of our most delicate fruits—all of which, it is unnecessary to say, are contrary to reason and fact. Insects are always injurious to every living thing on which they prey.

The presence of bots in a healthy horse, does not prove that they will never injure and eventually kill him; nor does the presence of the borer in a healthy tree, prove that the assailant will never injure and eventually destroy it. Disease and death, in both cases, depend on the amount of injury done and other attending circumstances.

Much more might be said, but I forbear. I will close this head with an extract from a paper, written on this subject, by Mr Clarke, a distinguished naturalist:—"It is fortunate for the animal infested by these insects, that their numbers are limited by the hazards to which they are exposed. Probably a hundred are lost for one that arrives to the perfect state. The eggs often hatch of themselves and the young larva without a nidus, crawls about till it dies; others are washed off by water—when in the mouth of the animal, they have to pass the dreadful ordeal of the teeth and mastication. Such are the contingencies, by which nature has wisely prevented the too great increase of their numbers, and the total destruction of the animals on which they feed."

3. That "so soon as the horse dies," the bots "knowing him to be dead, endeavor to make their escape by eating a passage out," and hence the perforations seen on dissection. This is contrary

to reason and fact. Nature has furnished every species of insect with an instinct, which is an impulsive sagacity or natural inclination to pursue a certain course, and this without variation. For instance, the common wasp constructs her nest with a kind of lint, deposits an egg in each cell, and feeds her young. She cannot build her nest like her neighbor, the mud-wasp, which forms her cells of clay, and deposits her eggs in the midst of half-killed spiders, leaving her brood to take care of themselves. One can never pursue the course of the other; neither can the insect in question pursue any course but that pointed out by instinct. Now, what is this course? It is this: When they wish to leave the animal, they invariably pass by the intestines. Instinct has taught no other way, and they must pursue it or die. Did the insect know the horse to be dead and wish to leave the body, we should find them, on dissection, instead of clinging to the stomach, passing the intestines in crowds. But this is not the fact. The author of the "new theory" observes, that "all insects that live on or near animals, endeavor to make their escape as soon as the animal dies." This may be true with those that are taught by instinct, not to taste of dead matter—but this is not the case with bots. Instinct never teaches a direct road to destruction. For them to leave the stomach in their unprepared state, is death, and of course they cling to it as their only chance for life.

While inhabitants of the stomach, they have nothing to do but to eat and grow. They probably keep themselves gorged. They are not provided with the means necessary to eat hastily and ravenously, nor do they, it is believed, have stated times to riot on the animal. Their work is done leisurely and gradually. They cannot eat more in one hour after death, than they consumed the hour before and probably not so much. But suppose that they have the knowledge of the horse's death, and wish not to "eat," but to gnaw out. They have not the means to accomplish the object. But suppose still further, that they have the means; then, what becomes of the gnawing? none have ever been observed; and who ever knew of any animal or insect that wished to leave its place of residence, and undertake the laborious task of gnawing out, when a passage way was left wide open, through which it might pass with ease?

Lastly. However active the insects may be while the horse is living, and however tenacious of life, they do not well sustain the cold and are found in a torpid state, on inspecting the stomach soon after death. The reason is evident. The heat of the horse's stomach, while living, is said to be 102 degrees of Fahrenheit; and when the heat is much reduced, as in fact it is soon after death, they of course become torpid, as we commonly see them when exposed to the atmosphere. Yet they still have animation enough to hang to the stomach, as their last and only effort. They cannot, probably, know the animal to be dead, only by the diminished temperature of heat, on which they become less active and less disposed to riot in a "last meal."

Without doubt, the insect in question (*Oestrus equi*) is the most formidable natural enemy to the horse. About the year 1800, the insects in their perfect state were in this vicinity, very numerous, and many horses died in consequence of bots. This circumstance led the writer to an investigation of their habits, with a view to discover a rem-

edy for the apparently increasing evil. A number of dissections and experiments were made about that time, in order to complete their history, not having seen any writer on the subject. The official means of prevention, as detailed in the result of his inquiries, were put in practice; since which, the insects have become comparatively few, and very few horses have died of diseases occasioned by them, in this neighborhood, for several years past.

In the close of this paper, I would remark, that dissections and experiments conducted by those who are not competent for the task, often lead into error. Often something is overlooked by carelessness or want of knowledge, which would have given, had it been noticed, a different result. In the prosecution of dissections and experiments every part ought to be noticed, nothing overlooked, and everything weighed without prejudice or partiality, having nothing in view but the discovery of truth.

Having extended these remarks far beyond what I first intended, I ought to apologize to the reader for detaining him so long. As the subject is of some importance to those who are fond of and keep that useful animal, the horse, I hope to be excused.

CULTURE OF GRAPES AND PLANTS.

MR. PEST-EMER—Contrary to my expectations, I find your correspondent, "Russeti," has endeavored to substantiate his former remarks, respecting the "gross inequalities" in the general award of premiums by the Massachusetts Horticultural Society, in a communication of some length; and while I regret that he should have written so much without approaching the point in view, or giving us the least information on the culture of the plants or fruits that are under discussion, I must avail myself of your correspondent's polite phraseology, and apologize for "the room I am likely to occupy in your valuable and useful paper," by my present communication, which, will, I fear, be more extensive and contain less useful information, than I could have wished. It is, I am aware, the duty of every correspondent to a periodical of useful knowledge, to study the quality rather than the quantity of his remarks—yet, if I do not possess your correspondent's perspicuity and force of language, I have the same right to your indulgence, in a sincere desire to be useful, and, with his permission, to be just.

Your correspondent regrets that we do not understand the word "forced," alike; as the term admits of but one definition when applied to vegetation, it is merely necessary to explain that application, and to convince him that to the very grapes to which he has referred me to substantiate his argument, the term is not at all applicable.

The grapes, *vitis riparia*, or what is termed here the European or English grape, is a native of Asia, and in its own climate, is cultivated to great extent. In the vicinity of Candia, where I have understood grapes are grown to as great perfection in the open air, as in any part of the world, the vines break about the first of March; the later kind of grapes, such as the Muscat of Alexandria and Tokay, are ripe the first of August; the Black Hamburgh and Frontignone, of course, three weeks earlier; and the Chasselas or white Sweet-water, three weeks earlier than those. This will make the first grape of the above kinds, ripe about the middle of July. Their general vintage commen-

ces about the first of August. Now, according to your correspondent's own calculation, this is the very case with the grapes we grow here under glass. What must have made my previous remarks appear rather contradictory to him, is his evident want of knowledge of the difference between the application of artificial heat to force any plant, and merely to protect it from injury. On the same grounds that he holds his argument, we may say, we force our camellias, geraniums, oranges, or any other tender exotic that requires an artificial climate to bring it to perfection. In England, where the only grapes they cultivate are under glass, or at least, are brought to perfection, forcing grapes is considered a very different process from merely supplying by artificial means the deficiency of climate—this is done in their peach-houses, fig-houses, and green-houses. If your correspondent, who presumes to answer for the capabilities of the English gardener, had turned in that country, the grape, grown in any of those departments, forced, that were not ripened before the first of August, I am afraid his knowledge would suffer in comparison with the ignorance he so facetiously describes—who "engages to bake, brew, and take care of a horse and zig," &c. The grapes that are forced, are either grown in vinerias appropriated to their culture alone, or as is more frequently the case, in pine stoves, as the heat necessary to grow pine-apples in perfection, will force grapes. In these departments, ripe grapes are gathered from March until they come to perfection in the houses above mentioned. These are properly termed forced, because they are grown and ripened at a season which their native climate will not admit of. If your correspondent will take an Isabella, or any other native grape that does not ripen in its own native climate until October, plant it in his green-house and ripen the fruit in August, he may then with propriety say, that he forces a grape.

In my previous communication, I observed, that I knew from practical experience, that it required more skill and attention to produce good grapes in the open air, in our precarious climate, than under glass. This affirmation your correspondent knows also from experience, to be an error, and with his usual polite consideration, regrets that our opinions should be so much at variance; at the same time he supplies us with no further information upon the subject, than that one of the gentlemen who obtained a premium last season, for the specimens of Hamburgh, informed him that he did not bestow any pains upon them, not even to prevent the approach of mildew. I am induced to think that his experience is, in this case, as it certainly is in many others on the same subject, merely imaginary. I have grown grapes under glass in America for nine years, and have never missed ripening a crop without any difficulty, nor have I ever seen a failure in any green-house in the vicinity, to ripen a reasonable crop of fruit, if set upon the vines, unless by some accident and then only in one case. It is true, I have seen too much fruit left on the vines; the result was, its not being so large or high-flavored; still it ripened. I have cultivated the vine four years, in the open air, in a bearing state—paid all the attention to it I possibly could and used all the skill I was master of, still the best season I was not able to ripen more than two thirds of a crop, and one season scarcely any; yet every spring I have had an abundant show of fruit, and this I know to have

been the case generally, I may almost say universally, where they have been cultivated to any extent in the neighborhood of Boston. I beg to remark, this observation does not include grapes grown in the city or in small and completely sheltered gardens. I could produce a great many more facts from practical observation, but I think that quite enough has been said to convince every horticulturist, that my former remarks were correct, notwithstanding the variance of opinion which your correspondent was pleased so politely to regret.

His arguments to substantiate his remarks upon the premiums for flowers, are equally chimerical, and evince a greater paucity of knowledge than he appears to possess, or is willing to shew, on the subject of grapes. He observes that I "have told him what every body knows, viz. how to pot and water chrysanthemums, but have said very little on the particular point where we differ." It may be recollected, that he spoke of the time and preparation of compost. I believe in his former communication he asks, if the compost for growing chrysanthemums required to be mixed, at least, a year? and replies, with emphatic decision, "certainly not." I think every grower must have felt very much obliged to him for the information. But further—he says, "now any one can have them in great perfection with no other care and trouble, than to put them in good loam and vegetable mould." I would ask him, if he possesses the art of decomposing vegetable matter, in one minute, to a proper consistency for the growth of plants? as he says, that "he never thinks of preparing the compost until the moment the chrysanthemums are ready to pot off." If he has, I believe that cultivators generally, would be exceedingly gratified for the information; for my part, it takes me nearly a year. The watering I recommended, he says is unnecessary, twice or thrice a week being sufficient, unless you want them as big as barberry-bushes. This remark betrays his perfect ignorance of the cultivation of this plant, for frequent watering obviates the very fault which he asserts it causes. When the plants are plunged, they are in very small pots and will in a short time fill them with roots, which, if they are well watered, will confine themselves to the pots and cause the plant to grow dwarf, and cover itself with foliage; but whenever they want moisture, they will strike their roots through, into the soil they are plunged in, run up tall; and the consequence is, when they are repotted, these roots are from necessity broken off—the plant wilts, loses its leaves; and this or similar causes is the reason why we see so many tall naked chrysanthemums, with a few half-grown flowers on the top. My previous remarks on the growth of chrysanthemums and tulips, arose from my own practice without reference to any author. Maddock, I have never read; but Hogg has not mentioned the culture of chrysanthemums at all. Speaking of the tulip, he says, "It was introduced into England in the year 1577, where it has been found to increase freely and grow in the open ground, without any extraordinary degree of care;" and this is undoubtedly the reason that the tulip has possessed more of the attention of early writers, than the chrysanthemum *sinensis*, which was not brought into England until the year 1790; and then only the "old purple"—making a difference of two centuries in their respective claims on the student. I also know that in 1821, there were not

more than ten varieties that had flowered in England, and those in the hands of a few nursery men in the vicinity of London. A little before this time, the London Horticultural Society became interested not only in the cultivation, but in the introduction of new varieties. Their success was so great that in 1836, they had forty-eight varieties in flower in their own garden; since that time I have had no means of obtaining an accurate account of the new varieties, but I have heard of five. If your correspondent will be at the trouble to examine the horticultural transactions, he will find that they spared no pains or expense in introducing it into general culture; and he will then, perhaps, condescend to acknowledge that it has been estimated to deserve the same approbation, and that it has been as much and as ably written upon, as the tulip, their different ages considered.

He also hopes, I have had sufficient observation of animal life, to know that what is life to one is death to another, and that the same may be said of vegetables and plants—for what is life to most plants, is deadly poison to bulbs. This remark will convince the reader that Mr Rusticus is no great cultivator or that his experience in the art is miserably limited, for with the exception of a very few natural orders of plants, such as the Apocynaceae and Ericaceae, whose native soil is on the tops of rocks, in dry sand or in heaths, or as the Nymphaeaceae tribes or other aquatics that grow in mud, immersed in water, there are few other plants, but the same soil that grows tulips, hyacinths, and other bulbs will also grow. It is true that some plants want more of one particular part of soil than others, to grow them well; for instance, a China rose wants a richer soil than an amaryllis; and a geranium and chrysanthemum want a more retentive soil than a tulip; but still the soil is composed of the same substances, only differently distributed. Rusticus also asks how many have tried to cultivate tulips, and how few have succeeded, whilst almost every individual in the practice of rearing flowers, has chrysanthemums. He could not surely have visited the horticultural exhibitions last season or read the report of the committee, or he would have found the exact reverse to be the case. The Society's glasses were filled every exhibition day, during the season of tulips, and there were several competitors for premiums; and if I mistake not, there was only one person showed for the prize on chrysanthemums. Now, judging from this, if he says every lover of flowers has chrysanthemums, it must be imagined that they either grow them so badly that they are ashamed to exhibit them, or that they would rather show tulips for three dollars than chrysanthemums for five. Again, he asks, how many ranunculuses, are purchased every year and come to nought? The reason is obvious to every person acquainted with plants—the "many thousands," he mentions, are no doubt bought at auction; sent out from Holland to be disposed of in that way—they are generally the weakest and poorest roots left in the florist's hands, and after having supplied his orders, he sends the refuse to bring any price in foreign markets, they can command. He takes no more trouble in packing them, than merely perhaps to prevent them from actually rotting on the passage. Many of them decay, and a dampness spreads from those over the whole case, so much as frequently to rot the paper in which they are packed. The ranunculuses being the smallest roots

and very tender, are the first killed. This is the cause that so very few ever start after planting, and what Rusticus terms the epidemic disease to the stronger bulbs, tulips, narcissus, &c., is nine times out of ten contracted in crossing the Atlantic and not to any cause he adduces. I think all florists ought to be governed by the information he received, through the medium of his friend from New York, as to planting the ranunculuses with the "claws upward." He is really taking us back into the 16th century at once, when conservatories were heated by making large holes in the ground and filling them with peat or ashes, and when the soil in Holland to grow a bulb, was kept a profound secret. He hopes, in conclusion, that he has said enough to prove that chrysanthemums, instead of being ten times the trouble of tulips are a hundred the reverse. Now I almost fancy that my faculties are somewhat more obtuse than formerly, for I cannot perceive that he has shown any proof that either of them are difficult or troublesome to grow, unless we are to rely upon his mere assertion, that "everybody has succeeded in chrysanthemums, and nobody in tulips, hyacinths, &c."

I will point out the compost that I have used for the above plants. The original soil of my tulip bed, is rather a strong and rich loam; to every square yard I applied a good large wheelbarrow full of well rotted leaf mould; half a barrow full of well rotted manure, and half a barrow full of coarse sand. This must be well mixed, eighteen inches or two feet deep, by turning it two or three times before the bulbs are planted. In planting, I take off the soil all over the bed four inches deep, make it perfectly level, mark the distance of the bulbs from each other, (the rows eight inches apart and seven inches in the row.) I then put a small handful of sand on the place where I intend each bulb to stand; place on it the root, the bulb in an erect position, and cover it with another handful of sand. I then replace the soil carefully so as not to move the roots, and finish off the bed perfectly level. Where the soil is light and not very rich, I would add half a barrow full of rotted manure, and not put any sand, only round the bulb. This is necessary in any soil to keep them dry in winter. For hyacinths, the compost will be better made lighter by adding more sand, but must be equally rich. I plant them the same depth, the distance eight inches apart each way, and in the same manner. I manage them, after they are planted, in the same way as recommended for tulips in my former communication. Ranunculuses, I have never grown in America, but the same preparation for tulips will grow them well. The method to plant them is, after making your bed perfectly level, to draw drills six inches apart and exactly two inches deep; plant the roots, claws downward, in the drill four or five inches apart; cover them with a little sand, like the others, and level your bed neatly. It is necessary to protect them during winter, with a hot bed frame, from the severe cold, and look at them occasionally to see that they do not start and draw up weak. Give them air in fine weather; in spring move away the frame, and when they are coming into flower, shade them from the hot sun and supply them plentifully with water—care must be taken not to wet the flowers, or it will immediately spoil their colors. One thing I particularly recommend, viz. to be very cautious and certain that the manure you apply to all bulbs,

is completely rotten. If this cannot be obtained and your ground is poor, bury your manure so that it do not come in contact with the bulbs, otherwise it will be sure to destroy the colors of the flowers. If Mr Rusticus or any other person, will procure good healthy roots (those from auction I would not recommend to any one,) and follow the above brief directions, I am confident he will be successful and be convinced that there is no such great art in growing any of the above bulbs, as he would make us believe. The compost in which I grow my chrysanthemums is, four wheel-barrow full of rich loam from rotten sods; one barrow full of well rotted manure; one barrow full of vegetable mould, and half a barrow full of sand—well mixed. If it lay a year after mixing it is the better. Destroy the weeds by frequent turning.

Your correspondent observes, with unusual modesty, that he has not the vanity to think his judgment superior to that of others, but will not give up to me. Allow me to reply, that I never was ambitious of such a sacrifice on my account, and would take very little trouble to obtain it—bearing in mind the good old adage, that "one man might lead a horse to water," &c. He does not seem to recollect any flower being in blossom, with the exception of a few lilacs, at the same time with tulips; he censures the weakness of my memory and then makes a further exception of one of the varieties I mentioned. As the beauty of different flowers must be judged according to taste, in which few horticulturists agree, and on which I have known endless and most unprofitable disputes. I believe the respective merits of tulips and chrysanthemums will find advocates enough, without Mr Rusticus or myself being over zealous in their behalf. I acknowledge his good nature in being glad that I am satisfied to compete for small premiums. "If I cultivate to perfection, it is all he wishes." Think of that, Mr Editor—with such an end in view, what would I not undertake? I can at present only wish that his prayer for the blessing of patience, may be granted, for I am confident he can never be a successful cultivator without it; and to his regret that I should so misinterpret his language, as meaning to cast any censure on the gentlemen forming the committee, I reply, that I am not the only one, by many, who has labored under the same impression. After advertising to the ignorance in which English judges are kept, from not knowing the owners of flowers offered for premiums, he says, "and thus it is that the poor and humble cottager is often the successful competitor." Such an assertion can bear but one inference, and Mr Rusticus is remarkably awkward in his attempt to conceal it. His compliment to Mr Loudon is, of course, deserved; but his admiration in this case, might have been usefully coupled with the recollection that the practical correspondents of the Gardeners' Magazine, neither advance suggestions nor endeavor to substantiate them, without giving their practical experience.

In conclusion, Mr Editor, though I have no objection to exchange opinions on the culture of any plant or fruit with which I may be conversant, with any person, I desire no further controversy with a writer whose only argument is contradiction, without affording us the least knowledge of any kind, but that he thinks himself wiser than other folks.

I am, yours respectfully,

A PRACTICAL HORTICULTURIST.

Charlestown, March 5, 1832.

HEATING HOT-HOUSES AND GREEN-HOUSES BY HOT WATER.

Although the subject of heating hot-houses, &c, by hot water, may not, to a superficial view, seem to be of very extensive practical utility, yet an investigation of the principles of this branch of economy of heat, may lead to results of much importance, which the inquirer could not have anticipated. We hope, therefore, that our readers will excuse us for dwelling somewhat in detail, on a topic, apparently in some degree foreign from the great interests to which our paper is devoted.

Those green-houses, and other repositories of untimely and exotic vegetation, in Europe called forcing-houses, in which fire was made a substitute for heat of climate, had been for two centuries, heated *solely* by brick flues; that is, by the heat given out by the blaze and smoke of burning fuel. That this mode had been entirely adequate to its end is proved by the *fact*, that at Kew, Paris, Liverpool, Leyden, Berlin, St Petersburg &c, they have been able to produce grapes in winter; pine-apples in spring; and to bring into flower the rarest West and East India plants, and even to ripen their fruits to great perfection.

When, however, the management of steam became familiar to British mechanics, they applied the surplus steam not required for their machinery, to the heating of their work-shops. This soon led to the employment of steam in heating every description of forcing-houses, hot-houses, green-houses, conservatories, graperies, and pineries.—They were the subjects of great praise, but, nevertheless, a great proportion of the *practical* gardeners revolted at them; not, as we shall endeavor to show, from well grounded objections to the use of steam, but from the *abuse* of it; because, instead of using it as an *auxiliary* power, the projectors, vain of their discovery, insisted on its being an *universal* remedy. It was like a quack medicine, able to cure, equally well, all diseases, however opposite their character.

The Hon. J. Lowell has, in our opinion, discovered and put into useful operation, an important improvement on the European modes of heating hot-houses, &c. After having derived much pleasure from the inspection of this improvement, we requested and prevailed on Mr Lowell to furnish us with the following notices, of the origin and progress of his mode of heating hot-houses, &c.

"I imported the horticultural transactions of Europe, and found the parties divided with regard to the comparative value of heating by *steam* and by *smoke* flues. I said to my friends, these gentlemen are so angry with each other, that they do not perceive that the two modes of heating green-houses, &c, may be very easily *combined*. Why should the advocates for smoke flues, be so obstinate as to reject the prodigious power of steam? And why should the new advocates for steam, reject the heating effects of the smoke and the flame, which must be at least equal to all the heat which they can force the ignited fuel to part with to the kettles?"

"I resolved to depart from the practice of heating by steam only. I placed my boiler *within* my house, instead of following their example. This alteration alone was a saving of one ton of coal. I then resolved to *continue my smoke flues in addition to my steam pipes*. I soon perceived that I had gained most important benefits. I found that

of one hundred and twenty days of winter, there were not more than thirty in the whole (one quarter part) in which it was necessary or even useful to raise *any* steam whatever. Here let me stop to explain this. Steam will not rise to heat a steam pipe, till your water in the boiler is heated to 212 degrees. But before that happens, your brick flue has been so heated as to raise the thermometer in your house, to 60 degrees at least. Now as this degree of heat is not only sufficient for your plants, but a *better* temperature for their health than any other, being about the average temperature of summer, *all artificial heat above that point is positively hurtful*. The practical gardener will comprehend me, when I say that it forces plants *prematurely* and they are weakly and sickly.

"Such was the state of our experience on this subject, when we were told that *hot water pipes* and *reservoirs* were adapted to *cure* all our evils, and produce, not only economy of fuel but of labor. I listened with the deepest interest to the accounts of this *new* discovery. The fact, unquestionable in itself, that hot water parts with its heat more slowly than any other substance, struck my imagination. I resolved at once to try the hot water system; but, instructed by experience, I resolved that if I adopted it, I would not give up the smoke flue, which I *know* had given out, at least, as much heat as either steam pipes or hot water pipes could do—or in other and plainer language, in using either hot water or steam pipes exclusively, you gave up one half of all your power—you reduced at once one pound of coal to half a pound.

"Having made these replies to your inquiries, I beg leave to ask you to republish the observations of Mr Paxton, principal gardener to the Duke of Devonshire at Chatsworth. His remarks were made, in reply to strictures of Mr Loudon, as to his, Mr Paxton's, refusal to adopt the *hot water* system. Of Mr Paxton's abilities, Loudon himself speaks in high terms. The public will judge of the comparative capacity of the two parties to decide, when they learn that Mr Loudon is an architect and Mr Paxton, whom he praises, has the care of nearly *thirty* green-houses, hot-houses and pineries, that he is the practical manager of one of the most extensive establishments in Great Britain. Mr Paxton urges the same objection which I have urged to hot water apparatus, when used exclusively, that it is a wasteful expense as to green-houses and graperies, because there is not more than twenty or thirty nights in the year, when you are obliged to get up your hot water pipes to their maximum.

"I believe fully, that if our improvement should ever be admitted into Great Britain, it would supersede the present modes of heating. Its essential superiority consists in this: the upper pipes without flanges, are laid along the top of the smoke flue, and the lower are returned in contact with the same flue. Thus the heating of the water pipes is very essentially accelerated, and their cooling as essentially retarded. At Roxbury, on the famous 27th of January last, the thermometer in my hot-house did not fall below 56; and at Gardiner, Me. in a very large green-house heated on the same principle, on the same day, the thermometer within the house stood at 39°, while without it sunk to the degree of 20 below 0."

"P. S. I ought not to conclude these remarks, without adding that your apparatus for heating rooms, embracing as it does, the principles

necessary to give a quick and durable heat, is, I think, of great value.

T. G. FESSENDEN, Esq."

The observations of Mr Paxton, gardener to the Duke of Devonshire, noticed above, were as follows:

"Question. How do you like hot water in comparison to fire flues?"

"Answer. So far as my experience has led me to draw any conclusion, I will answer your question. When hot water was first noticed in the horticultural transactions, I was almost in raptures with the idea, and as soon as possible I sat about heating those two pits you now see with it, and although it was thought the pipes then put in, (a double return,) would be more than sufficient for the purpose of heating the pits, independent of two large cisterns full of hot water, to my astonishment, on the approach of severe weather we had considerable difficulty to keep out the frost; and in the severe storm, two years since, our pine plants were so much injured, that they nearly all started prematurely into fruit in the spring. You are aware that water evaporates into steam at 212 degrees Fahr. and, consequently, the pipes cannot be heated to a greater degree. The difficulty in hot water is, that while in a severe frosty night, the external atmosphere is continually lowering, you cannot keep increasing the hot water to counteract its effects, without putting up nearly double the quantity of pipes that would be necessary under ordinary circumstances; when, with a well constructed flue, you could advance to any degree that might be required. Our houses are so contrived that we have full command of the internal air, without in the least distressing the flues in the most severe weather; and my foreman has repeatedly told me, that the only fire requiring attention more than once in the evening, is that attached to the hot water pit. I have offered him a man to assist him, but he has always refused, saying, he had no cause to visit the fires more than once in the evening, except in very severe weather. There are flues in the garden, erected before I came to Chatsworth, that almost burn one end of the house while the other is nearly cold; but these I do not now use for early forcing, and therefore have not altered them. All the flues I have built, give out heat in no uniform a manner, that there is no difference between one end of the house and the other; and by the plan of having an open canal of water at the front of the fires, to give out moisture according to the heat required, not the greatest action of the flue can in the least injure vegetation; being a self actor, it evaporates more or less as the decrease or increase of the fire becomes necessary. And on entering the house, after a severe frosty night, not the slightest unpleasantness is perceptible. This canal is made of block tin, and when properly painted will last a great number of years."

"Q. Do you mean then to discontinue hot water for forcing?"

"A. By no means; I have some alterations at present going on for improving it if possible: all I want is for it to stand on its own merits, and for all persons who give their opinions, to speak from experience."

We will close this article with a few brief remarks of our own. More or less heat is always expended in and about a fireplace, during the combustion of fuel. Of course it must be good economy, as a general rule, to construct a fireplace

within the apartment to be heated. A smoke flue is often pervaded by flame, as well as by smoke and hot air, for many feet from the furnace, and may be considered as a continuation of the fireplace, adding much to its power of heating. A hot water pipe placed on or in contact with a flue, receives heat from the latter and distributes it more equally, than could be done by the flue alone. This arrangement, together with a reservoir somewhat larger than the boiler, to make up in quantity what is wanted in temperature, may serve to equalize, or nearly so, the warmth of both ends of the house.

The boiler, flue, pipes and reservoir, are receivers, carriers, distributors and depositories of heat, and are all useful when judiciously employed.

There are three things to be desired in heating hot-houses, &c. A quick heat, which may be gained from brick flues or steam pipes. A durable heat, furnished by hot water pipes and reservoirs. And a moist heat, obtained, as mentioned above by Mr Paxton, by "open canals," or by any kind of open metallic vessels containing water and placed in a warm situation, or by perforated steam pipes and other modes now in use.

Mr Lowell's method of combining a quick with a durable heat, appears to us to be a great improvement, which might be advantageously used for many other purposes, besides heating horticultural edifices. Its value has been ascertained by the infallible test of experiment; and we think it will be embraced with avidity by European as well as American horticulturists.

We believe that the apparatus for heating by hot water, constructed by S. G. Perkins, Esq. and Col. T. H. Perkins, heretofore described in our paper, are perfectly in accordance with the latest English improvements in that branch of economy, and think their enterprise and skill deserve high commendation. Mr Lowell's apparatus, however, appears to us to be an improvement on the greatest advances of which we have seen any notices, in Great Britain or the United States.

CULTURE OF SILK.

MR FESSENDEN—I have seen the article in your last paper, of an unknown correspondent, calling on me to start associations of the State and Counties for the culture of silk, and offering assistance. In regard to this business, I am willing to do all that I can with safety, and have already proposed my views to one of the committee of agriculture in the House of Representatives. What seems to be most wanting at present, to encourage our farmers to raise silk, is that they should be sure of some fixed price for the cocoons, if it were not more than 25 cts. per lb. They would then go on with confidence, and set out mulberry trees and raise silk worms, knowing that if they could do no better with the cocoons themselves, they could at least sell them for that price. If the State Legislature or some association, would encourage a suitable person to give some standard price, for all the cocoons that were raised in Massachusetts for five years to come, there is no doubt but that an abundance of them would be raised, at the end of that time. The reeling is discouraging at first and is attended with some expense and waste; and without some aid, as above mentioned, from Government or an association, I fear that few individuals, if any, can be found to undertake it extensively. My opinion is, that the Governor, or the

agent of an association, should have power to contract with some responsible person to purchase all the cocoons, raised in this commonwealth, which might be offered to him for sale, and reel and manufacture them, or sell the raw silk at his own risk; and that a responsible person might be found to do this, for five years, at the rate of \$1000 per year. I have no doubt. This certainly would be a trifling sum for the State to appropriate to so useful and important a business, especially when it is considered what vast sums have been spent in other countries, to bring forward and foster this branch of domestic industry. I believe the manufacturing will go on without encouragement, but that it will not help the agricultural interest so much, while it is confined to the foreign raw silk.

Delham, March 5, 1832.

J. H. COBB.

GRAFTING FRUIT TREES.

MR EDITOR—I strongly suspect that it is not generally known that a great variety of trees, even the walnut or shag-bark, may be successfully grafted. The best kinds of the the plum tree will succeed well on the common plum stock. And although the pear will grow grafted upon the thorn, and the quince upon the pear, yet as a general rule, we think that they will flourish best upon their kindred stocks. The peach is an exception. It is the general practice in England, to graft the peach upon the plum stock; such ought to be the practice here—good reasons may be assigned. The plum tree is more hardy than the peach, will live twenty or thirty years, and is not so liable to be destroyed by worms at the root.—It is said that peach trees grafted upon plum stocks, will flourish thirty years, and are not so easily affected by our severe winters. If the latter remark be correct, and for the other reasons assigned, I advise all farmers disposed to cultivate this delicious fruit, to insert the peach scion upon the plum stock; some prefer budding—the experiment, should it fail, would cost but little. Peach trees ought not to be pruned at all, after the tree is well formed, or suffered to grow very high. Ashes round the roots are useful as manure, and to guard against worms. In this country I believe fruit trees generally are supposed to grow too high; they are more liable to be injured by severe and cold winds. The tops should be bent down and confined, or cut off, while the trees are young. This, I understand, is the common practice in the fruit gardens of England.

WILLIAM FLAGGETT.

Portsmouth, N. H. March, 1832.

BLACK CURRANT WINE.

The first knowledge I had of the virtues of the black currant, was from a paper written by the Rev. M. Cutler and read before the "American Academy of Arts and Sciences," and by them published in their first volume of "Memoirs," A. D. 1785. In that paper, a jelly or rob was recommended for sore throat, &c. I thought that if the currant possessed so many virtues, that the wine might be useful. Accordingly I made it, on a small scale, and found it exceeded my most sanguine expectations.

The shrub is as easily cultivated as any other currant with which I am acquainted; but the wine is not so easily made as other currant wines, on account of its pulp.

The currants should be fully ripe and collected

in dry weather, freed from leaves, webs of insects, and decayed or defective fruit. To a gallon of currants add a gallon of water; break the currants and press out the liquid by strong pressure, but in such a manner as to detain as much pulp as possible. To every gallon of liquid thus obtained, add three pounds of good clean sugar; one fourth of an ounce of alum, pulverized; and two gills of good brandy. Let the whole be well incorporated together, put into a clean vessel and placed in a cool situation, before the fermentation commences. Place the bung loosely in for a few days and then tighten it, leaving at its side a very small vent, which in a little time may be stopped. All the utensils used in the process should be perfectly sweet and clean, and the business be carried on with expedition. The alum prevents a too rapid fermentation; it should be added in the beginning of the process and completely incorporated with the liquor, that its peculiar astringency may be lost in the compound, which is to be made by the vinous fermentation.

The above process, I communicated to Mr Otis Peetee of Newton. He has made the wine according to the rule above detailed. His wine, I understand, has found its way into the market, is much approved, and thought to be inferior to none.

R. GREEN.

Mansfield, Feb. 10, 1832.

MANURE.

Few farmers are aware of how much of the strength of manure is lost and carried off, by rains, from their barn yards; especially when situated on the road and descending towards it, as is often seen, and a stream the color of strong ley or brown ston, constantly running from it. My yard is about 60 by 40 feet, and dishing towards the centre—the cattle stalls under the hovel on one side, with a clay bottom, also descend without any obstruction to the same point. There is a wooden tank sunk at one end, which will contain eight puncheons, but no drainings can run into the tank, until it is over eight inches deep in the centre; and yet although the litter is generally a foot thick, such is the quantity of moisture which accumulates from the 1st of March to the 1st of July, that one rainy day that will fill a puncheon which receives a quarter of the rain which falls on the roof of a house 40 by 40 feet, fills the tank after saturating the litter. How much then would be lost from a level yard or from one descending toward the street? and how much the dung must be deteriorated, after having such a quantity of its strength carried off by every rain. This liquid is drawn up into a puncheon, mounted on a horse cart, thence conducted into a sprinkler, such as is used for watering the streets of cities, and driven over my grass lands nearest home until the grass is half knee high, after which it is drawn out of the cask in buckets and thrown on the compost heap, which is generally in the highest part of the field which is intended to be next ploughed or broke up. My hired man can, when he chooses, carry out and sprinkle the contents of the tank in half a day.

Perhaps some of your readers would like to know the dimensions, materials, and expense of the tank. Material, the heavy southern $1\frac{1}{4}$ inch pitch pine, joined by a straight edge as if to be glued. Dimensions, 6 feet long, 4 wide, and 4 deep. I think this material will last as long under

ground as brick; it is covered with thick plank and we drive loaded carts over it. Whole expense, about thirteen dollars. It ought, however, to be larger, as it often runs over before we have an opportunity to carry it out. I think it has been perfectly tight from the first, as I have seen it stand full, within an inch, for many days.

An Irishman who lived with me, said he had lived in the neighborhood of a farmer who had a large one, and used to throw in every dead animal he could procure, and would run it over land drilled for potatoes, with as many tap holes in the cask, as there were drill rows under it.

Bridgport, Feb. 6, 1832.

INJURY TO FRUIT TREES.

THOMAS G. FESSENDEN, Esq.

DEAR SIR—As I am the first to announce the destructive effects of the past winter, upon every species of fruit trees, I am induced to hope that my suffering has not been extensively shared in other parts of the country. Having been applied to by several friends in New Hampshire, Connecticut, Maine and New York, for scions of the new varieties of pears, I was surprised and distressed to find that the shoots of last year were pretty uniformly destroyed. This led me to further examination, and I am grieved to state that, with me, the peach, the cherry, the pear, and even the apple, have suffered more severely, than with in my memory, a period of forty-seven years, since my attention to these subjects. The whole of the last year's growth is destroyed, so far as the examination of fifty young and old trees in every variety of situation, enables me to judge. My friends who have requested grafts from me, will consider this as a general reply to all their requests. I have not been able to find one pear scion which I could send to a friend. Nor is this the worst part of the case. The injury to the trees will be far greater than if the scions had been removed by the knife. They will become diseased and one can scarcely tell where this disease will terminate. All my hope is, that I have been more severely visited than others. It will be time enough after we have settled the facts, to discuss the cause. I have no doubt that it is not to be attributed to the cold of the late winter, but I should rather look to the extraordinary and unnatural heat of the last summer, which enabled gentlemen to ripen the Black Hamburg grape, and even the Muscat, on open trellises.

I said to a friend, who showed me some of those tender grapes nearly ripened in the open ground, last year, "My friend, I have a deep concern at your success, because, if you live thirty years longer, you will never see the same success. It is a misfortune to you."

The sap continued up and not inspissated till the 30th of November. The severe, unusually premature severity of December, burst the vessels of the plants, filled as they were with a watery fluid. Such is my conjecture, but what are conjectures worth? The alarming facts are the most important to us. May these facts be limited in their extent.

Boston, March 9, 1832.

WE are fearful that the calamity described above, has been very extensive as well as destructive, within the limits of its visitations. We have heard from Maine and many parts of New England, and are told that many if not most of the

fruit trees have been seriously injured, if not utterly ruined.—*Editor of N. E. Farmer.*

DAMAGE TO FRUIT TREES.

MR FESSENDEN—I think it very desirable for the public to ascertain, from New Jersey and the middle States, whether the effects of the past winter and autumn, have been so severe on fruit trees there as in this section of the Union.

The damage done to the pear, cherry, peach and apple, (more particularly young trees) is inconceivable, in every part of New England, as far as can be learned. Many young trees that appear to be green and healthy at first sight, are found, on removing the bark with a penknife, to be black and dead. I lately examined a young orchard of forty trees, every one of which was injured more or less, many utterly ruined, with the exception of two or three native cherry trees, that had never been budded. It is desirable to know whether native fruits in general have escaped, more than foreign varieties. An intelligent farmer in a town in Middlesex county, where thousands of barrels of winter apples are frequently raised in a season, informed me, he feared they should not produce a barrel this year, nor a pint of cherries. As it will be a long time before the trees can recover from this shock, we may calculate on a great scarcity of fruit, for ten years to come. I hope your correspondents in various parts of the United States, will furnish information of the state of orchards in their vicinity, through the New England Farmer.

A. B.

Salem, March 12, 1832.

LARGE OX.

Mr Thomas T. Farnsworth of Worcester, Mass. lately slaughtered an Ox of the Durham short horn breed, originally owned by his Excellency Gov. LINCOLN, which exhibited unequivocal testimony of the value of that race of animals. His weight was as follows:—

Alive,	2525;
Quarters,	370;
"	370;
"	380;
"	375;
Hide,	150;
Tallow,	118;
Total,	1763.

The Ox was five years old, only. He had no meal, except five bushels last spring, and twenty bushels of cob and corn meal since the commencement of autumn.

Barking the stems of Fruit Trees.—A writer for the Gardener's Magazine says, in substance, that his gardener in Holland, at the winter pruning, given in that country in February, cuts off with his common pruning-knife all the outer bark, down to the liber, of his apple and pear trees, and vines, above eight or ten years old; not so deeply, however, with the young as with the old trees. This man's practice is said to have been always successful in producing larger and better flavored fruit, than can be obtained without that process.

TO CORRESPONDENTS. We are obliged to defer this week, the Proceedings of the last stated meeting of the Massachusetts Horticultural Society, and many other favors.

HAMPTON HORTICULTURAL SOCIETY.

A meeting of about forty gentlemen was held at Springfield, Mass. last week, in which suitable arrangements were made for organizing a Horticultural Society, to embrace members from any part of the County of Hampton. We hope the proposed institution will prove as flourishing as its object is laudable. The following gentlemen were chosen officers:—

ROBERT EMERY, President.

CHARLES STERNES, Vice President.

HENRY STERNES, Recording Secretary.

W. B. O. PEARBODY, Corresponding Secretary.

ELISHA EDWARDS, Treasurer.

These, with the following named gentlemen, constitute the Executive Committee, to examine horticultural productions, award premiums, &c.

SAMUEL OSGOOD; THOMAS BOYD;
SOLOMON HATCH; JAMES CHAPMAN.

Notice.

A collection of Seeds and Cuttings will be distributed at the Hall of the Mass. Hort. Society on Saturday 17th inst. March 14.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscatel" Grape Vines, just received by the brig *Cora* from Cadiz, procured for him by the Consul of the United States, resident there. He writes, "I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds." They contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

Isabella; Barcelona;
Catawba; Blands;
Constantia; Black Cape;
Black Hamburgh;

3 varieties of valuable fruits, obtained from Xeres in Spain, and many other choice kinds.

Orders by Mail addressed to the subscriber, or personal application at his office, No. 73 Congress street, for any quantity of vines from one to one hundred, will meet with prompt attention. Z. COOK, Jr.
March 12, 1832. 5t

Durham short horn Stock.

FOR Sale, a few very superior half blood Durham short horn Cows, sired by *Admiral*,—who was presented to the Massachusetts Society for the promotion of Agriculture, by Admiral Sir Isaac Coffin,—these Cows are all warranted in calf by *Young Cattle*, a full blood Durham short horn Bull, out of the imported Cow *Annabella*, presented by Sir Isaac to the same Society. *Annabella* has repeatedly given forty-eight pounds of rich Milk per day, from grass feed only. For particulars, inquire of Mr. J. B. Russell, at the Agricultural Seed store, Boston, or at the Farm of E. Hery Derby, Esq. Salem, where the Stock can be seen. Salem, March, 1832.

Farm for Sale.

A first rate Farm, laying in Dorchester, six miles from the old State House, containing 90 acres; consisting of mowing, pasture, orchard and wood; a few acres of it is salt marsh, situated at South Boston.

There is a handsome two story house, in good repair, finely situated on a hill, having a very commanding prospect of the country, handsomely finished; a large barn with an excellent cellar under it for vegetables, shed room, pigsty, &c. &c.; a farm house, nearly new, and ice house—the whole combining as pleasant a situation for a gentleman, as can be found in the vicinity; the land is in good heart, and would make an excellent milk farm; 60 tons of hay was cut from it last season, and 10 cows kept on it; it is the farm formerly owned by John Gray, Esq. For further particulars, apply at the New England Farmer office. March 14.

Scotch Gooseberry Bushes, Dahlia Roots, &c.

THIS Day received by J. B. Russell, at the New England Farmer Office and Seed Store, a choice collection of Large Scotch Gooseberry Bushes, Double Dahlia Roots, Tuberoses, Amaryllises, &c. Particulars next week. March 14.

Golden Leaf Tobacco.

SINCE noticing Golden Leaf Tobacco for sale, in the papers, I have received orders for it from different parts of all the northern and eastern States and their principal cities. Many inquire the profits per acre. I have just received offers from Albany, which enable me to say that the produce of first rate crops is worth from 200 to \$250 per acre, in that city. I have yet seed sufficient for 2000 acres, which, for my own and the public's benefit, I wish to dispose of on the terms in the former notice.

THOMAS MATTESSON.

Matteson's Mills, Otsego Co. N. Y. March 1, 1832.
[E] A few packages of the above seed for sale by J. B. Russell, Boston—\$1 per package.

Printers use the above, by sending me a paper, Matteson's Mill, Exeter, Otsego Co. N. Y. shall receive seed for their kindness. March 14.

Stallions.

THE following Horses are for sale or to let, the ensuing season,—if not parted with they will stand for Mares at the farm of A. Day, at Lodi, Bergen Co. New Jersey, near Newark bridge, under the care of Hosca Worthington.

PATH KILLER—chestnut; five years old; sire, American Eclipse; dam, Haycinth, a pure thorough bred mare of the English race breed, whose pedigree is verified up to the original horses, more than a hundred years; his colts are remarkable for their size and bone.

NAVARRINO—blood-bay; four years old; sire, Sir Harry; dam, Haycinth.

HARPINS—beautiful blood-bay; upwards of sixteen hands high; sire, Hambletonian; dam, Messenger Mare; a great trotter, and his colts large and fine, well calculated for coach horses—for one pair of them, only 2 and 3 years old, \$100 was refused.

The above horses will stand at \$15, and the mare warranted with foal. If paid by the 1st of November, 1832, \$12.50 will be taken.

JERRY LEIGHORN—cream color; sixteen hands high; five years old; sire, imported horse Lehighorn; dam, a Defiance Mare. This breed of horses has proved great travellers, and valuable as roadsters and for farming horses. Stands at \$8, and the mare warranted with foal—if paid by the 1st of November, 1832, \$6 will be taken.

Bulls.

TWO Bulls of the imported short horned Durham breed for sale, or to let the ensuing season. Enquire of A. Day, No. 27, Nassau street, New York.
March 14, 1832. 3t

Evergreens, Silver Firs, &c.

THE subscriber being engaged in the seed business, would be happy to receive orders for Forest Trees, Seeds and Evergreens from Maine, and being agent for J. B. Russell, Boston, and Prince & Sons, Flushing, N. Y. orders sent through them or otherwise, will be attended to without delay. Particular directions for taking up and packing is requested. WM. MANN.
Augusta, Me. March 11. 6t

A list of Mr Mann's prices for Evergreens, &c. can be seen at the New England Farmer office.

Farm for Sale or to Let.

WILL be sold or let, and possession given immediately, the Waterhill Farm, (so called,) situated in Lynn, consisting of between 70 and 80 acres of as good Land as can be found in the County of Essex, with between 2 and 300 large Apple, Pear, and Peach Trees, two good Dwelling Houses, with ample Barns and out-buildings. Said Farm is most pleasantly located, between the Boston old road and turnpike, and only ten minutes' walk from the Hotel, affording an excellent opportunity for a Milk Farm or a Gardener.

For further particulars inquire of Mr Wiley, near the Lynn Hotel, or of the subscriber.

WM. B. BREED.
Lynn, Feb. 16, 1832. 1t

Bees for Sale.

FOR Sale by Emory Wheeler, Brighton, about a dozen Swarms of Bees in Bead's Patent Hives, from \$8 to 15 each, including the hives.
March 14. 4t

Farm to Let.

A first rate farm of about 120 acres, well proportioned in mowing, tillage and pasturing. It is capable of maintaining 30 head of cattle, and is well calculated for a Milk Farm, for which purpose it has been used a number of years. There is also one of the best orchards in the State—a good dwelling house, and three good barns. For terms apply at 56, Commercial st. 4t March 14

Valuable Farm for Sale.

THAT valuable Farm, pleasantly situated in the North Parish of Andover, one mile from the Rev. Mr Loring's meeting-house, and Mr Putnam's academy, on the road leading from said meeting-house to Andover bridge, and within half a mile of good Saw and Grist Mills, and Blacksmith's Shop—3 miles from the Theological Seminary, 4 miles from Methuen meeting-house and factories, and 12 miles from Lowell—all which places, together with a number of Factories in the vicinity, afford as good a market for produce as may be found in Boston.

There is on said Farm rising 300 Fruit Trees, half of which are young thirty and grafted with the best kind of winter apples, and tall and summer pears—the residue furnishes a plentiful crop of fall and cider apples. The farm consists of 110 acres, more or less, of excellent land, conveniently divided into lots of tillage, mowing, pasture, rye-land and meadow, and well watered. The road passes through the centre of the farm, and is fenced on both sides with firm stone wall, most of the Farm being fenced with the same material. The buildings are convenient and in good repair—the house is nearly new.

The whole offers a desirable residence for a farmer, or a summer retreat for a gentleman who wishes to retire in that season of the year.

Purchasers are invited to call and view the premises. The terms will be made known by the occupant,

JOHN ENDICOTT,

or Dr J. KITTREDGE.

The above Farm, if not sold before the 25th inst. will be offered at Public Auction on Tuesday, the 27th inst. at 12 o'clock.

Andover, (North Parish) March 6, 1832. 3t

To Let.

THE Farm on which the subscriber resides in Dracutt, within about three miles of the Lowell market, containing about three hundred acres of cultivated land of various descriptions, and all fenced with a stone wall. The buildings are a good dwelling house, shed, cider mill, three barns 174 feet long, grain and ice house, and are all in perfect repair. The farm is productive, and will summer and winter 50 cows, and offers the best encouragement for carrying on the milk and vegetable business at Lowell. It will be let from one to five years, with the stock and tools, and immediate possession given.

B. F. VARNUM.

March 2, 1832. 4t

A Farm for Sale.

ONE of the best Farms in West Newbury, pleasantly situated near the Merrimack river, on the stage road from Newburyport to Haverhill and Lowell, containing about one hundred and fifteen acres, well divided into Mowing, Pasturing and Tillage. An excellent Farm for Hay, having a large proportion of natural Mowing, and a fine young Orchard. The Farm is composed of three separate lots, and will be sold together or in lots to suit the purchaser. There is on the north side of the road about sixty-six acres, with a large two story House, a Barn, 100 feet by 30, Granary, Chaise-House, Sheds, &c. convenient to, and all in good repair. One lot on the south side of the road, opposite the House, containing eighteen acres.

Also, another Lot on the same side of the road, about 40 rods distant, containing about thirty acres, having a good barn on the same 51 by 25.

Also, a Lot of SALT MARSH, about ten acres, very handy to boat, and of the first quality.

If said Farm is not disposed of at private sale, before Monday the 26th March next, it will be sold on the Wednesday following, at Public Auction, together with the Stock of Cattle, Farming Utensils, about fifty Tons of English Hay, 20 Tons Salt Hay, 60 bushels of Red Top Seed, lot of Potatoes, and sundry other articles.

Sale will be positive. For further particulars inquire of the subscriber on the premises, or at No. 12 Essex street, Boston.

PAUL BAYLEY.

West Newbury, Feb. 20, 1832.

Buckthorns.

Gentlemen in want of this valuable plant for live fences, can have young quicks about 3/4 feet high, for \$3 per hundred, and plants 2 1/2 feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight.

March 14.

MISCELLANY.

From the Hampshire Gazette.

GOING TO LAW.

It is strange that men, especially farmers, do not all see the folly of going to law to settle disputes between neighbors. The following article, from the Keene Sentinel, exhibits the foolishness of those who engage in law-suits to adjust their difficulties, or rather to gratify their passions. A quarrel about three sheep, cost the plaintiff 400 dollars and the defendant 100 dollars, and they were finally necessitated to submit the cause to the decision of five persons in the neighborhood. They might have done this at first with little or no expense.

Beauties of Litigation.—A. sued his neighbor B. (both living in this county) for trespass, in taking three sheep from an inclosure, where a certain number belonging to the defendant, had been pastured through the summer. A. alleging that, to make up his number, B. had got part of his that had been pastured in an adjoining lot, and got mixed with a large flock belonging to different persons. The Justice gave judgment for the plaintiff. Defendant appealed to the Court of Common Pleas. The parties appeared with many witnesses at the January term, which was adjourned on account of the non-attendance, by reason of indisposition, of the majority of the Court. At the adjournment the case was argued, but the jury could not agree. The parties were then persuaded to submit the cause to the arbitration of five respectable individuals in the vicinity. The trial lasted three days, when the defendant obtained a verdict. The cost of this suit for the three sheep, we are told, amounts to nearly \$500—about 400 of which falls on the plaintiff.

A schoolmaster in Hampshire County, offered himself for examination, only three months ago, possessing the following rare qualifications:

1. He used very pure language. When told by the committee, that they should examine him in English Grammar, he said, "I am glad of that, for I am a horse at Grammar."

2. He not only used pure language, but was very accurate in his statements. When asked to bound the United States, he said, "they are bounded east by the ocean, and south by Florida, and west by the valley of the Mississippi." When told that the valley was part of the United States, he said, "I don't know, there is a darn'd great chunk of it off there."

His language and manners were in keeping with each other. In all the studies except geography, he was well qualified, but was rejected because he was a clown in language and manners. The committee thought the school might as well be without a teacher, as to have one who would set such an example. —*Hampden Gazette.*

Cultivation of the Mulberry tree.—We are glad to perceive that this important subject is likely to be taken into consideration by our Legislature, and that a bill was introduced into the Assembly on Friday last, by Mr Van Schaick of this city, to encourage the growth of the mulberry tree and silk worm in this State. This is a subject of great importance to the country, and is destined to add another branch to our great and growing system.

New York Advocate.

LABOR.

The value of labor.—A pound of iron in a crude state, is perhaps worth a cent. It is converted, we will suppose, into steel, and then into watch springs. Now, according to a calculation made in a work upon this subject, there are 7000 grains in a pound weight, and every watch spring weighs a tenth of a grain.—70,000 watch springs, worth, say, \$2 each, \$140,000 for the pound of iron, or rather the labor expended upon it.

Economy of labor.—The steam engines at work in England are equal to the united force of 1,200,000 men, and are managed by only 36,000 men.

Price of labor.—This depends upon principles which seem to defy the researches of the most scientific, the most philosophical minds. It cannot be declared by the quantity of coin, earned by a laboring man, since coin is only metal, with its weight and purity determined by the mint. The value is determined by the same principles that determine the value of other things.

Baltimore and Ohio Railroad.—A correspondent at Baltimore, makes the following statement in regard to the railroad.

"A stranger would be surprised to witness the operations on our railroad, and see the amount of business transacted on the sixty miles already completed. More than 350 cars or wagons are now in operation, and this number is insufficient for the demand for transportation. The road is now completed into the heart of the city. During the first 16 days of this month, (February) there arrived and departed 1,733 wagons, loaded inward with flour, produce, &c, outward with merchandise. During the 16 days there arrived in the passenger cars 1,723 passengers. Among the articles which arrived on the cars during the 16 days alluded to, there were 11,288 bbls. flour, 61 tons iron, 490 tons wood, 195 tons granite, 900 bushels grain.

"Neither snow nor frost has obstructed the cars an hour this winter. The work progresses with great rapidity, and those who are acquainted with the country, believe it will be completed to the Ohio river within five years from this time."

Alpine Farmers.—The farmers of the Upper Alps, though by no means wealthy, live like lords in their houses; while the heaviest portion of the labor which is performed, devolves upon the wife. It is no uncommon thing to see a woman yoked to a plough with an ass, while the husband guides it. He accounts it an act of politeness to lend his wife to his neighbor who is oppressed with work, and the neighbor reciprocates the favor when needed.

Nusturtium.—The blossoms of this plant have been observed to emit electric sparks towards evening, which was first noticed by the daughter of the illustrious Linnaeus, who could not credit the account until he had seen the phenomenon. It is seen most distinctly with the eye partly closed.

Ritulation.—When the late Marquis of Londonderry was Secretary of State, a friend one day, in familiar conversation, took the liberty of asking him why, in his official appointments, he did not promote merit? "Why," cried the Marquis, "why, because merit did not promote me, to be sure." —*London paper.*

The Horticultural Garden of the late Andrew Parmentier, is offered for Sale.

THE reputation of this establishment is not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyn, Long Island, at the junction of the Jamaica and Flatbush Roads, and contains 24 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed by a pointed stone fence, and inside of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; also, a splendid collection of Roses and Herbaceous Plants, the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers' Houses, seven Cisterns, and a never-failing Pump of excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any person who wishes to engage in the occupation of Gardening, by the purchase of this property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such as to warrant the belief that the purchase of the property will amply repay the enterprise of the one who may engage in the business.

Terms will be made known by applying to Mrs PARMENTIER, on the premises.

N. B. — Any orders sent to Mrs P. will be promptly and carefully executed. 6t

Feb. 16.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, JR., 63, Broad street.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned Jan 1.

White Mulberry Trees.

WANTED, a few thousands of White Mulberry Trees, two or three years old. Any persons having them are requested to forward the necessary information, with the prices, to the New-England Farmer Office, post-paid.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the past season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If No paper will be sent to a distance without payment being made in advance.

ORIGINAL AGRICULTURAL ESSAYS.

ANTS.

By the Editor.

These insects cohabit in numerous parties, and maintain a sort of republic, not unlike that of bees. Their nests are in the form of an oblong square and contain paths which lead to different magazines. Their method of constructing these habitations is truly wonderful. Some of the ants are employed in making the ground firm, by mixing with it a kind of glue, to prevent its crumbling and falling upon them; others may be seen gathering several twigs, which they use for rafters, by placing them over the paths to support the covering; they lay others across, and upon these, rushes, weeds, and dried grass, which they form into a double declivity, and thus conduct the water from their magazine.

For provisions they secure everything which to them is eatable, and we may often observe one loaded with a dead fly, sometimes several together with the carcase of a May-bug or other large insect; and, if they cannot transport it, they consume a part of it upon the spot, at least so much as may reduce it to a bulk adequate to their strength. They lay up hoards of wheat and other grain, and for fear it should sprout from the moisture of their subterranean cells, they gnaw off the end which would produce the blade. It is remarkable, that if one ant meets another which is loaded, it will always give way, or will help it if it be overburdened. Indeed, the strength of this little animal is astonishing, as one of them will frequently drag a burden many times heavier than itself.

On depriving a mouse or other little animal of its skin, and placing it on an ant hill in a little box perforated in several places, so as to admit a free passage for the ants, it will be found, in a few days, converted into the most perfect skeleton.

The ant deposits her eggs in the manner of the common fly, and from these eggs are hatched the *larva*, a sort of small maggot or worm without legs; which after a short time change into chrysalids, usually called ants' eggs.

The following are among the methods of destroying these destructive insects.

Forsyth says, "you may destroy many of them by mixing quick lime with soot, and laying it along their roads, where you see them thickest; but where you can come at their nests, the best way is to put a piece of quick lime into them and pour as much water over the lime as will slack it, the heat of which will destroy them—when you have poured in the water, cover the lime with a turf or a little earth, which will render it more effectual by confining the heat. You may slack the lime with a mixture of urine and soap-suds, which will render it still more effectual."

If the walls of an apartment are washed with a painter's brush, dipped in a solution made of four ounces of corrosive sublimate in two gallons of water, both the ant and the red spider will be destroyed.

When you find their nests or other collections of them near home, you may pour hot water on

them. When a farmer manures his land, if he uses ashes, lime, or sea-sand, he may be sure of not being annoyed by ants.

An English publication asserts, "Ants that frequent houses and gardens, may be destroyed by taking flour of brimstone half a pound, and potash four ounces; set them in an iron or earthen pan over a fire, till dissolved and united; afterward beat them to a powder, and infuse a little of this powder in water; and wherever you sprinkle it the ants will die or flee the place."

Likewise, "corrosive sublimate mixed with sugar, has proved a mortal poison to them, and is the most effectual way of destroying these insects."

Another remedy is as follows: "Make a strong decoction of tobacco and the tender shoots of elder, by pouring boiling water on them; then sprinkle fruit trees infested with ants or other insects, with this decoction, cold, twice a week, for two or three weeks, with a small brush; which will effectually destroy the insects and preserve the fruit and leaves."

To preserve dishes of meat in cupboards, &c., against ants, it has been recommended to take a wine glass well cleaned and place it in your cupboard or safe, upside down, and put the dish or plate which contains your meat, on it. It may be here balanced with the greatest safety, and it is said, will be preserved from ants, provided care is taken that the meat and dish be free from them when placed in that situation.

Ants are unjustly accused of damaging fruit trees, and are incorrectly supposed to be authors of mischief accruing from the depredations of aphides, alias plant lice, alias pucerons, alias *vine fretters*. The excrements of these last mentioned insects are sweet, and compose one kind of honey dew, called *sussio milita*. Ants ramble over trees which are infested with these insects, for the purpose of feeding on this sweet substance, and are mistaken for the cause of honey dew, and the disease of the tree of which honey dew is a symptom. The aphides, too, are often but erroneously supposed to be the young progeny of ants, when in fact there is no affinity between these two species of insects. Still, as ants feed on fruits, it may be expedient to extirpate them by some of the above mentioned methods.

DWARF FRUIT TREES.

MR FESSENDEN—Observing in your No. 31 some queries respecting dwarf fruit trees, this may inform that I have seen a garden bordered with dwarf fruit trees, perhaps none taller than two and a half feet; the tops spreading very wide, and well loaded with apples, pears, and peaches, many touching the ground. The gentleman who planted them being dead, I obtained no account how the dwarfing was effected.

I have since been informed, through a channel worthy of credit, that the mode of making such dwarf trees is very simple and easy. On the limbs of fruit trees there are what I call forked twigs, (fruit spurs,) say two or three inches long, that bear fruit. Take and graft them into a piece of root; put on the wax, and plant it in the garden, and it will grow into a dwarf fruit tree.

I have only tried one experiment, by setting

such a forked twig in an apple stock. It grows slowly enough for a dwarf tree and produced apples. I am now too aged, feeble, and trembling with the palsy, to graft any more.

Respectfully, SAMUEL PRESTON,
Stockport, Pa. March 3, 1832.

(CIRCULAR.)

Albany, Feb. 24, 1832.

SIR—You will perceive, by the pamphlet which accompanies this, that a State Agricultural Society has been organized, for the purpose of improving our husbandry, horticulture and household arts, and that you have been designated as one of a general committee, to aid in the furtherance of these objects of public utility.

Without presuming to dictate, or to limit the exertions of the general committee, I would respectfully suggest, that the following, among other subjects, will particularly merit their attention.

1. To encourage and promote the organization of county, or local societies, of agriculture and horticulture, as a means of exciting laudable emulation, and of promoting habits of industry, economy of labor, and improvement in the moral and social condition of society.

2. To add to the numbers and means of the State societies, by soliciting names to their constitution, and contributions to their funds. As the society pays neither salaries nor perquisites, its funds will be exclusively devoted to public and useful objects; and it is believed the members will receive an equivalent for their subscription in the publications they will become entitled to. The benefits which the society shall be able to dispense, will therefore be measured by the extent of its funds.

As one of the most efficient means of diffusing information, and thereby increasing its usefulness, the society contemplate the publication of a periodical work, devoted exclusively to improvements in the rural arts. The better to enable them to fulfil their wishes in this respect, permit me,

In the third place, to solicit communications, as well from others as from the members of the general committee, of well attested experiments and facts.

1. In *Stock Husbandry*—In relation to the breeding, management, habits, diseases and means of prevention and cure, of all kinds of domestic animals—methods of fattening, and choice of breeds.

2. In *Tillage Husbandry*—In relation to the cultivation of grains, grasses, field vegetables, and other useful products—manures and their application, including lime, gypsum and marls—rotation of crops; improved implements; new articles of culture; draining; fences, including live fences; the orchard, and manufacture of cider.

3. In *Horticulture*—In reference to the culture of fruit and ornamental trees, shrubs and plants, and methods of propagating them; the diseases to which they are incident, and the insects which do them injury, and the methods of prevention and cure; culinary vegetables, and the flower garden.

4. In the *Household Arts*—Embracing household labors; rearing of silk worms; manufacture of butter and cheese; of domestic wines; the

preservation of fruits, and their various preparations in household economy, &c.

By collecting together the practical knowledge of our best farmers and gardeners, in their respective branches of labor, a very valuable fund of information will be obtained, which, while it impoverishes not the contributors, cannot fail to enrich, very greatly, the community at large. Such contributions, like the offerings of charity, are blessed to the giver as well as the receiver. It is a satisfaction, perhaps somewhat peculiar to the philanthropic tiller of the soil, that while he is improving by intelligence, skill and industry, his own temporal and moral condition, he is, by his example, benefitting those around him, and that his benefactions, in this way, are co-extensive with the knowledge and importance of his improvements.

Your name has been inserted on the general committee, under the impression that the society would find in you an efficient co-operator in their labors of usefulness. Should you, however, unexpectedly decline the duties which the appointment imposes, I beg to be notified thereof as early as convenient, that the executive committee may appoint another in your stead.

As the society propose to issue their first publication in the present year, it is desirable that communications intended for the publication, the invitation for which is intended to be general, should be forwarded to me as early in the autumn as convenient. Very respectfully,

J. BUEL, *Cor. Sec'y.*

ON PRESERVING CABBAGES THROUGH THE WINTER, &c.

To those who are fond of fresh cabbages at this season of the year, the following information may be serviceable. To preserve them, dig a trench about six inches deep, in dry ground and wide enough to admit the heads of the cabbage; lay two sticks parallel with each other on the bottom of the trench, for the heads to rest on, to keep them from the ground; place the heads on the sticks with the roots up, and surround them with straw; then cover them with earth six or eight inches deep, having the ground sloping to carry off the rain; they will come out in the spring sound, fresh and tender, as they were when gathered.

Is it known, generally, that the sap of the butternut tree is better and richer, than that of the rock or sugar maple? I confess I was ignorant of the fact till within two days past.

Two years ago last fall, I filled two flour barrels with fine winter apples of different varieties, packed in sand previously dried with a good deal of care in an oven, and set them away in a dry cool room, designing to keep them till spring; but long before that time, I discovered to my mortification, that my apples were nearly all rotten and spoiled. Will gentlemen, who have been successful in preserving them in sand or otherwise, be so obliging as to inform your readers of the precise method to be pursued?

I fear your printer has seasoned my hop beer rather too high with ginger, to make it a cooling drink for hot weather; it may be thought, perhaps, to be too nearly allied, in some of its properties, to that kind of drink for which it is recommended as a substitute—(instead of $1\frac{1}{2}$ lb. I said $\frac{1}{2}$ lb. which gives it an agreeable flavor.) You make me intimate that there are but two months in twelve, when it may be made. I said that it

should be made in June, and in July should be drunk, &c. It should be made one month, at least, before it is used, to give it time to ferment and lose that quality which makes it deleterious to many, while in a state of fermentation. I recommended to make it in June, that it may be ready for July, when farmers and farmers' boys (too many of them, at least,) think they must begin to drink rum, if they have not begun before; a practice which cannot be too severely censured or too quickly abandoned, as it has, in thousands of instances, been the very nursery of intemperance, that remorseless enemy of the farmer's hopes and interests, whose very touch is pollution, whose embrace is death. Yours very respectfully,

JNO. TOWNSEND.

Andover, Con. March, 1832.

HORTICULTURAL PREMIUMS.

MR. EDITOR,

DEAR SIR—It is with much reluctance, that I again trespass upon the patience of your readers, (for they undoubtedly wish for something more instructive) in giving my views in full, upon the first remarks I made, respecting premiums, &c. I cannot but think it of great importance to the future success of horticulture, that all difference of opinion, especially with those who are most particularly interested, should be as nearly as possible adjusted. It is only by the combined efforts of many, that our transactions can be brought to any good effect. But I am now induced to make the following remarks, on reading in your No. of the 22d inst. the communication of "A Cultivator," in answer to my first essay. As your correspondent says, he dissented very far from me in some points of facts, he has given it quite a thorough review, in the form of an examination. I am heartily glad he has; for I wrote, or at least it was not my intention to write, anything which would not bear the most severe scrutiny; and who is there better able to review such a communication, than "A Cultivator." I feel myself amply compensated for the little time I have spent; and certainly, I cannot but feel highly flattered, in receiving the early attention of "A Practical Horticulturist," and "A Cultivator," in answer to the few hints and suggestions which I advanced. Your correspondent admits, that he has no doubt I "was influenced by the best motives," and most assuredly I had no other; yet he says, that such "sweeping censure" is not particularly acceptable, to those upon whom he thinks it directly reflects; and accuses me of not proposing a "remedy" for the defects I discovered—where, he says, in fact, there are none. After a long quotation from my communication, in regard to cucumbers, &c. he goes on to "deduce his inferences" and give us his objections.

All premiums, he says, "are but means to an end." First—to increase "certain skill" in the competitors, and produce an ultimate result. I admit it. But what is his ultimate result? The object of the articles enumerated on the premium list, he immediately says, is precocity of growth. And is this the result of "certain skill" in competitors? Is it the result of any skill? certainly not. "Precocity of season," is one thing intended, undoubtedly; but I would ask, if a person were to cultivate a cucumber, and produce it on the first Saturday in July, and it should be perhaps a small, half-grown, premature fruit of no flavor; would he be entitled to the "certain skill" of the one, who should present one on the second Saturday,

full grown, of good size and flavor, and beautiful color? Would the precocity of growth of the first, predominate over the "certain skill" of the other, who perhaps planted his seed quite as early, but was not favored with a piece of land particularly fitted for the growth of early vegetables? None would hesitate to say, he would not. The very quotation he has taken from a periodical, answers this question much more satisfactorily than I can. "The best dish of cherries gathered in July, perhaps, from standard trees planted twenty years ago, may imply but slender merit in the person who produced them." The good qualities of fruits and vegetables are what is mostly to be considered. As to bringing cucumber plants forward under a hand glass, so as to make a week's difference, it is a fallacy; they may be used to cover plants in chilly nights, or a few hoops with a cloth and a little straw covered over, may be used for the same purpose; but no other. The heat of the sun through the glass upon the plants, is of very little use, so early in the season, if there is not heat underneath. The idea is not in keeping with vegetable or animal nature. Would animal (or vegetable) existence be kept in good health, would perspiration go on in its proper course, would not the whole system be vitiated, were one half of the body situated in the temperature of an ice cellar and the other in that of the torrid zone? I leave this for your correspondent to solve.

Perhaps I have been led from a proper course; and I shall go back to the first part of this communication. He says, that "although it is no very difficult matter to grow a beet, or a carrot, yet a novice would find something to do, to insure an early crop; and if pursued as an object of field culture," &c. Who is there who doubts that as an object of field culture for insuring large crops, and cultivating them as articles of food for horses, cattle, hogs, &c.; who doubts the propriety of a premium? Who doubts the propriety of a very large premium? It is in this manner we find out who tills his land to the most advantage, and who is the most in lustrous farmer. But the Agricultural Society, if I recollect right, specifies no precocity of growth.

I come now to the most important part of your correspondent's communication; the part which, in fact, almost alone called forth my remarks at this time. That is, to show his love and desire for the future advancement of the distinguished science of horticulture. I could not have supposed, that there was to be found an individual who has any regard for that science, who wishes for its best interests and success, that would have indulged in such sentiments as "A Cultivator." We should soon go back to the primitive age from which we have been so rapidly emerging. If, by the beneficence of a Divine Providence, we live in a country blessed with health, wealth, and prosperity; if we live in a land where we never knew want, and have the assurance, that "seed-time and harvest shall never cease," where the beauties of spring revive in new splendor after bursting the icy fetters of winter, and the warm days of summer clothe our fields and forests with green, and scatter over the pastures a profusion of flowers of endless hues; where the fruits ripen in such abundance, nurtured without the hand of man; where we have all these in plenty in the natural season, can we say that we should dispense with all luxuries; can we say it is useless to have ripe mel-

ous in May, or cucumbers in March; can we say it is absolutely of "no utility?" I hope not. But what says your correspondent? "I should be glad to learn of what value to us here, is the skill used in forcing melons, that a high premium should be offered for it?" Of what use is horticulture? he might as properly ask. Dr M. A. Ward, in his excellent address before the Horticultural Society, has given a true synopsis of the word *horticulture*; and if your correspondent will turn to it, he will find it completely elucidated.

I would be one, to give the sum which is now offered as a premium for forced cucumbers, towards one of five or ten times the amount, to the individual who should produce the best melons, excelling in all qualities, during the month of May; or for a cucumber, a good bunch of asparagus, or a dish of strawberries by the first of April, all of good size and excellent qualities. Is it showing a love for improvement, to depreciate the raising of these at this season? I look forward to the time when we shall rival our transatlantic friends; to the time when every man who has amassed anything over the necessities and conveniences of life, will have his pinery, vinery, peach-house, fig-house, cherry-house, strawberry pits, melon pits, cucumber pits, and his aviary, apiary, park, lawns, &c. The work has begun, and we look forward with pleasing reflections, to the time when it shall be incorporated with all our necessities conducive to happiness.

As to the growing of grapes and the observations on flowers, he will find an answer (which it would be unnecessary to repeat) in my last, if it meets his eye. It is said, there is "no accounting for tastes," and perhaps it is well there is not. If he can make himself content by living on carrots, beets, and other vegetables, till the season for melons, cucumbers, &c. comes in, he has an undoubted right so to do; and without the thought of being "chilled." But your correspondent seems to comment very severely on the system which I proposed (he says, I did not) as a remedy; he says, "Is this the system we want? those who award the premiums must be incorrigibly stupid, if they do not go right with this luminous system." What system? What system is he speaking of? Certainly I do not understand him, unless he means the one I recommended. He has thought, he says, that it was rather difficult to decide correctly on premiums, because he read in a late number of London's Magazine, that some society had adopted general rules. This is all true. But are we advanced far enough to decide in this manner? Indeed I think not. And in particular, if we should follow his directions, we should never find one capable of telling the qualities of a forced melon from a pumpkin.

I should not have gone at such length in my remarks, were it not for the reasons stated; and the only apology I have to make is, that in what little I have written, I have not conveyed my ideas so minutely, as your correspondent's "essay" required.

Yours with much respect,

Cambridge, March 7, 1832. RUSTICUS.

Boxwood a substitute for Hops.—M. Du Petit lately stated to the Philomathic Society of Paris, that more boxwood than hops was employed in making almost all the beer brewed in Paris. Boxwood contains a powerful sudorific principle, with a bitter taste, which has lately been separated and is known under the name of *buzina*.—*Bull. Un.*

Gardening and Gardeners in America.—A writer for the Gardener's Magazine, who signs "R. C. near Philadelphia," says, "It is no less strange than true, that we have few or none of our natives, gardeners. Even when brought up in our gardens, they almost invariably prefer the plough and farming work, and have a strong dislike to weeding, &c., &c. They are generally very dextrous and handy with tools, and can do almost anything required in the use of them. On the contrary, the European gardeners who come here, are generally unaccustomed to any tools but the spade and hoe, and care but little to learn the use of others. If any alteration is required or mending wanted, they immediately require the assistance of the carpenter or the smith for trifling things, that one of our boys could do with a hatchet and knife; if he could not procure other tools. This helplessness renders them the laughing stock of our workmen; particularly when they assume such importance, and consequential airs, as they most generally do on their first arrival here. A few years since, a young gardener arrived here from Ireland, without a friend or acquaintance, and having paid his last guinea for his passage, I gave him employment until I procured a very good situation for him, at one hundred and eighty dollars per year, and board and lodging. His employer was a quaker gentleman, who was much pleased with him and treated him very kindly. His only care was a small vegetable garden for the use of the family; and indeed it was the only branch of gardening for which he was competent. Unfortunately a tavern was too near, and here liquor is too cheap; he soon began to tittle and neglect his work. He had soon accumulated a hundred dollars; and had a crop of fine early potatoes, amongst other things in his garden. Some friends having arrived to dine with his employer, the gardener was requested to dig a few of his fine potatoes for dinner, as the boy was absent. The gardener replied, swelling with indignation, 'Is it me, Sir, a thorough bred gardener, that you would ask to dig potatoes?' 'Surely friend,' replied his employer, 'thrice toiled to raise them, and it can be no disgrace to dig a few for one dinner; however, give me the hoe, and I will dig them myself.' The next morning he paid him off and discharged him. This, Sir, is the manner in which many of your gardeners conduct themselves, on their arrival here; and they are very frequently ignorant of their business. Still we are very far behind you in gardening, and willing to learn all we can from such as come here. In this country, no white man calls another 'master,' and land is so cheap that a few years' wages is sufficient to purchase a snug farm and stock it. The natural love of independence and comfort, carries nearly all the good gardeners to the western country, where they settle as farmers.

"In mentioning this term 'master,' which is obsolete here, I may remark, that I never knew a native American who were a livery; nor could extra wages induce them to put it on. I have frequently made the inquiry, but always found that there is one cabin for the ladies and servants for the gentlemen, in which all, whether master or servant, mix on a footing of perfect equality. It is the same as to stage coaches, which have only one fare, and neither the coachman nor any of the servants at the inn, receives a farthing from the passengers or customers.—All that takes place between man and man in this country, is on the principle of equitable exchange; there is considered to be no obligation on either side.

From the Gardener's Magazine.

CAUSE AND CURE OF THE AMERICAN BLIGHT: IN ANSWER TO JUDGE REEL.

STR—Your respectable correspondent, Jesse Buel, Esq. treating of trees and their diseases, solicits information respecting the causes of these diseases and their cures. He says, "We have lost many of our pear trees, by what is termed the blight." Now, what our English gardeners describe as the "American blight," and which here particularly affects apple and pear trees, is evidently the larva of some insect, enveloped in a substance like white cotton; by which larva, I suspect, are the consequence and not the cause of the disease he writes upon; that is, I believe the blight never fixes, except upon parts of the tree where the sap has exuded through or under the bark, or where the tree has been cut or bruised, and has put on the appearance he describes, viz. the bark becomes dead in irregular blotches, contracts, and ultimately separates from the wood. He says, farther, 'anything you can offer on the subject of the preceding remarks, will be particularly interesting to your American readers.' This leads me to mention, that about twentyfive years since, I planted on the east border of my garden, which was newly-raised land, a row of apple and pear trees, chiefly the former; and found that they all soon became affected with the disease above described. The subsoil being, particularly in winter, a morass, I planted the trees as high as possible; but some plants of the same kind and from the same nursery, planted in another and drier situation, being exempt from the disease, I considered that the other trees had become infected, from the absorption of the roots of too much moisture. To obviate this, I planted within three or four feet of them a row of willow stakes, which soon became bushes and now are trees. I could in a short time trace the roots of these willows, completely under the fruit trees, and as thick, generally, as a mat. I began, consequently, to fear that they would ultimately destroy them; but I was agreeably surprised by finding, from the period the roots became intermixed with those of the apple and pear trees, that this disease in the fruit trees gradually and I may say entirely disappeared; and for the last twenty years they have borne plenty of fine fruit. Now, as Judge Buel considers his trees to be thus diseased, from the elaborated sap, and to be most prejudiced in wet seasons, I think I am justified in supposing we both allude to the same disease, and I shall be happy if the remedial hint here given, should prove successful in America. ROBERT CAMELL, M. D.

Bungay, Sept. 20, 1832.

The Wire Worm.—A writer for an English paper, called the Country Times, states in substance, that he has ascertained by repeated experiments on a large scale, that by raising a drilled and hoed crop of white mustard seed on a field infested by the wire-worm, and keeping the ground clean by hoeing, the insect may be extirpated.

The conductor of the Gardener's Magazine, says, "The reason seems to be, that the wire-worm cannot eat the roots of the mustard, most probably from their acidity; and there being no other roots in the soil for them to live on, and no weeds or other plants than mustard, permitted to grow during the season, the insects necessarily die of famine."

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

An account of the Proceedings of the Massachusetts Horticultural Society, at the stated meeting, held at the hall of the Institution, on the 3d and adjourned to the 10th inst.

REPORT

Made by ZEBEDEE COOK, JR. 1st Vice President of the Society.

Since our last stated meeting, nothing important has transpired, that claims our particular notice at the present time. The intermediate portion of the year that has revolved since our last periodical interview, being unsuited to rural employments, furnishes little that is interesting to the general cultivator; but we may look forward with pleasing anticipations to the season that is advancing, when our hall shall again become the resort of the scientific and the practical, as well as of the beauty and taste which have on former occasions, been drawn hither to witness and to admire the display of the riches and the luxuries of Flora and of Pomona, which have afforded gratification to the visitors, and a becoming pride to the skillful and tasteful cultivator.

We have the satisfaction of knowing, that our institution is highly favored by the approbation and support of an enlightened and liberal community. We are stimulated by the public voice, and by an increasing love for horticultural employments to go onward; to render our institution what its early progress indicated, and its mature usefulness has so prominently disclosed. We could promise at its commencement, but little, for it was an experiment requiring time to develop its resources and our facilities. As an experiment, it was submitted to the consideration of our fellow citizens, to be cherished and fostered, if it should be found to merit their support and countenance. Of its ultimate triumph and acceptableness, the ardor and zeal of its friends was a sure and certain pledge. How that pledge has been redeemed, and how far those expectations we entertained, have been realized, are no longer problematical. We have laid its foundation broad and deep, and upon that we have reared a superstructure which we have good reason to hope, will be enduring and beneficial.

It is a source of grateful pleasure, that nothing has intervened to disturb the harmony nor mar the prosperity of our association; that differences of opinion upon subjects of minor importance, have become merged in the considerations of its vital interests, and that all are united in contributing individually and collectively, their skill and industry in the promotion of its common objects; improvement in the art of culture, the diffusion of scientific and practical knowledge, and the promotion of a taste for the delightful employment, which have a tendency to make mankind the lovers of peace, rather than of contention.

I cannot omit this opportunity to congratulate you, upon the prospect that the coming season promises, of the realization of hopes long entertained, of the establishment of a Garden of Experiment at Mount Auburn. That which the united efforts of many have hitherto in vain attempted, is now, by the influence of the Massachusetts Horticultural Society, about to be accomplished, and this success is attributable to its original founders and to them should the praise be rendered. A cemetery and a garden. A sacred and

a delightful association. There, in its sequestered and silent avenues, "the broken in spirit" may retire, to mourn over the spot which affliction and friendship will consecrate, as the resting place of the loved ones that sleep beneath the umbrageous foliage, with which nature has beautified that unrivalled combination of "valley and hill." And there too is the garden, in which the taste and ingenuity of man will be exercised, the flowers of every clime and of every hue will be collected, to furnish forth a treat hitherto unequalled in the annals of our country.

I have received letters from individuals upon whom the Society has conferred the title of Honorary and Corresponding Membership, which are herewith communicated.

1st. A letter from Madam Martha Johnson, the lady of George Johnson, Esq. of Salem, a gentleman to whose skill and assiduity, in the cultivation and agency in the origin of three valuable varieties of pears, the community are greatly indebted.

SALEM, Dec. 19th, 1831.

SIR—Gratified by the honor of being elected an Honorary Member of the Massachusetts Horticultural Society, permit me to say, that at an earlier period of life, it would have led to exertions that might have been acceptable. I can now only offer my sincere wishes that every hope and anticipation of the Society, may be realized.—With thanks to them for their marked attention, and to you in particular, for the politeness with which it was conveyed,

I am with respect, yours,

MARTHA JOHNSON.

ZEBEDEE COOK, JR. Esq. Dorchester.

2d. A letter from William Shaler, Esq. Consul General of the United States for the island of Cuba, residing at Havana. The recommendation of his distinguished friend to the honors of the Society, has been promptly attended to, and at a recent meeting of the Executive Council, Don Raman de la Sagra was elected an Honorary Member; the Society's diploma and the several addresses, with the rules and constitution of the institution, have been transmitted to him, accompanied by a letter informing him of his election, which follows in its proper order.

HAVANA, Jan. 29, 1832.

SIR—I have the honor to acknowledge the receipt of your official communication of the 16th ultimo, announcing that the Horticultural Society of Massachusetts, had done me the honor to elect me one of its Corresponding Members, together with my diploma, the constitution of the Society, and addresses delivered before it at its second and third annual festivals. I am duly sensible of the honor conferred on me by this election, and shall ever be happy to concur by any means in my power, in promoting the beneficent views of the Society. I am, however, bound in candor to say, that these are subjects with which I have but a limited acquaintance. Correct information as to the botany and rural economy of this fine island, being of unquestionable importance to the Society, I take the liberty, in this view, of respectfully recommending the election, as a Corresponding Member, of my friend, Don Raman de la Sagra, director of the Havana Botanic Garden, who is a man of talents and great zeal in the pursuit of science. Don Raman has requested me to present to the Society, in his name, a copy of his Statistical History of Cuba, which I have the honor to transmit herewith. And I am, with very great respect, Sir, Your most obedient servant,

WM. SHALER.

To ZEBEDEE COOK, JR. Esq.

1st Vice President of the Mass. Hort. Society.

BOSTON, Feb. 22d, 1832.

DEAR SIR—Our mutual and highly respected friend, William Shaler, Esq. Consul of the United States, residing at the city of Havana, has transmitted to me your valuable publication upon the statistics of the island of Cuba, to be deposited in the archives of the Massachusetts Horticultural Society, and in the name of that institution, I take leave to return you my thanks for the same.—Mr Shaler also took occasion to recommend to the Society, the propriety of conferring upon you the title of

membership, and I have now the honor to inform you, that at a meeting of the Executive Council, held a few days since, you were admitted an Honorary Member of said Society; and the present occasion is improved to forward you its diploma, with the accompanying pamphlets, being the constitution and by-laws, with the addresses delivered at the commemoration of the second and third annual festivals, the edition of that pronounced at the first being wholly exhausted, which I very much regret, as it was a performance of high character and would have afforded you much pleasure in its perusal.

It will afford me much gratification to hear from you whenever it may suit your convenience, and if any of the plants, shrubs, or other productions of this section of the United States, would be deemed acceptable to you, be pleased to advise me, and I shall promptly forward them. I have the honor to be, dear Sir,

With great respect, your very obedient servant,
[Signed] ZEB. COOK, JR.

DON RAMAN DE LA SAGRA, HAVANA.

3d. A note from John W. Boot, Esq. accompanied by a package of seed of the *Pinus Doodaea*, Roxburg, received by Mr Boot by the ship Dover from Liverpool. The following description of the tree producing the seed, accompanied the package:

"A most gigantic tree of vast dimensions, properly a species of cedar and very closely allied to the cedar of Lebanon; native of the elevated mountains, continuing the Henecelayo to the northward; the wood exceedingly fragrant and durable. The seeds were brought from India by the Honorable William Leslie Melville, and some presented by that gentleman to Doctor Wallich.—Very many of these seeds have already sprung up at the Horticultural Society's garden (at Chiswick,) at Lori Grenville's, &c."

4th. A letter from John Howland, Jr. Esq. of New Bedford, addressed to Samuel Downer, Esq. with a bundle of Missouri grape cuttings.

The seeds and cuttings were ordered to be distributed among the members on Saturday, the 17th inst. at the adjourned meeting.

The following were admitted members of the Society: Hon. Charles F. Mercer of Virginia, Honorary; Hon James L. Hodges of Taunton, and Mr Howland Cowing, Jr. of Roxbury, subscription members.

All which is submitted.

ZEBEDEE COOK, JR.

1st Vice President.

NEW-ENGLAND ASSOCIATION OF FARMERS, MECHANICS, AND OTHER WORKINGMEN.

It may not be generally known, amongst our farming brethren, that a delegation from several towns and five different States, composing a body of nearly one hundred, were lately assembled at the Marlboro' hotel in Boston, who have announced their doings under the imposing name of the "New-England Association of Farmers, Mechanics, and other Workingmen."

Mr Tillinghast, a respectable mechanic from Fall-river, presided; J. Frieze and G. W. Light, secretaries. Before the adjournment, a permanent organization was effected, and Dr Charles Douglass of New London, Connecticut, elected president.

The immediate object of the convention, appears to have been an improvement in the condition of men, women and children, who are engaged in the various manufacturing establishments, throughout New-England. I do not feel competent to judge of the propriety or of the practicability of all the measures proposed. So far, however, as they may operate to the benefit of work-

ing men, women, or children, if it is to be hoped they may succeed; since no permanent benefit can be bestowed on that class, without an ultimate gain to their employers, and an increase to the general happiness of both.

Another meeting is appointed to be held in September next in this city, and associations of farmers and mechanics throughout the New-England States, are invited to send delegates. It being the wish of the convention that the whole laboring population of New-England, should be immediately represented; and, as far as may be, by those who can exhibit with other required credentials, that sign of industry which never lies, the *hard hand of labor*.

It has been said by an intelligent Englishman, well acquainted with the boasted free institutions of his own land, and with our republic of half a century's duration before him, that "the *natural right* of every individual to a share of the earth on which God has placed him, (the people's farm, as it is sometimes called,) has never been practically acknowledged, insisted on, or enjoyed by any people. On the contrary, there has always existed, in every country, on one hand a party exercising an exclusive *de facto* property in the land; and on the other, the bulk of the people, who must obtain *leave to cultivate it*, or starve."

Perhaps we are entitled to some exception from a declaration so sweeping and so truly melancholy, yet I cannot avoid quoting a few lines from a letter now before me, fresh from the hand of a wise and good man and a practical farmer, which certainly goes far to sustain its application here.

He says, "There is no class of men of equal intelligence, who study their own interest so little as our farmers. The encouragement given to their labor is all-important; it in fact *regulates the wages of all other classes*. The most alarming symptom of the times is, that the title to real estate is passing out of the hands of those who work upon it. The whole economy of the government goes to depress it. I could point out many ways in which this is done, and unless relief is administered soon, we shall have a miserable and degraded tenantry after a while. At present, they can run away to the new countries, but the same causes will follow them there, and in the existing circumstances there is to be no rest for the sole of their foot. The real estate is now but a bob to the kite of a factitious credit currency," &c. &c.

I am not prepared to say, that this view of the state of our farming interest is entirely correct; yet the writer's intelligence, sound judgment, and disinterestedness, entitle it to serious consideration. No man however, among us, who will cast his eyes abroad, can fail of observing that throughout New England, the good land, indeed all the valuable property, both real and personal, is falling into comparatively few hands; and all of it, perhaps, by *legitimate* conveyance, yet much of it, by process that is considered ruinous and oppressive by many good men and sound lawyers, who are familiar with its operation.

The old saying is in every man's mouth, who has been fortunate in acquiring property,—that any one may get rich, who will be prudent and industrious. I have some doubts on this point, yet trust that all men will agree with me so far: that there are many industrious men and excellent citizens, in every part of New England, who are seduced into liabilities, and by degrees led through the process of mortgage, foreclosure and eject-

ment; and finally degraded at home, or driven in despair abroad, that under more indulgent provisions, might continue valuable members of society. I will close my too greatly extended remarks on this subject, by repeating the boast of a trader from a town in the new State of Vermont, who declared that he had, at successive intervals, held the title and possession of every farm in the town where he traded, *three times over*. He may tell us that this was all done strictly and according to law; but I think all my honest fellow citizens will unite with me in saying, that it might be profitable to submit such law to a revision.

There are many good men who feel deeply for the interests of the whole people; but reform or improvement, to be effectual or permanent, must proceed from the people themselves; and their will must be expressed in a manner more direct and less equivocal, than in that shape which prescription sanctions by the reverential character of *legitimacy*.

Frequent political excitements are salutary, and only to be dreaded when set on foot by the ambitions and designing. It may be useful, however, at all times to bear in mind the excellent caution of our immortal Washington:

"The *real people* occasionally assembled in order to express their sentiments on political subjects, ought never to be confounded with self-appointed societies, *usurping the right to control the constituted authorities*, and to dictate the public opinion."

Receipt for making Tomato Sauce.—Take tomatoes when ripe, and bake them till they become quite soft, and then scoop them out with a teaspoon, and rub the pulp through a sieve. To the pulp put as much Chili vinegar as will bring it to a proper thickness, with salt to your taste. Add to every quart, one ounce of garlic and one ounce of shallots, both sliced very thin. Boil it one quarter of an hour; then strain, and take out the garlic and shallots. After standing till quite cold, put the sauce into stone bottles, and let it stand a few days before it is corked up. If when the bottles are open, the sauce should appear to be in a fermenting state, put some more salt and boil it over again. The sauce should be of the thickness of rich cream, when poured out, and is, in my opinion, far superior to the famous Bengal chutney, to which it bears considerable resemblance.

Gardener's Magazine.

Economical Fuel.—A good fire on a winter day, at a mere trifling expense, is of importance to a poor man. One penny worth of tar or rosin water, will saturate a tub of coal with triple its original quantity of bitumen (the principle of light and heat), and of course render one such tub of three times more value, than it was when unsaturated.

—*English Newspaper.*
We believe that the additional value said to be acquired by coal, prepared as above mentioned, must be greatly exaggerated. "Bitumen" is not the only principle of heat and light; it furnishes more flame but less heat in proportion to its weight, than some of the harder sorts of coal, of which carbon is the principal constituents. But something may be gained, and we wish the experiment may be tried and its results made public.

Editor of N. E. Farmer.

Leaves of the Hawthorn as a substitute for Tea.—Mr R. Abbey has lately taken out a patent (in

England) for preparing the leaves of the hawthorn so as to make them a substitute for tea, and gives the following directions for the process. "Rince the leaves in cold water; steam them till they change from green to olive, and dry them on hot plates." The conductor of the *Gardener's Magazine* says, "We should think slow leaves would answer much better purpose than hawthorn leaves, on account of the prussic acid contained in the latter."

Light arable soils may be too much pulverized.—A writer for the *Gardener's Magazine* says, "I quite agree (from experience) with Mr Wallace (vol. vii. p. 36,) in thinking light soil sometimes injured, rather than improved, by too much digging, &c. I have for some years adopted the plan, of sowing August turnips on ground hoed and raked, in preference to digging; provided the ground be in good heart and not too much bound. I find the seed vegetates much sooner and is less infected with the fly; and, as the plants grow faster and bid defiance to the fly, they make less top but better roots."

Potatoes planted whole.—A writer in the *Gardener's Magazine* for Dec. 1831, states, "I quite agree with Mr T. A. Knight, in planting potatoes whole. As a testimony, I will state an experiment of mine: I planted four potato slips, containing two eyes in each; and four, the crowns containing, perhaps, four or five eyes each; four small whole ones; four large whole ones. The produce of the first four roots weighed eight pounds; of the second four, eleven pounds; that of the third four, sixteen pounds. I think this will make it clear to any one, that the reverse of what is generally followed ought to be practised, namely, to plant crowns or whole potatoes in lieu of a plant with two eyes. This is even the second trial I have made, and found it the same; but I was not so particular in the first experiment as in the second, having determined by my eye that the difference was so obvious. This is of the greatest importance to the agriculturist. If it holds good for an acre, what a difference in the produce!—The difference of a little extra seed bears no comparison to the extra produce; and besides, the labor of cutting is saved."

Magnificent Cypress Tree.—In the gardens of Chapultepec, near Mexico, the first object that strikes the eye is the magnificent cypress, called, the cypress of Montezuma. It had attained its full growth, when that monarch was on the throne, (1520,) so that it must now be at least 400 years old; yet it still retains all the vigor of youthful vegetation. The trunk is forty-one feet in circumference, yet the height is so majestic as to make even this enormous mass appear slender. At Santa Maria de Tula, in Oaxaca, is a cypress 93½ English feet in circumference, which yet does not show the slightest symptom of decay.

Ward's Mexico.

Lime-water for destroying Worms.—The use of Lime-water for destroying worms, was lately discovered in a garden near Edinburgh, by the overflowing of a brook, strongly impregnated with alkali from the refuse lime of the gas-works.—Wherever the soil of the garden was reached by this water, it threw up myriads of worms, which never returned again to their holes.—*Scotsman.*

From the Augusta Journal.

LIVERPOOL SALT.

We would call the attention of those interested, to the article on our last page, from the New England Farmer, (N. E. F. page 254.) in relation to the use of Liverpool salt. The views there taken of its qualities, appear to be corroborated in the experience of our farmers in other parts of the country. The Portsmouth (N. H.) Herald says,

"Last week we were told by a gentleman, who lives in the interior of the State and who makes several hundred pounds of butter every year, that this season he had been very unfortunate in the manufacture of his butter. He said that his family made and packed it down as usual; but that, for the first time, they used Liverpool or blown salt. Although the same care was taken in manufacturing and packing the butter, it was of so inferior a quality, that he did not think it expedient to bring it to market. This gentleman attributes his loss to the Liverpool salt.

From the above, as well as from what we have previously communicated, it would seem that the salt in question, has not those antiseptic properties which it has hitherto been thought to possess;—and upon further investigation, if this should prove to be the case, it will be perceived that there is great risk in using it in the manufacture of cheese also; as is now the custom with many of our farmers; nor would it be safe to use it in packing beef, pork, &c, because it will prove wholly inadequate to the preservation of these important articles of food from decomposition, and thus render them unfit for domestic consumption or shipping.

We have been induced to bring this subject again before the public, at the suggestion of a wholesale grocer in this town, who says that the difference between butter put up with this salt and with the natural crystallized salt, is so great, that he can generally distinguish it at once, by the odor, on piercing or opening a firkin. We should be glad to receive the opinion of some scientific gentleman, who has facilities for analyzing Liverpool salt and who can best judge of its antiputrescent qualities, when compared with salt brought from the Bahamas, Isle of May, Portugal, and the Bay of Biscay."

TEMPERANCE.

"Temperance!" says one, as he casts his eye upon this title, "yes, that's a good subject; I wish our newspapers would say more upon it. The little that has been said for three or four years past, has done a great deal of good. There is neighbor Slackhand, (he has lately altered his name to Up-and-doing,) three years ago, his buildings were going to decay and his farm running to waste, the sun looked into his bed-room in the morning and found him asleep, and nine o'clock at night, which should find honest men at home, found him at the tavern. Things were going on badly, and but for a little stir about temperance, he would have been a dead man before this time. Yes, and his family would have been upon the town.

"Three years ago, there came a man into our village and gave notice that he would deliver a temperance address. A temperance address! It is a new thing. A temperance address! what's that? said one and another,—and they all went. Mr Slackhand among the rest, for he did not like to stay in the bar-room alone. The stranger portrayed the evils of intemperance, in the blackest

colors. He said that the country was in danger, and every man ought to turn out and fight the monster. Intemperance, he said, was the great Goliath, and he had become so strong and so bold, that, every day, he appeared on the roof of a dram shop and dared the armies of the temperate, to send out a man to meet him in single combat, and they stood agast and fled before him. He took up the case of Slackhand, and told how he first began his downward course and how it would end—in the drunkard's grave. Mr S. was alarmed, and passed by the tavern that night, without stopping. He thought of his ways, and resolved that whatever his companions might say or do, as for him, he would leave off drinking; and to back up his resolution, as it were, with an oath, he dashed his running against the stone wall, and turned over a new leaf. It was wonderful to see how soon the faces of his wife and family began to brighten up. The broken windows were mended, the house newly painted, the garden fence repaired; and now the corn waves in his field, and the flocks and herds graze upon his hills, and peace and plenty crown his days. His wife holds up her head again; and the children, neat and clean, are among the first scholars in the village school. Who has wrought this wonderful, this almost miraculous change? It was not Rum. Rum and prosperity never yet were joined together. Or if prosperity may have been sometimes drawn, unwittingly, into the alliance, the partnership was of short duration; for he soon found that his partner, Rum, was a spendthrift, and drew out of the common stock faster than he could put in.

"Temperance!" others may say what they will, but I say it is a good thing; and for one, I am ready to hear what the man has to say upon the subject."—*Dedham Politician.*

HINTS TO MECHANICS AND WORKMEN.

If you would avoid the disease which your particular trades and work are liable to produce, attend to the following hints:—

Keep, if possible, regular hours. Never suppose that you have done extra work, when you sit up till midnight, and do not rise till eight or nine o'clock in the morning.

Abstain from ardent spirits, cordials and high liquors. Let your drink be, like that of Franklin when he was a printer, pure water.

Never use tobacco in any form. By chewing, smoking, or snuffing, you spend money which would help to clothe you, or would enable you, if single, to make a useful present to an aged mother, or dependent sister; or if married, to buy your wife a frock, or get books for your children. You also, by any of these filthy practices, injure your health; bring on headache, gnawing at the stomach, low spirits, trembling of the limbs, and at times sleeplessness.

Be particular in preserving your skin clean by regular washing of your hands, face, and mouth, before each meal, and of your whole body at least once a week; and by combing and brushing the hair daily.

Always have fresh air in the room in which you work, but not so that you shall be in a draft.

Take a short time in the morning, if possible, and always in the evening or towards sundown, for placing your body in a natural posture, by standing erect, and exercising your chest and limbs by a walk where the air is the purest.

If confined in doors, let your food consist in a

large proportion, of milk and bread, and well boiled vegetables. Meat and fish ought to be used sparingly, and only at dinner. You are better without coffee, tea, or chocolate. If you use any of them, it ought not to be more than once in a day.

Emigration to Oregon Territory.—It is stated, that a detachment of a long contemplated emigrating party for Oregon, is to leave New England the last of March; and march by land to the banks of the Columbia river.

The U. S. Telegraph remarks on this greatest of modern humbugs:—

"Of all the Quixotic expeditions ever set on foot, we consider this the most Quixotic. Those who know anything of the character of the Indians, who range the country between St Louis and the mouth of the Columbia, know that it will be impossible for the party to reach its destination; and those who know anything of the fur trade of the Rocky Mountains, know that those who now have possession of that trade, will not permit a rival interest to grow up, without purchasing their location at the cost of an Indian war. To suppose that a colony composed of emigrants, not one of whom knows, personally, anything of its inhabitants; without capital, and without the protection of Government, can maintain themselves at the mouth of the Columbia, is to anticipate a degree of Divine interposition in their behalf which requires an unexampled credulity—a delusion the most extraordinary."

Lace Works.—An establishment called the Rhode Island Lace School, has commenced at Newport. Notwithstanding its recent origin, not less than 700 females are actively employed by its proprietors. The style of lace work is said to be the most ingenious of its kind, and of that particular description with which the English dealers in lace have had to supply themselves in France, in consequence of the superior excellence of execution of their Gallic competitors. Several Englishmen are now settled in France, where they employ people to work upon lace for the American markets, and it is calculated that the people of the United States pay foreigners in this way, not less than 6 or \$700,000 annually, for what can as well be performed by themselves. A regular and habitual occupation in these delicate fabrics, must evidently lead to that beautiful state of perfection at which they have arrived in France, and some of the females engaged in the lace school have already attained a high degree of excellence.

The Washington Globe states, that by accounts from several of our vessels of war on foreign stations, it appears that more than half their crews have voluntarily relinquished ardent spirits, and accepted the commutation money allowed by the government.

The Philadelphia papers state, that two ladies belonging to highly respectable families in South-wark, died 7th inst. supposed from eating butter colored with some poisonous substance.

TO CORRESPONDENTS.—We received, too late for publication this week, a letter from Springfield, giving an account of the dreadful destruction of fruit trees in that quarter—as far as we have yet learned, the destruction has been great in every direction.

ERRATA.—In our last, page 274, column 2d, line 6th, from the bottom, for "first" read last. Page 275, column 2d, line 25th, from the top, for "Apanticea" read *Opuntia*; line 30 of the same column, for "in" read on,—page 260, 2d column, line 7th from the top, for "top" read top.

Kenrick Nurseries in Newton, near Boston.

FOR Sale at the Kenrick Nurseries in Newton, an extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Mulberries, Quinces, Raspberries, Grape Vines, Gooseberry and Currant Bushes, and ten finest varieties of Strawberries, including Wilson's Superior, Genuine Keen's Seedling, &c.

Also about 250 varieties of the most ornamental hardy trees and shrubs, including the Double Silver Fir and Double Spruce, Horse Chestnuts, Mountain Ash, Gum Acaia, Three Thorned Acaia, Butternuts, Alnus Tree of Heaven, Elm, Sugar Maples, Flowering Catalpas, Weeping Willows, Napoleon, &c. &c. Honey-suckles, and a superb variety of Hardy Roses, &c. &c. Many of the above sorts of trees of extra sizes.

White Mulberry Trees by the 100 or 1000—for plantations.

Isabella Grape Vines, either singly or by the 100, at reduced prices.

Written orders addressed to John or William Kenrick, Newton, and transmitted by the daily mail, or otherwise, or if more convenient, left at the office of the New England Farmer, where catalogues may be obtained gratis, will be promptly attended to.

But purchasers are invited when convenient, to call and examine the Trees, &c. for themselves, and make their own selections.

Trees, &c. will be delivered in Boston free of expense for transportation, when ordered; and when particularly desired, they will be packed in mats with either clay or moss for sea or land transportation. March 21.

Linnaean Botanic Garden and Nurseries.

Flushing, near New York.

WM. PRINCE & Sons, Proprietors, announce that the great extensions made in their establishment, which now covers near 50 acres, completely filled with the choicest TREES, SHRUBS and PLANTS, enables them to offer the various kinds at the reduced prices stated in their new Catalogues, which will be sent to any person who may apply for them. The size and excellence of the Trees exceed all former periods; and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their personal attention. To nurseries they will allow a liberal discount and convenient credit. As many persons are agents for different nurseries, it is requested that orders intended for be particularly specified. Every invoice sent has a printed heading and our signature, and such proof of origin must be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced.

Their Treatise on the Vine, describes 280 kinds of Grapes and their culture.—Their Treatise on Horticulture contains descriptions of a great variety of Trees and Plants, and directions for cultivating them; and their Pomological Manual, or Treatise on Fruits, contains full descriptions of above 1000 varieties of Pears, Plums, Cherries, Apricots, Peaches, Nectarines, Almonds, and other fruits, so that all persons can make their selections, with a knowledge of the qualities.

Their new Catalogues will be sent to all applicants, and orders sent to them per mail, will receive the most prompt attention, and all letters desiring information, will be replied to by the first mail. 4w. March 21.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscatello" Grape Vines, just received by the brig Cora from Cadiz, procured for him by the Consul of the United States, resident there. He writes, "I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds." They contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

Isabella; Barcelona;
Catawba; Blands;
Constantia; Black Cape;
Black Hamburgh;

3 varieties of valuable fruits, obtained from Xeres in Spain, and many other choice kinds.

Orders by Mail addressed to the subscriber, or personal application at his office, No. 7½ Congress street, for any quantity of vines from one to one hundred, will meet with prompt attention.

5t

Z. COOK, Jr.

March 12, 1832.

To Let.

THE Farm on which the subscriber resides in Duxbury, within about three miles of the Lowell market, containing about three hundred acres of cultivated land of various descriptions, and all fenced with a stone wall. The buildings are a good dwelling house, shed, cider mill, tree barn 174 feet long, grain and ice house, and are all in perfect repair. The farm is productive, and will summer and winter 50 cows, and offers the best encouragement for carrying on the milk and vegetable business at Lowell. It will be let from one to five years, with the stock and tools, and immediate possession given. March 2, 1832. 4c B. F. VARNUM.

Farmer Wanted.

WANTED, a young single man to do the work on a small place, 3 miles from Boston; no one need apply unless he can produce good recommendations for his home, try and industry. Inquire at this office. 2t. March 21.

Farmer Wanted.

A steady, faithful man is wanted, to take charge of a garden and small Farm in Dorchester; take care of a horse, cow, &c. and make himself useful on the place. An American would be preferred. Apply to No. 173, Washington street. March 21.

Notice to Gardeners and Nurserymen.

THE Subscriber being anxious to change his employment, wishes a person to take his place, and buy out his interest in the Garden and Nursery of Samuel Downer, Dorchester. For particulars please apply to Rufus Howe. 1t. Dorchester, March 17.

Gardener Wanted.

A Man is wanted to manage a com on Kitchen Garden, about 20 miles southeast from Boston. He must be temperate, industrious, disposed to advance his employer's interest, and have a thorough knowledge of his business. To such good encouragement will be given. An American would be preferred. Apply at the N. E. Farmer office. 3t. March 21.

Farmer for Sale.

FOR Sale, a small and productive Farm in Roxbury, containing 22 acres of Prime Land, in a good state of cultivation; it is well watered, and is calculated for raising early Vegetables for the market, being but 5 miles from State street,—it has a large and thrifty orchard, a good house and barn, and out buildings. Apply at the Farmer Office. 3t. March 21.

White Mulberry Trees.

1, 2, and 3 years old, for Sale. Inquire of Benjamin Burbank, East Parish, Bradford. 8t. March 21.

Durham short horn Stock.

FOR Sale, a few very superior half blood Durham short horn Cows, sired by *Admiral*,—who was presented to the Massachusetts Society for the promotion of Agriculture, by Admiral Sir Isaac Coffin,—these Cows are all warranted in calf by *Young Comet*, a full blood Durham short horn Bull, out of the imported Cow *Annabella*, presented by Sir Isaac to the same Society. *Annabella* has repeatedly given forty-eight pounds of rich Milk per day, from grass feed only. For particulars, inquire of Mr J. B. Russell, at the Agricultural Seed store, Boston, or at the Farm of E. Hersy Derby, Esq. Salem, where the Stock can be seen. Salem, March, 1832.

Farmer for Sale.

A first rate Farm, lying in Dorchester, six miles from the old State House, containing 90 acres; consisting of mowing, pasture, orchard and wood; a few acres of it is salt marsh, situated at South Boston.

There is a handsome two story house, in good repair, finely situated on a hill, having a very commanding prospect of the country, handsomely finished; a large barn with an excellent cellar under it for vegetables, shed room, pigery, &c. &c.; a farm house, nearly new, and ice house—the whole combining as pleasant a situation for a gentleman, as can be found in the vicinity; the land is in good heart, and would make an excellent milk farm; 60 tons of hay was cut from it last season, and 10 cows kept on it; it is the farm formerly owned by John Gray, Esq. For further particulars, apply at the New England Farmer office. March 11.

Scotch Gooseberry Bushes, Dahlia Roots, &c.

THIS Day received by J. B. Russell, at the New England Farmer Office and Seed Store, a choice collection of Large Scotch Gooseberry Bushes, Double Dahlia Roots, Tuberoses, Anarylls, &c. Particulars next week. March 14.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No. 110 State street, by ALBERT FEARING & CO

Farm for Sale or to Let.

WILL be sold or let, and possession given immediately, the Watchhill Farm, (so called,) situated in Lynn, consisting of between 70 and 80 acres of, as good Land as can be found in the County of Essex, with between 2 and 300 large Apple, Pear, and Peach Trees, two good Dwelling Houses, with ample Barns and out-buildings. Said Farm is most pleasantly located, between the Boston old road and turnpike, and only ten minutes' walk from the Hotel, affording an excellent opportunity for a Milk Farm or a Gardener.

For further particulars inquire of Mr Wiley, near the Lynn Hotel, or of the subscriber.

WM. B. BREED.

Lynn, Feb. 16, 1832.

1t

Valuable Farm for Sale.

THAT valuable Farm, pleasantly situated in the North Parish of Andover, one mile from the Rev. Mr Loring's meeting-house, and Mr Putnam's academy, on the road leading from said meeting-house to Andover bridge, and within half a mile of good Saw and Grist Mills, and Blacksmith's Shop—3 miles from the Theological Seminary, 4 miles from Methuen meeting-house and factories, and 12 miles from Lowell—all which places, together with a number of Factories in the vicinity, afford as good a market for produce as may be found in Boston.

There is on said Farm rising 300 Fruit Trees, half of which are young, thrifty and grafted with the best kind of winter apples, and fall and summer pears—the residue furnishes a plentiful crop of fall and cider apples. The farm consists of 110 acres, more or less, of excellent land, conveniently divided into lots of tillage, mowing, pasture, rye-and meadow, and well watered. The road passes through the centre of the farm, and is fenced on both sides with firm stone wall, most of the Farm being fenced with the same material. The buildings are convenient and in good repair—the house is nearly new.

The whole offers a desirable residence for a farmer, or a summer retreat for a gentleman who wishes to retire in that season of the year.

Purchasers are invited to call and view the premises.

The terms will be made known by the certificate.

JOHN ENDICOTT,
or Dr J. KITTREDGE.

The above Farm, if not sold before the 25th inst. will be offered at Public Auction on Tuesday, the 27th inst. at 12 o'clock.

Andover, (North Parish) March 6, 1832. 3t

BRIGHTON MARKET—MONDAY, MARCH 19, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 506 Beef Cattle (including 155 unsold last week,) 11 pair Working Oxen, 11 Cows and Calves, and 400 Sheep. About 145 Beef Cattle unsold at the close of the market. There are also about 225 left within a few miles of the market; making in all at Brighton and within one hour's ride, about 370 unsold.

Particulars of the *Beef Cattle* Market completely "glutted;" sales were very uneven, and prices, particularly for the milking and poorer qualities, reduced. We quote extra \$5.88 a 6, prime 5.25 a 5.62, good 5 a 5.25, thin 4.50 a 4.75. One yoke was taken at 6.25 and one at 6.17.

Working Oxen.—Sales at \$525, 55, 60 and 63.

Cows and Calves.—Sales at \$19, 24, 27 and 32.

Sheep.—Dull—a very few lots only were sold. We were not able to obtain the price of a single lot. Two lots were driven out of the market unsold.

The non-appearance of our report last week in season, was occasioned by the carelessness of the person who was charged with it from Brighton to Boston.

New York Cattle Market, March 16.—In market this week, 800 Beef Cattle; 100 Milch Cows and Calves, and 300 a 400 Sheep. There has been quite a decline in the prices of Beef Cattle, sales not averaging over \$6.50. One yoke of extra fine cattle, fattened by Mr Isaac Peck, Westchester co, sold at \$9; we quote sales from 5.50 a \$7.50, 30 Beef 5 a 5½, Cows and Calves—Sales show at \$25 a 30. Sheep—Prices very high—sales at 5, 7.50, and 8.

¶ In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From the Springfield Gazette.

A VETERAN IN THE CAUSE OF TEMPERANCE.

There is now living in M—, a few miles from this place, a man who is almost ninety-six years old; and who has never, as he can recollect, drank a drop of spirit, wine, or cider—even the smell of them is sickening. He has been sick only once or twice in his life, and that since he was seventy years old. He says he has done more work, or worked more hours, than any man living. He has always been well and able to work, and has loved it. He has not only labored by day, but by night. A man employed him to mow twenty days; the weather was fair, and he mowed every day till night, then walked home two and a half miles—and during the twenty night, he saved from the hours of sleep, time enough to hoe two acres of corn, to make a hundred rods of three pole fence, and to pull flax enough to make a hundred pounds when dressed. This was not a very uncommon thing with him. He knew nothing of fatigue, until he was more than fifty years old.

In consequence of his total abstinence from ardent spirits, he has not only been remarkably healthy, but remarkably strong. When upwards of sixty years old he was at an oil mill, where a load of flaxseed was being unloaded; on the cart was a sack which all agreed they could not carry; the old man said he could carry it; he stepped to the cart, took it upon his shoulder, carried it into the mill and deposited it safely on the floor of the second story. The sack contained seven bushels, weighing, I suppose, about four hundred and fifty pounds. Since he was ninety-five, he has carried a bushel of rye meal a mile upon his shoulder, and he says he can do it now. He says, he has not moved much for a year or two past.

His hearing is very good; eye-sight, much impaired. He never used glasses, and has been able to read till within three or four years. He was not when young near sighted, which circumstance renders the continuance of sight more wonderful. His memory is considerably impaired. He is seldom thirsty; has lived upon milk very much, and remembers going a month frequently, without drinking.

The good effects of total abstinence are very manifest in this old man's health, strength and industry. Were all men as temperate, there can be no doubt that a gigantic race of Methuselahs would spring up, and fabulous deeds of valor would become sober realities.

The old man says, when he was young, work was done principally without rum,—some farmers would purchase, perhaps, two quarts for the haying season. Buildings were generally raised without rum.

FARMING.

Many thousand farmers in New England, rear large and respectable families, pay all their debts and taxes promptly, and live independently, well clothed, and comfortably housed and provided for, and lay up money—on farms of fifty acres. The idea is, that these people labor severely. This is a great mistake. They have much, because they waste no time. With them, there is "a place for everything, and everything in its place." Their horses and cattle, tools and implements, are attend-

ed to with clock-like regularity—nothing is put off till tomorrow which can be done today. Economy is wealth, and system affords ease. These men are seldom in a hurry, except in harvest time. And in long winter evenings or severe weather, which forbids employment out of doors, one makes corn-brooms; another shoes; a third is a carpenter, cooper, or tailor; and one woman spins; another weaves; a third plait "Leghorn bonnets;" and a fourth makes lace. Little children, and the aged and infirm, knit stockings! And the families thus occupied are among the most healthy and cheerful in the world. It is easy with them to reduce their wishes to their means, if inconvenient or imprudent to extend their means to their wishes. These are the "sort of people" who fought at Concord and at Bunker's hill, Bennington and Saratoga. Two hundred yankee fire-holders were on board the frigate Constitution, when the flag of the enemy descended in homage to her power.—*Genesee Farmer.*

A subject for reflection.—Agreeably to a memorandum kept by the Rev. Dr. Catechrauf of York, Pa. it appears that one hundred and nine murders were committed in the United States, within the year 1831. Some of these were of the most appalling kind, such as parents by their children, children by their parents, husbands by their wives, and wives by their husbands, &c. Almost all of them are regarded as the consequence of an intemperate use of ardent spirits.

The Book of Glory.—If we judge from history, of what is the book of glory composed? Are not its leaves dead men's skins—its letters stamped in human blood—its golden clasp, the pillage of nations? It is illuminated with tears and broken hearts.—*London paper.*

The Horticultural Garden of the late Andrew Parmenter, is offered for Sale.

THE reputation of this establishment is not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyn, Long Island, at the junction of the Jamaica and Flatbush Roads, and contains 21 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed by a pointed stone fence, and inside of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; also, a splendid collection of Roses and Herbaceous Plants;—the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers' Houses, seven Cisterns, and a never-failing Pump of excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any person who wishes to engage in the occupation of Gardening, by the purchase of this property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such as to warrant the belief that the purchase of the property will amply repay the enterprise of the one who may engage in the business.

Terms will be made known by applying to Mrs. PARMENTER, on the premises.

N. B.—Any orders sent to Mrs P. will be promptly and carefully executed. 6t

Feb. 16.

Bees for Sale.

FOR Sale by Emmon Wheeler, Brighton, about a dozen Swarms of Bees in Beard's Patent Hives, from \$8 to 15 each, including the hives.

March 14.

4t

A Farm for Sale.

ONE of the best Farms in West Newbury, pleasantly situated near the Merrimack river, on the stage road from Newburyport to Haverhill and Lowell, containing about one hundred and fifteen acres, well divided into Mowing, Pasturing and Tillage. An excellent Farm for Hay, having a large proportion of natural Mowing, and a fine young Orchard. The Farm is composed of three separate lots, and will be sold together or in lots to suit the purchaser. There is on the north side of the road about sixty-six acres, with a large two-story House, a Barn, 104 feet by 32, a Cowshed, a Cheese-House, Sheds, &c. convenient, and all in good repair. One lot on the south side of the road, opposite the House, containing eighteen acres.

Also, another lot on the same side of the road, about 10 rods distant, containing about thirty acres, having a good barn on the same, 31 by 28.

Also, a lot of SALT MARSH, about ten acres, very handy to boat, and of the first quality.

If said Farm is not disposed of at private sale, before Monday the 26th March next, it will be sold on the Wednesday following, at Public Auction, together with the Stock of Cattle, Farming Utensils, about fifty Tons of English Hay, 20 Tons Salt Hay, 60 bushels of Red Top Seed, lot of Potatoes, and sundry other articles.

Sale will be positive. For further particulars inquire of the sub-criber on the premises, or at No. 12 Essex street, Boston.

PAUL BAYLEY.

West Newbury, Feb. 20, 1832.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished on order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr. 65, Broad street.

Ammunition.

OF the best quality and at lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1

Buckthorns.

Gentlemen in want of this valuable plant for live fences, can have young quicks about 34 feet high, for \$3 per hundred, and plants 24 feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight. March 14.

Farm to Let.

A first rate farm of about 120 acres, well proportioned in mowing, tillage and pasturing. It is capable of maintaining 20 head of cattle, and is well calculated for a Milk Farm, for which purpose it has been used a number of years. There is also one of the best orchards in the State—a good dwelling house, and three good barns. For terms apply at 56 Commercial st. 4t March 14.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If No paper will be sent to a distance without payment being made in advance.]

COMMUNICATIONS.

THE PLANTER AND FARMER:

A CONTRAST.

The traveller in passing through the eastern, middle, and southern States, cannot but notice the different modes of cultivating the soil, in the southern and northern region. The planter and farmer, though engaged in the same employment, are as distinct classes in our community, as any amongst us. This is doubtless owing to a variety of causes, some of which I will endeavor to point out in this communication. The northern and middle States were originally laid out into farms, of from one to three hundred acres each; and these were transmitted to their children; were frequently divided into fifths, and in some instances, of late years, (more especially in the neighborhood of the large cities,) subdivided into smaller ones of from ten to thirty acres. In all these changes and mutations, one thing is extraordinary; the income of these small farms, by a different mode of culture, frequently exceeded that of the large ones, and instances have occurred, where less than ten acres, devoted entirely to fruit and vegetables, have yielded a greater net income than three hundred acres as formerly cultivated. In the southern States, plantations were laid out from five hundred to three thousand acres each, and with slight and unimportant variations, remain the same at the present day. This circumstance alone, in my opinion, will account in a great measure for the difference of the two classes. The former course produces a dense population, the latter a sparse one. Towns, villages, and hamlets grow up with the former; everything progressing; not a year passes without its improvements; the mechanic, the manufacturer, and the tradesman, are continually employed; look where you will, and you will discover the marks of vigor and enterprise. A scattered population is the mark of the latter; plantations, perhaps a mile apart, which remain the same from generation to generation, the same round of tillage and old fields, and with little variation, the same succession of crops—if growing tobacco or indigo—impoverishing and exhausting the soil.

And now let us take a bird's-eye glance of the inhabitants of these two regions. The planter has much of the polish of refined life; he may justly pride himself as a descendant of British ancestors. In the main, he is liberal, intelligent, high minded; in many instances, possessed of a graceful eloquence, and ever delighting in generous emotions and in acts of hospitality. In acquiescents, too, he is respectable, as he has generally a private or a classical education.—The farmer has the roughness of the unlearned granite; from his boyhood to old age, his delight has been to till the soil with his own hands; labor has made him robust and given strength and energy to his character; he has little of the refinement of courtly manners, but he needs it not, as he has that which is more substantial, an honest simplicity and sound common sense. Located amidst schools, education is a part of his ordinary pursuit; and to read, to write, and to cast accounts, is not only the privilege of the farmer,

but is gratuitously bestowed upon every poor child of the community. Here, I am sorry to say, with many, education stops. The higher order of sciences, a taste for reading and polite literature, are confined to a few; yet these few, when found among the mechanical or agricultural part of the community, are the pride and ornament of the East. From such cottages spring the Websters and the Adamses of New England.

DESTRUCTION OF FRUIT TREES.

SPRINGFIELD, March 17, 1832.

MR FESSENDEN—I have recently examined my fruit trees, which I was induced to do, on reading a communication from Hon. John Lowell, in the last New England Farmer, upon that subject, stating that he found the last year's growth, on the ends of the limbs, dead and unfit for grafts. If that should prove to be the extent of the injury done by the last winter, to Mr Lowell's trees and to the fruit trees generally, in the vicinity of Boston, yet may consider yourselves peculiarly fortunate. I have this morning been with several of my friends and examined hundreds of fruit trees in various orchards and gardens, and in different situations, and the result is disheartening in the extreme. The Indian cholera has not been one half as destructive in any part of the world, where it has prevailed in the most malignant form, to the human species, as this cholera or disease has been or will be to our fruit trees, judging from our examination, thus far. But the injury here is on the body of the tree. Many trees, the limbs of which and buds, were green and apparently in good health, on cutting away the bark to the wood I find the inside bark, the growth of last year, turned to a brownish color and in many instances entirely detached from the wood. On many trees in this situation the scions of last year's growth are green, and I have no doubt would grow if inserted into good healthy stocks. I should think, from present appearances, that I should lose from two to three hundred of the choicest varieties of the peach, nectarine, apricot, pear, cherry, plum, and apple trees, that have been growing from four to seven years, luxuriantly; and many of them have yielded their fruit for several years. I fear, that in most of our gardens and fruit orchards in Springfield, there will not be one tree in ten alive, in 1833. I think most of them will leaf out, blossom, and perhaps bear some unhealthy fruit, the coming season; but I have no more hopes of their recovering or surviving, than I should have if they were all hewn down and cast into the fire.

The damage and disappointment to horticulturists is incalculable; five hundred dollars would not make good my loss in a pecuniary point of view, and money could hardly pay for the disappointment and vexation. The conjecture of Mr Lowell, as to the probable cause, I hope will prove true, and as far as my limited experience and observation extends, I think it will. The trees continued to grow till late in the fall, and the sap or juices remained up till the first of December, at which time the cold commenced with uncommon severity and continued through the month, and caused the veins of the bark, which were filled

with the juices that had not become sufficiently inspissated, to burst and diffuse their contents throughout the stem of the tree, which will prove as certain death to it, as the bursting of numerous blood vessels around the heart, would to animal life.

There were from two to three hundred fruit trees, various kinds, destroyed in this town the winter before this last, by the same disease. I lost nine, and one gentleman lost nearly a hundred fine healthy trees, that had been growing several years; he thought some enemy had destroyed them by applying oil of vitriol, or some acid, to the bark. If this disease is not caused by the uncommon wet and heat of the last summer, together with the severity of the last winter, horticulturists have much to fear in future. I hope the nurseries in the vicinity of Boston and at Long Island, are unimpaired, so that we may obtain a new supply of healthy trees.

Respectfully, your friend, &c,

E. EDWARDS.

BOTTOMS OF CORN STALKS FOR MANURE, COMPOST, &c.

Almost every farmer draws together the bottom stalks of Indian corn, with his harrow in the spring, gets them into heaps and burns them, and scatters the ashes, what little there is of them, though very trifling. Others draw what they can upon the head lands, and perhaps throw some of them into the road and some into their neighbor's field, where they remain, an excellent nursery for weeds, and the remainder is scattered by the harrow and lush, over the oat and barley ground; where remains of them may be seen for three years after; which gives the impression that they will never rot. But this is a mistake, they will rot in a barn yard under cattle, as soon as straw.

I get out the contents of my yard as soon in the spring as the ground is thawed. I cast in and litter my yards with the bottom stalks obtained from five to seven or eight acres, which, with the trampling of cattle, (which are not driven out of the yard to water,) get broken up and saturated with dung, during the rest of the spring and summer nights, while the cattle are out of pasture, by October or November, so that they may be carted out and stacked, and the yards relittered for the winter; and the stalks thus stacked in a manure bed, will be rotted and fine enough to plough in the spring following. And why should not the stalks thus rotted with the dung of the barn yard, be good manure? It is only the rind that resists decay, and that does not resist long, when combined with the contents of the yard; all the inside is like a fine sponge, which when green was filled with saccharine water. When the rind is broken by the cattle's feet, the spongy inside will absorb a large quantity of juice, which for want of some such absorbing substance would be carried off by rains. They are very good for littering sheep folds, when levelled off and covered by a thin coat of straw, as the weight of the sheep will not break through them; and their lying so open admits the ran and leaves the surface dry.

It behooves us to use every means in our power

to increase the quantity of manure. Every blade and stalk which a farm produces and is not consumed by some animal, should be returned to it again in shape of manure. Our oat and barley straw are eaten by some portion of the stock, instead of hay. Some of our rye straw we cut to mix with other provender, and the remainder is all wanted for littering stalls. We must find some substance with which to litter our yards, for which purpose potato vines and the weeds growing among them, if their seeds are green, must not be forgotten. Instead of carting in loam and having the trouble of carting it out again, I only use dry vegetable substances, as the loam can be added in the compost bed. The sides of fences, where sheep have lain about the farm, and under trees, in situations which would not benefit any crop, may be ploughed up, drawn into heaps with a hoe or shovel and left to ferment till the grass roots are dead, and then spread on grass lands immediately after mowing; or carried immediately to the compost bed, together with similar scrapings of turf and wear from the roadside, with peat and pond mud. Mix as much yard dung with these scrapings, &c., as will ferment and ripen, which Mr. Plumey says, and I think, correctly, "should be one load of dung to two loads of the other materials." The different kinds should be dropped from the cart, as near together as convenient, and mixed together as they are shovelled into the bed, four feet thick and covered over level, or hollowing, with another foot thick of mould. From many pasture grounds, three or four ox-cart loads of mullens might be pulled while in bloom and full leaf, with distles and poke weed in full growth, and worked into the compost heap at its first turning, in June. I had it done last year, and four weeks afterward, such was the heat of the half decayed stalks, that they burnt the hands of the person who was turning them. B.

Bridgeport, Conn. March, 1832.

THE LATE WINTER.

MR FESSENDEN—The past winter has been long and cold. It commenced the last of November. December was colder, in the aggregate, than any previous one within the recollection of any man with whom I have conversed on the subject. From the first to the last of the month, excepting the 24th, there was a continued frost. On the 24th, the thermometer stood, at sunrise, at 25 degrees above zero, and at 12 o'clock a little thawing took place for two or three hours, and some rain fell in the meantime. According to my thermometrical register, there was, during this month, more severely cold weather, in the whole, than in any winter since 1823, before which, I kept no accurate account of heat or cold. January was a cold month. February was comparatively mild. March commenced cold, but soon moderated. During the winter, snows were frequent but small. From November 28th, 1831, to February the 28th, we had twenty-four snows, say from one inch to six inches in depth; one in November, nine in December, six in January, and eight in February.

Whenever the mercury stands at or below zero, the weather may be considered severely cold.—The following table will show the very cold days during the past winter, and the coldest part of the day observed:—

1831, Dec. 8, sunrise	2	degrees below zero:
11, " "	2	" "
13, " "	4½	" "
15, 10 P. M. 6	"	" "

1831, Dec. 16, 5 A. M.	6½	degrees below zero:
18, sunrise	0	" "
22, 9 P. M. 5	"	" "
23, sunrise	2	" "
31, " say 10½	"	" "
1832, Jan. 2, " "	2	" "
23, " "	0½	" "
26, 10 P. M. 7	"	" "
27, sunrise	12	" "
28, " say 10	"	" "
Feb. 6, " 4½	"	" "
11, " 0	"	" "
17, " say 0	"	" "

It has been said, that the latent fruit of the peach, cannot endure the cold so intense as to sink the mercury eight degrees below zero. Although my peach trees promised much last autumn, yet, as far as I have examined, the fruit is completely destroyed.

For several years past, the greatest degree of cold in this vicinity, was as follows:—

In 1828, 1 degree above zero. Peaches abundant and fine quality.

In 1829, 6½ deg. below zero. Peaches, none.

In 1830, 10 deg. below zero. Peaches, none.

In 1831, 6 deg. below zero. Peaches very few and poor quality.

A few days of warm weather in December or January, may cause the buds to make an effort to evolve; in which case, a less degree of cold might destroy this delicate and delicious fruit.

Mansfield, March 16, 1832. R. GREEN.

Since the above was written, I have seen the alarming account of the damage done by frost to fruit trees, by the Hon. Mr. Lowell, whose observations are always correct, and to whom we are greatly indebted for his liberality and exertions, to extend useful information. I much regret his loss. On examination, I find that the last year's growth of my young and thrifty fruit trees, although at first view appear to be healthy, yet, are seriously injured, if not completely destroyed. On removing the cuticle, the true bark is found, more or less, black and dead. Those trees, whether peach, cherry, pear, or apple, which were the most thrifty and promising, have suffered the most severely. Apple trees have suffered less and peach trees more, than those of the cherry or pear. Two pear trees, trunks two inches in diameter, are nearly killed from a little above the surface of the earth to the limbs, which are yet alive. One of these, last year, was very thrifty and has received the greatest injury. I observed one very sound and thrifty tree, trunk five inches in diameter seriously split by the frost and probably ruined. Several valuable plants which have withstood the severity of frosts in former winters, in open ground appear now to be dead. Rose-bushes appear to be more injured, than at any previous time within my recollection.

March 20, 1832.

R. GREEN.

INJURY TO FRUIT TREES.

MR RUSSELL—On examination of the fruit trees in this vicinity, I find the injury much more serious than was anticipated, in Mr Lowell's communication. Not only the last year's growth is dead, of young trees, but a great part of the bearing trees in this vicinity, appear to have no life in them. On cutting into the inner bark, on the trunk of the tree, I find the greater part of the albumen has turned black, in some places this is

the case when the limbs are green and fresh. I wish to inquire, if it would not be advisable where trees are young, to cut them down to the ground and train up new shoots? If the trees are suffered to stand and the sap should ascend in the sap wood, as the bark being dead, it would possess no channel to return to the root, whether the tree would not die, root and branch? I have not examined any old trees that have come to their growth, and feel encouraged that they are not injured; but if the winter has been as fatal to fruit trees in all parts of the country, as it has in this vicinity, the injury is incalculable; and those who have spent the morning of their lives in cultivating trees, in hopes of reaping the fruit in their declining years, have met with a loss which can never be replaced. Yours, with respect,

B. WHEELER.

Frammingham, March 21, 1832.

From the Genesee Farmer.

THE SWEET POTATO.

MR GOODSELL—I have noticed in several numbers of your paper, some observations on the cultivation of the sweet potato, none of which meet my ideas of the correct mode. Having lived a number of years in the State of Georgia, and being conversant with the cultivation of that vegetable, experimentally, I am induced to give you some observations adapted to this climate, which, if followed, I am persuaded will be attended with full success.

About the 20th of March, make a hot bed in the usual form, about four feet square, in which plant your sweet potatoes about three inches apart; let them be treated as hot-bed plants during the month of April, keeping on the sash, and no matter how irregularly compressed within the frame, provided they are kept warm and in a growing state.

About the first of May, take a piece of ground well ploughed and prepared, make hills about three feet apart in the row, and the rows about three and a half or four feet apart; then take off your sash from the hot-bed, and cut the vines about twelve inches from the root, leaving the root in the bed; remove the vines to your prepared ground, and cut them into lengths about fifteen inches long; take one piece of the vine, wind the middle about the fingers so as to leave both ends out, plant the middle about three inches deep, leaving the ends about two inches above the ground, to each hill about five pieces of vine in open order; in about ten days they will have taken root, and about the first of November will have filled the hills with large potatoes.

Then take the seed potatoes out of the hot-bed and plant one or two in the middle of each hill, not in the same hills where the vines are planted, but in separate hills. About the middle of June the vines will have run a considerable distance, when they may be cut again and planted in a similar manner, in hills freshly prepared, for seed for the next year. By this method, the southern planters often raise from four to five hundred bushels to the acre, from the first planting, of large and fine potatoes for use; and from the last planting, which is usually done by them about the first of August, they get plenty of small ones for seed, which they call slips. It is very rare they plant more than a quarter of an acre with seed, depending chiefly on planting the vine, which if done by the 16th of June, is pretty certain to yield a large

crop, and will furnish vines sufficient to plant, at least, five acres.

To keep them over winter, or for any length of time for use, they should be packed in such manner as not to touch each other, being very liable to heat like corn; and kept secure from frost. As good a way as any is to set them about half an inch apart, covered with dry sand, in a warm dry cellar.

By observing the above directions, I have no doubt, they may be raised with great success in this climate. A sandy soil or loam is best adapted to their cultivation, but any dry muck soil will answer very well. I remain, &c,

R. M. WILLIAMS.

Middletown, Jan. 30, 1832.

From the New York Memoirs of Agriculture.

ON SWINE.

Little is necessary to be said on this subject, as probably no branch of husbandry is better understood in this State, than the raising of pork. As the old thin long-legged breed still prevails in various quarters, the sooner another is substituted for it, the better; besides, it is a gaint, voracious animal, difficult to fatten, and having too large a portion of bone.

In breeding, the sow should be selected with great care: broad and straight backed, with wide hips; a great many teats; short legs and fine boue. Farmers differ much in their plans of raising stock for pork; some permitting their shoats to run at large eighteen months, till they are penned up to fatten, this is the most troublesome and least profitable way; others give them a range in clover pastures and begin to fatten them earlier. I apprehend there is a much more profitable way and attended with less trouble, for those who have the right breed. According to the quantity of pork wanted, should be the number of breeding sows kept over, and there should be no other hogs on the farm, but the breeding sows. These, when they pig the latter end of March, should be fed in the most attentive manner with swill and shorts. The pigs, from a full grown sow, will generally be twelve in number; these should be thinned to eight; as soon as they begin to feed freely out of the trough, should be weaned, and afterwards fed regularly with green tares, clovers, boiled potatoes, ground peas, unmerchanted corn, or any other nourishing food; turning them out every day into a small yard, where there is a shallow pond for them to lie in. A remarkable breed of pigs which had been treated pretty much in this manner, were exhibited at the last Duanesburg Fair; when eight months old, one of them was slaughtered, and weighed exactly three hundred and eleven pounds; they attracted universal attention, and I certainly never saw such animals before. This method is attended with little trouble, and leaves so small a quantity of stock on hand to winter over, appears to me to be more economical in every point of view, than any other which is practised.

From the Journal of Health.

CHOCOLATE.

The editor of one of the eastern paper expatiates, in the most eulogistic strains, in favor of chocolate. "The laboring man," he remarks, "and particularly he who is exposed to the inclemency of the weather, will find it not only a comforter, but the firm ally and supporter of his

strength. He will find it to be worth all the grog ever distilled; more powerful and bracing than the strong waters of Cogniac; more nourishing than the rich wines of Madeira and Champagne. It gives strength and action to the stomach, when distilled spirits have no power to aid either; and then it brings no evils in its train; it engenders no evil feelings, heats no wives, starves no children, and makes beasts of no husbands or fathers. Unlike cold water, it does not chill the vitals and send the blood in a torrent back to the fountain of life, often producing spasms and sometimes death itself. Drink it then, ye that are wise, and be happy."—All this is very well said, and what is far better, it is generally true. There can be no doubt as to the nutritive and wholesome qualities of the cocoa nut, and of its being far better adapted to support the strength of the laboring classes, and to enable the system when exposed to the weather, to resist the effects of cold and fatigue, than either tea or coffee. To the traveller, a bowl of good chocolate and a slice of bread, before setting forth on his journey of a cold morning, will really produce all the good effects which have been erroneously attributed to ardent spirits, or to wine.

It is really a subject of regret, that the price of good chocolate could not be so far reduced, as to place it within the reach of every poor family. It has been calculated that one ounce of it, in substance, affords equal nutriment with one pound of meat. This is probably, however, overrating its value as an article of food. Nevertheless, when properly prepared, particularly when a large portion of milk is added to it, it is equally pleasant to most palates as coffee or tea, and affords what the latter does not, a solid support to the system.—From the very circumstance of its nutritive properties, it should be taken with bread, either at breakfast or at dinner, and but seldom in the evening. It is, also, a more appropriate food for those engaged in active pursuits in the open air, than for the sedentary, or those confined within doors. It should especially be avoided by those of ill habits and those who are inclined to an excess of fat.

The best way to prepare chocolate for persons of delicate habits, or valetudinarians, is to boil it in water, and allow it to grow cold; then to take off the fat which forms on the surface, to reboil the chocolate, and to pour it on cream and sugar—made in this manner, it is much lighter and more generally agrees with weak stomachs, than when prepared in any other.

Some persons with very weak digestion, make use advantageously of the shells of the cocoa, boiled in milk, or even in water, if a still lighter beverage be wanted.

From the American Farmer.

ON PACKING ACORNS FOR TRANSPORTATION.

MR SMITH—I take the liberty of proposing to you, the publication of the following addition to a piece signed "Jesse Bud," in the American Farmer of the present year, No. 26, page 208, the necessity of which, that gentleman probably overlooked. It is, that in order to secure the growing of acorns sent abroad, they ought to be packed in sand, moss, or any other substance likely to keep them from drying, and this ought to be done very soon, say within two or three weeks, at farthest, after they have been gathered. Without this precaution, not ten in a thousand will vegetate. This

is the case with many other kinds of seed, such as chestnuts, walnuts, and other oily nuts. For want of attention to this object, the kind intentions of many persons are very frequently defeated.

Yours, with respect,

N. H.

ELASTICITY OF FEATHERS.

The elasticity of feathers was well illustrated by an experiment lately performed in the library of the Royal Institution, London, of immersing feathers, rumpled and bent in almost every direction, in boiling water, and on withdrawing them they were seen to have resumed their regular and natural form. This was accidentally discovered by a specimen of a foreign bird, the plumage of which had been very much rumpled, falling into some hot water, which restored it; and the process appears to be one that may prove of much advantage to the preservers of those beautiful animals.—*Southern Agriculturalist.*

DISEASES OF POULTRY.

From a series of observations made on the diseases of domestic poultry, Mr Flourous makes the following conclusions:—

1. In these animals, cold exercises a constant and determinate action on the lungs.
2. The effect of this action is the more rapid and more severe, the younger the animal is.
3. When cold does not cause acute and speedily fatal inflammation of the lungs, it produces a chronic inflammation, which is pulmonary consumption itself.
4. Heat always prevents the attack of pulmonary consumption; when the latter has taken place, heat suspends its progress, and even some times arrests it entirely and effects a complete cure.
5. Pulmonary consumption is never, in any stage, contagious; fowls affected with that disease were not only all day long with the healthy fowls, but at night roosted in the same places, without communicating their disease to them.
6. Lastly. The action of too long confined air exposes these animals to abscesses of the cornea, and inflammation of the ball of the eye. These abscesses and inflammations are also caused in a still more cruel manner, by cold, especially when accompanied with moisture.—*Annales des Sciences Naturelles.*

Prevention of the Mildew on Peach and Nectarine Trees.—The following preventative of mildew on peach and nectarine trees, has simplicity, as well as the experience of many years, to recommend it: Take of sulphur and rain or river water, in proportion of two ounces of sulphur to every four gallons of water; put the quantity which may be required, into a copper or boiler, and let it (after it commences boiling) boil for half an hour; after which, it may be taken out, or suffered to remain until it becomes of a tepid state, when it ought to be applied to the trees by means of the garden engine or syringe, as in a common washing with water. The time for applying it, annually, as soon as the fruit is set and considered out of danger.—*Gardener's Magazine.*

He that bath a trade bath an estate; and he that bath a calling bath a place of profit and honor. A ploughman on his legs is higher than a gentleman on his knees.

If you do not hear reason, she will surely rap your knuckles.

Rather go to bed supperless than rise in debt.

HORTICULTURE.

The following extracts, on the subject of Horticulture, were embraced in a letter which appeared some time since in the New York Farmer, from Mr Alexander Walsh of Lansingburg, to the corresponding secretary of the Albany Horticultural Society, acknowledging the honor conferred upon him, by constituting him one of its committee of correspondence:

"The knowledge acquired by individual horticulturists in our country, is undoubtedly considerable. There is, however, wanting a combination of action and correspondence of sentiment, so essentially necessary to general intelligence and utility. It is not only the highly cultivated mind that can bestow interest on the subject; we are all laborers in the great garden in which wisdom, more than human, has placed us; the humblest digger in it may possibly add something, although but a mite, towards the maturing of nature's plan, the perfection of a science indispensable to human happiness, so supremely that professions claiming superiority, are in many respects, dependent on it. The healing art owes no small share of its power, to the laborious research of the botanist; the gardener and farmer are the pioneers of the mineralogist; the sacred desk finds, in the reflections that arise in the cultivation of the earth, materials to enforce and elucidate sacred truths.

"The portion of knowledge conferred on the brute creation, as necessary to their support, was given at once, and admits of no improvement. The house of the beaver has undergone no change in its architecture; it is now, as at first, unchanged in shape, size, or convenience. Man alone has the capacity to improve and to alter everything, so as to suit every change and purpose. The capability to improve is then worthy of man's special regard, and is more particularly the concern of those engaged in the raising of plants and the sowing of seeds; for these pursuits are not only the most natural, but also the most necessary.

"Our country is comparatively new, its resources and capabilities but imperfectly explored or unknown; even the immediate tiller of the soil knows not the wealth that its surface produces, or is capable to sustain. For this there is a remedy within our reach, and it is worthy of the citizen and the philanthropist to apply it.

"It will not derogate from us as a nation, to take lessons from other countries, where there is ought worthy our imitation or adoption which we are unacquainted, or which we have not practised; it will do us honor if we come up to them in skill; it would be still more to our honor, should we outstrip them by our improvements.

"The Horticultural Society of London is a remarkable instance of industry and intelligence. The British people, on other occasions, sufficiently tenacious of personal rank and distinctions, have on this, submitted to the equality which nature recognises; rank, wealth, and talent, the lord, the mechanic, and the laborer, unitedly, constitute more than three thousand members. By their members and agents, almost every portion of the globe contributes to increase the stock of plants and seeds; these are cultivated in the grounds of the Society and distributed throughout the island and the colonies, and with an honorable liberality, sent into various foreign nations; our own partaking of this noble generosity. While we should be grateful for such and all similar kindness, it is sufficiently evident that the benefit to be thus derived, must continue too limited for our wants and too slow in its progress. We must set ourselves to

work at home, if we would arrive at any extensive degree of usefulness.

"The cultivation of indigenous plants, deserves a first place in the consideration of every people. The principle applies forcibly to our country, where, owing to its great extent, variety of climate and general fertility, the diversity of products is so extensive. The great facility of communication daily on the increase, removes every difficulty that nature would oppose to the transmission of plants, flowers and seeds, to any of our horticultural societies, where a scientific examination of their quality, or a practical experiment of their growth and produce, could best decide on their value and the propriety of recommending their general cultivation. This should not, however, be acted on to the exclusion of exotics, few of which of any country would not find a congenial soil and climate in the United States. No country has an opportunity equal to ours, for collecting valuable exotics at so cheap a rate; our commerce is co-extensive with every sea; our merchants are so intelligent and enterprising, that no port or haven is left unvisited by their ships.

"What multitudes of sources have we to transplant to our country, whatever is valuable in other climes? Every merchant should be united to our associations, every commander of a sea vessel, whether national or private, and be an actual honorary member of our societies; through them, in a few years, could be collected such a variety of exotic plants, vegetables, flowers, fruit, and seeds, as no one nation ever owned; and that no nation but ours is capable of collecting and naturalizing. Horticulture and Botany should in some degree enter into the education of children, in all our primary schools; where practicable, small allotments of land should be attached, that boys might have practical illustrations of the theory. By parceling the ground among the young students, and holding out premiums for superior cultivation and produce, a most useful rivalry might be excited. One or two hours thus daily occupied, would soon tend to the promotion and preservation of health, and usefully relieve the tedium of unvarying application to letters.

"Every college and extensive seminary should have its professorship of agriculture, horticulture, and botany, with its garden for practical illustrations and experiments.

"Among our periodical literature, we have the New York, New England and the Genesee Farmers, and the Southern Agriculturist; all of which are doing much towards increasing a taste for the cultivation of the soil, but their circulation is too limited, and measures should be taken to have them better known; our horticultural and agricultural societies ought to pay part of their premiums in these valuable publications.

"To complete the great scheme of improvement, an annual convention to consist of County delegates, should be held alternately in each of the four great districts of our State; it would be in the power of such an assembly to provide for a State school, where horticulture in all its departments, would be taught theoretically and practically.

"Out of such a system a taste for the useful and the ornamental would gradually grow, until not only the gardener and farmer, the professional florist and the nurseryman, but even those, who like the writer of this, are engaged in different pursuits, would become from choice, or perhaps,

because it was the fashion, gardeners and botanists; until every dwelling would have its garden, its parterre, and its nursery; until our country would present but one general scene of all that would be agreeable to the taste, or fascinating to the eye."

DOMESTIC ARCHITECTURE.

We annex a part of an article from the New England Magazine, which is worthy of the consideration of our friends in the country.

Our houses are too large for comfort, convenience, or beauty. The consequence of erecting them of such dimensions is, often, that they remain unfinished and incomplete; and, instead of the neat rural villa, which almost every farmer might own and enjoy, we see huge houses, the original cost of erecting which, too often, has entailed upon its tenant a load of debt, which he can never remove during his life; and he lives on toiling to keep down the accumulating interest of the money thus expended, for what he cannot enjoy; with a consciousness every year, that his chance of redemption is becoming less, and that his children must, ere long, yield their paternal acres to some stranger, who will enter to enjoy it, if he can, the mansion for which the tenant has sacrificed the best years of his life and the best hopes of his family.

This weakness is, if we mistake not, a peculiarity of New England and New England men. We should look in vain for such an idle expenditure of money, among the thrifty descendants of the Dutch and Germans, in New York or Pennsylvania. They understand those things better. Whatever they expend in the way of buildings, is put to actual use. They have large barns and large granaries, because they can fill them, and if they know not the luxury of a fine house, they know the comfort of a full and warm one; and never think, while thus enjoying ease and competence, of voluntarily becoming the tenants of a gripping landlord, and paying rent in the form of interest, for money expended in enlarging their dwelling houses, and contracting their means of enjoyment.

It has so often been our misfortune to trace the progress of a farmer or a mechanic, who has, indiscreetly, run into debt to build or purchase a large house than he has had occasion to put into actual use, that we can almost infallibly tell at the first sight, the precise stage of his career of ruin. Here might very easily be formed a pretty accurate scale, by which we could determine the condition of a stranger by the external marks, that meet the eye of a traveller while passing by his dwelling house. If we see a large house, with here and there a tattered garment to supply the places of broken panes of glass, we expect soon to see the shingles and clapboards loose, the doors with broken hinges, the fences broken down or carried away for fuel; and we soon look for the last step in his downward scale, a sheriff's flag hanging from the premises, to tell the passers-by that the tenant's equity of redemption in those premises, is about to be sold to pay a store debt or settle a tavern score. We might point out, too, the marks of this progress of poverty, with the doors of such an estate; but, the dwelling soon becomes too desolate, and the wife and children too strongly marked with the seal which ruin has set upon them, to make such a spectacle anything but painful and melancholy.

Let no man imagine that this is a fancied picture. It may be seen in almost every town in New

England. Go with us to the registry of deeds of any county in Massachusetts, and, we doubt not, we can point to instances, in every volume of its records, of mortgages of estates made to secure the payment of money, horror to renew or enlarge the buildings on those estates, and where the whole has been forfeited by the borrower, who, otherwise, might have been the independent tenant of the acres he had purchased or inherited.—Of the propensity to which we have referred, though it is the besetting weakness of our men of moderate fortunes, it is difficult to trace the origin or the cause of this general proclivity. We are willing to ascribe it to honorable and praiseworthy considerations, but we think them unfortunate and indiscreet.

There is a feeling of independence and of republican equality among our citizens, which, if properly directed, makes them the best citizens in the world; but which, if misapplied, makes them the veriest slaves. And this feeling may be traced in the style of our farm houses, as well as in objects of luxury or convenience. No man is willing to be outdone, if he can avoid it, by his neighbor. In the consciousness of acknowledged equality, he cannot bear, with patience, to be surpassed in the *externals* of style or independence. Instead of converting this feeling into an incentive to greater exertions, gradually to attain an actual equality with his more fortunate neighbors in wealth and the means of display, too many begin with assuming the appearance of this equality which they cannot sustain, and thereby take a load upon themselves that sinks them to the dust. Fashion in this thing is a tyrant, to whom they blindly submit, even with all their high notions of independence which spurn every appearance of control. They are dazzled by the hugeness of the idol they worship, and lie down to be crushed by the wheels of his car, the willing victims of their own idolatry. We have, again and again, seen families of limited means, forego the very necessities of life in order to keep up the appearance of being able to enjoy its luxuries, and this, because they were unwilling to be seen inferior to those with whom they have been accustomed to associate in life.

The folly of an individual who has blundered into a fortune, or acquired it at the sacrifice of all pretensions to taste and refinement, often operates in this way to the lasting injury of a country village. His extravagance gives a tone to the fashion of the place; and the dimensions of his house, as well as his style of expenditure, become a sort of standard for others; and many is the village we could name, where a false style has thus been introduced in the construction of their dwelling houses, in which comfort, and fitness, and neatness have been sacrificed to a false and ill-grounded jealousy or pride. The active capital that gives life to business, is hereby absorbed or withdrawn from general use, by being thus converted into what cannot be profitably improved; and how often, where we see the marks of dilapidation and decay in a village, may be traced to an injudicious and misapplied expenditure of the wealth of its inhabitants in idle and useless show.

We might dwell upon this part of our subject, and show by abundant examples, how this foolish fashion of extravagance in building houses, which prevails in New England, tends to private suffering and to public loss. But enough has been said, and the observation of every one would, of itself,

be sufficient to illustrate the truth of the proverb, that "fools build houses, and wise men live in them."

From the Genesee Farmer.

THE SWEET POTATO.

The sweet potato was successfully cultivated perhaps more than thirty years ago, by SAMUEL FALKENBERG, of Romulus, Seneca county.—The only difficulty he found, was in preserving the "slips" through the winter; and when these perished, in procuring others from the south, in time for planting. Since those days, however, the facilities of intercourse with distant places, have greatly increased.

I had long wished to cultivate this plant, but had failed in some attempts to procure the seed. Most unexpectedly, last spring, G. T. of Owaseo, generously sent me a supply. Without delay, I placed them in a hot-bed; and by the time the warm season was confirmed, I had sprouts in plenty for my purpose. My success has been very encouraging. On opening a hill at the request of a friend, he exclaimed, "This sight is worth five dollars! I am now satisfied that we can raise our own sweet potatoes." One weighed twenty ounces.

The soil in which these grew is not such as I prefer; and I have been much gratified with the still better success of my friend, Dr S. Mosher, of Union Springs. In his garden, one slip produced eleven pounds. The largest potato weighed two pounds ten ounces, and another two pounds six ounces. The soil is a sandy loam, which was dressed with well rotted manure in the spring.

Muck from the woods, mixed with common earth, in equal portions, forms a very light rich soil; but in this, the sweet potatoes though numerous and well shaped, were small. Unquestionably, a sandy soil is the best.

The red sweet potato is the kind we have both cultivated; but I observe that H. G. Spafford, in No. 6 of his Journal, says, "The white are the earliest and best for our climate." Again, in No. 18, he adds, "Two years' experience satisfies me that the white sweet potato is preferable for this climate and my soil. The crop here is double in quantity, and the potato no way inferior in quality." Dr McClesney prefers the red and yellow to the white; but the climate of his residence varies considerably from ours.

D. T.

From the Daily Albany Argus.

The following, from a correspondent, is a deserved tribute to the character of the respected citizen, recently elected President of the New York State Agricultural Society:—

LE RAY DE CHAUMONT.

In noticing the proceedings of the recent convention in this city, which has resulted in the formation of a State Agricultural Society, I am gratified to observe that a venerable citizen of Jefferson county, James Le Ray de Chaumont, has been elected president of the society. This selection is a sure guaranty of the future usefulness of the new Institution, for Mr Le Ray may be expected to devote himself to the duties of his station, with a zeal and experience possessed perhaps by no other individual.

The father of this gentleman, early embraced the cause of the American Revolution, and with his bosom friend, La Fayette, was among those

who at the French court gave the first impulse to public feeling, which led to the alliance of France with the United States in achieving our independence. His doors were open to all Americans; his house was the home of the American ministers, and his fortune was devoted to the cause of America, in the purchase of some of the earliest supplies of the munitions of war which came to our relief.

The early years of Mr Le Ray were spent in the society of Franklin and Adams. In the year 1785, at the age of twenty-five, he emigrated to the United States; in 1787 he became a naturalized citizen, and few have fulfilled the duties of citizenship with more fidelity.

Soon after his arrival in this country, in 1785, in the spirit of enterprise which has distinguished him through life, he conducted the first settlement of the county of Otsego. In 1799, Jefferson county became the scene of his useful labors, and all his energies have from that time been devoted to the improvement of the country. To the opening of roads, the construction of bridges, mills, and public edifices, his time and fortune were devoted with a liberal hand. Operating upon a country of great natural capability, his labors were crowned with success, and he was soon surrounded by an active and intelligent population. In 1817, two years before legislative aid was extended to county agricultural societies, the efforts of Mr Le Ray were successfully directed towards the formation of Jefferson County Agricultural Society, which, under his superintending care, as its president, has sustained itself to this day, surviving the withdrawal of legislative aid seven years. The influence of this society upon the agriculture of the county is obvious to the most casual observer. It has excited emulation among farmers in regard to modes of tillage, in the construction of fences and out-buildings, and in the selection of stock; the finest animals of the finest breeds being universally sought for; and bringing farmers into habitual intercourse with each other, it enables them to form a more just estimate of their value in the scale of society.

Universally beloved and respected by the people among whom he resides, the selection of Mr Le Ray as president of the State Society, will be hailed with delight by the county of Jefferson, and will afford an assurance of the practical usefulness of that institution.

A CITIZEN OF JEFFERSON COUNTY.

THE FLORIDAS.

Mr Audubon, the naturalist, who is pursuing his researches in the Floridas, gives a very different account of the face of that country, from his predecessors. In the Philadelphia Gazette, is an extract of a letter written by him and dated "U. S. schooner Shark, 160 miles up St John's river, bound upwards, Feb. 17, 1832," he says:—

"I have only time to say we are all well. A dreadful accident to one of our sailors, (the shooting off of his hand,) gives me an opportunity to send this to St Augustine. We have here a continuation of the poorest country on earth, with the exception I suppose, of the deserts of Arabia.—No birds; no plants that are worthy of attention. Never was a person so deceived as I have been by the accounts of the Floridas; not even a view worthy of the pencil, has yet been observed; nothing but the pine barrens, poorer and gloomier than those on the Atlantic shore of the southeast Jersey. If we shoot ten birds in a day, of the

most common sort, we look upon it as an achievement bordering on the wonderful. Not a shell have I seen since I left the St Johns. Alligators, it is true, are fully abundant; we have twentyfive or thirty, alive, on board to experiment upon.—How far we shall be able to proceed up this chocolate colored river, I do not know; but I feel as if to return to its entrance was the best occurrence that could happen. It would take about five years to inspect what I call the Floridas; and after all, the report would be, '*Alas, poor Yorick!*'"

NEW ENGLAND FARMER.

Boston, Wednesday Evening, March 28, 1832.

BUTTER.

A writer for the Genesee Farmer observes, that the quality of butter would be much improved if purchasers were willing to make a difference between a good and a bad article. "If housekeepers would attend more to the purchasing of their butter, making more difference in price according to quality, we think it would have a very good effect."

ASHES FOR SHEEP.

Mr T. Stanton, in an article published in the Genesee Farmer, says, "In consequence of the long and severe winter, my sheep, especially the last spring lambs, became diseased, cecive, and undoubtedly affected with the worm in the stomach, and were rapidly dying off. I then tried, and with complete success, giving them ashes mixed with a small portion of salt, and immediately perceived an improvement in the health of my flock. Within forty eight hours the alteration was evidently for the better; since which, I have scarcely suffered a single loss. The mixture may be one fourth salt—feed twice a week."

PINE BONGHS OR TAR FOR SHEEP.

Dr Deane observed, that "When sheep have colds and discharge mucus from the nose, good feeding, together with pine boughs given them occasionally, will cure them; or tar spread over a board, over which a little fine salt is strewn, will induce sheep to lick up the tar, and this will cure a cold."

DEAD ANIMALS.

Good meat and drink are not more necessary to health and good living, than good air. You may as well take noxious substances into your stomach as into your lungs. You will therefore please to omit a practice of some, who are more properly *cumbers* than cultivators of the soil, who hang dead lambs, cats, &c, on fruit trees, or expose them about their premises, to generate poisonous and pestilential effluvia. Rather than suffer such nuisances to annoy and defile your homestead and neighborhood, you should cover all dead animals with five or six times their weight of earth, (it mixed with about a sixth part of quick lime the better,) and the whole mass in process of time, will become excellent manure.

CLEANLINESS AND COMFORT AS REGARDS ANIMALS.

Cleanness is favorable to health, by promoting perspiration and circulation. Animals in a wild state, attend to this part of their economy themselves; but in proportion as they are cultivated, or brought under the control of man, this becomes out of their power; and to insure their subservience to his wishes, man must supply by art, this, as well as other parts of culture. Combining and

brushing stall-fed cattle and cows, is known to contribute materially to their health; though washing sheep with a view of cleaning the wool, often has a contrary effect from the length of time the wool requires to dry. This often brings on cold, and aggravates the liver complaint so incident to those animals.

COMFORT.

An animal may be well fed, lodged and cleaned, without being comfortable in every respect; and in brutes as well as men, want of comfort operates on the digestive powers. If the surface of the stall on which an ox or horse stands, deviates much from a level, he will be continually uneasy; and he will be uneasy during the night, if the surface is rough, or if a proper bed of litter is not prepared every evening for him to repose on.—The form of racks and mangers is often less commodious than it might be. A hay rack which projects forward, is bad; because the animal in drawing out the hay, is teased with the hay seeds falling into its eyes and ears; and this form, it may be added, is apt to cause the breath of the animal to ascend through its food, which must after a time render it nauseous.

The gentleman who signs "*Curiosity*," and adverts to certain eminent statesmen, who were at a loss to know the difference between "*Beef Cattle*" and "*Stores*," as used in the technical phrases of Brighton market, is informed, that the former term means cattle fattened and fitted for the slaughter house; the latter is synonymous with cattle to be kept a while on hand, or in store for milk, butter, beef, &c, as the case may be.

NEW SCIENS.

MR J. B. RUSSELL.—

DEAR SIR—When I sent the fruit scions to the Massachusetts Horticultural Society, last spring, I did not doubt but that the three old favorite and celebrated Montreal apples, were in your vicinity, having seen an account in the New England Farmer, of the exhibition of the *Fameuse* before your Society; but I was informed by Mr Curtis, last summer, that those apples were taken from this place by him, and that he was certain the other varieties had never been introduced into that part of the country. I therefore have the satisfaction of forwarding them to you, for the Society, and hope that they will prove an acquisition.—No. 1, is the Pomme Gris, our best keeping winter apple. No. 2, is the Bourassa, also a winter apple.

Yours truly, HENRY CORSE.

Montreal, March 15, 1832.

The above scions are deposited at the Horticultural Hall, and will be distributed next Saturday.

QUARTERLY REVIEW.

Lilly & Wait have just republished the 32d No. of this able work, which contains article on the following subjects: Memoirs of Madame Junot—Origin of the Latin Language and Roman People—Condition of the Laboring Classes: Wiltshire Emigrants to Canada—Results of Machinery—State and Prospects of Ireland; Irish Poetry—Times—Works of Beranger—History of English Dramatic Poetry—Tour in England, Ireland, and France, by a German Prince—Progress of Misgovernment. Published quarterly, at \$5 00 per annum.

Several communications received.

CHURN.—INQUIRY.

MR EDITOR—Having accidentally met with a churn, some years since, which was worked by means of a weight, I am desirous of knowing where they can be obtained; as, also, the opinion of those of your correspondents who may, by experience, be acquainted with their merits. From all the personal inquiries I have hitherto made on this subject, I have not been able to obtain any information whatever, respecting them. Probably, to many of your correspondents, these churns may be quite familiar; and from such, I should be obliged to be favored with a communication relative to them, through the medium of the New England Farmer. Very respectfully, yours,

A SUBSCRIBER.

Near Yonkers, N. Y. March 17, 1832.

GARDENERS' WORK.

Lettuce may be sowed in the open ground as soon as frost will permit. It may be sowed between vacant rows, intended for other plants, and pulled out for use before the other plants are large enough to be encumbered by it. Early peas cannot be planted too soon after the ground is thawed. Radishes may be sowed as soon as the seeds can be raked in. Low cabbages, cucumbers, melons, cauliflower, squashes, &c, in hot-beds, under glass, &c. Dig up vacant ground, applying manure. Dress borders, and clip edges of box. Clean, relay, or make new gravel walks. Attend to and turn over compost beds. Dress asparagus beds or make new ones, the latter part of this month or the beginning of April. Select from your cellar the best cabbages with heads, and set them in some proper place to stand for seed. Set the different kinds remote from each other, to prevent their mixing at the time of blossoming. Likewise, set some of your best cabbage stumps for early salad and greens.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At a meeting of the Massachusetts Horticultural Society, held at their hall on Saturday, the 24th inst. GEORGE RUSSELL, M. D. of Lincoln, and THOMAS WILEY of Charlestown, Mass. were admitted members of that Institution.

From the American Farmer.

LARGE PRODUCT OF A GARDEN.

MR SMITH—The following is the product of about half an acre of ground. The garden whence the produce was obtained, although comprising an acre of ground, yet the grass walks, slopes, &c, occupy at least half an acre, so that we may fairly estimate the year's crop, as being produced off the quantity of ground above mentioned.

Exclusive of carrots, radishes, cabbages or greens, lettuce, parsnips, and celery, the quantity of these not being ascertained, I gathered:—cymings, 442; cucumbers, 54; potatoes, 1110; ears of corn, 548; beets, 108; citrons, 7; green globe or cardoon artichokes, 12; green peas, 3½ bushels, being the produce of fiftyfive circles; snap beans, &c, 1 bushel and a peck; tomatoes, 1247; pods of fall peas, (green) 1219.

Having for the first time last year, tried the method of planting peas in circles, I find it to answer fully my expectations, the increase being greater than could be obtained in any other way, on the same complement of ground. J. F. B. Annapolis, Md. March 1, 1832.

Land for Sale in Milton.

A very valuable tract of Land in the centre of the town, containing about 120 acres, located on the north side of the old road leading from Boston to Taunton, and opposite to the seat of Francis Amory, Esq. consisting of mowing, tillage, fresh meadow, and wood land, well watered. It is very pleasantly situated for improvement, and is of a superior soil, well adapted to the cultivation of fruit. The above will be sold together, or in lots to suit purchasers. It is well worthy the attention of gentlemen of taste, enterprising mechanics or farmers; being near the meeting-house, and literary institution, and within eight miles of the city of Boston. The terms will be liberal, and may be known by applying to

NATHANIEL TUCKER,
SAMUEL ADAMS, or
ISAAC GULLIBER, near the premises.
Milton, March 26 6w

Valuable Farm in Brookline.

On Wednesday, the 4th of April next, at 3 o'clock, p. m. On the premises.

BY a license granted by the Court of Probate, in the county of Norfolk, the subscriber will offer for sale a public auction, forty-five sixty-fourth undivided parts (belonging to the five minor children of *Elisha Pennyman*, late of Brookline, merchant, deceased.) of that valuable Farm and premises, which was formerly owned by Gen. Isaac S. Gardner, situate in Brookline, on the road to Brighton, containing about 70 acres; of which 61 are tillage, and 9 of well watered pasturage land. The fences and buildings are in excellent order—the fruit trees numerous and very thrifty, and the land under the best cultivation. Upon the premises are a commodious Dwelling House, two Barns, one 45 by 65 feet, built about two years since; the other 36 by 50, with shed, wood-house, two wells, &c. Also, the right, title and estate of the same minors, being 45-64 undivided parts of a parcel of Land, with a Barn and Corn barn thereon, adjoining the estate of Benj. Gould, Esq. in said Brookline. This latter parcel of land will be sold on the premises on the same fourth day of April, at half-past three o'clock, 1837.

For further particulars, recourse may be had to the subscriber, on Front-street, in Boston. The terms of payment will be made convenient and advantageous to the purchaser.

CHARLES HEATH.

March 5, 1831.

N. B.—The owners of the remaining nineteen sixty-fourths of the said Farm and parcel of Land, will dispose of their shares in conjunction with the 45-64 above mentioned at the same sale.

March 28.

COOLIDGE & HASKELL, Auctioneers.

Double Dahlia Roots, etc.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a fine collection of Roots of the Double Dahlia, or Georgia, viz. Double Scarlet, Red, Dark Crimson, Dwarf Red, Dwarf pale Purple, Yellow, Naukeen, Black, Dark Purple, Curled Purple, and Buick color, at 75 cents each. Also, Tubel Roses and Anemones, 25 cents each. Large Scotch Gooseberries and Bushes, \$1 50, and in six rows of different sorts—with the greatest collection of Flower and Garden seeds. March 28.

A Stud Colt, and North Devon Bull.

A beautiful Colt, near three years old, dark Bay with black mane and tail—being the first Colt got by the celebrated Horse *Barfoot* in this country, and from a superior and large native mare—price 250 dollars.

A North Devon Bull, near 9 years old; was imported by the subscriber from England, and is a fine animal.—This breed are always in color dark red, therefore easily matched for working cattle and are quick travellers, is a sure Calf getter, in good health and condition, but from his age will be sold for \$50.

Several superior Cows from the best Imported stock, partly *Hollderness, Alderney, and Durham* short horns, have Calves, or near Calving, by the North Devon Bull; from 35 a 50 dollars. Apply to JOHN PRINCE, Jamaica Plain, March 27, 1832.

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed store, 50th North Market street, by J. B. Russell.

100 lbs. Large Mangold Wurtzel, of the very first quality. 100 lbs. French Yellow Sugar Beet, imported directly from France. 100 lbs. Ruta Baga, of the first quality, European growth; 100 lbs. large White Flat English Field Turnip; 150 lbs. Short Top Scarlet Radish, of English growth—very early, and of deep scarlet color. March 28.

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 50th North Market street, by J. B. Russell:

A fresh supply of Tall Meadow Oats Grass Seed, so valuable on thin soils for either a hay crop or for grazing. Col. TAYLOR, a distinguished farmer, says of it, "It is the hardest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It keeps possession of the ground in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and if cut before the seed ripens, its hay is as pleasant and nutritive to stock, as any grass known to me."—See also the opinion of M. PUTNEY, a most judicious farmer, in the New England Farmer, vol. vii. page 300.

Also—Lucerne Orchard Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Brown Corn, Seed Corn, &c. March 28.

New American Gardener, sixth edition.

This day published by J. B. Russell and Carter & Hemlee:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, Asparagus, &c. &c. by T. G. Fessenden, assisted by several gentlemen. Sixth edition. Price \$1 00.—This we think may be considered the most popular and practical work on Gardening, extant. March 28.

Howard's Improved Cast Iron Plough.

Just received at the Agricultural Warehouse, No. 51 and 52, North Market street—a complete assortment of Howard's Improved Cast Iron Ploughs. There was sold last season, upwards of 300 of this kind of Ploughs, which gave universal satisfaction, and are highly recommended by our best farmers, for doing the work in the best manner, and with less team than any other ploughs now in use.

Farmer Wanted.

A man with a family is wanted, to take charge of a farm in Salem, on shares, or as may be agreed on. None need apply who cannot produce good recommendations. Apply at the Farmer Office. March 28.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscat" Grape Vines, just received by the brig *Cora* from Hiss, procured for him by the Consul of the United States, resident there. He writes, "I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds."—by contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

labella; Barcelona; awbwa; Blands; instantia; Black Cape; Jack Hamburg;

3 varieties of valuable fruits, obtained from Xeres in Spain, and many other choice kinds. Orders by Mail addressed to the subscriber, or personification at his office, No. 74 Congress street, for quantity of vines from one to one hundred, will meet prompt attention. Z. COOK, Jr. Feb 12, 1832. 5t

Farmer Wanted.

WANTED, a young single man to do the work on a small place, 3 miles from Boston; no one need apply unless can produce good recommendations for his honesty and industry. Inquire at this office. 3t. March 21.

Farmer Wanted.

A steady, faithful man is wanted, to take charge of a garden and small Farm in Dorchester; take care of a horse, &c. and make himself useful on the place. An arduous would be preferred. Apply to No. 173, Washington street. March 21.

Notice to Gardeners and Nurserymen.

THIS subscriber being anxious to change his employment, wishes a person to take his place, and buy out his interest in the Garden and Nursery of Samuel Downer, Dorchester. For particulars please apply to Rufus How. 4t. Dorchester, March 17.

BRIGHTON MARKET—MONDAY, MARCH 26, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 410 Beef Cattle, 26 pair Working Oxen, 23 Cows and Calves, 175 Sheep, and 360 Swine. About 50 Beef Cattle and 160 Sheep were reported last week; 60 Beef Cattle unsold. Of the number left within a few miles of the market, 100 have been sold or driven to other markets, the remainder are included in the whole number.

PRICES. Beef Cattle—A little better prices were obtained on some qualities as will be perceived by quotations. We quote one yoke at \$6 50, and one yoke at 6 25, extra at 6, prime 5 50 a 5 75, good 5 25 a 5 50, thin 4 25 a 5.

Working Oxen.—We noticed six yoke from Shrewsbury, driven by Mr Wyman, sold at the following prices, viz. \$125, 105, 93, 82, 75, 70; also sales at 54, 57, 63, 65, 80.

Cows and Calves.—Sales at \$18, 21, 23, 27, 30 and 31.

Sheep.—We noticed the sale of about 100 at \$4 25. Swine.—In good demand; lots of 50 to 100 were taken at \$4 25 for Sows; and 5 1/2 for Barrows; at retail, 5 c. for Sows and 6 c. for Barrows.

MISCELLANY.

From the Nashville Herald.

LETTER FROM A TENNESSEE SCHOOL-MASTER.

The present winter will long be remembered on account of the intense, and hitherto unparalleled, severity of the weather. All the concentrated frosts of the key States, have been let loose upon us, and have played such fantastic tricks with our Italian atmosphere, that a Russian or a Norwegian might here have fancied himself some twenty degrees north of his accustomed latitude. We have, indeed, had winter and summer in delightful contact. One day oppressively hot; the next as cold as if the sun had been instantaneously annihilated.

What think you, courteous Bostonian, of twenty degrees below zero, here in Nashville, forty miles nearer the equator than sultry Algiers? The 25th of January was the coldest average day we ever experienced anywhere. We were nearly frozen in riding a quarter of a mile on horseback. And our juvenile grackles looked so, that we could not find in our hearts to scold them for not threading the mazes of Euclid or Euripides. By the way—Old Nick was a fool, or he would have made Job a schoolmaster; and then, if he had not triumphed, we are no conjurers.

That our winters are gradually becoming milder, and that our climate is ameliorating, we utterly disbelieve. The clearing of our dense forests will render the seasons more inclement and uncertain. Our own experience satisfies us that the cold is greater on this side of the mountains, than in the corresponding parallels of latitude along the Atlantic coast. Tennessee is most unfortunately situated. It is liable to all possible changes; to late frosts in spring and to early frosts in autumn; to blasting heats by day and to chilling damps by night; to every form and type of the torrid and frigid zones, at all times and seasons.—Nothing here ever reaches perfection. We have no good fruits; no good melons; no good sweet potatoes, (nor Irish either); no good wheat, but, mutton, fish, fowl, or venison; no good garden vegetables; no good butter, cheese, nor pumpkin pies;—nothing but cotton, tobacco, corn, whiskey, negroes and swine, and those not worth the growing. Everything degenerates in Tennessee. Doctors are made by guess, (anatomical dissection is a penitentiary offence); lawyers by magic; persons by inspiration; legislators by grog; merchants by manumission; farmers by necessity; editors and schoolmasters by St Nicholas, to do penance for the sins of their youth; mechanics are too cunning to live amongst us. We cannot naturalize a shoemaker or a tailor. We import our ploughs and saddles. We send to England or Barbary for our horses, and to Mexico for our asses, (a work of supererogation in all conscience). We get our notions from the Yankees; our fashions from travelling milliners and pedlars; our flints, clocks and nutmegs from Connecticut. Our colleges and schools are like fires kindled upon icebergs, their light is scarcely visible before they are extinguished.

All the world here is migratory, and fitful, and chaotic, like the climate. We have players, buffoons, jugglers, rope-dancers, harlequins, giants, pigmies, caravans of wild beasts, circus-riders, fiddlers, tumblers, fire-eaters, steam-doctors, picture-vendors, tooth-makers, panaceists; all sorts of

lions, stars, showmen, lecturers, teachers, and hold-ers-forth;—but they are birds of passage; they pocket our cash, and then are off by the first steamer. We are fleeced by all the charity-men, and meekness, and impudence, and craft, and knavery, and cockynism, which can muster the lucrative ability to teach this most gullible, tropical, polar, non-descript and uniformly variable territory of ours—whereof, Nashville is and ever will be the splendid, golden, august, magnificent, refined, literary, freezing and boiling tropics.

A PEDAGOGUE.

HISTORY OF GEORGIA.

The Charleston Evening Post, gives the following information on this subject:—

“The first newspaper published in Charleston was commenced in the same year that Gen. Oglethorpe established his settlement, 1732; and that its numbers contain a connected account of events in the early history of Georgia. Files of this paper were obtained by Mr Benjamin Elliot, from the descendants of Justice Lamboll, and are deposited in the Charleston Library. The first newspaper published in Georgia was established in 1763, edited by James Johnston, probably a descendant of one of the first settlers, as the first Anglo-American female born in Georgia, was named Johnston. It is worthy of remark, that at the end of the first century from the settlement of that State, the population of Georgia was double that of the population of the whole United States, at the end of the same period after the first settlement.”

The Horticultural Garden of the late Andrew Parmenter, is offered for Sale.

THE reputation of this establishment, not confined to the vicinity of New York, but is well known throughout the United States, and different parts of Europe. It is situated two miles from the city of New York, at Brooklyne, Long Island, at the junction of Jamaica and Flatbush Roads, and contains 24 acres.

The Grounds are in a very high state of cultivation, and laid out with judgment and taste. The situation is very healthy and the view very extensive, commanding the bay, the city, &c. The Garden is enclosed a pointed stone fence, and made of that is a hawthorn hedge. The Nursery contains a fine and extensive collection of Fruit, Forest, and Ornamental Trees; a splendid collection of Roses and Herbaceous Plants; the object of the late proprietor having always been to collect every new variety.

On the premises are a Dwelling House, two Laborers Houses, seven Green-houses, and a never-failing Pump, excellent water; four Green and Hot Houses, containing a rich variety of rare exotics.

The advantages to be derived by any persons who wish to engage in the occupation of Gardening, the purchase of the property, are very great; the business already secured is very extensive, and the prospect of increased encouragement is such as to warrant belief that the purchase of the property will amply pay the enterprise of the one who may engage the business.

Terms will be made known by applying to Mr. ANTHONY, on the premises.

N. B. — Any orders sent to Mrs P. will be promptly and carefully executed.

Feb. 16.

Evergreens, Silver Firs, &c.

THE subscriber being engaged in the Seed business, would be happy to receive orders for Forest Trees and Evergreens from Maine, and being agent J. B. Russell, Boston, and Prince & Sons, Fushing's, Vt. orders sent through them or otherwise, will be attended to without delay. Particular directions for taking and packing is requested.

WM. M.N.

6t

Augusta, Me. March 14.
A list of Mr Mann's prices for Evergreens, &c. can be seen at the New England Farmer office.

Stallions.

THE following Horses are for sale or to let, the ensuing season,—if not parted with, they will stand for Mares at the farm of A. Day, at Lodi, Bergen Co. New Jersey, on Newark bridge, under the care of Hosea Worthington.

PAUL KILLER—chestnut, five years old; sire, American (Belph); dam, Hyacinth, a pure thorough bred mare of the English race breed, whose pedigree is verified up to her maternal horses, more than a hundred years; his colts are remarkable for their size and tone.

NAA ARNO—blood-bay, four years old; sire, Sir Harry; dam, Hyacinth.

ALBERT'S—beautiful blood-bay; upwards of sixteen hands high; sire, Hambletonian; dam, Messenger Mare; a great trotter, and his colts large and fine, well calculated for coach-horses—for one pair of them, only 2 and 3 years old, \$400 was refused.

The above horses will stand at \$15, and the mare warranted with foal. If paid by the 1st of November, 1832, \$2.50 will be taken.

JERRY LAGBORN—cream color; sixteen hands high (five years old); sire, imported horse Lagborn; dam, a female Mare. This breed of horses has proved great travellers, and valuable as roadsters and for farming horses. — Stand at \$8, and the mare warranted with foal.—paid by the 1st of November, 1832, \$6 will be taken.

Bulls.

TWO Bulls of the imported short horned Durham breed for sale, or to let the ensuing season. Enquire of A. Day, No. 27, Nassau street, New York.
March 14, 1832.

Flooring Boards, &c.

OF Ard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr, 65, Broad street.

Ammunition.

Of the best quality, and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street, N. Y. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1

Buckthorns.

Gentlemen in want of this valuable plant for live fences, can have young quicks about 34 feet high, for \$3 per hundred, and plants 34 feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight.

March 14.

Farms to Let.

A first rate farm of about 120 acres, well proportioned in mowing, tillage and pasturing. It is capable of maintaining 30 head of cattle, and is well calculated for a Milk Farm, for which purpose it has been used a number of years. There is also one of the best orchards in the State—a good dwelling house, and three good barns. For terms apply at 56, Commercial st. 4th March 14.

Bees for Sale.

FOR Sale by Emerson Wheeler, Brighton, about a dozen Swarms of Bees in Beards Patent Hives, from 8 to 15 each, including the hives.
March 14.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the past season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If no paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 32, North Market Street.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAR-HOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. X. BOSTON, WEDNESDAY EVENING, APRIL 4, 1852. NO. 38.

ORIGINAL AGRICULTURAL ESSAYS.

CUTTING CORN STALKS.

MR FESSENDEN—I have made a small experiment the past season, to ascertain the damage, if any, that results to the corn crop, from topping the stalks in the usual way. And, influenced by the request of several individuals and the thought that, perhaps, it might lead to a better knowledge of this important branch of agriculture, (the growing of corn,) I am induced to forward the particulars to you for publication. Although I am aware that *guessing* enters largely, and perhaps necessarily, into the calculations and business of the farmer. I am also aware that experiment cannot be conducted with too much precision; indeed, that experiment to be relied on, must be conducted entirely without guessing. Therefore, I have been somewhat particular in conducting this. And lest some of your readers may be a little sceptical in regard to the result, and perhaps unwilling to allow that the course which has been pursued by our ancestors, from time immemorial, is not the best course, I will give the details; and if an apology be deemed necessary for being so very minute, I am merely say, that as the experiment seems to me so deeply to involve the interests of corn growers, it may be well to give a detailed statement of the case, so that any interested may be able to draw their own inferences. And if in your opinion, it is worthy a place in your useful Journal, or likely to promote the interest of New England Farmers, you are at liberty to publish all, or a part, as you shall think best.

For a few years past, I have not cut my corn stalks until the corn was harvested, *guessing* that it was a course preferable to the one commonly pursued in this part of the country, of topping the stalks while in a green state. But for the purpose of settling this point more clearly and with as little trouble as the case would admit, I selected, about the 5th of September, a row of corn in a field of about five acres, intending to take one that would average in quality equal to the field throughout, that I might at the same time be able to ascertain with tolerable certainty, the product of the whole field. The manure having been spread on the surface of the ground and harrowed in lengthways of the furrows, and the corn planted across the furrows, made it apparently less difficult to select an average row. On this row I cut the stalks from half the hills; beginning at one end and cutting the first hill, then leaving the next uncut, and so proceeding alternately, cutting one and leaving the next uncut, through the row. I had intended to confine the experiment to this row, but finally was led to extend it so far as to include four rows, and numbering them agreeably to the order in which they were standing in the field, this row may be called No. 2. There were ninetytwo hills in the row and the stalks were cut from forty-six hills, all of them in the manner that is here termed jointing, (i. e.) cut off between the ear and the first joint above the ear. I thought they were somewhat more ripe than is usual at the time of cutting; a few of them were nearly dry. The soil was a sandy or gravelly loam, anciently covered with pine, oak, and chesnut. In hoeing the corn

no hills were made, but some care was taken that the surface of the ground should remain as level as possible, through the season.

My estimate of the number of hills on an acre, was made in the following manner, and if I am wrong in my calculations, I shall be corrected by some of your readers:—

In an area of 200 feet square (or 40,000 square feet,) there were sixtytwo rows with fiftyfour hills in a row, making 3348 hills. This is equal to 3346 hills per acre, each hill occupying nearly 12 square feet of surface. There were about four stalks of corn in a hill. In estimating bushels, I have allowed the lawful weight of fifty-six pounds to the bushel.

At the time of harvesting, the corn was husked in the field. The forty-six hills from which the stalks had been cut, gave fortyeight and a half pounds of ears; and the forty-six hills on which the stalks had not been cut, gave sixtytwo pounds of ears. The number of ears in the two cases was about the same; those from the uncut hills were evidently the best filled out and the most hale, on a large proportion of them the kernels were so closely wedged in, as to make it difficult to bend the ear at all without breaking it. There was very little mouldy corn in either case, a few ears were gathered, mostly from the cut stalks, but the whole quantity was so small as to make it questionable whether cutting the stalks had much effect in this particular.

Both parcels were carefully laid aside in a dry chamber for about six or eight weeks, at the expiration of which time they were again weighed, and the parcel of ears from the uncut hills had lost in drying, about two per cent. more than the other; affording some evidence that the sap continued to circulate for a greater length of time, in the uncut than in the cut stalks. The uncut hills gave 42 lbs. 8 oz. dry shelled corn, equal to 11 oz. 12½ grs. per hill, or 60 bushels and 8 pounds per acre. The parcel from the cut hills gave 33 lbs. 7 oz. equal to 11 oz. 10 grs. per hill, or 47 bushels and 18 pounds per acre. Making a loss of 12 bushels and 46 pounds per acre, by cutting the stalks. Conclusive evidence, that while the sap is in circulation, nature does not assign the stalks an unprofitable office. The product of this whole row, taken together, cut and uncut hills, was equal to 53 bushels and 41 pounds per acre.

The product of row No. 3, taken by itself (containing ninetytwo hills, on one half of which the stalks were cut on the same day the others were) would not show the practice of cutting stalks quite so destructive in its effects, as that exhibited in row No. 2, its whole produce was 77 lbs. 9 oz. dry corn, equal to 55 bushels and 10 pounds per acre, or 1 bushel and 25 pounds per acre more than row No. 2.

Not satisfied with resting the experiment here, I gathered the corn on the rows Nos. 1 and 4, (i. e.) the rows each side, next adjoining No. 2 and 3, and on which none of the stalks had been cut. These rows, taken together, contained 186 hills, and their product of dry shelled corn was 171 lbs. 13 oz. equal to 14 oz. 12½ grs. per hill, or 60 bushels and 8 pounds per acre, precisely the same average yield as that part of row No. 2, on which

the stalks had not been cut; this *exact* coincidence, however, I think may be numbered among those cases which rarely happen.

The difference between the two rows on which half the stalks were cut, and the two rows on which none of the stalks were cut, was 5 bushels 3½ pounds per acre. If this difference arose from cutting half the stalks (and I know of no other reason,) then cutting the whole, would have reduced the crop 11 bushels and 21 pounds per acre, or from 60 bushels and 8 pounds to 48 bushels and 33 pounds per acre.

To recapitulate row No. 2, on which the experiment was commenced, taken by itself, is as follows, viz. 46 hills on which the stalks had *not* been cut, gave 42 lbs. 8 ozs. dry shelled corn, equal to, per acre, 60 bush. 8 lbs. 46 hills from which the stalks *had* been cut, gave 33 lbs. 7 ozs. dry shelled corn, equal to, per acre, 47 " 18 "

Loss by cutting the stalks, per acre, 12 bush. 46 lbs.

The four rows, taken together, stand as follows: Nos. 1 and 4, on which no stalks were cut, gave an average of, per acre, 60 bu. 8 lbs. No. 2 and 3, from which half the stalks were cut, gave an average of, per acre, 54 " 25½ "

Loss by cutting ½ the stalks per acre, 5 bu. 3½ lbs. on cutting all the stalks, would make a loss, equal to, per acre, 2 " 11 bu. 21 lbs.

The difference in the result of the two cases, is 1 bushel and 25 pounds per acre; or, in the two experiments (if it may be so termed,) there is an average loss by cutting the stalks, of 12 bushels 5½ pounds per acre; a loss quite equal to all the expense of hoeing and harvesting, especially when we consider that in hoeing, the labor of making hills was dispensed with.

If I had cut all the stalks and obtained a crop of fortyeight bushels to the acre, the very fact of having fortyeight bushels, would, I think, be considered by farmers generally, in this section of the country, as proof positive that the stalks were cut without injury to the crop. Or if I had gone one step farther and made large hills, at an additional expense of one dollar per acre, and thereby reduced the crop to fortyfive bushels per acre, the fortyfive bushels would be considered sufficient proof, that making hills (which, by the way, are usually made equally large and high on wet or dry land, without regard to soil or situation,) was labor well laid out. For although you occasionally give us a large corn story, swollen a little, perhaps, by *guessing* it off in baskets; yet, judging from what we see and know about raising corn, we call fortyfive bushels per acre, a good crop.

A measured bushel, from the cut hills, weighed 57 lbs. 6 ozs.—one pound less than from the *uncut*; the shrinkage being very near equal to the whole loss in weight.

If this experiment is a fair test, it seems that about twenty per cent. or one fifth part of the crop is destroyed, by cutting the stalks in the way they are usually cut. If further experiment should estab-

lish this fact, I think there are few farmers that will hesitate long in deciding which is the most valuable, one acre of corn or five acres of top stalks. But this twenty per cent. is not saved at the expense of losing the stalks, they are worth as much and I think more, all things considered, after the corn is harvested, than they are, gathered in the usual way. If after being launched up in a green state, they heat or become mouldy, (a case of frequent occurrence,) they are utterly worthless except it be for manure; I know of no animal that will eat them. But after they have once been dried by the frost and wind, a subsequent moderate degree of mouldiness, seems to be no injury.

The course which I have pursued with them, and for the present I know of no better, has been as follows: In the first place, they are cut off near the ground, and for this purpose a short scythe is found the most convenient instrument. The expense of cutting in this manner, however, is but a mere trifle, if any, more than cutting the stub stalks in the spring, and may with propriety be entered as an item of expense against the next crop, for which it is preparing the ground. After cutting, they are gathered into bunches of suitable size for binding, and three good sheaves of rye straw, if wet, will be sufficient to bind a ton. In gathering them up and laying in bunches, an active boy will do as much as a man. In this way, the whole expense of gathering, binding and loading, will not exceed 75 cents per ton. As they are very bulky, for want of barn-room, I have them stacked near the barn-yard; and I think I may safely say, that my cattle eat more pounds of stalks from an acre gathered in this way, than they would from the same acre, if gathered in the usual way. It may be objected to this, that they are not as good and nourishing as others; as to that matter, I am not able to say; but if the cattle are good judges in the case, (and I think they ought to be admitted as such,) they are quite as good and quite as nourishing, for they are eaten, apparently, with quite as good a relish. In addition to this, they are obtained without breaking off ears, or breaking down hills in hauling out, occurrences quite frequent in the other case. They also furnish more than double the quantity of bedding for the yard, an item of no small moment in the list of "creature comforts," during our cold winters. And last, though not least, they make more than double the quantity of manure, the value of which will be duly appreciated by every good farmer, without argument. It may be said that the butt stalks can be gathered after harvest, and furnish the same quantity of litter and manure as in this case; that is true; but the expense of gathering both parts in that way, from the butts being so short and inconvenient to bind, would be three times as much as it is to gather them whole.—Thus viewing the subject in various points, I think this method of managing corn stalks is much better than the old one; and that a little observation and experience will convince the most sceptical, that this branch of agriculture is not yet brought to a state of perfection, that there is yet room for improvement.

In passing through a field of corn, about the first of September, I noticed that my clothes contracted a strong smell of smut, and not being aware that I had come in contact with any smutty ears, I was led to examine a little to ascertain the cause. I found many of the corn leaves nearly

covered with rust (something similar to that observed on the stalks of English grain, preceeding a blight,) and intermingled with the rust, was an abundance of very minute blisters of smut or something which had the appearance and smell of smut. As I had never observed anything of the kind before, and smut is said to be injurious to cattle, I have thought that something of this nature might have occasioned the difference of opinion, entertained by some of your correspondents, last fall, in regard to the utility of feeding milch cows with green corn stalks. Feeding cows with smutty stalks, even if "fed to the full," would probably tend to dry them up; while feeding them plentifully with healthy stalks in a green state, would undoubtedly increase their milk.

In conclusion, I would inquire, if you can (through the columns of the Farmer) give us the detail or result of any experiment made to ascertain the damage sustained by pasturing or feeding English grain on mowing land. I think this an important subject of inquiry to every New England farmer, and submit it for the purpose of obtaining information. That good crops are sometimes gathered after feeding, is well known; but facts are wanted, which will fairly exhibit the effect of feeding those lands. Although this practice is handed down to us with the claims of ancient usage for its support, and perhaps might have been expedient in former days, yet, from some years' observation, I have little doubt that accurate experiment, particularly with English grain and young clover, will prove it to be a species of farming similar to that of topping corn stalks, and equally disastrous in its effects.

WM. CLARK, JR.

(Northampton, March, 1832.)

STONE BUILDINGS.

MR FESSENDEN—In compliance with your request, in the New England Farmer of the 7th inst. I shall offer the following remarks respecting stone buildings. The advantages of them are their great durability; their seldom wanting repairs; their greater security against fire; and their offering to the owners places of abode of greater comfort, both in cold and shot weather. Being more solid and compact than wooden houses, the inside of them is less affected by the changes of the weather, and I conceive, on that account, better calculated to protect the health of their inhabitants. In the countries where none but stone houses are used, there are various ways of erecting the same, accommodated to the nature of the materials most within reach of each particular spot, and of the pecuniary circumstances of individuals; I shall briefly state them, as follows:—

No. 1. Are houses suitable for wealthy individuals, the walls of which are raised altogether with slabs of hammered stone, from the ground to the roof; the foundations (being the walls of the cellar) built in all cases with promiscuous stones, well laid in mortar.

No. 2. Are houses, in the building of which, hammered stones are used only for a basement about two feet high, as a course next above the soil, all round the house; then for the four corners of the house, the whole height of the building, in slabs of various dimensions and so interlaid that the longest of them, say about two and one half feet, or more, should answer the purpose of binding the work together; then round the doors and round the windows, being eills, and caps, and side

stones; the main body of the walls to be raised with promiscuous stones, chosen, to be well suited for laying a face wall, and the stones to be carefully pointed between; for the beauty of such walls, it will be desirable to have the stones, as much as possible, of a uniform color.

No. 3. Are houses built as above, with slabs of stone split straight, but not hammered, and the main body of the wall built with promiscuous stones, but not suitable for a faced wall, and covered over with a rough cast of strong mortar.

No. 4. Are houses built without any slabs at all, but altogether, with promiscuous stones well chosen to lay strong work, reserving the stones of the best shape and dimensions for the corners of the building and to go round the doors and windows. If the stones should be uniform in color, they might be laid for pointing between, and if not, then the whole wall should be rough cast.

No. 5. Are buildings erected as No. 4, but with less choice for the materials and always rough cast, suitable for inferior houses and for barns.

The following remarks are applicable, equally, to all styles of houses of the foregoing denominations:—

1st. On the top of the walls are to be laid suitable plates of timber, for the roof to be framed upon.

2d. The stone work round the doors and windows must be laid in such a manner, that the door and window frames may be placed and fastened, back of the said stone work.

3d. Central division walls for the formation of the rooms may be built on piers for the support of the flooring timbers.

4th. The inside of the walls of the building may be laid carefully and even, so as to be suitable to be plastered upon, for the finishing of the rooms, which is the general method in old countries; and the plastering performed with the plaster of Paris, of a good quality and fresh burnt, which will make the handsomest and most durable work.

5th. The inside divisions for the rooms may be performed partly by walls, and partly by joist and boards, lath and plaster.

6th. On the outside of the windows, holes should be drilled in the stone for the hooks of the blinds; the holes should be a little wider at the bottom part, than out, and the iron hooks fastened by running in some melted lead.

The power of the frost is so great and the changes in winter so sudden, in our climate, that it is most essential that the whole work should be performed with mortar of the strongest kind; the best lime should be used, and coarse sand of an even grit and perfectly clean. When extra strength in the mortar is required, it may be procured by mixing with it a due proportion of iron filings, which in our days may be easily procured from the machinist's shop in every factory; this kind of mortar is very superior and desirable for pointing.

A great part of the cost of a stone building is the expense of collecting the materials; therefore, the first inquiry of the builder should be, after that kind of stone most abundant near the spot where he wishes to build. Granite is a superior stone, and if in suitable blocks and good to split, is all that a builder could wish.

Ledges of shelly stone would be very suitable; sand stone of a mild soft grit, is very desirable,

because it may be sawed by water machinery; such was the red sand stone from Connecticut river, which some years ago was much used in Boston, and which has been superseded, in some measure, by granite. Rocks of any kind, blown by gunpowder, would also answer the purpose; and in fact, any stones that will lay a strong field wall, may be made to answer a useful purpose for building with mortar, if not a handsome house, at least, a solid and lasting one.

If the materials should be collected in winter, or at any leisure time, and be handy to the spot, it is presumed that the cost of a neat and handsome stone house, would not exceed much, if any, the expense of a wooden building, when the timber and the boards are to be purchased and carted from some distance.

I have endeavored to collect, as above, the result of my observation and the reminiscence of younger days, to satisfy in some measure, as you wished, the inquiries of your friend; from practical men he could obtain more precise and minute information. A fact is evident to us all, which is, that almost all over New England, the traveller sees vast quantities of *building stone*, and almost none but *wooden buildings*. Another fact, equally certain, is, that the buildings in England, France, and I believe the whole continent of Europe, are *tiled*; we have good clay almost all over New England, and yet our buildings are almost all *shingled*.

Respectfully, yours, &c, J. M. G.
Weston, March 26, 1832.

INJURY TO FRUIT TREES.

T. G. FESSENDEN, Esq.—Noticing several communications from different sections of our country, announcing the dire effects on fruit trees, caused by the past winter, I have made it a point to examine its effects on our nurseries and on the orchards of this vicinity, and the result of these investigations has proved the injuries to be so trivial in extent, that I have thought it well to communicate the facts. Peach and apricot trees are generally deemed the most susceptible of injury by cold, but I have not seen a tree of either species, among all that are standing in our nursery rows, that is injured; and even some peach trees, the roots of which were buried in trenches last autumn, have only about a third part of the blossom buds killed, the others being green and perfect when cut open, although on the outside they have the appearance of being somewhat affected. I particularly examined the buds of apricots, which had been inserted by inoculation the past season, and found them perfectly alive and uninjured. I have seen no plum or apple trees the least injured. In regard to nectarines, the same remarks will apply as made above in regard to peaches. Cherries have in a few instances been injured at the extremities of the young shoots, where the trees are young and the growth has been rapid; but of the thousands in our grounds, I don't think there are two hundred which have been injured, and those to so small a degree as to be unimportant; and on no tree over two years from the inoculation, have I seen even a branch affected. Pears have withstood the winter remarkably well, and although we have more than forty thousand that are of two or more years' growth from the inoculation, there is not a single tree of them that is injured in the least. The only instance of any injury is about fifteen trees of one year's growth, that stand in a shady location exposed to the north,

where the wood did not become well matured. Quinces are entirely uninjured, but they appear to possess, naturally, a very hardy character. Almonds are also free from injury, except a few of the tender twigs of the more delicate species. Of the hibiscus syriacus, or the althea frutex, no varieties are affected except the double white and double deep blue, and these but partially so; and the varieties which we have originated here from seed, appear to be exceedingly hardy. But what surprises me most is the morus medicagalis, which, contrary to my expectation, has not been injured; this species, it is well known, continues to vegetate to a later period in autumn than most other trees, and it is thence to be inferred that the late formed shoots are more susceptible of injury, but even these appear to have been sufficiently matured the past season, to withstand the rigor of our winter.

I can only account for the small extent of the injury sustained by the different species of trees in our nurseries, on the ground of location; the land being mostly elevated and exposed to all winds; to those from the ocean, on the south; to those from the sound or East-river, on the north; and to those of Flushing bay, on the west. From this free and open exposure, the wood becomes more fully matured during the summer, and acquires a degree of hardihood which renders the trees more capable of supporting the rigors of winter, and when thus hardened by nature, they are found extremely eligible for removal to colder latitudes. I am therefore of opinion, that elevated situations are decidedly to be preferred for nurseries. Taking into consideration the frequent variations from the extremes of cold and warmth, which have distinguished the winter just passed, I consider it the most trying one, in its influence on trees and plants, that I have ever experienced.

Yours, respectfully,

WM. ROBERT PRINCE.

Lin. Bot. Garden, March 24, 1832.

POULTRY.

MR FESSENDEN—Allow me to make a few remarks upon poultry yards. Poultry are very profitable incumbents of a farm, but not unless considerable care is devoted to them, for if left to take care of themselves, they are the most vagrant and vexatious creatures living. Now I say, the art of keeping them to advantage consists in having for them a proper and convenient yard. In the first place it should have a pleasant southern aspect; they will not thrive in a severe exposure, for if it is placed as it frequently is, on the north side of a barn or in some cold situation, that it may not occupy a choice spot or be in the way, the poultry suffer, do not thrive, and when let out for recreation, will not return. In our severe winters, hens are sometimes frozen, and as the most profitable kind (a mixture of a small and the large English) are somewhat delicate, from not being quite hardened to our climate, care should be taken that the yard be in a warm situation, which they so much prefer, that they will lay, thrive and flourish, sufficient to repay the expense of the situation.

Next, a poultry yard should be in a dry situation, and for the simple reason that a damp and wet place is also generally cold, and fowls are fond of light and fresh air. But I would observe, that they should always have clean and fresh water, by

which a much greater number of eggs will be produced, and the fowls themselves be in better condition for eating.

Next, the yard should be large; well and high fenced, of course. The size must depend upon the discretion of the raiser; I should say, the larger the better; it would depend upon the quantity of space to spare, and the number kept. If it is large, it will admit of many conveniences which could not be afforded in a small yard—for instance, a part should be supplied with gravel, lime from old bricks, rubbish of that kind and clean shells, which fowls convert to their use. A part should be occasionally turned over with the spade, a few minutes labor, and which furnishes much food; there might be a few bushes or shrubs planted in a part, as fowls are fond, in a sultry day, of reposing in their shade, and the many insects creeping about them, serve for a ready food—all this would not require much space, though the more the better. I would say concerning the poultry house, which should open upon the yard, that the principal thing to be attended to is, that it be kept as clean as possible; or the hens will wander, if possible, and prefer the sweet scented hay-mow for their purposes. There is a double profit in keeping the house clean, as the fowls not only thrive better, lay a greater number of eggs easy to be got, but the contents when swept out, are the most useful of garden manure. The poultry house, if in a conspicuous situation, might be of a fanciful and tasteful form.

These remarks are the result of some experience, and are suggested on the consideration of the high price of eggs in the market, generally, and more especially the past winter, and of the high price of fowls, when well raised and well cooked.

W.

THE SEASON.

Extract of a letter to the Editor, dated Johnstown, N. Y. March 23, 1832.

We have had, thus far, a very severe winter with us. The snow fell here on the 21st day of November last, and the ground has not been bare since. The snow is now on an average in the wood about us, three feet deep, and the sleighing very good. A gentleman who has been careful to measure every snow that has fallen since November last, tells me that we have had more than twenty feet of snow. The thermometer in December was at eight degrees below zero; in January, at twenty-four degrees below zero; in February, at twenty degrees below zero; and in the present month of March, at sixteen degrees below zero. This will give you rather a frightful picture of the severity of our climate. Yet, the snow having fallen early, there is but little frost in the earth; and many tender plants, to wit, the polyanthus, carnation, magnolia, and China roses, in the open ground, will have escaped uninjured from the severity of the frost.

Yours, &c, T. A. STOUTENBURGH.

Fruit Trees.—The editor of the Worcester Spy says, from some observation and inquiry, there is good reason to believe, that that vicinity has almost entirely escaped the evil which seems to have fallen on other parts of the country. In many orchards and nurseries, the trees look remarkably well, and there is no reason to suppose, that, throughout the country, they have suffered more in the average, than in common seasons.

* From one part of our nursery grounds, the rocky palisades of the Hudson are plainly visible.

Horticulture.

From the Genesee Farmer.

THE ISABELLA GRAPE.

N. GOODSELL, Esq.—In your paper of the 31st of December, I notice, under the signature of "Umus," some comments on the Isabella grape, connected with a quotation from the "Treatise on Horticulture," published by my father, Mr. Wm. Prince, in 1828.

My father received the scions of this vine in 1816, from Mrs. Isabella Gibbs, lady of George Gibbs, Esq. (not Col. Gibbs,) then residing at Brooklyn on this island. That lady stated that she obtained it from North Carolina, her native State, and that it was originally brought from Dorchester, in South Carolina. It being deemed a highly valuable variety, and no similar one having been previously noticed as cultivated in the gardens of our country, my father gave it the name of "Isabella grape," after the lady from whom he received it. His impression, as well as that of every other person who then examined the fruit, derived from the fact that no such variety had been previously described, and the improbability that so valuable a fruit would, if cultivated in other gardens, have remained unnoticed, was, that no similar vine then existed under culture in any of our gardens. That opinion was (in the absence of all proof to the contrary,) entertained by myself, until the autumn of 1830, when a vine was described to me as identical with the Isabella, which had been growing for thirty-three years in a garden at Newport, Rhode Island. Some of the fruit had been presented to me, previously to the statement of the particulars relative to the vine that produced it, which I pronounced at once to be the Isabella. Being desirous to act cautiously, in every point connected with the nomenclature of our fruits, I declined commenting upon the circumstance until I should receive *proof incontrovertible*, not only as to identity, but as to the *age* of the vine. In consequence, I visited the garden the past season and examined the parent vine, together with several of its progeny, growing near it. The appearance of the old vine comports with the age awarded to it; the circumference of the main stem is ten and a half inches. It is located in a spot unpropitious to its development, being shaded by large trees that appear to correspond with it in age. I made notes of many other particulars, but I cannot at this moment find them; the investigation, however, convinced me of its identity with the Isabella grape, and I have hitherto deferred publishing the facts, only from the hope of attaining some additional light expected on the subject. The former occupant of the ground, states, that he planted the vine in 1798, and that he received it from New York. I am investigating the latter point, and the result of such investigation, as well as the contents of the notes above referred to, shall be made public hereafter; it having been the constant desire of my father and self, to shed all possible light on horticultural subjects. The inconsiderate practice of adopting foreign titles for our native productions, has already caused much inconvenience; and I hope there is no American so miserable a sycophant, as to suppose that any product of our country, can be enhanced in its value, by the application of a foreign title.

The *Wm. Prince* grape of Albany, was announced two years since in one of the publications of that

city, as having been brought from Bordeaux, when investigation has shown it to have been brought from Pennsylvania. The Troy grape is generally there called the *Hamburg*; and we are now told, that Mr. Vernet, a French gentleman, resident at Norwich, called the Isabella "*the Lisbon grape*," and that it "was supposed to have been brought by Mr. V. from France or Cuba, where he had a plantation." And these claims to foreign origin are attached to productions as strongly and indelibly marked with the characteristic distinctions of *natives*, as are the indigenous monarchs of our forests or the untutored aborigines of our wilds and prairies. But there is another circumstance that places the native origin of the Isabella, &c. beyond the reach of cavil. It is the *acknowledgment* of the fact by foreign nations themselves. Whosoever they have been introduced to other climes, they have failed to be claimed as natural productions, or even as old acquaintances. And the country of their origin has been acknowledged in the publications of their horticultural societies, and in all others I have perused, save one, which being an amusing exception, I cannot fail from adverting thereto. In a catalogue of one of the most extensive collections of grape vines in France, the Isabella is not only enumerated as one of those producing the choicest wine, but has an additional note attached, which I translate literally: "Isabella, a variety newly introduced to Europe, and which is said to afford the most excellent oriental wine; it also produces extraordinary crops."

Your correspondent, Umus, states that he does not believe the Isabella "is a native of our country, of original stock, as all the indigenous grapes," that he has "ever yet seen, possesses the same acid, hard pulp, and thick leathery skin, of the ordinary Fox or Buller grape," referring, evidently, to the varieties of *Vitis labrusca*, which are common in this State. In reply, I will simply remark, that the varieties of *Vitis aestivalis*, which are far more rarely met with in our State, but abound in Maryland and Virginia, have a much thinner skin and far less pulp; and some of the varieties of this and other species which grow abundantly further to the south, such as the Bland, Beverdam, &c. have *as thin a skin as the foreign varieties*; and the Bland, White Scuppernon, Catawba, and many others, are *devoid* of the acid, hard pulp. In regard to native grapes, there exists, perhaps, in our vineyard, at the present period, a greater number of varieties, originated from seeds we have sown, than have been obtained by a similar process in all the gardens of the Union, and the friendly tributes of our fellow-citizens, have concentrated in the collection thus formed, the natural products of every section of our country.

It may be well here to remark, that the Troy grape appears to me to approach the Isabella, in character, more nearly than any other variety that has met my notice. And in concluding these remarks, I have to state, that I fully agree with those of my fellow citizens who deem pomological investigations, as regards our natural productions, to be yet but in their infancy; and while in common with others, I tender a few crude ideas on such subjects, I view and intend them as *germs* of information, which by the investigation of more intelligent co-laborers, may attain to an ample development. Very respectfully,

WM. PRINCE.

Lin. Bot. Garden,
Flushing, N. Y. Jan. 1832.

Remarks of the Editor of the Genesee Farmer.—We are much gratified with the communication from Mr. Prince, concerning the Isabella grape, as called forth by *Umus*. From the frank and gentlemanly manner in which he communicates whatever relates to American Pomology, which comes within his knowledge, and from his untiring zeal in collecting and digesting such information, the public will receive great benefit.

As the cultivation of the grape is now becoming, not only a matter of private interest, but of national importance, tending to render us more independent of other nations, and also more temperate within ourselves; we believe that whatever relates to their history or cultivation in these United States, will be interesting to most of our readers. As the Isabella grape ranks with the best of our indigenous varieties, which, by general consent, are allowed to be superior to foreign ones for vineyards, in point of profit, its correct history is desirable, more especially as some have been disposed to consider it an exotic.

That it may have been brought into notice at some particular place, by being imported from a foreign country, we will not deny; but that its general characteristics are truly American, we have no doubt. That our native grapes were early taken to England, the following descriptions, taken from *Parkinson*, will plainly prove. The author published this work on plants, in 1640, which has been considered one of the early standard works of England. He arranges grapes under five different heads, viz.

1st. "*Vitis Vinifera*. The manured vine," (meaning the cultivated.) Under this head he enumerates many of the European grapes, which are cultivated at this time, and says, they are so variable that he cannot describe them.

2d. "*Vitis lucinatifolia*. The Parsley vine, or grape with thin cut leaves. The grapes of which are white and green, are like unto the White Muscadine grape."

3d. "*Labrusca*, or *Vitis Sylvestris Europea*. The wild vine of Europe. "The wild vine in regard to it is natural, and therefore neglected, lyeth for the most part on the ground, and thereby is made less fruitful, unless it meete with some hedge or tree, whereon it may climb, and then spreadeth as the manured, (cultivated,) being both in branches, leaves, and tendrils like unto the manured vine."

4th. "*Vitis Sylvestris Virginiana*. The wild vine of Virginia. "This one sort of vines of Virginia, like all other wild sorts, runneth on the ground and taketh hold of whatsoever it meeteth with, being in all things like the former wild sorts, but that the grapes are small and white, and with little sappe or juyce in them, and the kernel twice as bigge as others. There is another sort that hath bigger blew grapes, and sower in taste. A third they call the Fox grape, and hath a regged bark, a very broad leaf, without any division almost, but dented, and the grape is white, but smelleth and tasteth like unto a foxe."

5th. "*Vitis Sylvestris trifolia Canadensis*. The wild vine of Canada. "This wild vine of Canada groweth like unto other wild vines of those parts, with slender reddish branches, climbing where it can get whereon; but the leaves on them being little more than half so large as the manured vine, hath only three partitions in every leaf, but each cut is deepe, even to the long smooth stalk whereon they stand, making them seeme as three

leaves, which are of a dark green colour, and somewhat thicker also, the fruit is like the other wild sorts, having more skin and kernel than substance or juice."

Thus it appears that Parkinson enumerated four different species of American grapes, which had been introduced into England at that time, corresponding with the number of species as laid down by Mr. Prince, in his Treatise on the Vine. Is it not possible that the Isabella was among those, enumerated by Parkinson?

DAMAGE TO FRUIT TREES.

In another part of this paper we have inserted a letter from John Lowell, Esq. in relation to the damage which fruit trees have sustained during the winter just passed. We have been led to make particular examination of the orchards and nurseries in this vicinity, and have ascertained to our great regret, that our neighbors have suffered in a similar manner. Of twenty-eight twigs, cut indiscriminately, from four different nurseries, from the apple, pear, peach, cherry, and quince, twenty were killed. The bark on some trees, several inches in diameter, appears to be killed nearly or quite to the ground. When cut open with a penknife, it appears of a dark color and nearly rotten. The growth of last year has been most injured. We cannot but hope, that trees which grew but slowly, having short shoots which usually bear blossoms, may have escaped the general destruction, and will yet give us some fruit.

The causes of this great calamity—for it is estimated that millions of money will not repair it—have been hinted at. Last year was one which produced an abundant growth of every kind of vegetable matter. Trees grew with an astonishing rapidity; and they grew tenderly. The cold winter came suddenly and severely, and found the trees filled with sap. They froze and burst the vessels containing the sap, which is supposed to have killed the trees.—*Concord Gazette*.

MICE IN THE MEADOWS.

We are told, the short-tailed field mouse, has made destructive ravages in the meadows. Whole acres are ploughed up, the roots of the grass destroyed; and the trees, wherever there happen to be any, are divested of their bark in a most workman-like manner. In consequence of the snow falling before the soil froze, they formed habitations above ground and have multiplied in prodigious numbers during the past winter, in proportion as three to one in ordinary seasons. These mice are usually food for foxes, the weasel, the long-tailed mouse, and often, when provision is scarce, eat each other with avidity. They are often most destructive to fields and fruit trees, cutting up everything around them, existing in such prodigious numbers as to defy all possible precautions. Should the meadows not be inundated this spring, and the mass of them drowned, we fear their ravages will be seriously felt by our frugal husbandmen, the ensuing summer.—*Northampton Gazette*.

THE CHOLERA.

The following article, which we extract from a late number of the Boston Medical and Surgical Journal, would seem to indicate that a disease, very nearly approaching the Indian Cholera, formerly existed in New England.

"In the history of disease in this country, we

recollect but one that appears to bear any analogy, either in its general mode of attack, its great fatality, or the means most clearly indicated in its treatment, to the present Cholera of Europe.—The disease to which we refer, is the *spotted fever*, which prevailed in the State of Maine in the year 1811. Its symptoms were more various than those of the cholera, and its fatal issue was not quite so speedy. But the attack consisted in the main, in a sudden departure of the blood from the surface, and an appalling prostration of the powers of life. Having been an eye-witness to this epidemic, it has been recalled to our mind by every history we have read of the symptoms of cholera. We have seen persons in the fullness of health, suddenly fall under its blow, apparently lifeless; and the sudden and obstinate coldness of the surface, in all cases, gained for the disease the popular name of the *cold plague*. In no disease have we seen so marked effects, from different modes of treatment. Purgatives and venesection were generally followed by fatal results; where calomel was given, the unhappy sufferer often died whilst under its operation; and in spite of most forms of treatment, its ravages were unparalleled in that part of the country. It was at length discovered that a treatment, from the first, most phlogistic—stimulants internally and externally, with an unsparring hand—exerted an entire control over the disease. This practice was pursued with marked and almost uniform success, by Dr. Page of Hallowell, by that man of Ross, whose benevolence will never be forgotten by the hundreds of his townsmen, to whom it has ever been liberally extended. In the small town of Wiscasset, containing about two thousand inhabitants, 2 or 3 (equal to sixty a day in Boston), were dying daily of this epidemic, until Dr. P. was persuaded to visit the place; and after the day he entered the town and introduced the mode of treatment, that had been so successful at home, not an individual died of this disease."

Hints respecting the Cholera; with directions which may be most safely followed, when medical aid is not immediately to be obtained.—As it is easier to prevent than to cure this dangerous disease, the following cautions should be observed. Great moderation in diet and in the use of fermented and spirituous liquors. Raw vegetables and unripe fruit should be carefully avoided. The state of the skin should be particularly attended to, so that perspiration should not be checked suddenly. The feet should be kept dry and warm. Flannel should be worn next to the skin, or at least a flannel bandage round the body. The utmost personal cleanliness should be maintained by frequent washing. Every room in the house should be ventilated by opening the doors and windows frequently, in the day-time. Gentle exercise in the open air is highly useful to preserve the general health of persons, who may be exposed to the risk of infection.

When the patient is seized with the disorder, he complains first of giddiness and nervous agitation, and is extremely feeble. His features become sharp and contracted, his lips, face, neck, hands and feet, blue. The fingers and toes are contracted. The pulse is so small as to be almost extinct. The skin is deadly cold and shrivelled; the voice nearly gone; breathing quick, the patient speaks in a whisper; suffers cramps in his limbs and body. The urine is totally suspended. He

vomits and purges a liquid like rice water or whey.

A person so seized should have his feet put into hot water immediately. He should be wrapped in hot blankets; and friction all over his body, with camphorated spirits and hot flannels, should be used. Poultices of flour of mustard and linseed meal, in equal parts, mixed with warm water, should be applied to his stomach. He should drink hot brandy and water, or hot water with a tea spoonful of sal-volatile, or with ten drops of oil of peppermint and some sugar in it. In case of his complaining of much pain, from twenty to thirty drops of laudanum may be given—but medical assistance should be obtained as soon as possible. It is important to add, that when the patient shivers or the sheets of his bed are changed, which should be done as frequently as possible, the dirty linen should be plunged immediately into a tub of cold water.—*British Almanack for 1832*.

ONONDAGA SALT SPRINGS.

The annual report of the superintendent of the salt springs, and the inspector of the salt in the town of Salina, has been communicated to both houses of the New York Legislature.

It appears by the report, that during the year 1831, there were 1,514,637 bushels of salt inspected in the town of Salina; 189,000 bushels of which was coarse salt; 166,000 having been made by solar evaporation, and the residue by solar heat and artificial heat combined.

The number of manufactories of salt by artificial heat, in that town, is 135; containing 3,676 kettles. The manufactories making salt by solar heat or evaporation are, the Onondaga salt company, the Syracuse salt company, and Henry Gifford's works; in all, consisting of 1,303,634 superficial feet of lots.—*Albany Argus*.

The American Rail-Road Journal, published in New York, gives the honor of the invention of rail-roads, to Col. J. Stevens, of Hoboken, N. J. In May, 1812, twenty years ago, Col. Stevens published a pamphlet, strenuously recommending a rail-way from the Hudson to Lake Erie, instead of the canal which was then under discussion.—In this pamphlet, Col. Stevens proposed the employment of steam power to propel cars or carriages, and made the following singularly prophetic statement: "I should not be surprised at seeing steam carriages propelled at the rate of 40 or 50 miles the hour." But at that time, (1812,) Col. Stevens was in advance of the age, and such enlightened men as Governor Morris, Robert L. Livingston, and De Witt Clinton, considered the project as visionary.

Cotton, to the amount of about £2,000,000, is annually imported into Providence, and manufactured into cloth, which sells for about seven millions of dollars.

Bronzing.—The following method, which is simple, may be useful to some of our readers:—

"After having covered the article with a coat of gum-water, mixed with a little minium, take a little isinglass, dissolved in spirits of wine by exposing them to a gentle heat, and add to it some saffron; then take the filings or fine dust of any metal which it is desired to imitate, and apply this, when mixed with the isinglass, to the article with a hair pencil."

NEW ENGLAND FARMER.

Boston, Wednesday Evening, April 4, 1832.

FARMER'S SPRING WORK.

Working Ovens.—It has been said, that laboring cattle will perform their spring work with much more energy and alacrity, if they are fed two or three times a day, with a few ears of Indian corn. Some, however, prefer giving them small quantities of raw potatoes, which are said to be more cooling than corn, and to answer the purpose of physic as well as that of food. Perhaps it may be well to change their diet occasionally, from the roots to the grain; and these, with regular meals of good English hay, will, in ordinary cases, keep their animal mechanism in good repair, and render them as active and powerful, or thereabouts, as steam carriages running on a rail-road.

Pasture for Swine.—A lot well seeded with clover is an elysian field for swine, and will fit them for the butcher much quicker than you could qualify a dull boy for college. Besides, if the ugly but useful creatures are accommodated with a puddle and a clover patch, together with the fee simple of a snug and dry dormitory, in which they may enjoy their nap after dinner, like other epicures, they will be as quiet as lambs and as fat as aldermen, and will need but little more waiting on than if they were already in the pork barrel, well saturated with rock salt of prime quality. But you must not allow them all these privileges, without depriving them of the natural right of rooting, otherwise they will be as much out of place in a pasture as a pig in a parlor, or a bad man in office. A few sweet apple trees in a pig pasture, will add utility to ornament, and prove auxiliary to other means of bringing forward its animal products. Swine, however, should not become "spigs in clover," till about the first of May, that the grass may have a little time to get the start of their voracity.

Top Dressing.—Lime, air slacked and well pulverized, is said to be useful as a top dressing in spring, for winter grain. Ashes, too, either leached or dry, are very usefully applied about this time, to grain or grass. Dry unleached ashes are best for manure, but leached ashes, particularly soap's waste, which has lime mixed with it, are of use to accelerate and strengthen useful vegetation.

Drilling Potatoes.—We do not insist on the cultivator's planting his potatoes in the drill method, especially if his land is rough, strong, or hard to cultivate. In such case the old method of planting in hills should doubtless be preferred. But in a rich mellow soil, the drill method is much the most advantageous. Dr Deane observed, as follows: "One of my neighbors planted in his garden, drills, and rows of hills, alternately, of equal length and equally manured: when he dug them he found the drill rows produced twice as much as the others. It is not more labor to lay the dung in drills than in hills, and the labor of hoeing is but little increased."

A British writer says, "The potatoes for seed should be kept in a separate pit, which should never be opened until the time when the potatoes are to be planted, for if vegetation commences previous to that time, it is apt to cause the curl. The sets should be placed about a foot distant from each other. Many crops are spoiled from being

planted too deep in the ground. This ought to be avoided.

The best time to plant potatoes for winter's use, feeding stock, &c, is about the middle of May to the first of June; but it is good economy, generally speaking, to plant an early sort in early ground to feed hogs before Indian corn is ripe, as soon as the ground is thawed in the spring.

TREES.

MR EDITOR.—As the season to transplant fruit trees is fast approaching, I have thought I might be doing some good, to communicate to the public the following facts, and leave each one to draw his own inferences.

In 1824, I procured some hundreds of apple, pear, plum, cherry and peach trees, from France, Long Island, N. Y., and Sherburne and Newton, Mass. These trees were all set out on my farm, in the vicinity of Boston. The first and second seasons after transplanting, I perceived that the New York apple, and the French apple, pear, peach and plum, did not do so well as the New-Englanders. My French cherry did well. The New York pear, peach, cherry and plum, have now grown pretty well. The French apple, pear and peach, and the New York apple, I pulled up the last season, and threw them on my wood pile.

O. G.

Fruit buds, &c. destroyed in the State of New York.—Mr David Thomas, in a communication written for the Gen. sec Farmer, states as follows:

"In my fruit garden, I have examined more than a hundred blossom buds, of the peach, the nectarine, and the apricot, and have invariably found the petals, stamina and pistels, discolored and dead. Of course we are not to expect the trees to exhibit blossoms this season.

"The destruction is not to be ascribed to any unusual severity of winter, but to the buds being started by the mild weather of last autumn. At that time, I observed several bulbous plants in flower, which commonly continue dormant till spring; and the peach buds are now found to be so large, that a few more days of warm weather at that time, would probably have brought them into full blossom."

To Restore the Germinating Power of Seeds.—The fact deserves to be extensively known, however torpid a seed may be, and destitute of all power to vegetate in any other substance, if steeped in a diluted solution of oxygenated muriatic acid, at a temperature of 46° or 48° of Fahrenheit, provided it still possesses its principle of vitality, it will germinate in a few hours. And if, after this, it be planted, as it ought to be, in its appropriate soil, it will grow with as much speed and vigor, as if it had evinced no torpidity whatever. —*Good's Book of Nature.*

ISABELLA GRAPES.

We have been favored by Mr. James Hunewell of Charlestown, with a box of Isabella Grapes in the finest order, which had been packed down in dry sawdust since last October, thus affording evidence that this delicious fruit, if properly taken care of, can be kept till the last of March. They should be spread upon a floor immediately after being picked in October, and dried moderately, before being packed. Mr. H. raised about 4½ bushels from one vine, of which he packed down a tea chest full, very few of which were spoiled.

PRIZE CATTLE IN ENGLAND.

A meeting of the Smithfield Prize Cattle Club, was held at the Crown and Anchor Tavern, in London, on the 22d of December last; Lord Althorp, one of the members of the present British cabinet, in the chair.

The attendance, according to the London papers, was much greater than usual, as the club had intimated their intention of presenting Lord Althorp with a splendid piece of plate, for his exertions to promote the interests of agriculture. After the removal of the cloth and the routine toasts, Lord Althorp was presented with the piece of plate, which was valued at 200 guineas, (£32 dollars.) His Lordship in returning thanks, expressed his acknowledgments. As this was a meeting to promote the purposes of science, he expressed his hopes that politics would not be entered upon. His Lordship then proposed the health of the Duke of Richmond, (P. M. general), the new member of the Club. The Duke of Richmond returned thanks in a short speech. He felt great pleasure in becoming a member of the Club, which he considered calculated to promote the interests of agriculture. The health of the noble chairman was drank, and his Lordship proceeded to distribute the prizes awarded by the judges for the cattle, &c, exhibited at the last show. Among the prizes awarded, we perceive the following:—

A prize of 20 sovereigns, in Class I., to Earl Brownlow, for his 4 years and 7 months old, Durham Ox, bred by his Lordship; a silver medal as the breeder of the same; and a gold medal for the best beast shown.

Prize of 15 sovereigns, in Class V., to Lord Althorp, for his 7 years and 3 months old, Durham Cow, bred by L. Spencer; and a silver medal, as the breeder, to the Earl.

First prize of 10 sovereigns, in Class VII., to Mr W. Pawlett, for his three, 20 months old, Leicester wethers; and a silver medal, as the breeder.

Second prize of 5 sovereigns, in Class VII., to Lord Althorp, for his three, 21 months old, Leicester wethers, bred by him.

First prize of 10 sovereigns, in Class IX., to Sir P. H. Dyke, for his three, 20 months old, South Down, bred by him, who received a silver medal, as the breeder.

TO CORRESPONDENTS.

We are under great obligations to Mr Clark for his communication, commencing on the first page of this day's paper. Theorists have supposed, and practical men have asserted, that Farmers often are losers to a considerable amount, in consequence of cutting the stalks of Indian corn at too early a period; but nobody had, so far as we have learned, attempted to form any estimate of the amount of injury resulting from the practice, before Mr. Clark instituted his exact and conclusive experiments.

J. M. G. has, as usual, furnished facts worth knowing, and merits the thanks of all who feel a due regard to those accommodations which compose the *real* property, and constitute the *stable* interests of the Commonwealth.

We are under obligations to "*Rusticus*," for another elaborate attempt to rectify certain proceedings with regard to "*Horticultural Premiums*," but it seems to us the subject has been sufficiently canvassed. At any rate, three sheets of letter paper, closely written on, contain more matter than we can find room to display in our columns, unless the topics possess more interest, than is attached to the controversy as it now stands.

We have other favors from correspondents, which though necessarily deferred, are not forgotten.

The full blooded Horse Sportsman.

THE Subscriber has secured the full-blooded horse Sportsman, to stand the ensuing season at the "Ten Hills Stock Farm," commencing April 10th, and ending August 10th.

Terms—One Dollar to the Groom, and ten dollars for the season—cash, or a note on demand, or fifteen dollars to ensure a mare in foal, by a conditional note at eleven months.

Good keeping for mares, at one dollar per week, at the risk of the owners.

Sportsman is not surprised for spirits, and has as good strains of blood, as any horse in this country. His dam was a direct descendant from the best blood in England, his sire, the full-blooded imported Arabian Horse—"Bussorah." It is with these strains of blood that England has bid defiance to the world on the turf and in the field, for more than a century past.

Sportsman's get are very promising, and may be seen on the farm.

Satisfactory proof of the pedigree of this horse as given below, is in my possession.

PEDIGREE.

Sportsman was foaled in 1823, the property of the late Gen. Coles of Dorset, Long Island, and sired by the "Bussorah Arabian," out of Sports-mistress by Hickory, her dam the famous racing mare Miller's Damsel (the dam also of American Eclipse) by Messinger Grand Dam, the imported Potos mare, G. G. dam by Gin crack, &c.

Hickory was by Whip, his dam, Dido by Dave Devil, G. G. dam by Wildair, G. G. dam by Clockfast, G. G. G. dam the dam of the celebrated Virginia, "Bucephalus and Lady Teazle."

"Messinger" by "Mambriao," Dam by Turf, G. G. dam by Regulus, G. G. dam by Starling, Fox, Bay Bolton, Duke of Ancaster's Turf, Byerly Turk, Tafflet Barb, Place's white Turk, Native barb mare, Potos mare by Eclipse, Dam Sports-mistress, by Warren's Sportsman, G. G. dam Golden Locks by Oronoko, Pantan's Crab, Partner, &c. See 1st and 2d volume of English-tand book.

PERFORMANCE.

At three years he won the sweepstakes on the Union course, Long Island, against five horses. On the same course, the same season, he won a match race against Mr. Stevens' "Rattler." In the autumn of 1827, he ran upon the same course, and won at three heats, (three mile heats) beating Richard 3d from Virginia, Misfortune and American Boy. He has never given way in his limbs or wind. These are all his public performances, and he never was beaten.

Ten Hills Stock farm, on the Modford Turnpike, two and a half miles from Boston.

SAMUEL JACQUES, Jr.

Ten Hills Farm, April 4.

Spring Wheat.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street,

A few bushels of genuine Gilman Spring Wheat; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society.

April 4.

Flower Seeds, \$1 per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market street,

Packages of the most showy and rare varieties of Flower Seeds, containing 18 varieties, among which are,

Geraniums (mixed)

Ten Weeks Stock Gillflower.

Sensitive Plant.

Mexican Blue Ageratum.

Crimson Cypress Vine.

Forget-me-Nut.

Ice Plant.

Elegant Coreopsis, &c. &c.

With directions for their culture. Each sort is labeled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 sorts.

April 4.

Pruning and Budding Instruments.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, 20 dozen of superior Pruning and Budding Knives and Shears.—Likewise a very general assortment of Horticultural Instruments.

J. R. NEWELL.

April 4.

A-paragus Roots.

JUST Received at the Seed Store connected with the New England Farmer, 50½ North Market Street:

A few thousand Large Early A-paragus Roots, packed in moss, in boxes of six, two and three hundred roots each,—will bear transportation any distance—price \$1 per hundred for those 3 years old, 75 cents per hundred for the others.

April 4.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:

Five large Vines of the Isabella (purple); Winne, (dark purple); Alexander, (black); and Catawba (red) Grape, with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each.

April 4.

For Sale.

A Fine Stallion, from Bell-bunder, coming five years old this spring, a noble animal, price 500 dollars. Valuable milking stock will be taken in exchange. Col. Jacques is acquainted with the horse, and will give any information respecting him. Apply to J. B. Russell, Boston, if by mail, post paid.

4t

April 4.

Market Man wanted.

A steady and industrious man, who is a good salesman and ready reckoner, to take charge the present season, of a Market Wagon to Salem, Lynn, and Marblehead Markets. Preference will be given to one who is acquainted with marketing in this vicinity. Application may be made at the Reform Inn in Lynn.

4t

April 4.

Improved Green House Syringes.

AGRICULTURAL WAREHOUSE,

Nos. 51 & 52 North Market Street.

JUST received a further supply of Willis' Improved Brass Syringes. This article is highly approved of for preventing the mildew on Grapes, and likewise for destroying insects on trees, and is a useful article for Hiving Bees.

April 4.

Hitchcock's Plough.

An assortment of Hitchcock's Cast Iron Ploughs, with wrought iron standard and square Colter edged shares, may be had of the subscribers. These Ploughs are warranted equal if not superior to any that have been offered to the public. Try and See!

April 4.

DAVID PROUTY, Hanover.

JOHN MEARS, Dorchester.

Land for Sale in Milton.

A very valuable tract of Land in the centre of the town, containing about 120 acres, located on the north side of the old road leading from Boston to Taunton, and opposite to the seat of Francis Amory, Esq. consisting of mowing, tillage, fresh meadow, and wood land, well watered. It is very pleasantly situated for improvement, and is of a superior soil, well adapted to the cultivation of fruit. The above will be sold together or in lots to suit purchasers. It is well worthy the attention of gentlemen of taste, enterprising mechanics or farmers; being near the meeting-house, and literary institution, and within eight miles of the city of Boston. The terms will be liberal, and may be known by applying to

NATHANIEL TUCKER,

SAMUEL ADAMS, or

ISAAC GULLIVER, near the premises.

Milton, March 26.

6w

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 50½ North Market street, by J. B. Russell:

A fresh supply of Tall Meadow Oats Grass Seed, so valuable on thin soils for either a hay crop or for grazing. Col. TAYLOR, a distinguished farmer, says of it, "It is the hardest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and if cut before the seed ripens, its hay is as pleasant and nutritive to stock, as any grass known to me."—See also the opinion of Mr. PHINNEY, a most judicious farmer, in the New England Farmer, vol. vi, page 300.

Also,—Lucerne Orchard Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Broom Corn, Seed Corn, &c.

March 28.

New American Gardener,—sixth edition.

This day published by J. B. Russell and Carter & Henslee:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, Asparagus, &c. &c. By T. G. Fessenden, assisted by several gentlemen. Sixth edition. Price \$1 00.—This we think may be considered the most popular and practical work on Gardening extant.

March 28.

Farmer Wanted.

A Man with a family is wanted, to take charge of a farm in Salem, on shares, or as may be agreed on. None need apply who cannot produce good recommendations. Apply at the Farmer Office.

March 28.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscatel" Grape Vines, just received by the brig Cora from Cadiz, procured for him by the Consul of the United States, resident there. He writes, "I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds."—They contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

Isabella; Barcelona;
Catawba; Blands;
Constantia; Black Cape;
Black Hamburgh;

3 varieties of valuable fruits, obtained from Xeres in Spain, and many other choice kinds.

Orders by Mail addressed to the subscriber, or personal application at his office, No. 7½ Congress street, for any quantity of vines from one to one hundred, will meet with prompt attention.

March 12, 1832.

5t

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed store, 50 North Market street, by J. B. Russell,

100 lbs. Large Mangold Wurtzel, of the very first quality. 100 lbs. French Yellow Sugar Beet, imported direct from France. 100 lbs. Ruta Pataga, of the first quality. European growth; 100 lbs. large White Flat English Field Turnip; 150 lbs. Short Top Scarlet Radish, of English growth—very early, and of deep scarlet color.

March 28.

Farmer Wanted.

WANTED, a young single man to do the work on a small place, 3 miles from Boston; no one need apply unless he can produce good recommendations for his honesty and industry. Inquire at this office. 3t. March 21.

Farmer Wanted.

A steady, faithful man is wanted, to take charge of a garden and small farm in Dorchester; take care of a horse, cow, &c. and make himself useful on the place. An American would be preferred. Apply to No. 173, Washington street.

March 21.

BRIGHTON MARKET.—MONDAY, APRIL 2, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 241 Beef Cattle, (including 55 unsold last week); 27 pairs Working Oxen, 13 Cows and Calves, 110 Sheep, and 780 Swine. About 25 Beef Cattle remain unsold.

PRICES. *Beef Cattle*.—The Beef Cattle today were of a better quality than usual, and more were probably sold for extra and prime; prices were uneven, but at a considerable advance. We noticed two yoke taken at \$6, 75, extra at 6, 25 a 6, 50, prime 6 a 6, 25, good 5, 50 a 6, thin 4, 50 a 5, 25; we noticed two yoke taken at 4, 00.

Working Oxen.—Sales were effected at \$6, 25, 65, 75, 78, 80 and 108.

Cows and Calves.—Sales at \$22, 25, 27, and 29.

Swine.—Sales were rather slow, but advanced. We noticed one lot of 70 taken at 5c for Sows, and 6 for Barrows, and one of 50 at 5 for sows and 6 for barrows, one lot of 30 large selected barrows at 6; one or two small lots of selected barrows at 6, and one entire lot of 34, two-thirds sows, at 5c; at retail 5, 50 for sows, 6, 50 for barrows.

New York Cattle Market, March 30.—In market 350 head Beef Cattle, and advanced prices were obtained; sales averaging \$7, we quote 6 a 8, for Cows 4, 50 a 5, 50. Sheep very scarce and high prices are obtained, \$3 a 7.

MISCELLANY.

From the Salem Gazette.

The following Ode was written several years ago, and has been often published. But in this age of enterprise and of activity in the pursuit of wealth, it may be well sometimes to call in our thoughts and muse upon such subjects. It is thus introduced by the author of Læon:

"There is so much of true genius, and poetic feeling of the highest order, in the following stanzas, that I cannot withstand the temptation of enriching my barren pages with so beautiful a gem. This ode of Doctor Leyden's, in my humble opinion, comes as near perfection as the sublimity of muse can arrive at, when assisted by a subject that is interesting, and an execution that is masterly. It adds a deeper shade to that sympathy, which such lines must awaken, to reflect that the spirit that dictated them, has fled."

ODE TO AN INDIAN GOLD COIN.

Written in Clerical, Malabar.

SLAVE of the dark and dirty mine!

What vanity has brought thee here;

How can I love to see thee shine

So bright, whom I have bought so dear?

The tent-ropes flapping lone I hear

For twilight converse, am in arm;

The jackall's shriek, bursts on my ear

Whom north and music wont to charm.

By Clerical's dark wandering streams,

Where cane turis shadow all the wild,

Sweet visions haunt my waking dreams

Of Tevot lo'd while still a child,

Of castled rocks stupendous piled

By Esk or Eden's classic wave.

Where loves of youth and friendship snail'd

Uncurs'd by thee, vile yellow slave!

Fade, day dreams sweet, from memory fade!

The perish'd bliss of youth's first prime,

That once so bright on Lney play'd,

Revives no more in after time.

Far from my sacred natal clime,

I haste to an untimely grave;

The daring thoughts, that soar'd sublime,

Are sunk in ocean's southern wave.

Slave of the mine! thy yellow light

Gleam: hateful as the tomb-fire deat;

A gentle vision comes by night

My lonely widowed heart to cheer;

Her eyes are dim with many a tear,

That once were guiding stars to mine;

Her fond heart throbs with many a fear!

I cannot bear to see thee shine.

For thee, for thee, vile yellow slave,

I left a heart that loved me true,

I cross'd the tedious ocean-wave,

To roam in climes unkind and new,

The cold wind of the stranger blew

Chill on my wither'd heart:—the grave

Dark and untimely met my view—

And all for thee, vile yellow slave!

Ha! comest thou now so late to mock

A wanderer's banish'd heart forlorn,

Now that his frame the lightning shock

Of sun-rays' tip with death has borne?

From love, from friendship, country, torn,

To memory's fond regrets the prey,

Vile slave, thy yellow dross I scorn!

Go mix thee with thy kindred clay!

RESOURCES OF MAINE.

The Gardiner Standard makes the following enumeration of some of the natural productions of Maine:—

"An abundance of excellent land, needing nothing but good culture. A healthy climate. An extensive sea coast. Navigable rivers. Abundance of lumber, (how long it will last, at the rate it is destroyed now, is a serious question.) Plenty of lime, both on the sea coast and in the interior; the most of that in the interior is somewhat impure, mixed with slate, &c. We have no doubt

that good 'water lime' will be found, ere long, among us. We have seen specimens of excellent lime stone from the region of Mt. Katahdin, and also from the highlands on the Kennebec. We have the best of granite; near Harpswell and along the coast, abundance of zeis, &c. much used for flagstones, for sidewalks; and plenty of slate, iron enough to supply half a dozen smelting furnaces; on Arrowsmith island, it is abundant; in Buckfield, Oxford, Co. there is a full hill of it, and in hundreds of other places, bog ore, &c. may be found.

"Sulphuret of iron or copperas rock, sufficient to make copperas enough, when added to our maple bark, to dye all creation, black as the dark days of Egypt. Plenty of clay to make brick; and some white enough to make China for our belles to sip green Hyson in. A mountain of graphic Granite, which we verily believe might be manufactured into Kaolin, and the said Kaolin into the best of porcelain. And while the spirit moves us, we will prophecy that anthracite coal will one day be dug in our present territory.

An interesting experiment was tried at Newswell last week, on the state of the atmosphere. A kite was sent up, having attached to it a piece of butcher's meat, a fresh haddock, and a small loaf of bread. The kite ascended to a considerable height, and remained at that elevation for an hour and a quarter. When brought to the ground, it was found that the fish and the piece of meat were both in a putrid state, particularly the fish; and the loaf, when examined through a microscope, was discovered to be pervaded with legions of animalcules. It may be worth while to repeat the experiment, in other places, to which the cholera may unfortunately extend itself.—*English paper.*

Stallions.

THE following Horses are for sale or to let, the ensuing season,—if not paired with, they will stand for Mares at the farm of A. Day, at Lodi, Bergen Co. New Jersey, near Newark bridge, under the care of Hosca Worthington.

PATH KILLER—chestnut; five years old; sire, American Eclipse; dam, Hyacinth, a pure thorough blood mare of the English race breed, whose pedigree is verified up to the oriental horses, more than a hundred years; his colts are remarkable for their size and bone.

NAVARRINO—blood-bay; four years old; sire, Sir Harry; dam, Hyacinth.

HARPERUS—beautiful blood-bay; upwards of sixteen hands high; sire, Hambletonian; dam, Messenger Mare; a great trotter, and his colts large and fine, well calculated for coach horses—for one pair of them, only 2 and 3 years old, \$400 was refused.

The above horses will stand at \$15, and the mare warranted with foal. If paid by the 1st of November, 1832, \$12.50 will be taken.

JERRY LEITCH—cream color; sixteen hands high five years old; sire, imported horse Lehigh; dam, a Defence Mare. This breed of horses has proved great travellers, and valuable as roadsters and for farming horses. Stands at \$8, and the mare warranted with foal—if paid by the 1st of November, 1832, \$6 will be taken.

Bulls.

TWO Bulls of the imported short horned Durham breed for sale, or to let the ensuing season. Enquire of A. Day, No. 27, Nassau street, New York. March 14, 1832. 31

Buckthorns.

Gentlemen in want of this valuable plant for live fences, can have young quicks about 32 feet high, for \$3 per hundred, and plants 24 feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight. March 14.

Farm to Let.

A first rate farm of about 120 acres, well proportioned in mowing, tillage and pasturing. It is capable of maintaining 20 head of cattle, and is well calculated for a Milk Farm, for which purpose it has been used a number of years. There is also one of the best orchards in the State—a good dwelling house, and three good barns. For terms apply at 56, Commercial st. 41st March 14.

Bees for Sale.

FOR Sale by Emerson Wheeler, Brighton, about a dozen Swarms of Bees in Bees' Patent Hives, from 8 to 15 each, including the hives. March 14. 41st

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the last season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr. 65, Broad street.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1

Evergreens, Silver Firs, &c.

THE subscriber being engaged in the Seed business, would be happy to receive orders for Forest Trees, Seeds and Evergreens from Maine, and being agent for J. B. Russell, Boston, and Prince & Sons, Flushing, N. Y. orders sent through them or otherwise, will be attended to without delay. Particular directions for taking up and packing is requested. W. M. MANN.

Augusta, Me. March 14. 61
A list of Mr Mann's prices for Evergreens, &c. can be seen at the New England Farmer office.

Double Dahlia Roots, &c.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a fine collection of Roots of the Double Dahlia, or Georgina, viz. Double Scarlet, Red, Dark Crimson, Dwarf Red, Dwarf pale Purple, Yellow, Nankeen, Black, Dark Purple, Curled Purple, and Brick color, at 25 cents each. Also, Tube Roses and Anarallis, 75 cents each. Large Scotch Gooseberry Bushes, \$1.50, and in six roots of different sorts—with the greatest collection of Flower and Garden seeds. March 28.

A Stud Colt, and North Devon Bull.

A beautiful Colt, near three years old, dark Bay with black mane and tail—being the first Colt got by the celebrated Horse *Barfoot* in this country, and from a superior and large native mare—price 250 dollars.

A North Devon Bull, near 9 years old, was imported by the subscriber from England, and is a fine animal.—This breed are always in color dark red, therefore easily matched for working cattle and are quick travellers, is a sure Calf getter, in good health and condition, but from his age will be sold for \$50.

Several superior Cows from the best imported stock, partly *Hollanders*, *Shirleys*, and *Danish short horns*, have Calves, or near Calving, by the North Devon Bull; from 35 to 50 dollars. Apply to JOHN PRINCE, Jamaica Plain, March 27, 1832.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

☐ No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BETTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE).—T. G. FESSENDEN, EDITOR.

VOL. X. BOSTON, WEDNESDAY EVENING, APRIL 11, 1832. NO. 39.

Horticulture.

FOR THE NEW ENGLAND FARMER.

HORTICULTURAL JOURNAL.

MR. EDITOR.—Having, during the past season, kept a journal of some few horticultural operations, I now send it to you in the hope (imperfect as it is), that it may be of some use to your readers. What I send is a copy, with the exception of a few omissions not important enough to be transcribed. I send it to you, Sir, with great diffidence as respects my skill in gardening and horticultural accomplishments, generally, compared with those of many of your ingenious correspondents; but with entire confidence in my fidelity and most anxious desire to advance our captivating, emulating art. You will see that I have taken notice of some of the most common, everyday operations of the garden. This can be of no service to many of your readers, but it may to some. There are always beginners, as I was, upon removing from the city of Albany to the country, nine years since, to whom even the simplest instructions are valuable; indeed we must begin with A B C in every art and science; and the greatest error, perhaps, in those who attempt to instruct is, that they consider too many things as *already known*.

Besides, Sir, many of these common circumstances that I have mentioned, may give all your readers some idea of differences of climate.

As to these particulars, they should know that my residence is at Stockbridge, Mass. thirty miles from the Hudson, in the County of Berkshire, in the latitude of Kinderhook on that river. I give you, Sir, my name as a pledge of fidelity, and I cannot but think that it would be more conducive to the cause of truth and science, if the like were generally done in such communications. I see that many of your correspondents are anonymous, with whom I should be ashamed to compare myself, either as a practical or learned gardener—it is a false modesty and injurious to our art. Mr John Lowell, who is our greatest benefactor in this State, one of the greatest, certainly, to the country, and whose general attainments, sound judgment and pure life, are not surpassed, even by his own great accomplishments, in our department, has in this respect placed before even the humblest of us, a true example. At a long distance from him, I follow.

I have inclosed in brackets, observations *now made* upon the subjects mentioned in the journal. The reader will see that the various absences mentioned, have rendered it more imperfect than it might otherwise have been.

THEODORE SEDGWICK.

West Stockbridge, Mass.

JOURNAL.

1831. March 11th. Sowed lettuce and pepper-grass seed in hot-bed.

15th. Sowed, to be transplanted, in box No. 1, Musk-melon, *Green*, [the name of an individual from whom the seed was received] boxes Nos. 2, 3, 4, 5, *Minorea*; 6, 7, 8, large Ribbed Montreal; [these were sown in wooden boxes without bottom, not having pots enough. The box is a bad thing, as I was informed before I tried it—the

wood absorbs moisture very rapidly, and independently of that, for the plants had moisture enough the wood seems to be unfavorable to the root of the plant.]

14th. Sowed Spinach in hot-bed and on terraces. 24th. Spinach in hot-bed up; Lettuce ditto; Pepper-grass about four days since.

25th. Planted, in pot No. 1, Casaba, [said to be excellent in the Mediterranean, but cannot give the correct name] Musk-melon, 2d ditto; Delavan, 3d ditto; 4, *Green*; 5, 6, *Minorea*; 7, 8, large Ribbed Montreal; 9, 10, 11, Boston Cantelope. Planted also Cucumber seed in eight Squash shells, [these are shells of the large summer Squash; the plants flourished more in these shells than in the boxes, or the pots. I find no difficulty in breaking them when the plant is to be put out. The bottom of the shell is cut out when the seed is sown, to permit the roots of the plant to enter the ground, their confinement in the pot seems to be injurious. In the large shells I had the finest plants, and have saved fine shells this year for this purpose. It is proper to mention here, that the numbers of my pots get into confusion, and my plants, though put down in four different parts of two gardens, of course become intermixed.]

25th. Sowed Cape Broccoli; Montreal; ditto early York, ditto purple Cabbages. [These Broccoli seeds were Cabbage; all false.]

26th. Put out on terraces, in boxes, Kidney potatoes to sprout for early potatoes, covered with horse manure.

April 1st. Put charcoal refuse about Baltimore Grape, on surface of the ground. [I call this "Baltimore" because I received the plants from a friend there, it is very much like the Isabella, if not the very thing. As to names, I hope that Mr Prince's book will prove valuable to us, and his nomenclature. It is certain that we are in great confusion now. As to kinds, I have many of those usually recommended at the nurseries, and by friends; several of these I have rejected as worthless where I am, on account of climate, and I can say with truth, that had my varieties not extended beyond three or four, I should have been saved a great deal of vexation.]

2d. Planted bishop and blue imperial dwarf Peas; sowed Cauliflower, Radish and Tomatoes, in hot-bed. [These cauliflower seed, also entirely false.]

15th. Took up several sweet-water grapes and transplanted them; buds not started, and wood does not bleed when cut, season not being forward enough. Took up the box of pippin Apples, buried below the frost on terraces, about three-quarters entirely sound; all somewhat mouldy from dampness, but not injured thereby; mould wiped off. [Apples in my ground have deteriorated greatly in a few years. For the three last years, including the present, there has not been one apple in a hundred, not stung by the insect; this year worse than ever. I found the mode of burying more perfect than any other for preservation; though for two years past, I have put many with great care in cut straw, a layer of apples and then a layer of straw. The burying is troublesome and not to be recommended; where apples keep well, I prefer the straw.]

16th. Uncovered some of my vines and put by them bass mats, in order to cover them at night till the frosts are over. Tied all the limbs of the vines, temporarily, to lower bar of trellises, in order to cover without breaking young shoots, some buds beginning to swell. [These mats I find very useful; they come about Russia iron, and I have bought the full size (now) for 12½ cents, and the half size for 6 cents each.]—Fruit set on some currant bushes. This is a mild rainy morning.

18th. Peas up. Pear blossoms sufficiently expanded to be visible. Planted Kidney potatoes, some of which had sprouted, having been put down for that purpose. Forked one square, on which are grape vines. Transplanted several plum trees, budded last season from a Reine Claude imported from France. [In all cases lately of trees budded in my own garden, I have, besides the bud, preserved some of the natural wood, in order to get varieties. I transplanted these budded trees this year, in order to try the effect upon the buds; the buds failed; at the time that the buds would have come out, the season was more unfavorable from drought, than I have known at that period of the year.]

19th. A few strawberry blossoms appear on a strawberry obtained from a neighboring garden, and said to be a wild strawberry; these on terraces. [These plants all males, not a single fruit; all head up; this is the second time that I have had this mortification.]

19th. Transplanted plum and peach trees; washed the bark of young pear trees with very strong lime water, [one of these trees being in a miserable state, covered with Aphides, (vulgarly called *plant-lice*), is nearly recovered. I have in other cases since, tried strong soap-suds, and believe it to be better than the lime.]

19th. Transplanted Hauthois strawberries, all young plants of last year's growth, [this is essential.]

21st. Planted sweet corn, and Mohawk bean; sowed onions and beets. [This Mohawk bean is a speckled bean, white and flush, well known in the shops, but I do not know by what name; the best early string bean that I have seen; next best as a string bean to the red cranberry, that is very late.]

22d. Uncovered some foreign grapes on terraces; buds begin to swell, and a few are injured in taking out, by pressing against the ground.

23d. Put down grape slips, sweet-water and Isabella.

27th. Uncovered residue of grapes. Put charcoal dust about an inch in thickness, about several grape vines, in order to ascertain whether this would accelerate the time of ripening, by increasing the superficial heat, or had any other effect. [No effect perceived as to maturing the fruit, but I think the experiment is worthy of being continued; whenever the ground was forked, I renewed the dust.]

27th. After looking diligently, I cannot find a single live bud on peach or apricot tree. [These buds I presume were destroyed, either during the fall or winter. As early as March, I examined them, when I supposed them nearly all to be dead.] Plums have very few buds; Prince's large green

gage has few, his yellow gage more; a young "green Charlie," imported, has few, [this is the small kind, and bears the most delicious plum I ever tasted.] A blue plum, called with us the horse-plum, an excellent plum, has many buds; a young damson, full; [these buds matured into fruit, which was entirely cut off in the early dry weather. I had not one plum, peach, or apricot; as to the plum, a circumstance uncanceled.]

May 5th. Returned from Albany after an absence since 25th ult. Find vegetation very backward. There appears to be more than a week's difference between vegetation on the Hudson and at this place. Buds of plums and cherries just begin to open.

6th. Transplanted some musk-melon, and put charcoal dust around some on the surface; [these plants appeared to be invigorated by the dust—never so fine in my garden.]

9th. Very cold; fires all day; snow nearly all the afternoon, by turns. At 5 o'clock, P. M. began to cover all grape vines old enough to bear fruit, with mats; this done in one hour, being assisted by two men for half that time, there being about a hundred vines that were likely to bear fruit. This from *extreme* caution, as the buds do not seem forward enough to be injured. [Of these one hundred vines, I had fruit only on about one third part. The greater number were not more than two years old after transplanting; many being three years old from the slip; at that age I believe they do not generally bear.]

10th. At 5 o'clock, A. M. thermometer at freezing; ground still with frost, but nothing injured; many plants covered, melons, &c.

11th. Some pears in blossom fairly out; apple blossoms not quite out; early strawberries in full blossom, on terraces.

12th. A few blossoms of the Hawthoits.

13th. Pears in full blossom. Grapes on terraces, in a few cases, in leaf. Thermometer, yesterday at 78, at half past eleven in the morning—being warm in the evening, the beetle first seen on fruit trees. [As the ravages of this insect are becoming more and more destructive, I have taken great pains to ascertain facts in regard to it, but thus far without success that has led to any satisfactory results. In this part of the country the evil is worse and worse; the plum, the apricot, and lately the apple, are its victims. I say the beetle, for I suppose this to be the insect. The suggestion was made to me by my friend, Mrs. Griffith of Brunswick, N. J. some years since; a lady equally well known for her knowledge, skill, and admirable enthusiasm, in the art to which she has principally devoted her time and talents. Unsatisfactory as my efforts have been, they may perhaps supply useful hints to some more fortunate cultivator; I therefore, Sir, give you extracts from my Journal, both of the last year and the present.

6th May, 1830. On the night of the 3d inst. I saw, for the first time, the beetle on my fruit trees. Trees full of the insect, appeared about dusk; at 9 o'clock I shook from one tree about one hundred and fifty, into a sheet. The two succeeding nights appeared the same way, on plums, apricots and cherries; at the same hour on both nights, shook all my trees and thousands came off; some entered the ground immediately, others remained on it nearly in a state of torpidity; I could not perceive that they rose again to the trees. On the 7th instant, the weather having come off cold, wind to the northwest, at 9 o'clock in the evening I

could find none on the trees. During two nights I protected a French plum tree, by covering the half of it with a sheet; there were no insects on it.

1830, May 14th. There having been a succession of cold nights, I have not seen the beetle again till the night before the last, when the trees were again covered; at dusk they seemed to be in motion generally; at 9 o'clock they had settled upon the trees, which were then shaken, and I could not observe that they rose after falling.

1830, June 10th. Having for several nights made fires with shavings, in the hope of attracting the beetle, I have failed; a very few only flew into the fire; this insect is yet in numbers on my plum trees. I have not found shaking the trees to effect the object of driving them away, though most for the time fall; they now feed upon the leaves of the trees; this I can see every night, but I do not see them on the fruit, though it is obvious that a large portion of the fruit has been stung. The young plum trees which I put down last year look very badly, which I attribute partly to the season and partly to the beetle, having ascertained that the beetle resorts regularly to these young trees. Some of my early apples look quite speckled, as if they had been stung in several directions.

Journal for 1831, continued.

May 13th. At 12 o'clock, went out with a lantern and discovered the insect (beetle) on two Siberian crab-apple trees, saw them eat the blossom; took off the stem and insect, brought them into the house; before morning the blossom was entirely devoured; after witnessing their progress on the crab, saw them afterwards on the plum. Shook several trees, and saw the insect fall; found several on young green gages, eating the leaf, there not being any blossoms on those trees.

14th. Saw the beetle again at 9 o'clock, P. M. on the crab and on the plum, but not near as numerous as last year; many much smaller. Saw it on some young green gages, on which there was not a blossom.

15th. Hung the two halves of a mackerel in two plum trees, to try the effect of the scent of the fish upon the insect. [This is a New Jersey prescription, and though I am no great believer in these penance, we are too ignorant of the laws of nature to be authorised to reject, as quackery, all such propositions.]

16th. Find the beetle at 9 o'clock, P. M. on one of the trees in which the fish was. See very few of these insects, though the night is warm and fine. There are few, compared with last season. Sweet corn, potatoes and beans, up. For the last three days, have watered with liquid manure some of my oldest grapes and some of my four years' old vines; watered also strawberries, cabbages, lettuce, onions, &c. There has been no rain for a week. Hawthoits in beds, in full blossom.—Thermometer at 58, at 10 o'clock, P. M.

17th. Beetle appears; not so many by far as last year; find them again on the trees where the fish was.

20th. Examined young nursery plants, found some badly injured by the worm; same worm that destroys the peach tree; several trees so badly injured as to be nearly girdled by the worm.

21st. Laid down lead pipes in garden. [In the mode of delivering this water, there is a peculiarity that is worthy of attention. The water proceeds from a spring, that was supposed to be sufficient for forty or fifty houses only. It being important

that there should be no waste water, it is delivered through apertures in leaden pipes, not generally larger than to admit the head of a common pin; at my house a common knitting-needle will not enter the aperture, and still nothing has ever interrupted the water for more than a year, but careless management in one or two instances.]

To be concluded next week.

The following letter, from an eminent cultivator in Maine, will prove useful as well as interesting to all who have suffered by the destruction among fruit trees, so much deplored by horticulturists.

Maine, March 26, 1832.

HON. JOHN LOWELL, Boston.

DEAR SIR—I have read, with regret, your intelligence on the subject of the death of the shoots of certain fruit trees. If the evil prevails to the extent apprehended, you will judge how far the following expedient offers a chance of a partial remedy.

Various botanists conceive that nature has provided trees with sets of *imperfect buds*, or *latent germs*, ready to be brought into activity as exigencies shall require. Now I presume to suggest the cutting off the whole of the wood of the damaged trees, which was generated in 1831, (so far as shall be found requisite) and trusting to the exertions of the shoots made in 1830, for providing you with a stock of buds, or germs, to form new wood for the present season, 1832. No evil seems to attend the first part of the operation, namely, the removal of the damaged wood from your trees, but the contrary, and you may then as the result of it, *probably*, bring into play some of the buds or germs which we have supposed to be laid up by nature for *occasional* uses; especially if you employ the ordinary means for provoking their appearance, suggested by different authors. For experiment's sake, however, it may be wise to leave some of the damaged shoots of 1831, standing, to see whether nature (who is fertile in resources) may not do something unexpected for us, out of that very wood, even though it has lost its *primary ostensible buds*.

It will be observed, that the principal object in the scheme above proposed is to provide buds for the present year, 1832. I shall proceed, therefore, to offer to your notice two other auxiliary modes for obtaining the very same object, namely, the supply of buds for the present year, 1832.

The first of these *auxiliary methods* is founded on a particular within my own knowledge. Many years ago, some bundles of fruit scions came to me from England, late in the season; and the lower ends of the scions being well packed, many powerful shoots (both terminal shoots and side shoots) made their appearance. The bundles being forwarded to me in this condition by the mail coach, a Postmaster in a neighboring village, who was curious as to fruit, cut off some side shoots, from which he took buds; and he told me, that on inserting these buds in proper stocks, they grew. Hence I ask, whether some of the various bundles of scions, imported this year from Europe, may not be pushed forward in their vegetation so as to form powerful shoots, from which shoots buds may be taken and employed as above mentioned by the postmaster. May not the same question also be put, as to valuable scions received this season, from different parts of the United States?

But I break off these queries to continue my nar-

*For the documents to which reference is here made, see New England Farmer for March 14th, 1832, p. 278.

native, as it will lead me to important objects.—When the bundles of scions arrived with me, I had them opened in my presence, and found vigorous shoots from them, as above particularised; but these shoots having been formed in the dark, their color was sallow, or in other words, (as some would call them after the French botanists,) they were *stiolated*. I now committed them to the care of a skilful English gardener, who had long lived with me; and I presume that they succeeded as grafts, for I recollect nothing peculiar having been mentioned to me to the contrary; and it was an obvious precaution to let in the light of the sun gradually to the scions, in order to furnish them with their natural green color.* These may possibly be called refinements; but facts, illustrating principles, may often be useful, independent of the specific applications made of the facts in question.

My *second auxiliary method of providing buds* in the ensuing season, 1832, rests on an invention adapted in England about thirteen years ago, for transmitting buds to great distances by the post, inclosed in *letters*. Directions for accomplishing this, are given in "The Transactions of the London Horticultural Society," vol. 4, part 3, page 403, by its president, Thomas Andrew Knight, in an article read to the society April 3, 1821. The directions are as follows:—

"Some experiments were made two years ago, by Sir Charles Monk and myself, to ascertain the most eligible method of transferring buds from one part of the kingdom to another; the result of which has had the effect of saving me some trouble, and my friends some expense. It has also led me to adopt a better mode of using buds which have become somewhat *withered*, than I previously knew."

"Several methods of packing buds were tried, but the following, which was first adopted by Sir Charles Monk, having proved at once to be the most efficient and most easy of execution, it is needless to describe others. The leaf stalks of the bud were reduced to a very short length, and the young branch was then inclosed in a double fold of cabbage leaf, bound close together at each end, and inclosed in a *letter*. It was found advantageous to place the lower surface of the cabbage leaf inwards, by which the inclosed branch was supplied with humidity, that being the perspiring surface of the leaf; (* the other surface being nearly or wholly impervious to moisture.)

"I did not (says Mr Knight) usually receive the buds from Belsay Castle, the seat of Sir C. Monk, in Northumberland, in less than five or six days; and the leaf-stalk had often parted from the bud, and the bark [of the bud] could not very readily be detached from the wood; the wood was therefore suffered to remain, but it was pared very thin, particularly such part of it as extended above the bud; and as the loss of the leaf-stalk deprived me of the usual method of holding the bud, I found it necessary to suffer that to remain attached to the branch above it, or to a part of it, till I had placed the bud in its proper position. The bud was then severed from the branch with a sharp knife; and the bud almost always succeeded as

well as one recently taken from the tree could have done."

Thus far, Mr Knight; the plan described by him being useful for all who are concerned in budding, in the budding season; though it requires some modification in the United States, where the climate in the budding season is much *hotter* than it is in the budding season in England.

For a plan of this kind to succeed to any extent in the U. States, it ought to provide for coolness, for economy, and for the presence of a certain degree and kind of moisture, (that is, of moisture free from unhealthy dampness and from danger of fermentation.) The English plan of removing the *expanded* leaves from their foot stalks, must also not be forgotten, as preventing a needless expenditure of sap, &c; nor yet should the aid of the inner surface of cabbage *leaves* be overlooked. But, instead of using the inclosure of a *letter*, the lower ends of the branches of scions should be included in proper earth somewhat moistened; or in coarse damp linen, refreshed from time to time with cool water. A suitable covering must then be provided for the whole, of a nature to resist heat and to prevent damage from blows or pressure.

In this shape, the English expedient for spreading buds through a whole country in the budding season, may be carried to any desired extent in the United States. The plan is the more to be recommended, as it is beginning to be felt, both in this country and in England, that *grafted* apples can be converted into the finest cider, should such fruit not meet a market in its natural state, or in any of the forms into which it may be brought by means of art. Let us conclude by observing, that Mr Knight does not speak of his plan as applied to buds of this or the other kind of fruit only, but he speaks of buds *generally*; (of course, meaning to confine himself to the buds of such trees as can be propagated by buds.)

Some short *miscellaneous remarks* will conclude this letter. It being premised that we, like you, had some intensely hot days in the summer of 1831; and a winter to follow it which not only set in very suddenly, but was for some time perfectly unrelenting, though not uncommonly remarkable for the *extremity* of its cold. It should be added that many of our buds for 1831, began to form early in the *preceding winter*; and that our spring had in it some cold and damp weather. Thus prepared, I leave you to make your own observations in what follows, only occasionally offering some remarks of my own.

1. A peach tree was early covered with beautiful blossoms, which were soon followed by fine leaves; when, suddenly, the border below became strewn with the ruins of this noble appearance; saying that two large ruddy peaches remained, as we thought, but one of the ends of each peach became soft and the stones split. A second crop of blossoms and of leaves came out on this tree, less forward than the first, but no satisfactory crop of fruit followed.

2. The heat of the summer made the leaves of several of our apple trees wilt, curl, and stiffen; and though it was reported to me by a sensible observer, that some of these leaves recovered themselves, yet, I myself noticed others which failed to do this. Indeed, my present gardener has assured me that in a former year, he has seen the fruit itself, of the apple, wilt—and he is usually an exact noster of such incidents.

3. Some of the leaves of our maple trees be-

came twisted on their foot stalks, in the autumn; the cause of which, I had not the opportunity of observing; nor had I the opportunity of noticing afterwards, any alteration in their position.

4. Many of our blossoms, in the spring of 1831, had the appearance of having set, but the young fruit fell. Various of our field and garden crops suffered also, more or less; though in general, all succeeded sufficiently well, excepting our potatoes, which had too much wet. I must here remark, what I have also seen in books, namely, that as fructification depends much on the spread of the *farina* of blossoms, such spread of it cannot very easily occur in very misty weather. Hence we have not to look at the coldness of our weather alone, when the blossoms are setting; but on the dryness of the *farina* which is to be spread abroad. It is possible, that a fierce wind also may prevent the setting of the *farina*. Hence I have always been used to attend, of late years, to the dryness of the season when the blossoms are open; to wish for a gentle air to be then abroad; and I am glad also to see sunshine at such periods.

The lurches of the current tree seem to me, in particular, to depend on favorable weather for the proper ripening of *all* their berries. I presume, in short, to think that we want a regular series of observations and experiments on this point. Such are a few of the detached circumstances on these subjects, which have presented themselves to my recollection since the fall of the year 1830, up to this date; reserving myself for the fuller notice of our buds of 1831, till mild spring weather shall have taken possession of our orchards and gardens, when you may possibly again hear from me. In the mean time I may observe, that our trees at present bear many buds which appear lively, but are very small, having made no progress during the winter.

By way of *review* of the subject of this letter, I beg to remark, that as you seem deprived of many of the fruit buds and leaf buds, which you expected to find on your fruit trees at this season, (the spring of 1832,) I have turned my attention to the *artificial creation* (if I may so term it) of such buds, and to the economical use of such as might be found within your reach. Secondly—as the course of vegetation between the fall of 1830 and the present moment, has been peculiar, I have added the mention of a few miscellaneous circumstances, after the example you have set me, leaving the causes and effects of them to be discussed hereafter at leisure. I am, my dear Sir,

Most truly yours,

P. S.—As some persons have affirmed that much greater injury has been done to fruit trees in some places, than you have represented in your late statements, it is necessary to observe, that my letter speaks only of the precise amount of evil you have pointed out; namely, the destruction of the leaf buds and fruit buds, generated in 1831, on which you depended for the prolific powers of your scions to be grafted in 1832.

Fruit Trees.—We learn from various directions, that the past winter has been lamentably destructive of fruit trees in this State; the peach, pear, and plum trees, in particular. In fact, very few, if any, have escaped. We trust, however, that this calamity will not discourage their cultivation, as it may be a half century ere another such incessantly cold winter shall return upon us.—*Maine paper.*

* The change of color of whole forests in this country from sallow to green, after wet and cloudy weather in the proper season, is now well known to observers. When M. A. F. Michaux was in this country, in a dry season, which was followed by a sort of weather just mentioned; a grafted scion made vigorous shoots in the open air, which only gradually became green by means of solar light.

MANGEL WURTZEL AND SUGAR BEET.

Soil and preparation.—The soil for these roots should be a loam, inclining to clay, in good tilth, well manured, and made fine to a good depth. John Hare Powell, Esq. corresponding secretary to the Pennsylvania Agricultural Society, in giving an account of his mode of cultivating this crop, says, "My soil was not naturally strong; it has been gradually so much deepened as to enable Wood's plough, No. 2, drawn by four oxen, to plough fourteen inches deep. Fresh barn-yard manure was equally spread upon the surface, and ploughed under in the early part of April, in quantities not larger than are generally used for potato crops in this country. Early in May, the land was twice stirred with Benson's scarifier, harrowed, rolled; after stirred, harrowed and rolled again in the opposite direction." The soil on which Messrs. Tristram Little and Henry Little, of Newbury, Mass. raised their premium crop in 1821, is a clay loam. In 1823, about three fourths of the same was sowed with onions, and manured with about eight cords of compost manure to the acre. The other quarter was sowed with wheat without manure. In the fall of 1823, there were about ten cords of compost manure drawn on the lot, and put in a heap. Most of said compost was drawn from the salt marshes, when ditching the same; the other part was from the barn-yard. In the month of April, 1824, the heap was thrown over and well mixed.

Planting.—Col. Powell says, "The holes for the seeds were made by a wheel, containing pegs in its circumference, which penetrated the ground about an inch, leaving intervals of four inches; the rows were made two feet asunder; two capsules were dropped in each hole; the wheel of a common barrow was passed over them, thus compressing the earth, and leaving a slight rut for the retention of moisture."

Messrs. Tristram and Henry Little observe, that, "Between the 8th and 11th of May, the land was ploughed and sowed in the following manner:—After one deep ploughing, the ground was furrowed two and a half feet apart, and the manure put into the furrows, and covered with a double mould-board plough; a roller was then passed on the top of the ridge, and the seed dibbled in with the finger over the manure, about six or eight inches apart." The quantity of seed, according to English writers, is four pounds to an acre. Mr. David Little, in obtaining a premium crop, sowed four pounds, but observed that he thought half that quantity would have been sufficient.

After-culture.—In raising Col. Powell's crop, "A small cultivator, which I have contrived for the purpose, was drawn between the rows soon after the seed appeared; a three inch triangular hoe removed the alternate plants, leaving the others at distances varying from eight to twelve inches asunder. The cultivator was twice used before the 20th of July. The heavy rains of August made another hoeing necessary, and surcharged the ground so much with moisture, that all roots increased much less in that month, than during the same time in the two last years." The Messrs. Little, "in the course of the season, thinned their plants, and left them from six to twelve inches apart in the rows. They were once hoed, and ploughed three times between the rows."—Mr. Powell, in raising a previous crop, had ploughed the rows thirty inches apart, and left the plants six inches apart in the rows. He says, "I this year

desired smaller roots, which might grow so closely, as, by their leaves, to protect the soil as much as possible from the rays of the sun. My cultivator by its peculiar form, enabled me to cut off the weeds when the plant was so young, that, if I had applied the plough, their crowns must have been covered in many instances, by earth occasionally falling from its land side. The failure which attends the cultivation of most root crops in drills, proceeds from the neglect of weeds in their early stages. Four or five days of delay, frequently make the difference of fifteen days in the labor of making clean an acre of ground. The weeds which a boy with a sharp shingle could remove at the commencement of one week, may, before the end of the next, require the application of an implement drawn by a horse.

"I ascribe my success, in great measure, to the use of Wood's extraordinary plough, which enters the soil more deeply and pulverises it more perfectly, than any other I have ever seen, with equal force, in any country; to the use of cultivators, which complete the production of fine tilth; to the destruction of the weeds on their first appearance; leaving the smallest space upon which a horse can walk, between the rows; and, above all, to planting the seeds of a proper kind upon a surface which is kept perfectly flat."

General remarks.—Agriculturists have not agreed whether it is most expedient to plant the seeds of this root, on ridges or on a level. Col. Powell condemns planting on ridges in this country, as a practice not adapted to our soil and climate, in which vegetables are very liable to suffer by drought. He says, among the various practices, into which we have been seduced by the plausible theories of the advocates of European husbandry, there is none which appears to me more absurd than that which has led us to drill or dibble our crops on ridges. The English farmer wisely contends with the evils produced by too much rain; the American husbandman should as anxiously guard against his most formidable enemy, drought. I am inclined to think that there is no crop cultivated in this State, Pennsylvania, which ought not to be put on a flat surface."

The climate of New England, especially its northern part, is not so warm and dry as that of Pennsylvania, and in that part of the United States, perhaps the nature of the soil should decide the question, if dry, level planting, or if moist, ridge planting should be adopted."

We have heard complaints from American farmers, that the seed of this root is slow and uncertain in coming up. Perhaps the seed or soil, or both, may sometimes be too dry at the time of sowing. A writer in the English Farmer's Journal says, "I have of late years steeped my seed for at least forty-eight hours. I made an experiment with twenty sound seeds not steeped, twenty steeped twenty-four hours, and the same number steeped forty-eight hours; every seed of the latter produced plants, which came up two or three days sooner than either of the others, and some of those not steeped did not come up at all." Mr. Cobbet, in treating of the culture of common garden beets, (American Gardener, par. 198.) directs to soak the seed four days and nights in rain water before it is sowed; and observes, that the mangel wurtzel should be cultivated in the same manner as the other kinds of beets. American writers, so far as we have observed, give no directions for soaking the seeds of this vegetable before planting;

and it is possible that the omission of this part of the process, may cause the slowness and uncertainty of vegetation, complained of. The capsule or husk, which contains the seeds, is dry, and it requires a long time for the moisture which it may derive from the earth, to penetrate this integument, so as to cause the seed to sprout. But if the soil be very moist at the time of sowing, soaking the seed had better be omitted.

Use.—The following remarks are from a paper communicated to the trustees of the Massachusetts Agricultural Society, by J. Lowell, Esq. late president of said society. They are derived, principally, from a French publication, by the Abbé Rosier:—

"This root is very little affected by changes of weather. It is attacked by no insect; drought affects but little its vegetation. It prepares the land extremely well for other crops. It may be sown and treated precisely like the common beet, except that it ought to stand eighteen inches asunder."

"In good land, they often weigh nine or ten pounds, and are stripped eight or nine times. In a light, sandy, but well manured soil, they sometimes weigh fourteen and even sixteen pounds each!"

"The first crop of leaves in France is taken off in the latter end of June, or the beginning of July. In this country, probably the latter period would be preferable. The lower leaves, those which incline towards the ground, are those which are taken away, and care must be taken to preserve the top leaves or the crown of the plants. The leaves may be taken off every 15 days after the first gathering. Oxen, cows and sheep, devour them greedily, and fatten readily upon them. All domestic poultry eat them readily, when chopped fine and mixed with grain. Horses will eat them very well, mixed with chopped straw. Hogs also fatten upon them."

"Cows fed upon this root, solely, give a greater quantity of milk and cream and of better quality, for the first fifteen days, after which they grow too fat and the milk lessens. The food of cows must therefore be varied. Oxen and sheep fatten very well upon them. Cows should have grass in proportion of one third to the beet leaves, or every third day they should be turned to grass. In this mode their milk will be excellent. The trouble of gathering the leaves is less than that of gathering any other green fodder. It may be done by children, while men are required to cut other green food for cattle. It is the surest crop, since the plant will stand the largest droughts. The roots are gathered and treated like those of the common beet. The skin is very tender, and care should be taken to handle them so as they may not be wounded, as they will, in that case, not keep so well. In order to preserve the seed in purity, care should be taken to change the ground in which the seed-beets are planted. The seed can be preserved, after it is gathered, three or four years, without injury. In giving these roots to cattle for food, they are first washed and then cut up into pieces about the size of a nut. It is always best to accompany them, when given to horned cattle, with clover, or other hay or straw, and if the hay or straw has been previously cut fine, it will be preferable. If horses are fed with this root, with a proportion of hay or cut straw, (half of each,) they will be fat, vigorous and healthy. If they are worked severely, a little oats or corn

may be added. It is thus they are treated in Germany, where this root stands in the stead of meadows or grass lands, and whose excellent horses are well known.

"Hogs, fed upon them raw, after they have been cut up fine and mixed with milk or other drink, fatten as well upon them as upon boiled potatoes, by which, the fuel and trouble of boiling is saved.

"As to the quantity given to animals, much will depend on the proportion of other fodder which you allow them. Cows fed twice a day in winter, upon eighteen pounds of these roots at each time, together with four pounds of hay or chopped straw, will give as much and as good milk as in summer, and they will be kept in the best possible state.

"Oxen fed with forty weight of these roots per day, with ten pounds of hay, for one month, and after that with fifty weight per day of the roots alone, will be fat enough for sale in two months more.

"Any person disposed may, from the facts above stated, calculate how many cattle will be supported by a single acre of land on which this plant is cultivated.

Men can eat this vegetable throughout the year; it is agreeable and healthy. No insect attacks it, and it suffers but little from the variety of the seasons. The leaves of this plant form, alone, an excellent food for every species of domestic quadruped, during four months in the year. Turnips and other vegetables are, besides, liable to be destroyed by insects, whereas this beet is not. The roots can be preserved eight months in a sound state, while turnips are of little value after March. In some soils turnips will not grow, particularly in those which are very stiff or strong. The root of scarcity grows everywhere. The milk of cows fed on turnips, has a bad taste. That of those fed on this plant is excellent, as is also the butter made from it. This forage on green fodder comes also at the hot seasons, when almost all other green food is scarce, and sometimes not to be procured. Cattle never get tired of it. In many parts of Germany, where it is raised with success, they prefer it to everything else, to fatten those large herds of cattle which they annually export to France. In feeding cattle with beets, the same dry food must be given which is usually given with turnips."

Col. Powell observes, "My neat cattle prefer mangel wurtzel to any other root which I have offered to them. I have found its effects in producing large secretions of good milk, very great. I selected, in November, two heifers of the same breed and very nearly of the same age, and in similar condition; they were fed in adjoining stalls, and have been fed regularly, three times a day, by the same man. One of them has had three pecks of mangel wurtzel, and four quarts of corn meal, daily; the other, four and a half pecks of mangel wurtzel. The last, which has had mangel wurtzel alone, is in the condition of good beef; the other is not more than what graziers call half fat.

"The application of mangel wurtzel as food for sheep, is not the least important of its uses. Ewes year usually at the season when grass cannot be supplied. The health of themselves and the thrift of their lambs, essentially depend upon succulent food being had. I am inclined to think, that no small portion of the success which English breeders have met, is to be ascribed to the large stores

of roots, which they always have at command. It cannot be denied, that Indian meal will, of itself, in most cases, produce extraordinary fitness as well as great size; but I have been led to believe, that diseases are generally engendered by this species of forcing, which is always expensive, and too often, eventually destroys the animal which has been thus reared."

A writer in the Farmer's Journal says, "This root is now generally allowed to stand eminent for the excellence of its fattening qualities. Among our field productions, parsnips and carrots may justly be declared the most nutritious; Swedish turnips, as holding divided empire with it; while white turnips and cabbages sink into insignificance before it. The taste, both of the leaf and root, is most grateful to every description of stock—bullocks, sheep and hogs, instinctively lay hold of them, and, when once accustomed to their flavor, they reject every other sort of green food, if they have the election.

"No edible root has yet been brought into use, which has an affinity to the one under consideration, with respect to its imperishable properties. The white turnip is in March entirely divested of its fattening power; the Swede in May becomes shrivelled, and is almost refused by cattle; the potato, after this time, entirely sprouts away all its vigor, diminishes in bulk, and dries up; but not so the mangel wurtzel. It is not only ready for use in the autumn, the winter and spring, but may, if required, be continued with unabated advantage, and in the following autumn it may be found in full possession of its most valuable properties, undiminished in weight and abounding in saccharine juices." It has, however, been thought by cultivators in this country, that the ruta laga is more easily preserved, and will remain useful to a later period in the spring and summer after its growth, than the mangel wurtzel.

Messrs T. and H. Little observe, as to the value of the roots for feeding stock, "there is a variety of opinions; but, from a number of years' experience, we think them a valuable addition, and highly worth cultivating. Comparing them with English hay,—and we know of no better standard—in our opinion, three tons of mangel wurtzel, or potatoes,—of the two, we value the mangel wurtzel the highest,—are equal to one ton of hay, for feeding stock generally; but for milch cows, we think two tons of equal value; for feeding store swine, mangel wurtzel is the only root that we know of, which we can cultivate and feed to profit. Six bushels of raw mangel wurtzel we think equal to one bushel of Indian corn."

Quantity to an acre.—The premium crop of the Messrs Little was 33 tons, 10 cwt. and 14 lbs. on an acre. Col. Powell, inclosed certificates to the president of the Penn. Agr. Society, showing that sixteen hundred and thirtyfour bushels of mangel wurtzel, weighing seventyeight thousand four hundred and fortyeight pounds, were produced upon one acre and fourteen perches; and a part of the same field, containing thirteen contiguous rows, produced at the rate of two thousand and sixtyfive bushels per acre, weighing 44 tons, 5 cwt. and 27 lbs. In Great Britain, it is said that upwards of sixty tons have been raised on an acre.

Gathering and preserving.—In gathering the roots, care should be taken to cut off the leaves about half an inch above the crown, as they will not keep so well, if cut more closely. Messrs Tristram and Henry Little say, "As to the best

mode of preserving them, we have tried divers ways—by piling them, by putting them into a barn and covering them with hay, and by putting them into the cellar; the last mode we think the best." Col. Powell observes, that one of his crops was "piled in a cellar, in rows, as wood, and covered with sand." A writer in the English Farmer's Journal observes, that he practised with success, the following mode of preserving this root: "I packed it in long heaps, about seven feet wide at the bottom. I begin by forming the outside with the roots, not stripped of their top; tops outwards; the internal part to be filled with roots without leaves; continue one layer over another, until the heap is about six feet high, and about two feet broad at top, which may be covered with straw and earth; the ends of the heap should be covered in the same way; the leaves form an efficient covering against rain and frost."

Mr Hall, the editor of the Jerseyman, a Jackson paper, is about to vacate his editorial chair in favor of a Mr Robbins from Massachusetts, and devotes his time and talents to a cultivation of the earth. May the "teeming mother" of us all be propitious to her returning child, who leaves the creation of paragraphs for the growing of parsnips, and drops his pen to take up the pitchfork. May he find potatoes more profitable than politics, and peaches, rather than peltings, the fruit of his application.

We applaud the resolution of our brother; the new profession, if it is as little productive of wealth (which is scarcely possible) as that which he has left, will, nevertheless, minister directly to health, the mother of happiness. The rounded visage, the firm muscle, the steady gait, and smile of content, all owe themselves to rural labors; while dimness of vision, trembling nerves, bowed frame, uneven tread and an early grave, come from the editorial desk. Men may talk of exercise as they will; the best functions of the human frame fail before these labors. Point to the man who sits among newspapers, inditing paragraphs and pasting selections, and you may designate one to whom belongs, either in profession or short perspective, decayed physical powers, the sunken eye and sallow sickly visage. Early habits may for a short time prevent these things, but "to this complexion must he come at last."—U. S. Gaz.

From the Genesee Farmer.

WHEAT AND CORN.

That like begets like, is a generally acknowledged truth; and yet how often do we see people in the every day concerns of life, denying in effect this important fact; and to say nothing of the absurd practice of sowing chess, nowhere is this inconsistency more apparent than among many of our respectable farmers.

They seem not to be sufficiently aware that if they sow poor wheat and plant poor corn, poor wheat and poor corn they must expect to harvest. So in all other productions of the farm. Our mother earth is not so propitious as to return us fifty, sixty, or a hundred fold, even of a better quality than was entrusted to her care, and indeed it would be an unjust expectation.

Some years ago, I took pains to select from my wheat in the sheaf enough to sow about half an acre, of the longest, fullest and most perfect heads I could find.

I sowed it in the same field with my other wheat

which was very good, cultivated precisely in the same manner, upon the same kind of soil, and when harvest time came I was surprised to see the difference.

It could be plainly distinguished from the surrounding wheat, at the distance of thirty or forty rods, by its height; it was much heavier, and the heads were longer and better filled.

I once let out a piece of ground to a neighbor to be planted with corn. Soon after he got it planted, I found out that he had taken the corn from the crib, "just as it comes," without selecting or choosing.

In answer to my telling him that we should each of us have been ——— dollars better off, if he had planted good corn, he said, "Poh! do you 'spose it makes any difference what kind of corn you plant?" But harvest day told the story; and when he saw sixty bushels per acre upon my field adjoining, of good sound corn, and found upon harvesting his, that he had but forty bushels per acre, and most of that "pig corn" and "nubbins," he was forced to acknowledge with sorrow the truth of my remark.

FOR THE NEW ENGLAND FARMER.

SUGAR MAPLE TREES.

MR. EDITOR.—As the season for transplanting the Rock Maple, or as it is more frequently called, the Sugar Maple, is near at hand, I take the liberty to offer a few remarks on the cultivation of that useful and beautiful tree. I have long regretted, as I think every gentleman of taste will, when travelling through our flourishing country towns, to notice the almost universal neglect of shade and ornamental trees about buildings and by the sides of roads, where a little labor and expense judiciously bestowed at the proper season, would in a few years, amply and doubly repay the cultivator, by the additional beauty and absolute value of his estate. And I do most ardently hope, that for the future, more attention and better skill will be bestowed on this branch of rural decoration.—There seems to be a great want of knowledge of the proper method of transplanting and treatment of this tree. It is painful to see them set out at their full natural height, (often not larger than fish poles,) with most of their original tops left on, dangling about in the wind; for most of them will die the first year, and those that live will have but a sickly existence, a slow growth, and never become handsome or useful. Thus he who sets them is discouraged, the attempt to decorate his grounds is given up, and the spot remains vacant, waiting for the next generation to try some further experiment.

The Sugar Maple is most successfully transplanted from the 1st of April to the 1st of May, or even later, according to the season. The best time is when the buds are swollen and just bursting into foliage. Fair, thrifty, young trees, of from two to three inches in diameter, should be selected, and taken up with about as much care as to preserving the roots, as in removing other trees of the same size. The long roots may be shortened. The stalk should then be sawed off smoothly, from ten to twelve feet high, and no limbs or twigs left on it. In setting, it is well to dig the hole deeper than the roots require, and fill it partly with loam or top mould. Care should be taken not to set too deep, for this tree delights to send its latent roots far abroad, near the surface of the ground.

Let the earth be well trodden in around it, to give support and keep the tree erect. When the buds show themselves near the top, as they will in a few days, if too numerous they must be rubbed off, except from four to six, or so many as shall be proper to grow as branches, which are best situated to form the top or head of the tree. All buds or sprouts below are to be rubbed off and the stalk kept clear during the season. Any time before July will do for this. Sometimes the sprouts will grow so fast, be so brittle and tender, as to be blown off by high winds. I have lost a few fine trees in that way, but they will mostly recover by sprouting again. No further care is necessary except to trim the shoots at top with skill, so as to send them up and out in proper form, occasionally for three or four years; keep them free from sprouts below, and keep the trees erect. This latter is very easy, except where cattle rub against them, as having but small tops, they are not liable to be moved by the winds until the roots become sufficiently established to afford a firm support. After the first three or four years, the tree will grow very fast and form for itself an elegant head. It is a fresh, healthy looking tree. The leaves when rotted, make rich food for plants, as may be seen by observing the grass and other herbage about these trees to be more luxuriant than elsewhere in open ground.

It is believed that in twenty-five years after they are set, they will afford a handsome income, in the sweetest sugar and molasses which is produced from any plant whatever. They grow to a large size, and probably live two hundred years. They form a very pleasant shade in summer, and to those who delight to look upon beautiful trees, there are none more pleasant to the eye.

The expense of labor for transplanting, exclusive of transporting when brought from a distance, need not exceed ten or twelve cents each. I have set within the last three years, on both sides of the road which passes the distance of a mile through my farm, upwards of four hundred of these trees, most of which are in a thriving condition. Although I shall not live to see them grown very large, yet, somebody else will; and I hope that whoever may successively occupy the same place hereafter, will not only see them of large size, but have taste and feeling to enjoy their beauty and preserve them for their usefulness. And why should men delay to plant and cultivate all sorts of good trees, because they may not live to see them fully grown? What can a man do better on the face of the earth than to cultivate and beautify it? While ever ready to depart, the lover of beautiful trees should act as if he expected to live a thousand years. How pleasant it would be to have our road-sides planted with trees for miles together, instead of being overrun with brush and unsightly weeds!

Now, Sir, I do hope you will publish something in your valuable paper, which will excite more attention and encourage more exertion for the cultivation of this, as well as other ornamental trees.

Respectfully, yours,

ETHAN A. GREENWOOD.

Hubbardston, March 31, 1832.

SNAPPING FIRE-WOOD, &c.

MR. FESSENDEN—I saw in your paper of the 29th of February, an article giving directions how to place chestnut and hemlock wood upon the fire, to prevent its snapping and throwing its coals into

the room. I would suggest a better mode, that of cutting the wood at a time which will prevent its snapping at all. I am not much acquainted with hemlock wood, and have never tried the experiment; but chestnut wood, if cut in the dark of the moon, that is to say, on the day before or day on which the moon changes, will not snap much more than oak or any other kind of wood. However frivolous this may appear, and I am not philosopher enough to give the reason, certain it is, that the moon has an operation upon the sap of trees. Every farmer who has been in the habit of peeling oak bark for tanning leather, well knows that it will not run except at or near the changing and fulling of the moon. Fencing stuff and timber are said to be much more durable, if cut in the dark of the moon; it will prevent the worms from working between the wood and the bark which is sometimes left upon the corners of timber. Bushes, also, are said to be less liable to sprout again, if cut in the dark of the moon.

This is an experiment easily tried by any one, and if you think it worthy a place in your paper, are at liberty to insert it.

By the Editor.—We are altogether an unbeliever in the doctrine of the moon's influence on vegetation, &c.; and believe that planet has no more agency in the snapping of chestnut wood, or any other wood, than she has in the firing of cannons or the blasting of rocks with gunpowder. The cause of the little explosions from wood when burning, is the expansion of air in the cellular substance of the fuel; which air, when heated, becomes dilated and bursts the cells which inclosed it, with a crackling noise, scattering small pieces of its tiny wooden barriers in the direction in which they yield with most facility. The more wood is interspersed with air cells the more it will snap in burning, provided the cells are closed so that the heated air cannot escape without bursting its integuments. Wood, however, may be light and porous, and still not remarkable for crepitation, because its pores are not closed, and the air which pervades it is not confined.

With regard to cutting timber, &c., in any particular stage of the moon, we cannot at present spare time nor room to discuss the subject; but will merely add, that we believe the less sap or juice there is in the tree when cut, or the more thoroughly the sap is exhausted by peeling the bark from the timber, when the juice will exude freely, the less liable will it be to decay. But as to the moon's having any concern in the matter, we shall wait for further evidence before we decide against her as a trespasser in that particular.

Fruit Trees.—A further examination, made since our last, induces us to believe that the damage sustained by fruit trees in this vicinity, during the past winter, is much more extensive than we had supposed. In many instances, where the twigs of the more tender kinds of trees look as if they were in a healthy state, on cutting through the bark, the wood is found to be discolored and will probably die.—*Worcester Spy.*

Seasonable Information.—Dandelions are said to be a corrector of the bile, a fine laxative, and most excellent in the liver complaint and dropsy.

The Baltimore papers state, that the Baltimore and Ohio Rail-road is now completed through the city nearly as far as Pratt street.

Morus Multicaulis.

FOR Sale at the Seed Store connected with the New England Farmer, 503 North Market street:

A few very fine and vigorous plants of the celebrated Chinese Mulberry, so valuable for Silk worms, originally from the elevated regions of China—and introduced into France from the Philippine Islands a few years since.

These plants now offered for sale, have been received direct this spring from Paris, and were selected by Mons. Andre Michaux, author of the North American Sylva, and are much larger than any that have heretofore been offered here. Picked in moss separately for transportation, price \$1 dollar each. A particular account of this tree by Gen. Deaubon, will be found in the New England Farmer, vol. ix. page 28. April 11.

Gooseberry and Currant Bushes.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, a good assortment of the finest Large Scotch Gooseberry Bushes, in lots of six roots each, two of a sort; white, red and yellow; imported direct from Glasgow, Scotland. Price \$1 50 per lot of six bushes.

Also, Large White and Red Dutch Currant Bushes, in lots of six and twelve each; packed in moss for transportation. Price of the White sorts \$1 50 per dozen—the Red, 75 cents. Specimens of the fruit preserved, can be seen at the store. Also, cuttings of the Large Red Currants—price 50 cents for a bundle of 200.

Agricultural Implements.

FOR Sale at the Agricultural Warehouse, 51 and 52, North Market-street, a general assortment of Agricultural and Horticultural Implements, among which are Howard's double mould Board Ploughs, and Cultivators; Bigelow's wrought iron Ploughs; Ties' cast iron do; Willis' improved Drill Harrows for sowing garden seed; Leavitt's do. do. do. do; Eastman and Willis' Straw Cutters; common hand do; Chandler's improved double Harrows; Willis' improved Yards and other vegetables; Corn and Cob Cracking Machines; Corn Shellers; Grain Cradles; 20 dozen very superior cast steel Scythes; 100 dozen Dudley's; Passmore's and Blanchard's steel back and common Scythes; 20 dozen Sickles; 100 doz Derby's patent Rifles; Grass and Garden Shears; Hay and straw Knives; Peat and Ditching Spades; Garden and Transplanting do; a general assortment of Pruning and Budding Knives and Shears, some very superior; Pruning Saws and Chisels; 50 dozen Ames' common and cast steel Shovels and Spades; 50 doz Simonds and Co's do; Willis' improved best spring steel socket Manure Forks; 100 doz Goodyear's and Perkins' two and three tine Hay Forks; 100 dozen Cass and Baker's Syclo Sineaths. April 11.

Howard's Cast Iron Ploughs.

FOR Sale at the Agricultural Warehouse, Nos. 51 and 52, North Market street,—Howard's improved Patent Cast Iron Ploughs, of all sizes, with wrought iron standards. The above Plough, which has been in general use the past season, is much improved by our best practical farmers, and considered by them the best Plough now in use. The iron and wood work being finished to the best possible manner, and the casting being ground and closely fitted, make the Plough work very free and easy, as will appear by the following certificates.

CERTIFICATES.

Mr. Newell—I have used the Nos. 1 and 2 Howard Ploughs, which I purchased of you, and am much pleased with them. I have used a number of different kinds of cast iron ploughs, but have never found one that did the work so perfectly, with so little labor.

DANIEL CHANDLER.

Lexington, Aug. 27, 1831.

Mr. Newell—The Howard Plough which Capt. D. Chandler introduced into Lexington, from your establishment, I consider to be a first rate article. I purchased a No. 2, last spring, and turned over about eight acres of very rocky turf sward land. I have likewise used it through the season upon different soils, some of which were very rough and stony, and find that it holds well and does the work easier and more perfectly than any other plough I ever used on my farm, either wood, wrought or cast iron.

April 11.

Wanted.

50 cents will be paid for one copy of No 33, vol. ix. of the New England Farmer.—Apply at this office. April 11.

Morus Multicaulis or New Chinese Mulberry.

WM. PRINCE & Sons offer for sale, 200 trees of this valuable variety, from 6 to 7 feet high, and vigorous stalks; also several hundred of smaller sizes, the former at \$1 dollar each, and latter at 75 cents. Also—Fruit and Ornamental Trees of the various kinds, of good size and of the most vigorous growth. Isabella Grape vines, 3 years old, at 25 dollars per 100. Alexander Grape 25 dollars per 100, and other kinds in proportion.

N. B. None of the trees have been injured by the winter. It April 11.

Fruit Trees.

ORDERS for Fruit, Forest and Ornamental Trees, shrubs, honey-suckles, &c. from Winslow, Kenrick, Prince, Bruch and Wilson, Davenport's, and any other respectable Nurseries, received by the subscriber, and executed at Nursery prices. J. B. RUSSELL.

New England Farmer Office. April 11.

Just Received.

AND for Sale at the Agricultural Warehouse, No. 51 and 52, North Market street—a further supply of Westfield & Co's much approved Zinc Milkpans. These pans are highly recommended by those who have used them, as being superior to any other pans used for that purpose, keeping the milk much longer, which produces more cream from the same quantity of milk. Likewise, a general assortment of Zinc Kettles for culinary purposes.

Cast Steel Scythes.

JUST received, a few dozen of extra Cast Steel Scythes, which were highly approved of the last season. Likewise, a few dozen of Cass and Baker's Patent Scythes Smiths, the most approved article now in use.

J. N. NEWELL, No. 51 and 52 N. Mar. st. April 11.

Corn Mills.

A few of Willis' Improved Hand Corn Mills, just received and for sale at the Agricultural Warehouse, Nos. 51 & 52 North Market Street—an article well adapted for the Southern and West India market. April 11.

Silkworm Eggs.

FOR sale at the New England Seed Store, 50, 1000 Silkworm Eggs, warranted good, in packages of 5,000 each. Price \$1 per thousand; with short practical instructions for rearing them. April 11.

Hitchcock's Plough.

AN assortment of Hitchcock's Cast Iron Ploughs, with wrought iron standard and square Colter edged shares, may be had of the subscribers. These Ploughs are warranted equal if not superior to any that have been offered to the public. Try and See!

DAVID PROUTY, Hanover, JOHN MEARS, Dorchester. April 4.

Spring Wheat.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street.

A few bushels of genuine Gilman Spring Wheat; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agriculture Society. April 4.

Flower Seeds, \$1 per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 503 North Market street.

Packages of the most showy and rare varieties of Flower Seeds, containing 18 varieties, among which are, Geraniums (mixed) Ten Weeks' Stock Gilliflower. Sensitive Plant. Mexican Blue Ageratum. Crimson Cypress Vine. Forget-me-Not. Ice Plant. Elegant Coreopsis, &c. &c.

With directions for their culture. Each sort is labelled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 sorts.

Early Potatoes.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street:

A few bushels of the prime, early Potatoes, which have taken the premium at the Massachusetts Horticultural Society's Shows the two last seasons; and are considered the earliest variety in this vicinity. March 7.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscato" Grape Vines, just received by the bag. Cordon from Cadiz, procured for him by the Consul of the United States, resident there. He writes, "I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds." They contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

Isabella; Barcelona; Catawba; Blands; Constantia; Black Cape; Black Hanburgh;

3 varieties of valuable fruits, obtained from Nees in Spain, and many other choice kinds.

Orders by Mail addressed to the subscriber, or personal application at his office, No. 7 1/2 Congress street, for any quantity of vines from one to one hundred, will meet with prompt attention. Z. COOK, Jr. March 12, 1832. 51.

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed Store, 50 North Market street, by J. B. Russell, 100 lbs. Large Mangold Wurtzel, of the very first quality. 100 lbs. French Yellow Sugar Beet, imported direct from France. 100 lbs. Ruta Baga, of the first quality. European growth; 100 lbs. large White Flat English Field Turnip; 150 lbs. Short Top Scarlet Radish, of English growth—very early, and of deep scarlet color. March 28.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 503 North Market Street:

Fine large Vines of the Isabella (purple); Winne, (dark purple); Alexander, (black); and Catawba (red) Grape, with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each. April 4.

BOSTON PRICE CURRENT.

Hops, first quality 20; second quality 18. CORN, northern 62 to 65; southern white ditto 51 to 52. RYE and OATS, none of good quality at the market. BARLEY, 1 00 to 1 25. FLOUR, Baltimore Howard Street, 5 62 to 5 87. BEEF, Mess, 10 00 per barrel. PORK, Clear, 16 00 per barrel. LARD, No. 1, Boston inspection, 9 to 12. SEED, Northern Clover, 11 to 12; Herds Grass, 2 25 to 2 50; Red Top, 75 to 81. WOOL, prime Saxony, 60 to 70; American Juli blooded, washed, 50 to 55; superfine Northern pulled lambs, 58 to 60. American TALLOW, 8 1/2 to 9.

BRIGHTON MARKET—MONDAY, APRIL 9, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 411 Beef Cattle, (including 25 unsold last week.) 23 pairs Working Oxen, 21 Cows and Calves, 130 Sheep, and 230 Swine. 100 of the Swine were "fatted," weighing about 260 each. 53 Beef Cattle remain unsold.

PRICES. Beef Cattle—Last week's prices were not supported, particularly on the medium and thinner qualities. We quote extra at \$6 25 a 6 50; prime at 6 a 6 25; good at 5 25 a 5 75; thin at 4 50 a 5.

Working Oxen.—Sales were dull and buyers scarce. We noticed an extraordinary value taken at \$130, one at 63, one at 81, and one at auction at 57.

Cows and Calves.—Sales were effected at \$21, 23, 25, and 29.

Sheep.—We noticed one lot taken at \$4 50 and one at 5.

Swine.—We noticed a prime lot of 60, all Barrows but five, taken at a fraction over 6c, and a lot of 25 at 6c, for Barrows and 5 for Sows. The "fat hogs" were contracted for some four or five weeks since at 4-1-8 c.

New York Cattle Market, April 6.—At market this week, as last, a very short supply of Beef Cattle, only 260 head; prices have advanced, the average of sales being \$7 50 per hundred. We quote 6 a 8 50; some extra fine 9 a 9 25; Cows Beef 5 50 a 6. Cows and Calves, market well stocked, sales slow from \$20 a 30. Sheep scarce and prices very high; 5 a 7.—Daily Adv.

At the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY

From the Salem Observer.

DESTRUCTION OF BIRDS.

The wanton destruction of birds and their eggs, at this season of the year, cannot too forcibly be reprehended. They were made to subserv the best purpose—the destruction of worms and insects that prey upon trees, and vegetation generally. Now that our orchards are devastated by that scourge, the *canker worm*, the subject becomes of great importance; and if nothing else will check this most injudicious and ruinous practice, the strong arm of the law should be made to interpose. Let every land-holder, then, vigilantly guard his grounds in this respect; and punish every interloper and destroyer of birds, with more severity than he would the purloiner of fruit. A correspondent in the Marblehead Register, has some sensible and timely remarks on this subject, from which we make the following extract:—

"The millers or small butterflies, from which the canker worm is produced, and the worm itself, form the food of all the species of small birds which frequent our fields and gardens; and in every one of these which is wantonly destroyed by boys, we lose an active and efficient friend. So great indeed is the aid which they afford us, that I have heard a gentleman declare that he would give more for a wood-picker to work in his orchard, than for a hired man. The common ground-sparrow and the robin, are also of the most essential service in this way. Let parents, then, impress these facts on the minds of their boys, and if no other argument will do, let them appeal to the self-interest of their children, and explain to them, that if they like apples, they must not go gunning nor rob birds' nests."

STUDY.

The knowledge we acquire in this world, I am apt to think, extends not beyond the limits of this life. The Bentite vision of the other life needs not the help of this dim twilight; but be that as it will, I am sure the principal end why we are to get knowledge here is, to make use of it for the benefit of ourselves and others in this world; but, if by gaining it we destroy our health, we labor for a thing that will be useless in our hands; and if, by harassing our bodies, though with a design to render ourselves more useful, we deprive ourselves of the abilities and opportunities to do that good we might have done with a milder talent, which God thought sufficient for us, by having denied us the strength to improve it to that pitch which men of stronger constitutions can attain to, we rob God of so much service and our neighbor of all that help, which, in a state of health with a moderate knowledge, we might have been able to perform. He that sinks his vessel by overloading it, though it may be with gold and silver, and precious stones, will give his owner but an ill account of his voyage.—*Locke on Study.*

The Norfolk Herald, speaking of the experiments of Mr Houghton, the Yankee Fire King, says:—"Mr Houghton then commenced his experiments with Prussic Acid. A goodly sized grimaldin was brought upon the stage, and a dose of the deadly extract administered to it; the poor animal was in a few minutes convulsed in the agonies of death—the antidote was then applied, and

he was laid on the stage as dead as Chelsea. But behold! in less than ten minutes, he began to show signs of life—stretched out his hind feet, raised himself on his fore paws, then, staring wildly around, gave utterance to the feline exclamation of *mud!* and trotted off the stage, followed by shouts of applause. A similar experiment was tried on a fine sleek tabby, but not with such decided success. Her ladyship perhaps being more delicate than her predecessor, tom, was operated on so violently by the poison, that it took an hour to resuscitate her.—A wag in one of the stage boxes, remarked, that the poisonous ingredient with which Mr Houghton experimented, was more properly the *prussic* than the *prussic acid*.—These things are almost beyond belief, and therefore we should say to the curious, go and see, and be satisfied."

Cure for the Gout.—"Pray Mr Abernethy, what is a cure for the gout?" was the question of an indolent and luxurious citizen. "Live upon a sixpence a day, and earn it!" was the reply.

Interesting Anecdote.—In the debate on the removal of Washington's remains, in the House of Representatives, Mr Howard of Maryland, related the following interesting historical anecdote:—"When the British fleet was passing up the Potomac with hostile intent, during the late war, the commander directed that when he arrived opposite Mount Vernon, he should be informed of the fact. When he was told that the ship was passing the tomb of Washington, the officers assembled upon deck and passed by *uncovered and in silence.*"

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street.

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the past season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Flooring Boards, &c.

OF hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr., 65, Broad street.

Ammunition.

OF the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 65 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned Jan. 1

Evergreens, Silver Firs, &c.

THE subscriber being engaged in the Seed business, would be happy to receive orders for Forest Trees, Seeds and Evergreens from Maine, and being agent for J. B. Russell, Boston, and Prince & Sons, Flossing, N. Y. orders sent through them or otherwise, will be attended to without delay. Particular directions for taking up and packing is requested. WM. MAXN.

Augusta, Me. March 11. 6t
A list of Mr Mann's prices for Evergreens, &c, can be seen at the New England Farmer office.

Double Dahlia Roots, &c.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a fine collection of Roots of the Double Dahlia, or Georgia, viz. Double Scarlet, Red, Dark Crimson, Dwarf Red, Dwarf pale Purple, Yellow, Naueken, Black, Dark Purple, Curled Purple, and Brick color, at 75 cents each. Also, Tebe Rosos and Amariyllis, 25 cents each. Large Scotch Gooseberry Bushes, \$1 50, and in six roots of different sorts—with the greatest collection of Flower and Garden seeds. March 28.

A Stud Colt, and North Devon Bull.

A beautiful Colt, near three years old, dark Bay with black mane and tail—being the first Colt got by the celebrated Horse *Barefoot* in this country, and from a superior and large native mare—price 250 dollars.

A North Devon Bull, near 9 years old; was imported by the subscriber from England, and is a fine animal.—This breed are always in color dark red, therefore easily matched for working cattle and are quick travellers, is a sure Colt getter, in good health and condition, but from his age will be sold for \$50.

Several superior Cows from the best Imported stock, partly *Holderness, Alderney, and Durham* short horns, have Calves, or near Calving, by the North Devon Bull; from 35 a 50 dollars. Apply to JOHN PRINCE, Jamaica Plain, March 27, 1832.

The full blooded Horse Sportsman.

THE Subscriber has secured the full-blooded horse sportsman, to stand the ensuing season at the "Ten Hills Stock Farm," commencing April 10th, and ending August 10th.

Terms—One Dollar to the Groom, and ten dollars for the season,—cash, or a note on demand, or fifteen dollars to ensure a mare in heat, by a conditional note at eleven months.

Good keeping for mares, at one dollar per week, at the risk of the owners.

Sportsman is not surpassed for spirits, and has as good strains of blood, as any horse in this country. His dam was a direct descendant from the best blood in England, his sire, the full-blooded imported Arabian Horse "Bussarah." It is with these strains of blood that England has had defiance to the world on the turf and in the field, for more than a century past.

Sportsman's get are very promising, and may be seen on the farm.

Satisfactory proof of the pedigree of this horse as given below, is in my possession.

PEDIGREE.

Sportsman was foaled in 1823, the property of the late Gen. Coles of Dorset, Long Island, and sired by the "Bussarah Arabian," out of Sports-mistress by Hickory, her dam the famous racing mare Miller's Damsel (the dam also of American Eclipse) by Messenger Grand Dam, the imported Potos mare, G. G. dam by Ginerack, &c. Hickory was by Whip, his dam, Dido by Dave Devil, G. G. dam by Wildair, G. G. dam by Clock-st, G. G. G. dam the Dam of the celebrated Virginia, "Bucephalus and Lady Teazle."

"Messinger" by "Manbrino," Dam by Turf, G. Dam by Regulus, G. G. Dam by Starling, Fox, Bay Bolton, Duke of Ancestor's Turf, Byerly Turk, Taffolet Barb, Place's white Turk, Native barb mare, Potos was by Eclipse, Dam Sports-mistress, by Warren's Sportsman, G. Dam Golden Locks by Oronoko, Panton's Crab, Partner, &c. See list and 2d volume of English stud book.

PERFORMANCE.

At three years he won the sweepstakes on the Union course, Long Island, against five horses. On the same course, the same season, he won a *match race* against Mr. Stevens' "Rattler". In the autumn of 1827, he ran upon the same course, and won at three heats, (three mile heats) beating Richard 3d from Virginia, Misfortune and American Boy. He has never given way in his limbs or wind. These are all his public performances, and he never was beaten.

Ten Hills Stock farm, on the Medford Turnpike, two and a half miles from Boston.

SAMUEL JAKUES, Jr.

Ten Hills Farm, April 4.

Pruning and Budding Instruments.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, 20 dozen of superior Pruning and Budding Knives and Shears.—Likewise a very general assortment of Horticultural instruments. J. R. NEWELL.

April 4.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If No paper will be sent to a distance without payment being made in advance.

Printed by J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

ORIGINAL AGRICULTURAL ESSAYS.

CULTURE OF THE HOLLY FOR HEDGES, &c.

By the Editor.

HOLLY.—(*Ilex*.) This is a small evergreen tree or shrub, but little known in the United States. It has shining, irregular and spinous leaves, and white flowers which grow in clusters round the branches, and are succeeded by small red berries.

These shrubs, or dwarf trees, present very agreeable picturesque objects to adorn a landscape, and on that as well as other accounts, they are cultivated, in England, in gardens, shrubberies, &c. As a plant for hedges, holly is highly recommended, and is said to be eminently serviceable. It admits of being clipped or cropped, and retains its verdure and beauty through the severest winters. Its growth is slow, but its duration is longer than that of most trees.

The wood of the holly is hard and has a close grain, is much used in veneering, and is frequently stained black to imitate ebony. It is advantageously used in making handles for knives, cogs for mill wheels, and other similar purposes. The leaves in winter afford a grateful food to sheep and deer; and the berries yield a subsistence during this inclement season, to the feathered tribes. In some places the inhabitants use the seeds of the holly as a substitute for coffee, but the beverage thus made is inferior to that obtained from the genuine berry of Mocha.

"The bark of the holly," according to Willich's Encyclopedia, "is smooth, and replete with a strong mucilaginous substance, from which the article called bird-lime is made. For this purpose it is boiled ten or twelve hours; and when the green rind is separated, it is covered up in a moist place to stand for a fortnight. It is afterwards reduced to a tough paste, and washed in a running stream until no impurities are left. The next part of the process is to suffer it to ferment for four or five days; after which, it is mixed over the fire, with a third part of nut oil or some other oily fluid, and is thus rendered fit for use.

"Holly deserves to be much more extensively cultivated than it now is. Some years ago, a person who purchased a holly wood in Yorkshire, (England,) sold the bird-lime prepared from the bark, to a Dutch merchant, for nearly the whole

sum of his original purchase. Bird-lime has an adhesive quality very remarkable, particularly to feathers and other dry substances. It is on this account employed for the snaring of twigs, to ensnare birds. In its elasticity and inflammable nature it has much resemblance to India rubber; and, if any means could be adopted to harden it, there is little doubt but it might be substituted for that article.

"Among the ancient Romans it was customary to send branches of holly to their friends, with new years' gifts, as emblematical of good wishes. We [in England] decorate our houses and churches with it at Christmas, to give an air of spring in the depth of winter."

The *Library of Entertaining Knowledge* observes, "A holly hedge is a pleasing object, though it is too often clipped into formal shapes. Evelyn had a magnificent hedge of this sort, at his garden at Say's Court, which he planted at the suggestion of Peter the Great, who resided at his house when he worked in the dock-yards at Deptford. He thus voluntarily speaks of this fine fence:—Is there under heaven a more glorious and refreshing object of the kind, than an impregnable hedge, of about four hundred feet in length, nine feet high, and five in diameter, which I can show in my new raised gardens at Say's Court, (thanks to the Czar of Muscovy,) at any time of the year, glittering with its armed and varnished leaves, the taller standards, at ordinary distances, blushing with their natural coral."

The following receipt for raising holly plants, is copied from a work by Mr Phillips, entitled *Sylva Florifera*.

"The English nurserymen have collected fifty different kinds of holly, all of which may be propagated by grafting in a common stock. The berries, like the seeds of the hawthorn, hang on all winter, and remain in the earth *two years* before sprouting, unless they have passed through the stomach of fowls, when they vegetate in one year. We have therefore only to give them a similar fermentation by art, to enable us to raise plants in one year instead of two. For this purpose take a bushel of bran, mix it with the seed in a tub, wet it with soft water, and let it remain undisturbed for sixteen days, when the bran will begin to ferment; sprinkle occasionally with warm water to keep it moist, and in about thirty or forty days the heat of the bran will put the berries in a state of vegetation, fit for sowing in about a week after the fermentation has commenced."

The American holly abounds, we believe, in Hingham, Quincy, and Bridgewater, and many other places, where seed can be procured.

CUTTING CORN STALKS.

MR FESSENDEN—I was highly gratified with the perusal of the leading article in your 38th No. from the pen of Mr Clark, on cutting corn stalks. Experiments like those he has detailed are of great value to the farming interest, and richly entitle those who make and publish them, to the appellation of public benefactors. I beg leave to suggest the cause of the difference in the product which resulted from Mr Clark's experiments.

There is a striking analogy between the animal and vegetable kingdoms. Food taken into the stomach of animals does not nourish, but is prejudicial to health, unless it undergoes the process of digestion. Nor does food nourish the plant until it has been elaborated by the leaves. Plants, therefore, without leaves cannot grow; but, on the contrary, if defoliated in hot weather, the unelaborated sap becomes stagnant, ferments, and destroys the vitality of the plant. Thus when the tops of corn are cut, the supply of food to all the ears *above* the remaining leaves, is cut off, and the supply is materially diminished to those below. A diminished product must of course be the consequence.

I very much regret that Mr Clark did not carry his experiments one step further, and ascertain the relative weight of forty-six hills cut with the entire stalks, at the time he topped his No. 2. It would have decided whether the stalks afford nutriment to the grain, after they are separated from the roots and to what extent. This last has been my method of harvesting my crop, from an impression that I lost by it nothing in the weight of the grain, while I gained much in the quantity and quality of the fodder. The objection that the stalks mould is not tenable. They will not mould while the corn is upon them, if tied above the ears. And if not sufficiently dry when the corn is picked, they may be left in stacks till perfectly cured; and yet be housed in far better condition than they are by the ordinary mode of saving them. It is not the drying that deteriorates their value for fodder, but the *drenchings* which they get when left out till the corn is picked, and the frosts, which diminish very much their nutritive properties. If well cured, and especially if cut and steamed, cattle eat them freely, and I consider them nowise inferior to hay. The grain from the crop secured in my way, has weighed sixty and sixty-two pounds the bushel. It is a twice rowed early variety, which I denominate the Dutton corn.

I have remarked, that the modes of planting corn, or rather the distance between the plants, is different in different States. In New England the distance is greater than in New York, and greater in Pennsylvania than in the former. Mr Clark's hills were four by three feet, which gave him 3646 hills, or by my estimate 3630, on the acre. Our Mr Stimpson plants at two and a half feet each way, and gets upon the acre 3609 hills, or nearly double what Mr Clark does. I once planted an acre in drills, two rows in a drill, the plants six inches apart in the rows, the rows six inches apart, and three feet between the centres of the drills, quincunx, and had, if there were no vacancies, 36970 stalks, equal to 7742 hills on the acre. The ground and entire product were accurately measured and weighed. While the Messrs Frauts, of Madison, produced 170 bushels on the acre, by planting in drills, three rows in each, quincunx, thus, . . . and four feet from the centre of the drills. If the rows were six inches apart, and the plants nine inches in the rows, the plants amounted to 43,560, equal to 10,890 hills. Assuming as data, that in all the above cited cases each plant produced an ear of corn, and that the ears averaged one gill of shelled grain, their pro-

ducts would be as follows, in bushels and quarts:

Mr Clark's,	56 bushels, 13 quarts;
Mr Stimson's,	108 " 24 "
My own,	120 " 31 "
Messrs Pratts'	170 "

The close planting, whether in hills or drills, requires high manuring, and the two and three rowed drills, extra labor; and the ears may withal be somewhat smaller. Yet I nevertheless believe that seventy or eighty bushels may be obtained on an acre, with good manurings on a genial soil, in our mode of planting, with about as little labor as twenty, thirty, or forty bushels, are obtained in the New England or Pennsylvania open method.

I have detailed the preceding facts and calculations, not with a view to vaunt of our skill or the fertility of our soil, but to show how the large crops of corn have been raised in this State, which have been noticed in the papers.

There is one fact connected with the experiment of the Messrs Pratts, worthy of consideration: there was not a plant missing, or deficient, in their field. They quadrupled the seed; and pulled up, as the characters of the plants were developed, all but the requisite number, reserving only the strongest and most promising. It is common to see corn-fields very deficient in plants and even in entire hills. This deficiency often amounts to one fourth or one half. The loss incident to this defect may be readily estimated, and greatly counterbalances the expense of extra seed, and the labor of thinning the plants. J. B.

Albany, N. Y., April 9, 1832.

I would suggest to your correspondents, who notice the effects of the winter upon fruit trees and plants, that they note, particularly, the soil upon which the damage has been most apparent; with the view of developing the direct cause of the evil. So far as my observations enable me to judge, the injury has been the most severe on porous or sandy soils, while upon clays it has been trifling or hardly perceptible.

HEDGE ROSES.

T. G. FESSENDEN, Esq.—It has become generally known, that the *rosa levigata* or Cherokee rose of Georgia, is admirably calculated to form a hedge of the most interesting description, and hence many persons in the eastern and northern sections of our country, incur the expense and trouble of obtaining this species for that object, with the supposition that it will succeed equally well with them. I deem it therefore an act of duty to dispel the illusion, as the plant is not sufficiently hardy to answer that object even in this locality, and it merely attains here to a moderate size.

The best of all roses for the purpose of forming a hedge in a northern climate, is (as far as my experience goes) the *rosa rubifolia* or bramble leaf rose. It forms shoots of from ten to twenty feet or more, with great rapidity, and is in July crowned with exceedingly large clusters of flowers, which present various shades in the same manner as the Greville rose of China. This species is so very hardy and rustic that it exacts no care in its culture, and will withstand the cold of the most northern parts of our country.

Yours, respectfully,

WM. ROBERT PRINCE.

Lin. Bot. Garden,
Flushing, N. Y. April, 1832.

HORTICULTURAL JOURNAL.

(Continued from page 306.)

1831. May 22d. This finest morning of the season; grape shoots, the longest about a foot. For eight or ten days I have seen on my grape vines, generally on the leaves, a small black insect commonly about the size of the head of a very large pin, some much larger than this; it eats the leaf which is perforated with small holes; when touched, it generally hops from the leaf as a flea hops; its body a shining black; this insect not observed before. For several days the air in the garden has been swarming with a black fly, about one third of an inch in length, a good deal thinner than a horse fly; they now fill the air, and may be seen on every plant and tree in the garden.

25th. Cut down within six, eight, and twelve feet of the ground, several peach trees, so badly injured by the winter that I have little hopes of them. [Several of these trees recovered entirely.] Many raspberries of three years' growth are greatly injured by the winter, some quite killed. These plants never looked so badly as this year.

26th. Thermometer, at 10 o'clock, A. M. at 70. With the exception of one week, this said to be the wettest season remembered here. The small black insect no longer to be seen on grapes, and very few of the black fly before mentioned. To-day, first appearance of the little yellow bug or fly, that attacks the melon, cucumber, &c: some young plants, not covered with millinet boxes, full of them; [these boxes I have found almost indispensable in a garden.] Upon looking over my plum trees, one half of the fruit seems to be stung; the appearance is generally that of a small piece taken out of the fruit in the form of a crescent—I attribute this to the beetle. Thermometer this afternoon at 86.

Having left home on the 30th of May, returned the 18th of June; the following memoranda made in my absence.

June 6th. Cucumbers in blossom; Baltimore grape ditto.

12th. Musk-melons in blossom. Strawberries first picked. (Hautbois.)

13th. Beans in blossom.

14th. First peas picked.

During my absence the weather was uncommonly hot and dry; for a fortnight there was no rain; laying water in my garden, vegetables did not suffer. Upon my return home, find muskmelons and cucumbers in very fine order, plants large and forward; charcoal dust has been sowed about nearly all of them, to which I attribute a good deal of influence. Strawberries in tolerable condition, only fruit not near as large as last summer; this attributed to the drought, though they have been plentifully watered. [My crop, after all, was very fine.] Those in beds, most abundant; fruit riper than that in hills. [I will hereafter state my mode of raising the strawberry.] Sweet-water grapes generally in blossom, but not wholly; bunches small; many young peach trees that were injured by the winter, greatly recovered; [these trees are now nearly all in admirable order.] Not a single fruit of the peach to be seen; nor one plum. Pears in abundance on old trees; on young trees have disappeared, generally. Apples universally stung, supposed, by the beetle; [my apples this year, from this cause, wretched, hardly a sound one or one of decent appearance.] Several fine grafts of foreign pears, on very young healthy trees, have perished; [this in no case true

of the Stocke grafts, of which I have several very fine in bearing;] it seems to be a universal blight over every part of the graft. A young pear, foreign, (Napoleon) blighted, the whole top affected and cut off, [since dead.] A young French cherry which has borne fruit two years and had a very vigorous growth, is dying with blight, [since dead.]

30th. Strawberries in beds as abundant as they have been at any time during the season. Cucumbers about the length of the finger. Muskmelons not formed.

July 4th. Picked cucumbers over large for the table. Bush summer-squash in blossom. Last week, for the first time, saw the rose-bug in my garden, and yesterday on two grape vines. Never saw the rose-bug till I saw it in Philadelphia during my late absence.

4th. Syringed some old vines this morning for first time. Currants fully ripe.

12th. Picked the last strawberries for the table. [The reader will see that my strawberries have been in bearing a month. This is one of the excellent qualities of this strawberry, (Hautbois)—I cultivate no other; it is also, in my garden, a most abundant bearer; some people do not like the musk taste of it. This strawberry has a softness, a mellowness, adapted to delicate stomachs, which I have seen in no other; my experience, however, is very limited. To my taste, the common strawberry of the New York and Philadelphia markets, bear no comparison in excellence with it. But it would not, I think, answer for a market strawberry, for when dead ripe it is so soft and tender, that it will often cleave asunder when raised by the spoon in the dish.]

13th. Forked the ground around some grape vines, young and old; dug in rich compost about several bearing vines; these vines look flourishing, foliage very perfect, no insects visible. Rose-bug not seen again. Upon many bunches of grapes there appears an incipient mildew, this so only in cases where bunches are much obscured by foliage, the sun having little chance to penetrate; all these bunches I have brushed with a fine painter's brush, so that they became bright; this was done in half an hour.—Overlooked peach trees, found no worms. [The peach worm is a white worm, about an inch long, with a yellowish or brownish head, as all gardeners know. I have tried the various prescriptions recommended, but have ceased to rely upon them, and have substituted in their place a frequent examination of the trees, which I believe, in a long run, to be far the most economical mode. My trees are principally in ploughed ground; if in grass land, the turf is removed for three or four feet from the body of the tree in all directions, and this ground is kept in garden cultivation—it is dug or forked four or five times in the season. Immediately round the body of the tree the ground is in so fine a state, that the dirt can be removed from the body of the tree down to the forks of the roots, with great ease. I scrape the body of the tree from the roots to the surface with a single prong hoe, to dislodge any insects that may be just forming. This is done four or five times in the season; the labor is nothing compared with the object; this I can truly affirm. I have many young trees that have never been touched by the worm. I have tried chamber ley for several years, after it has stood in a vessel for some days. This is an excellent manure for the trees and a considerable protection against the

worm, but not equal to the eye, the hoe, and the knife. Even with these, the worm will sometimes escape detection. It appears principally in July, August, and September. There are statements as to the time the egg is deposited, but this I have no certain knowledge of.]

27th. Find a very little mildew on a few bunches of grapes, on old vines; brushed these as before; upon young vines, no trace of mildew this season.

29th. Picked first green-corn; small sweet corn. [This I find to be one of the best vegetables of the garden, and in my family, a perfectly healthy vegetable; it has now been used for six weeks without an instance of known injury, either to young or old. It is on the table every day during its season; but then it is always eaten when quite tender, and when the tough hull of the corn has not appeared. For this purpose, I always have three or four successive crops; the common corn as it is usually eaten is a kind of poison. It is a crime thus to trifle with health and spread human misery. The benevolent community who are doing so much for the cause of *temperance in drinking*, can now do little more needful than to instruct the people on *temperance in eating*. As to what, also, is the most healthful and economical food, and the best preparation of it.]

30th. Sowed raspberry and strawberry seed; former all of the white Antwerp; latter of the common field strawberry. [These seeds sown for new varieties; plants have not yet appeared.]

August 3d. Syringed old grape vines with lime and sulphur water, on account of the mildew which has increased, but still in a small degree. Weather for three weeks unfavorable, rains almost every day, and the days hot. Notwithstanding the appearance of mildew there is very little of it, and I believe the brushing, heretofore, has been useful.

8th. Mildew having increased much on old vines, cut out nearly half the wood which is much mildewed, so as to leave remainder very open; no mildew on young bearing vines; not a bunch of grapes on those injured. Rainy yesterday and today. More hot weather in last six weeks, than I have known for a long time. Put compost about some young bearing vines and dug it in. I have found, for some days, many young shoots of vines, young and old, entirely covered with eggs of the black ant; saw the old ant on the shoots in more than fifty instances; cut off many shoots. This ant I have never seen in this way before.

15th. Black ant in great numbers; do not see that it injures the grape vines. Mildew has increased on the wood and fruit of old vines; grapes apparently all touched, more or less; they still appear, however, as though they would all ripen, except a few bunches that were left untouched by the brush, by way of experiment. Fruit on all young vines yet unimpaired.

16th. Cut off the entire head of a young winter St Germain pear; it having been attacked by the blight in the branches some time since; but the blight has continued to destroy the tree. Picked the first melons; cantelopes. No rain since Wednesday of last week; weather very hot; most of the time, thermometer at eighty. Grapes, sweet-water, begin to show ripeness; in some cases, soft to the touch. Ever since dry weather came on, have watered daily one young sweet-water, to see if it would ripen the fruit the sooner; [no effect perceived.] Black ant increased im-

mensely, though not perceived that it has injured the vines.

23d. Heavy showers this morning, after dry weather since Wednesday of the week before last. Black Cluster or Burgundy begins to turn black. Some few berries of the sweet-water quite palatable. Larger berries on the young vines than I recollect to have seen in my garden. Melons ripen fast; have watered these vines a very little during the dry weather; they have suffered from it apparently.

September 1st. Some grapes, sweet-water, ripe—i. e. what is usually called ripe, and such as I have often seen brought to the table, and in the market; still, they are far from ripe; many berries on the bunch are still acid, and some bunches are still entirely unripe. Mildew apparent on every bunch on old vines—i. e. on the stem of every bunch; though in most instances the grapes are sound, not perished or shrunk. On the contrary, berries often larger and finer than usual; not the bunches. The wood of these vines all affected by mildew; I allude to the old vines before mentioned, nine in number. As to young vines, though the wood is in a few cases partially discolored by mildew, there is but a single bunch on all these vines, that is injured by it.

15th. Sweet-water grapes now in perfection, and many of them have been for some days; those bunches turned to the sun have acquired the *russet* color, which shows perfect maturity in the grape. Burgundy or Black Cluster not ripe. [This grape is a spirited fine grape, and in the books is said to be earlier than the sweet-water, but in this instance I have not found it to be so; this may be accidental; I have but three bearing plants of this kind. In no instance was fruit ripe as soon as on other vines. I have no doubt but that mine is the true kind; the description in the books is too plain to be mistaken.] Isabella not ripe; indeed, far from it. [I must enter a solemn protest against this grape in this climate; unless cultivated in the most protected situation it will not ripen. My friend, Mrs. Griffith, has given it a bad name in all cases. Ripened within the walls of Albany and New York, I have found it delicious; men, women and children will attest to it. I do not mean as delicate as the Chasselas or Frontignac, but still excellent; and I must say again, in its sweetness *delicious*. And then as to fruitfulness it is not surpassed.] For the first time and within a few days, robins have attacked my grapes, not the black only, but the sweet-water; having shot five, the rest have disappeared. [Here was an unexpected thief, and a horticultural mortification not looked for. After watching, nursing, protecting these offspring of care, by night and by day, as the mother does her children, now comes the spoiler. What is to be done? I had never suffered one of these beautiful tenants of the bough and the air, to be shot on my place; but this was too much; my humanity gave way, and the deadly shot removed my fears and preserved my fruit. Was I wrong? I commit myself to the taste, judgment and humanity of the horticultural republic, and will abide its decision. As to the *white* grape, it has been said that its color would preserve it from the attack of birds, and till now, I supposed that this was the fact. It may be so, generally.] Trimmed six vines as I intend they shall remain at the next year's growth; when cut, the old wood bled a little. [This done as an experiment; Loudon asserts that this early trimming

will greatly accelerate the fruit the next year; even two or three weeks.]

Here, Sir, ends my meagre journal. On the 26th of September I left home and was absent some weeks, and since that time I have not had leisure to note down the various operations, that always go forward in the garden in the fall. Before I leave the subject, I will take notice of two or three particulars.

1st. *Grapes*. The beauty, the delicacy, the healthfulness of this fruit, early attracted my attention, and I was determined to be successful, if diligence would insure that result. My confidence is not diminished, though I am aware that most cultivators in the northern and middle States have less hope. Mildew is the great enemy. The excellent lady I have mentioned, says, that two or three good crops may be expected from our young vines, but that, after that, we all "*fab*" about our grapes. I will not plead guilty, and cannot stand mute. I have given the reader a faithful account of my vines this year; my crop on the old vines was *poor*; the young vines were too young to expect much from. For the first time, my old vines were a good deal infected with mildew; this attacks the stem, the wood, and the fruit. I think I can account for the mildews on the old vines I have mentioned; I suffered a good deal of wood to grow, much more than usual—this was partly intentional and partly owing to an omission to take off superfluous wood, as the buds started in the spring; the wood accumulated before I was well aware of how much was left on the vines. In addition to this, we had very hot and very wet weather during a part of the season. Not expecting mildew, I was not prepared for it. After all, upon these nine years old vines I did not lose twenty bunches of grapes; this I attribute in a good measure to the *brush*. To my recollection, I have never in one season before lost ten bunches of grapes from mildew, and I attribute my success to these causes. To *climate* I cannot say how much. 1st. I trim very closely during the summer, by keeping the *false* wood always down; I shorten many bearing shoots, so that the vine is left very open to a free admission of the air and sun. 2d. I manure very highly, and dig or fork my grape ground not less than four or five times during the season; so that the ground, being a light sand and loam, is like an ash heap. My grapes are now prepared for the next season, by the richest manure from the hog pen. On the continent of Europe, they speak of manuring with vegetable manure; and I well recollect that the late ingenious Mr. Parmentier of Brooklyn, told me that he preferred a good deal of vegetable manure. But I am satisfied that this will not answer in my garden. I do not rely on the *brush*, nor on *lime* and *sulphur* as practised in Boston. The latter may be useful, and I once supposed from the statements made, that it was a panacea; but I fear that there is none; that therefore we must build our hopes, whatever they are, upon that industry and diligence to which are awarded the greatest bounties of Providence. Let none, therefore, despair. I have mentioned that there was no mildew worth regarding, on my young bearing vines; the best of these were taken care of, almost exclusively, as to the trimming and disposing of the trellis, by a young lady of the family, whom I instructed as to keeping the vines *open* and exposed to the sun and air.

2d. *Strawberries and Raspberries*. There is

no fruit that I would sooner cultivate in a garden than these, except the apple. These are fruits that you can have almost of course, for six weeks in the season, provided you have water; that the strawberry demands; it will not bear drought. The expense of raising these fruits is well rewarded, compared with that bestowed on other fruits. As to the strawberry, I much prefer the *bed* to the *hills*. In England, this plant is very much cultivated in hills, and they sometimes practise the refinement of suffering only a single plant in a hill, and this plant to stand *one* year only. I now speak of my own experience. The fruit is much larger in the hills, but not so fine; and I think the reason is, that our sun is too hot; I am aware that many will deny this. Those in beds give me ten times as much fruit as the same ground in hills. I have now six beds, two and a half feet wide, twenty-four feet long; these beds were formed thus: young plants were taken up with a trowel or spade, generally four or five together, and so put down in the intended bed, about one foot apart each way. This was done partly late last fall and partly last spring. The runners spread in all directions. Those that at first spread out of the limits of the intended bed were turned in, so that by the first of August, the whole ground was nearly covered; now the plants cover the ground entirely. There is but one difficulty in getting forward these beds of strawberries, that is, *weeds*; and here there is occasion for constant attention. But this is all—a strawberry plot full of weeds is a trial almost beyond human endurance. On the other hand, the strawberry if permitted to run, makes so perfect a mat, that if the ground be attended to the first three months, the difficulty is over. And how much time is necessary for my six beds? Seventy-five cents would pay all the expense of keeping these beds clean the whole summer; not a weed is to be seen in them now. Half of the work has been done by a female child not seven years old. I do not speak of hoeing the alleys; that, however, is not female work. There is now no more labor to be performed upon my beds this season, but to cover them with litter from the horse stable. I do not cut the vines before covering.

Having water in my garden, I am as sure of strawberries enough to fill my house the next season, (as Cobbett would say, of pork at Christmas,) as I am of corn and potatoes; and I will have these strawberries for half of the price that will obtain the same quantity from the field. My crop is certain, the other is not.

I fear, Mr Editor, that half of what I have written will not be read. I had intended to touch upon some other topics, but I will not, farther than to conclude with a few general observations.

When people hear a horticulturist talk of forking up grape vines four or five times in the season, they say to themselves, this is monstrously expensive, and we cannot afford to have grapes upon such terms. Now, Sir, there is no doubt that to possess a good garden is unquestionable economy, with or without grapes. Again—look at the lamentable want of fruit in this country; neither Baltimore nor Albany are supplied, even with garden raspberries or strawberries. I speak of these cities because I know the fact. A man may travel from Boston to Buffalo, and it is a chance if he gets a dish of good fruit at an inn; whereas the intermediate villages ought all to be supplied with fruits. There is no doubt, that even garden rasp-

berries and strawberries might be sold in every considerable village. The demand is limited; so it is for onions and everything else. Abundant fruits would be a new creation of property, greater than we are now aware of. To produce them, would give a new occupation to many old and infirm people, in light labor; to many children who are now more or less idle in every family, and who might do three fourths of the labor of the garden; to many delicate females, also, whose narrow circumstances are a sore evil. To find proper and profitable occupations for this class is a great difficulty; certainly I do not recommend hoeing and digging for them, this must be done by men and boys. If gardening was put upon a proper footing, it would change the face of our villages greatly and give a new impulse to the whole society—nothing more so. Our children in the country ought to be educated for the garden; nine out of ten are wild with pleasure in a garden, they fly from flower to flower like the bees. In our villages, at present, there are too many idle people, there is too much of what Cobbett would call “dawdling about.” This idle time alone, well applied, would give an additional value of twenty per cent to the land, in nine out of ten of all the villages of the country. How then shall we make fruit common? There is but one way; there can be plenty in no article unless it is *bought and sold*. The rich may partially supply themselves, but then there is nothing for the poor or middling classes. The gentlemen of Boston have set the country an example; their surplus (I speak of many) is sent to market. In a republican country, to be ashamed of buying and selling, is really a silly aristocratic air. To make fruit property, like other things, is the only means of breaking up *garden thieving*—this will do it effectually. Let gentlemen consider how much good they can do in rendering fine fruit as common as good vegetables—this is the merit of making two spears of grass grow where there was one before.

Mr Editor, in respect to cultivation, I am but a learner and have but a limited experience; therefore, what I have said is with a just deference to the judgment of others. While others are doing so much for society, we horticulturists owe something; though as members of a great community we are far apart, let there be but one soul pervading our bodies! Let a man be ever so poor, if he wears our badge, we will take him by the hand, he shall have a free ticket in our republic. As we are enjoying the bounties, let us dispense the blessings of heaven. Such is the order of Providence; while a man is toiling *honestly* for himself, he labors also for his neighbor.

None can do more for the cause of temperance than we can. Our delicious fruits are a natural safeguard against the brutifying passion for intoxicating liquors. Our calm pleasures tranquillize the mind and secure it against the desire for extraordinary excitements. To children we can give motives to increased industry; to the other sex, to the poor, the aged, the infirm, appropriate and profitable occupations; to our country, improved tastes, more health, enlarged enjoyments, and a new source of wealth.

THEODORE SEDGWICK.

West Stockbridge, Dec. 1831.

The eye of a master will do more work than both his hands. Not to oversee workmen is to leave them your purse open.

CATTLE SHOW,

Exhibition of Manufactures, Ploughing Match, and public sale of Animals and Manufactures, at Pawtucket, R. I. on Wednesday, Oct. 10, 1832.

Officers of Rhode Island Society for Encouragement of Domestic Industry, elected September, 1831:—

JAMES RHODES,	President;
SAMUEL SLATER,	1st Vice President;
JAMES D. WOLF,	2d “ “
CHARLES ELDRIDGE,	3d “ “
WILLIAM RHODES,	Treasurer;
RICHARD WARD GREENE,	Secretary.

The Standing Committee of the Rhode Island Society for the Encouragement of Domestic Industry, offer the following premiums:—

FOR STOCK.

For the best Bull, to be kept in the State one year after the fair, not to exceed three years of age, \$10; for the next best, same conditions, 8; for the next best, same conditions, 6.

For the best Bull Calf, \$6; for the next best, 4; for the next best, 3; for the next best, 2.

For the best cows, not less than six in number, which shall have yielded the best quantity of milk in any thirty days previous to the 28th of September, a certificate thereof, duly sworn to, will be required, and the cows must be exhibited at the fair, \$15; for the next best cows, not less than four in number, same conditions, 5.

For the best two year old Heifer, having had a calf, same conditions, \$6; for the next best, do. do. 4.

For the best heifer yearling, \$4; for the next best, 2.

For the best pair of working cattle, to have been owned in this State at least three months, not exceeding six years old, \$8; for the next best, 6; for the next best, 4; for the next best, 2.

For the best pair three years old steers, \$6; for the next best, 4; for the next best, 2.

For the best pair of two year old steers, \$5; for the next best, 4; for the next best, 3.

For the best Boar, to be kept in this State until the 1st of April, 1832, \$6; next best, do. do. 4; next best, do. do. 2.

For the best Pigs, not less than six in number, not less than four nor more than eight months old, to have been raised in this State, \$8; for the next best, do. 6; for the next best, do. 3.

For the best Stud Horse, not less than three years old, owned in this State, and having been wholly kept for Mares in this State the season previous, and to be kept for Mares the year succeeding the fair, \$20.

For the best bred Mare (owned in this State) and colt by a horse that may be deemed of the best blood, \$8; next best, same conditions, 6.

No stock from distilleries or breweries will be entitled to any premium. No animal on which a premium has heretofore been awarded shall be entitled to a second premium, except it be for an entirely distinct premium, and for qualities different from those for which the former premium was awarded.

FOR GRAIN, VEGETABLE CROPS, AND AGRICULTURAL EXPERIMENTS.

To the person who shall raise the greatest quantity of Indian Corn, on not less than four acres in one piece of ground, and not less than seventy bushels to the acre, \$20.

To the person who shall raise the greatest quantity of corn, on not less than one acre of land, and

not less than one hundred bushels, \$10. To the person who shall raise the next greatest quantity, and not less than seventy bushels on one acre, \$6.

To the person who shall raise the greatest quantity of Rye on two acres, not less than thirty bushels per acre, \$5.

Next greatest quantity of Rye on two acres, \$3.

To the person who shall raise the greatest quantity of Onions, in proportion to the land cultivated, \$5.

Next greatest quantity, \$3.

To the person who shall raise the greatest quantity of Millet on an acre, cut and cured for hay, the claimant giving evidence of the time of sowing, the quantity of seed sown, and the quantity of hay produced, \$10.

To the person who shall raise the greatest quantity of potatoes, not less than three hundred and fifty bushels on an acre of land, \$8.

Next greatest quantity, not less than three hundred bushels to the acre, \$4.

To the person who shall raise the greatest quantity of Beets, on not less than a quarter of an acre of ground, \$5.

To the person who shall raise the greatest quantity of Carrots on not less than one acre, \$5.

To the person who shall raise the greatest quantity of Parsnips on not less than a quarter of an acre, \$5.

To the person who shall make the most satisfactory experiment to ascertain the best mode of raising Indian Corn, in rows, in hills, or in ridges, not less than half an acre being employed in each mode in the same field, the quantity and quality both of land and manure to be equal and uniform in each mode, and all to receive a cultivation requisite to produce a good crop, \$12.

To the person who shall introduce any Grass not before cultivated in this State, and prove by actual experiment, tested by satisfactory evidence, its superiority to any other grass now cultivated, \$20.

To the person who shall by actual experiment prove the best season and mode of laying down land to grass, and whether spring, summer, or fall seeding be preferable, and with or without grain on different soils, \$10.

To the person who shall take up in the season on his own farm, the greatest quantity of good Honey, and shall at the same time exhibit superior skill in the management of bees, \$5.

For the best barrel of cider, \$6.

[Should the Society retain the barrel of cider for which the premium is awarded, they will pay in addition to the premium four dollars.]

Persons claiming a premium must state in writing the process of making and managing their cider, and the kind of apples used.

Competitors for the above premiums must furnish the Secretary, on or before the first day of December, 1832, with written statements, certified by disinterested and respectable persons, as to the following particulars:

1. The state and quality of the land in the spring of 1832.
2. The product and general state of cultivation, and quantity of manure employed on it the year preceding.
3. The quantity of manure used the present season.
4. The quantity of seed used, and if potatoes, the sort.
5. The time and manner of sowing, weeding, and harvesting the crop, and the amount of product ascertained by actual measurement, after the whole produce for which a premium is claimed is harvested, and the entire expense of cultivation.

The statement of crops must also be accompanied by a certificate taken under oath of two respectable persons,

who assisted in measuring them, as well as a certificate of a surveyor of the measurement of the land, together with a plat of the same.

FOR SHOP MANUFACTURES.

For the best side of Sole Leather, with a written statement duly certified of the mode and time of tanning, \$4.

For the best Belt Leather, \$4.

For the best white oak Hogshead, \$4.

For the best white oak Barrel, \$2.

For the best imitation Beaver Hat, \$3.

For the best woollen do, \$2.

Three dollars for each of the following implements:—best Cast Iron Plough; best Corn Shelter; best Straw Cutter; best Ox Harrow; best Vegetable Cutter; best Horse Harrow.

Three also to each of the following, not less than twelve in number:—Hoes, Axes, Scythes, Rakes, and Iron Shovels.

Implements of Husbandry and Articles of Shop Manufacture, of superior excellence, not particularly enumerated, may receive premiums at the discretion of the Examining Committee.

BUTTER AND CHEESE.

For the best Cheese, all from the same dairy, not less in quantity than one hundred pounds, \$8; for the next do. 6; for the next do. 4.

For the best Butter, not less than sixty pounds, to be exhibited in firkins, \$15; next best do. 10; next best do. 8.

Next best, in boxes not less than twenty-five pounds, \$8; next best do. 6; next best do. 4; next best do. 2.

HOUSEHOLD MANUFACTURES.

For the best piece of carpeting, 4-4 wide, and not less than fifteen yards, \$6; next best do. do. 4; next best do. do. 3. For the best woollen knit hose at least three pairs, \$2; for the best flax or hemp knit hose, 2; for the best cotton do. 2; for the best worsted do. 2; for the best silk do. 3. For the best piece of woollen flannel, 7-8 wide and thirty yards at least, 5; next do. 3. For the best piece of woollen cloth, filled and dressed, 3-4 wide and sixteen yards at least, 3; next do. 2. For the best woollen blankets 8-4 wide, 5; next do. 3.

All to have been manufactured in this State, within the last year, and a certificate thereof required.

MULBERRY TREES AND RAW SILK.

To any person who may within the present season have raised on one piece of land the largest number of thrifty mulberry trees, not less than one thousand, a certificate thereof being required, \$5; for the next largest quantity, not less than one thousand, 4; next do. 3. For the largest quantity of raw silk, 5; next do. 4; next do. 3; next do. 2; next do. 1. For the best sample of sewing silk, 5; next do. 4. For the best dress, manufactured from silk made in this State, 10. Premium of 20 dollars for the best barrel of potato starch, made in this State.

PLOUGHING MATCH.—No drivers allowed.

First Plough, \$9;	Fifth Plough, \$5;
Second do. 8;	Sixth do. 4;
Third do. 7;	Seventh do. 3;
Fourth do. 6;	Eighth do. 2;

The depth to be ploughed will not be less than five inches, and the breadth of the furrow not more than twelve inches.

The strictest regulations will be adopted, to insure the proper management of the cattle. They will not be per-

mitted to be driven faster than their natural pace; and these premiums will be adjudged for the best work with the least expense of labor.

It must be understood, that in all cases, whether there be any competition or not, it is at the discretion of the Committees to withhold a premium, if in their opinion the objects so offered are not worthy of it.

Any attempt to obtain premiums by unfair practices, will be punished by a forfeiture of the premium should it have been awarded before the discovery, and will also preclude the offender from being permitted to apply for premiums in future. Premiums to be demanded within six months after they are awarded.

RICHARD WARD GREENE, Sec'y.

From the Boston Transcript.

SUPERIOR QUALITIES OF THE BLOOD HORSE.

MR EDITOR—It has been suggested to me, that the term "blood horse" is not properly understood, and that a common impression prevails, that the word *blood*, as applied to this animal, imports only high spirits and vigor; and that every horse, no matter what may have been his origin, is entitled to this qualification, if he is young, high mettled, and strong. Nothing can be more absurd, or indicative of greater ignorance on the part of those who profess an acquaintance with the perfect qualities of this noble quadruped.

A blood horse is one whose origin can be traced to the "Arab steed," or "Barbary courser." To be of pure blood, implies direct genealogy without the least collateral admixture, from an Arabian sire and a Barbary or Arabian dam. There are no distinguishing attributes so perfectly characterized, as those of the high bred or blood horse; and there is no animal, whether biped or quadruped, that so certainly perpetuates its ancestral virtues. The blood horse is the only legitimate aristocrat. His pretensions to rank are undisputed.

The common objection of our breeders to the blood horse is, that their bones being small, there must consequently be a deficiency of power, as compared with the common animal of the country. I grant this appears somewhat reasonable at first sight, but the contrary is susceptible of demonstration. There is the same comparative difference of compactness and strength, between the bones of the blood horse and those of other races, excepting perhaps the hunter, as there is between white and red oak; the one being solid and the other porous—less surface is required to produce the same power, either of support, resistance or endurance.

I have said, that the bred horse certainly perpetuates his excellent qualities. As a proof of this assertion, a remarkable anecdote is related in the 2d number of the first vol. of the Turf Register: About the year 1777 or 78, Gen. H. Lee, of the cavalry, and his officers, had their attention drawn to some uncommonly fine eastern horses employed in the public service; horses of such superior form and appearance, that the above officers were led to make much inquiry respecting their history; and this proved so extraordinary, that Capt. Lindsey was sent to examine and make more particular inquiry respecting the fine cavalry which had been so much admired, and with instructions, that if the sire answered the description which had been given of him, the captain was to purchase him if to be sold. Capt. Lindsey succeeded in purchasing the horse; when, on inquiry, he ascertained beyond all doubt, that he had been the most valuable animal in the stud of the Emperor of Morocco, who presented him to the commander of a British

frigate for the very important services rendered his son. The frigate visited one of the West India islands before she returned to England, and the horse having been put on shore for exercise, fell over some timbers in a lumber-yard and broke three of his legs. In this state he was given to the captain of a Connecticut vessel, who bound up his fractured limbs, brought him to this country, and succeeded in putting him on a good footing. The horse was known in Connecticut as the Ranger, and in Virginia as Lindsey's Arabian.

GODOLPHIN.

FOR THE NEW ENGLAND FARMER.

DESTRUCTION OF FRUIT TREES.

MR FESSENDEN—I have been repeatedly applied to by cultivators, since the ascertainment of the deep and extensive injury to fruit trees during the late disastrous winter, for advice as to the course to be pursued in a case so singular, and, as I believe, wholly unexampled in this country or in Europe. I have no doubt, that the destruction occasioned by the late winter, whatever may be the causes of it, is as wholly new as the Asiatic cholera, which is spreading itself throughout the world. I have been extremely embarrassed by these applications for advice, as much so as medical men seem to be as to this new disease so alarming to human life. It would be the highest presumption for one so conscious of his own ignorance, to undertake to give advice in such a new and unexampled case. But there are certain general rules and principles, and certain facts which are of more moment than rules, because they lie at the foundation of all sound practice, which may guide us in this case.

The mischief, in the present instance, has been extended to trees and plants which have for two hundred years, uniformly endured the severity of the climate of Massachusetts. The peach tree is the only exception. I think it may be affirmed of the tender varieties of that tree, that it suffers from frost in our Massachusetts climate, more or less fatally, in about one year in five. It suffers from other causes more frequently, and I think, I hazard nothing in saying, from forty-four years' personal experience, that a good crop of fine and perfect peaches cannot be fairly relied upon, in more than one year out of four. Happily, the rapid growth of that tree and its early coming into bearing, is some recompense for its great tenderness.

But although the harder fruit trees have always withstood the severity of our winters, we have at all times had among us trees and plants of a more delicate and tender nature, which frequently suffer by our too severe climate, such are the Madeira nut or English walnut, the Bignonia, Catalpa, the Bignonia radicans, and many others. These are often deeply and seriously affected by our winters, and the treatment applied to them may be some guide as to the course to be pursued with the peach, nectarine, apricot, plum, pear, and apple, in the present disastrous condition of these trees. Now, what is the most judicious course in such cases? Not to prune before the tree shows the extent of the injury done to it. When the buds break, (if they shall break, which is this year doubtful in many cases,) to prune back to the first vigorous and healthy shoot; to disregard all feeble shoots which have a sickly appearance; to cut off fearlessly all limbs, however large, which exhibit the appearance of decline or feebleness; to en-

courage only those shoots which give promise of future vigor; to abandon the wish to preserve the next year's fruit, at the expense of several years' disease.

I am well aware that these rules are loose and so are all general rules. The good sense and sound judgment of each individual must govern at last. But this I would say, that where the new shoots are feeble, the bolder the pruning the greater will be the success. I infer this from experience as to semi-hardy plants, which suffer every winter with us.

AGRICOLA.

Boston, March 31, 1832.

Note to the above.

Curious and anomalous facts for the consideration of philosophical farmers.

1. The semi-hardy plants have stood the late winter better than the hardy ones. The Magnolias, the Calicanthus florida, the Bignonia Catalpa, have not suffered; while the roses of the hardest descriptions have been cut down to the surface. The Macheure Aurantiaca of the Arkansas, has not suffered.

2. The slightest possible protection has secured plants, though the ground under that protection has had eighteen inches of frost.

3. Potatoes have been dug up at four inches depth, in a finer and fresher state than those gathered and stored in cellars.

These certainly are curious facts; that they are facts, the readers of this article may be assured. They are not exceptions; they are nearly universal on my estate. How are they to be explained? First, then, as to the plants of southern climates; they lost their leaves and soon after all their circulations, early in October; cold which was not hurtful to the pear leaf, was death to them; their buds were eased in their wintry coating; they were not moved by the comparatively inviting but chilly warmth of November. Simple cold is rarely destructive to a thoroughly well ripened stalk or bud. Hence all the Magnolias, the Calicanthus and Bignonias having no freezable fluids in their vessels, escaped; while the apple, pear, cherry and peach, continuing in a state of circulation till the tremendous cold of early December, perished. Such is my fancy.

2d and 3d. As to the two other facts referred to, they have often excited my astonishment; they are not new but perfectly familiar to most of us. They have never been explained, and what is singular, there never has been (so far as I know) even an attempt at explaining them. They seem to me to have been abandoned, as among the facts above, or beyond our reach, as much so as the cause of vitality and heat in animals and vegetables. It is undoubtedly owing to some power like that which preserves animal heat in living bodies, when dead flesh will freeze solid; but we are ignorant of the cause. That a potato should be kept fresh, when the ground is frozen one foot below it, is a matter, though certain, above our reach.

From the Genesee Farmer.

SEEDING.

There are a great variety of opinions concerning the time and manner of seeding lands with the different kinds of cultivated grasses, as also with regard to the grasses themselves. Our object at this time is not to combat those various opinions, knowing that many farmers are in the practice of

sowing their grass seeds in the latter part of winter, while yet sufficient snow remains upon the ground to indicate where it has been sown and where not.

With regard to the varieties of grass seed which are the most profitable, much depends upon the soil upon which it is to be sown. In wet or low grounds where they are unfit for ploughing, the common red-top, mixed with timothy grass (*Phleum pratense*) is found to be very profitable, making a tough and even surface, and enduring many years without decreasing in quality or quantity. There is a material advantage to the farmer in having some of this kind of mowing ground, that is, the red-top does not arrive at perfection until after wheat harvest, which enables him to cut more hay with fewer lands; but red-top should never be sown on lands intended for ploughing, as it is very difficult to subdue, and the sods remaining green, are apt to render the surface uneven when it is again stocked down. For plough lands, under a proper rotation of crops, we believe there are no grasses so generally approved as timothy and red clover (*Trifolium pratense*). These two grasses combine the properties of making excellent hay, and restoring strength to the soil; for the last purpose, red clover is better calculated than any other grass in common cultivation, as from the shape and construction of the leaves, it is capable of absorbing a larger quantity of carbon from the atmosphere, than almost any other grass. The major part of seeding that is done at this season, is upon grounds that were sown in autumn, with wheat or rye. It sometimes happens when grass seeds are sown in this manner, that there is an entire failure. This happens when our first warm weather in May is succeeded by a drought, by which the roots of the young grasses are dried, and the seeds or young plants undergo the same process as maling, which entirely prevents all after vegetation. To prevent this is desirable, and one of the surest ways is, as soon as the ground becomes sufficiently dry to allow a team to travel over it without sinking deep in it, to pass a light drag or bush over the ground, after which, roll it with a moderately heavy roller.

This may be objected to by those who have not tried the experiment, as being likely to tear up the wheat or rye; this will be the case to a small extent, but the remaining part will be sufficiently better to compensate for those lost. When the ground is intended for mowing, the rolling process should never be dispensed with. There has been much published respecting other varieties of *Trifolium*, besides the pratense of the Shamrock clover (*T. procumbens*), and the Italian clover, (*T. incarnatum*), but the red and white appear to be the only varieties which are counted profitable with us.—There are various other plants which belong in the same class, which bear so strong a resemblance to the clovers, that we will refer to them as they are frequently mentioned. Both the lucern (*Medicago sativa*) and saint fain or holy hay (*Hedysarum onobrychis*) are grown in France, but we do not consider them calculated to supplant the red clover and timothy in this country, for common farming purposes, although they may be found profitable near large towns, where early grass is a greater object. Neither of these last form an even sward, but as a manure crop they would be like other clovers.

At the working man's house hunger looks in, but never enters.

To CORRESPONDENTS.—We received, too late for publication this week, an interesting letter from T. A. KNIGHT, Esq. of England to the Hon JOHN LOWELL, accompanying a box of scions of new fruit sent by him to Mr Lowell.—Also several other communications, some of which are in type.

Kerrick Nurseries in Newton, near Boston.

FOR Sale at the Kerrick Nurseries in Newton, an extensive assortment of Apples, Pears, Berries, Plums, Cherries, Apricots, Nectarines, Mulberries, Quinces, Raspberries, Grape Vines, Gooseberry and Currant Bushes, and ten finest varieties of Strawberries, including Wilnot's Superior, Genuine Kerrick's Seedling, &c.

Also about 200 varieties of the most ornamental hardy trees and shrubs, including the Double Silver Fir and Double Spruce, Horse Chestnuts, Mountain Ash, Gum Acaia, Three Thorned Acaia, Butternuts, Ailanthus Tree of Heaven, Elm, Sugar Maples, Flowering Catalpas, Weeping Willows, Napoleon, &c. &c. Honeysuckles, and a superb variety of hardy Roses, &c. &c. Many of the above sorts of trees of extra sizes.

White Mulberry Trees by the 100 or 1000—for plantations.

Isabella Grape Vines, either singly or by the 100, at reduced prices.

Written orders addressed to John or William Kerrick, Newton, and transmitted by the daily mail, or otherwise, or if more convenient, left at the office of the New England Farmer, where catalogues may be obtained gratis, will be promptly attended to.

But purchasers are invited when convenient, to call and examine the Trees, &c. for themselves, and make their own selections.

Trees, &c. will be delivered in Boston free of expense for transportation, when ordered; and when particularly desired, they will be packed in mats with either hay or moss for sea or land transportation. March 21.

Linnæum Botanic Garden and Nurseries.

Flushing, near New York.

WM. PRINCE & Sons, Proprietors, announce that the great extensions made in their establishment, which now covers near 50 acres, completely filled with the choicest TREES, SHRUBS and PLANTS, enables them to offer the various kinds at the reduced prices stated in their new Catalogues, which will be sent to any person who may apply for them. The size and excellence of the Trees exceed all former periods; and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their personal attention. To nurseries they will allow a liberal discount and convenient credit. As many persons are agents for different nurseries, it is requested that orders intended for us be particularly specified. Every invoice sent has a printed heading and our signature, and such proof of origin will be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced.

Their Treatise on the Vine, describes 250 kinds of Grapes and their culture;—Their Treatise on Horticulture contains descriptions of a great variety of Trees and Plants, and directions for cultivating them; and their Pomological Manual, or Treatise on Fruits, contains full descriptions of above 1000 varieties of Pears, Plums, Cherries, Apricots, Peaches, Nectarines, Almonds, and other fruits, so that all persons can make their selections, *with knowledge of the qualities.*

Their new Catalogues will be sent to all applicants, and orders sent to them per mail, will receive the most prompt attention, and all letters desiring information, will be replied to by the first mail. 4w. March 21.

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 503 North Market street, by J. B. Russell: A fresh supply of Tall Meadow Oats Grass Seed, so valuable on this soil for either a hay crop or for grazing. Col. TAYLOR, a distinguished farmer, says of it, "It is the hardest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It keeps possession of the ground in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and if cut before the seed ripens, its hay is as pleasant and nutritive to stock, as any grass known to me."—See also the opinion of Mr. PHINNEY, a most judicious farmer, in the New England Farmer, vol. vii. page 300.

Also,—Lucerne Orchard Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Broom Corn, Seed Corn, &c. March 23.

Gooseberry and Currant Bushes.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, a good assortment of the finest Large Scotch Gooseberry Bushes, in lots of six roots each, two of a sort; white, red and yellow; imported direct from Glasgow, Scotland. Price \$1.50 per lot of six bushes.

Also, Large White and Red Dutch Currant Bushes, in lots of six and twelve each; packed in moss for transportation. Price of the White sorts \$1.50 per dozen—the Red, 75 cents. Specimens of the fruit preserved, can be seen at the store. Also, cuttings of the Large Red Currants—price 50 cents for a bundle of 200.

Fruit Trees.

ORDERS for Fruit, Forest and Ornamental Trees, shrubs, honeysuckles, &c. from Winslow, Kerrick, Prince, Buel and Wilson, Davenport's, and any other respectable Nurseries, received by the subscriber, and executed at Nursery prices. J. B. RUSSELL, New England Farmer Office. April 11.

Howard's Cast Iron Ploughs.

FOR Sale at the Agricultural Warehouse, Nos. 51 and 52, North Market street,—Howard's improved Patent Cast Iron Ploughs, of all sizes,—with wrought iron standards. The above Plough, which has been in general use the past season, is much approved by our best practical farmers, and considered by them the best Plough now in use. The iron and wood work being finished in the best possible manner, and the casting being ground and closely fitted, make the Plough very free and easy, as will appear by the following certificates.

CERTIFICATES.

Mr. Newell—I have used the Nos. 1 and 2 Howard Ploughs, which I purchased of you, and am much pleased with them. I have used a number of different kinds of cast iron ploughs, but have never found one that did the work so perfectly, with so little labor.

DANIEL CHANDLER.

Lexington, Aug. 27, 1831. Mr. Newell—The Howard Plough which Capt. D. Chandler introduced into Lexington, from your establishment, I consider to be a first rate article. I purchased a No. 2, last spring, and turned over about eight acres of very rocky turf sward land. I have likewise used it through the season upon different soils, some of which were very rough and stony, and find that it holds well and does the work easier and more perfectly than any other plough I ever used on my farm, either wood, wrought or cast iron. N. WILLINGSTON.

Gardener Wanted.

A Man is wanted to manage a common Kitchen Garden, about 20 miles southeast from Boston. He must be temperate, industrious, disposed to advance his employer's interest, and have a thorough knowledge of his business. To such good encouragement will be given. An American would be preferred. Apply at the N. E. Farmer office. 3t. March 21.

Hitchcock's Plough.

AN assortment of Hitchcock's Cast Iron Ploughs, with wrought iron standard and square Colter edged shares, may be had of the subscribers. These Ploughs are warranted equal if not superior to any that have been offered to the public. Try and See!

DAVID PROUTY, Hanover. JOHN MEARS, Dorchester.

Spring Wheat.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street, A few bushels of genuine Gilman Spring Wheat; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society. April 4.

Market Man wanted.

A steady and industrious man, who is a good salesman and ready reckoner, to take charge the present season, of a Market Wagon to Salem, Lynn, and Marblehead Markets. Preference will be given to one who is acquainted with marketing in this vicinity. Application may be made at the Reed farm in Lynn. Lynn, March 28, 1832. 4t

Silkworm Eggs.

FOR sale at the New England Seed Store, 50,000 Silkworm Eggs, warranted good, in packages of 5,000 each. Price \$1 per thousand; with short practical instructions for rearing them. April 11.

BRIGHTON MARKET—MONDAY, APRIL 16, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 317 Beef Cattle, 16 pairs Working Oxen, 13 Cows and Calves, 359 Sheep, and 160 Swine. 50 Beef Cattle were reported 1st week. 84 Beef Cattle remain unsold at the close of the market.

PRICES. Beef Cattle.—No particular variation from last week, the Cattle generally of not so good a quality. We quote extra at 6 25 a 6 50, prime at 6 a 6 25, good at 5 25 a 5 75, thin at 4 75 a 5.

Working Oxen.—We noticed the sale of one yoke at \$624, one at 70, one at 80, and one at 87; and one extraordinary yoke from Northampton at \$117 50.

Cows and Calves.—Sales were effected at \$22, 24, 25, and 30.

Sheep.—We noticed the sale of one lot of about 100 at 25 each, and a small extra lot at 8 75 each.

Swine.—In demand; lots were sold at 5c for sows and 6 for barrows.

New York Cattle Market, April 13.—At market this week 400 Beef Cattle; sales all brisk, and prices high; average \$7 50 per hundred. One superior Ox weighing from 16 to 1700, was sold at \$12. We quote \$6 50 a 8 50. Sheep, very few come to market, and for them high prices are obtained, \$5 a 7. Swine, sales brisk at \$4.—Daily Ad.

MISCELLANY.

From the New York Farmer.

EDITORIAL CORRESPONDENCE.

AN EVENING AT JUDGE BUEL'S.

One of the greatest enjoyments of society, is that of friendly colloquial interchange of sentiments, particularly when the conversation, from habit and taste, takes a useful turn, uniting the *utile et dulce*. And, since Providence has considered the conversational powers of men, too limited in their sphere of operation for the universal diffusion of knowledge, I shall, I trust, stand excused by Mr. B. for committing a few hints and facts to the press.

To protect plants.—The method which Mr. Buel adopts, to protect his young plants that are liable to be injured by insects, is to nail four pieces of thin boards or shingles, in the form of a square or oblong, and of convenient breadth; these are covered with cheap millinet. Thus made, it is put over the plant, and by being pressed into the soil, serves not only to keep off winged insects from the leaves, but also those worms or grubs that crawl on the surface. If one side of the frame is lower, or pressed down into the soil deeper, than the other, and placed towards the soil, more sun is admitted. The millinet is taken off of the frames, washed, and put away for another season.

Preserving Turnips.—It is not uncommon when turnips are buried, to have them sprouted in the spring, before it is convenient to take them out. This is prevented by making a small hole through the covering of the pit, with a crow-bar or similar instrument, to let the confined and heated air escape.

The Dibble.—This is a very useful little cheap implement. It is generally made like the upper half of a shovel handle sharpened to a point. It is used for transplanting. After a little practice, a person will use it with great facility, and set out a great number of plants in a short time.

Transplanting.—Mr. B. is in the habit of sowing in beds, and transplanting a great many kinds of plants and vegetables. When taken out of the beds, the roots are immediately put into a mixture of soil and water, so thick as to adhere to the roots. They are then transplanted with the aid of the dibble, at any time of the day and in any weather. Should it be dry, they will require watering the first night. The advantages of sowing in beds and transplanting are, that the plants are more easily protected from insects, can be brought forward earlier, require less labor to keep out weeds, and are put into fresh ground at a time favorable for a healthy growth.

Iron Plough.—This is entirely of wrought iron. It is sold by Mr. Smith, seedsman, Broadway, New York. Mr. Buel considers it a good article; it turns a more uniform and a handsomer furrow than others. It costs between twenty and thirty dollars, and is of course very durable.

Potato Hook.—This is an implement having three or four times, wider than those of a dung-fork, and nearly at right angles to the handle. Those who have many potatoes to dig, will find a convenience and profit in using it in preference to the hoe.

Drill Barrow.—When any considerable quantity of seeds are to be sown in drills, the drill barrow is a saving in the seeds and expedites the work,

independent of the advantages of a greater regularity, and consequently a more uniform and healthy growth of the plants.

Peach Pits are saved in the fall, and put away over winter, in boxes mixed with earth, to keep them from getting dry and hard. Pits that have been drying all winter, will seldom sprout the first spring, unless the shell is cracked. It is customary with unseymen to plant them without the shells. These are often sown in beds and transplanted.

Butter.—This important article in domestic economy, is manufactured in the best manner.—No water is put either in the cream or in the butter after it comes from the churn. Judge Buel considers that much of the aroma, on which the agreeable flavor of butter greatly depends, is carried off with water, particularly when warm or hot. Care is taken to have all the butter-milk thoroughly worked out, and the purest salt well incorporated with the butter. It is then put away in stone pots and covered with a little brine, in order to keep it from the air, on which the preservation of its good qualities depends in a very considerable degree, even after being made in the best manner. Butter thus made and preserved, in cutting it, neither sticks to the knife like soft wax, nor crumbles or cracks like cheese. That of last June's make is now apparently as mild and sweet as when first packed down.

Salt.—The salt manufactured at Syracuse and Onondaga, put up in baskets or in sugar-loaf form, is a most beautiful and snow-white article. Its purity makes it a valuable article for butter.

Loss of Trees.—Judge Buel states, that they have suffered in the nursery a loss of young trees, principally plum and pear, to the value of more than one thousand dollars. The cause he is unable fully to divine. Some of them, last summer, dropped their leaves prematurely. The eastern papers complain of great loss, attributed to the sudden appearance and great severity of frost.

To protect plants from frost.—It often happens that frosts appear in April or May, when vegetation is considerably advanced. By having a few square frames, and a number of sashes with four panes of glass to fit the frames, many thousand plants, in beds particularly, may be easily protected. These frames answer to protect and force early sowings, and keep off insects.

Preserving Strawberries.—Mrs. B. gives the following directions:—For every pound of berries take one of sugar. Dissolve the sugar in water over the fire; skim off the impurities that rise. When boiling hot, scald a few berries at a time; take them out and put them into a tumbler or small jar. Thus continue until all are scalded; putting only a few into one vessel or jar, in order to keep them whole. Boil down the syrup and pour it on the berries.

Rhubarb Pies.—Adjoining the barn, Mr. Buel has three barrels without heads, placed over three rhubarb plants. The tops of the barrels are covered with boards, and over the whole and on all sides, stable manure is placed. About the 25th of March, these three plants will fill the barrels with well blanched leaves, which will grow and flourish sufficient for fifty to a hundred pies. These pies, when eaten cold, are very much like, in flavor, to those made of gooseberries. Every farmer could, without trouble or expense, provide himself with them.

Albany, March 20, 1832.

Grape Vines.

THE subscriber offers for sale, at his garden in Dorchester, a few cuttings of the black and white "Moscatel" Grape Vines, just received by the brig "Cora" from Cadiz, procured for him by the Consul of the United States, resident there. He writes:—"I obtained these cuttings from vines on which I have seen clusters of grapes, weighing as much as Twenty-six pounds."—They contain several joints, and will be sold at 50 cents each.

Also, some very thrifty vines of the Ferrol Grape, a splendid black fruit, recently imported.

—ALSO—

Isabella;
Catawba;
Concord;
Black Hamburg;
Parcelona;
Blancs;
Black Cape;

3 varieties of valuable fruits, obtained from Xeres in Spain, and many other choice kinds.

Orders by Mail addressed to the subscriber, or personal application at his office, No. 73 Congress street, for any quantity of vines from one to one hundred, will meet with prompt attention.

March 12, 1832.

51

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed store, 50 North Market street, by J. B. Russell.

100 lbs. Large Mangold Wurtzel, of the very first quality. 100 lbs. French Yellow Sugar Beet, imported direct from France. 100 lbs. Ruta Baga, of the first quality. European growth; 100 lbs. large White Flat English Field Turnip; 150 lbs. Short Top Scarlet Radish, of English growth—very early, and of deep scarlet color.

March 28.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 50 1/2 North Market Street:

Five large Vines of the Isabella (purple); Winne (dark purple); Alexander, (black); and Catawba (red) Grape, with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each.

April 4.

Double Dahlia Roots, &c.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a fine collection of Roots of the Double Dahlia, or Georgina, viz. Double Scarlet, Red, Dark Crimson, Dwarf Red, Dwarf pale Purple, Yellow, Nankin, Black, Dark Purple, Curled Purple, and Brick color, at 75 cents each. Also, Tube Roses and Anemones, 25 cents each. Large Scotch Gooseberry Bushes, \$1 50, and in six roots of different sorts—with the greatest collection of Flower and Garden seeds.

March 28.

Flower Seeds, \$1 per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 50 1/2 North Market street.

Packages of the most showy and rare varieties of Flower Seeds, containing 15 varieties, among which are,

Geraniums (mixed).
Ten Weeks Stock Gilliflower.
Sensitive Plant.
Mexican Blue Ageratum.
Crimson Cypress Vine.
Forget-me-Not.
Ice Plant.
Elegant Coreopsis, &c. &c.

With directions for their culture. Each sort is labeled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 sorts.

Early Potatoes.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street:

A few bushels of the prime, early Potatoes, which have taken the premium at the Massachusetts Horticultural Society's Show the two last seasons; and are considered the earliest variety in this vicinity.

March 7.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within six days from the time of subscribing, are entitled to a deduction of fifty cents.

[If no paper will be sent to a distance without payment being made in advance.]

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

Horticulture.

NEW FRUITS.

MR FESSENDEN.—Having received a box of grafts with the inclosed letter from Mr Knight, by the ship *Lion*, I shall place the greater part of them at the disposal of the Massachusetts Agricultural Society, under whose directions and sanction my correspondence with Mr Knight commenced many years since. I publish the letter as affording a useful original and authentic account of their varieties, by the miser of them. It will be valuable fifty years hence. Yours,

April 16. J. LOWELL.

[Extract.]

Dorchester, Feb. 13, 1832.

"MY DEAR SIR—[I have great pleasure in sending grafts to you, because I have long known that you have been making the best use of them, and because I view you in the light of an *old friend*, who, I am sure, ardently wishes me well. I shall address the box to you, though as you will place the contents to a *great extent*, probably, in the hands of the Massachusetts Agricultural Society, I hope I shall not cause you expense, of which you have already borne so much, for the good of others.—[*Note.* Mr Knight misunderstood my meaning in asking him to send the grafts, not to me, but to the Massachusetts Agricultural Society. It was not to avoid *expense*, but *responsibility*—for I had found, to my extreme mortification, that I had been held answerable for all my own and the blunders of everybody else. J. LOWELL.]

"I wrote you last spring, that I had had the good fortune to obtain from seeds, several very excellent varieties of pears. I have now seen these varieties a second time, some a third time, and I feel confident, that for the climate of England they are unrivalled. The '*Monarch*' and the '*Althorpe Crassane*,' will not be excelled by any other varieties in your climate; both grow rapidly and bear abundantly.

"LIST AND CONCISE DESCRIPTION.

"*Monarch*, (not numbered.) This, in my estimation and that of a great many others, is without a rival, though its high musky flavor offends some persons. Season, December and January *here*.

"3. *Althorpe Crassane*, very excellent, rose flavored; November.

"4. *Belmont*, very excellent here in November. See Horticultural Transactions of this year, for an account of the above varieties.

"5. *Winter Crassane*, very large and excellent pear; season January. *Easton Castle*, season December. See Horticultural Transactions.

"6. *Pilford Pear*, [if I read Mr Knight's difficult hand correctly,] a rich, melting pear; season November.

"7. *Iceworth*, melting, rich, rose flavored March and April.

"8. *Broome Park*, a rather small but excellent variety, of which an account will appear in next No. of Horticultural Transactions.

"9. *Brougham Hall*, an excellent variety *here*.

"10. *Pengelly Pear*, a large dark brown pear, quite new and *not* ripe, i. e. February, 1832.

"11. *Gloire Mareau*, very large, of great excellence, a *Belge* variety. I see your grafts failed.

"No. A. 23. New, rather large, and very good at this time, Feb. 13. As yet, not named.

"No. 44. *Cuba*, pale yellow approaching white, quite new and *not* ripe; not yet named.

"The *Monarch*, above mentioned, grows so fast and bears so well, that I am planting it for *parry*, convinced it will make a very fine liquor.

"APPLE TREE GRAFTS.

"1. *Dorset*, *Nonpareil*,—2. *Cornish Gilliflower*,—*Iceworth Lapentrice*,—plum, keeps in perfection through the winter. Sincerely, yours,

THO. A. KNIGHT.

Hox. JOHN LOWELL, Roxbury.

"P. S. I have added two other varieties of early pears, *Dumore*, No. 13, and the *Craft Castle*, 14. See Hort. Trans. of present year."

DESTRUCTION OF FRUIT TREES IN MAINE.

THOMAS G. FESSENDEN, Esq.—Since your noticing the remarks of Mr Lowell, and others in different sections of Massachusetts, I commenced an examination of my fruit trees. I had one orchard containing about one hundred thrifty trees, which had been set about four years; also another orchard containing about one hundred more, set last year. Besides these, I had about one hundred of various kinds of apples, pears, and peaches; also about one hundred trees set out in trenches, to preserve them for sale, which were sent me last year from different persons, consisting of cherry, pear and apple trees. The first of these bore some fruit last year, and all were healthy and thrifty in November. About the first of November, I discovered some trees lousy, and I applied a portion of strong soft soap and the next day it rained profusely, and I found the soap had effected the object and destroyed every insect on the trees, and the bark became clean and smooth.

Before anything was said on the effects of the winter upon trees, I went into my best and largest orchard, and on examining some of the buds, by cutting open, I found them all dead in the centre. I could not find one which appeared to be free from the disease. This led to further examination, and I found several trees apparently injured. I immediately recollected the soap and fully believed that my soaping had destroyed my trees.

The next number of the *New England Farmer* brought Mr Lowell's account. This led to a further examination; and to view my orchard it looked in perfect health, but on examination I found my best orchard entirely destroyed, except two trees of early fruit, which stood on the highest ground. These suffered some, the last year's growth having been injured, but I think may survive. But all the others, consisting of Baldwins, russets, pippins of various kinds, with various other choice fruits, are all destroyed. The sliver, on cutting through the bark, was a dark brown color. I pursued the business of examining, and found the damage almost universal. Out of about 250 to 300 trees of my own, not more than 20, if there is that number, can possibly survive the winter. With some particulars I shall now close.

In one case, a tree about four inches in diameter, burst the bark near the ground in a perpendicular direction at the length of ten to twelve inches, and was entirely severed from the tree all around the body. Several which were grafted a foot from the ground, about the same size as the above, appear to be dead down to the original stock. A row of seedling trees set out last year in readiness to graft, appear to be in perfect health. A number of greenling trees received last spring from Rhode Island and set out, appear to be but little affected. About twenty seedling peaches, which grew with great luxuriance last year, appear in good health; also four rare pear trees I received of W. Kenrick; but all these, except the greenlings, were shielded from the north winds.

I received a letter from Bowdoin college, stating the effects in Brunswick, and in that town it is a general destruction; and I feel that it will discourage many from attempting the trial of rearing fruit trees. I fully concur with your correspondents in the cause, and hope no one will be hindered from the object, although they are in this vicinity much retarded in obtaining fruit. And I would suggest to you, Sir, the idea of those who are in a habit of sending trees at a distance, that after so severe a shock I should hardly think it prudent to transplant trees the present spring, as no one would be willing to purchase them if they are diseased, being sure of a failure. And I should likewise hope, that no nurseryman would put up any order unless he should be sure the trees are uninjured, as it would be a great means of still retarding the progress of horticulture. Much interest is felt on the subject, and Maine will necessarily have to contend with her mother State, as well as others, in suffering this evil. I would add one remark, that the apple trees which stood the most exposed appear at present to be the least affected. Now, Sir, I should like, through the medium of your useful paper, to have you request some of your friends to inform us what is the best course to pursue in order to save the roots, that they may sprout and grow. I am informed that one gentleman has already cut off the tops of an orchard and grafted them. Information on the subject is much needed and will be gratefully received. I remain, Sir, yours, respectfully.

Bath, Me. April 4, 1832. A. TYLER.

P. S.—Every day seems to develop more and more of the destruction of fruit trees in this vicinity. Since I wrote the above, I have heard of several instances and I fear Maine has suffered more than any other section of the country, in comparison with the quantity of fruit trees.

DESTRUCTION OF FRUIT TREES IN NEW YORK.

MR FESSENDEN—When I read in your paper of March 14th, Mr Lowell's account of the destructive effects of the past winter upon his fruit trees, I hastened into my garden and orchard, and, melancholy to relate, I find all my trees more or less injured; the young ones, in a particular manner, I fear are mortally affected. Upon these all, or nearly all, the wood of last year's growth is dead; grafted trees appear to have suffered the most; all

the thrifty suckers or gormands are dead quite to the ground, and I have examined a great many stocks which were grafted last spring and grew well, both in my own and neighbor's orchard, and I cannot find a single one that I think alive.—Pears, apples, plums, and engrafted cherries, have indiscriminately fallen victims to this destroying angel, nor does this end the distressing catalogue; all the variety of raspberries, all my holly roses are dead almost to the ground. The old apple trees which were never grafted, the common cherries and horse plums, I am in hopes are not so universally injured; while the gooseberry, the crab apple, the currant and filbert, have escaped with little or no damage.

This is a misfortune, sorrowful, indeed, and unheard of before in this country. Hitherto we have always thought that the apple tree, and many of the variety of plums, were as hardy and would sustain the severities of our winter as well as any of the forest trees; and as we had only a small crop of fruit last year, this disappointment will be severely felt, although the destructive effects should not extend beyond the present season.

Peach and quince trees have very frequently suffered with me in the same manner, and I conclude from the same cause. The trees continue to grow too long and until late in the autumn, and the winter approaches before they fill or perfect their buds, which are the vital parts and hyemal lodge of these plants.

Besides, if these vernal arborous flowers should fall to any great extent, may we not anticipate a famine among our honey-bees; for last summer the long and frequent rains very much impeded the labors of these industrious insects; their stores, consequently, were not as abundant as usual and must now be nearly expended. Ought we not therefore to bear this in mind, and afford them seasonable relief. In this way, we may atone for some of the cruel robberies committed upon their species last fall; and perhaps convince them that to live in the neighborhood of man, is not always a misfortune.

Our winter has been remarkably long and severe. In November, before the ground was frozen, there fell a great depth of snow, and great and steady cold immediately followed. For more than forty days in succession, previous to the 8th of January, the mercury in Fahrenheit was at no time above 32, and then for a few hours only. On the 27th of that month it was depressed 25 below zero, and continued several days and nights without rising 10 degrees. March has been a tedious prolongation of winter, and our fields are yet covered with snow.

Yours,

S. REYNOLDS,
Florida, Montgomery Co. N. Y., April, 1832.

PEACH TREES.

MR FESSENDEN—Having suffered much from the depredations of worms on fruit trees, and having tried everything recommended in this section of country, without destroying the worms or entirely preventing their depredations, I had almost despaired of ever succeeding in raising peach trees to perfection, until accident threw me in a way of acquiring some information, and learning a remedy, at least new to me. On a recent visit to Saybrook, I found T. Starkey, Esq. had applied coal tar to his trees with the most decidedly beneficial effects. On examining the trees to which this application had been made, I found no ap-

pearance of worms and every tree is healthy and flourishing; the old wounds have healed, and I should think run no danger of another attack.

Mr Starkey procured his coal tar from Capt. Champlain of the London packet ship President, whose family reside in Saybrook. The flavor of the tar is so strong, that the earth at the foot of the tree on which the tar ran down during last summer, appears to retain the strong flavor of the tar itself. It is applied with a common paint brush, about a foot in length on the lower part of the tree. I believe the coal tar can be procured at ship-chandlers, but whether as good as that brought by Capt. Champlain, I have no means of ascertaining. Very respectfully,

Your obt. serv't, J. ELLSWORTH.
Ketch Mills, Conn. April, 1832.

THE SEASON.

MR RUSSELL—It may be interesting to some of the readers of your Journal, to know what intense cold weather we have had to endure the past winter, in Anson, Maine, latitude 41° 55' north. And if you think this worth publishing you may give it a place, when it will not exclude more valuable matter.—The thermometer observed at sunrise,

Yesterday I examined my small apple orchard, that contains sixty young thrifty trees, and found them all alive; but among one hundred scions from New York that were set last May, I found sixty dead. I find my mulberry trees all alive.

ROBERT DINSMORE.

Anson, Me. April, 1832.

CATTLE SHOW,

And Agricultural Exhibition for the County of Bristol.

This will be held at Taunton on Wednesday Oct. 3d, 1832. The Committee state that the Bristol County Agricultural Society, "having been encouraged by the success of their efforts heretofore made, for the promotion of Agriculture and Manufactures in the County of Bristol, and by the patronage of the Commonwealth," offer certain Premiums, of which the following is an abstract.

STOCK.

For the best fat Ox, (meaning the one having the most flesh produced by the least expense,) \$8; second do, 6; third do, 4. Best fat Cow \$3; second 2. Best Heifer or Steer, not less than two nor more than three years, \$3; second 2. Best Bull, not less than one year old, having reference to size, form and disposition, \$10; second 7; third 5. Best Bull Calf, not less than four nor more than twelve months old, \$4; second 2. Five best milch Cows, all owned by one person, having re-

gard not only to their qualities for the dairy, but all other essential qualities in cattle, \$8, &c. A number of three dollar premiums for Merino and Saxon Bucks, and of any imported Ram except Merino and Saxon; six best Merino or Saxon Ewes, &c. For the best Boar, &c, \$3.

A disposition to early maturity in any of the animals, particularly swine, will be a strong recommendation.

WHITE MULBERRY TREES AND SILK.

To the person who shall produce satisfactory evidence of having in a course of cultivation, and in the most thrifty condition, the greatest number (not less than one hundred) of White Mulberry Trees, standing in rows not less than three feet apart, and not less than twelve inches apart in the rows, and not less than five feet high, \$10; second do, 5. To the person who shall produce satisfactory evidence of having in a course of cultivation, and in the most thrifty condition, the greatest number (not less than one hundred) of White Mulberry Trees, \$10; second do, 5. For the best raw silk or sewing silk, produced from the White Mulberry tree, not less than four pounds, \$4; for the second best, 3; for the third best, 2. A proportionally increased premium for a greater quantity of silk, not exceeding ten dollars.

GRAIN AND VEGETABLE CROPS.

Indian Corn on an acre, not less than eighty bushels, \$10; next best, averaging not less than sixty bushels per acre, raised on not less than two acres, \$7. Potatoes, not less than 550 bushels, \$8 and 6. Summer Wheat on a quarter of an acre, not less than six bushels, \$3 and 2. Rye, not less than twenty bushels on an acre, \$6. Barley and Oats, \$4 each. Hay, principally Herd's Grass, Fine Top, and Red Top, \$6 and 4. To any person who shall introduce any Grass not before cultivated in this country, and prove after actual experiment its superiority to any grass now cultivated, \$10. Premiums are also offered on Ruta Baga, Carrots, Mangel Wurtzel, Onions, English Turnips, Cider and Apples.

For the best cultivated Farm, \$15. For the second best, \$10. Competitors for the two last premiums must give notice thereof to Roland Green or Jacob Dean of Mansfield, or Alfred Baylies of Taunton, (the committee on farms,) on or before the first day of June next, that said committee may have time to view the same.

The premiums on Butter are \$10, 6, 4; on Cheese \$8, 6, 4; on Honey \$4, 2.

With regard to domestic and household manufactures, premiums are offered on cotton or linen shirting, sattinet, carpeting, hearth rugs, flannels, grass or straw bonnets, broadcloths, cassimere, woollen hose, blankets, broad hoes, narrow axes, gentlemen's and ladies' palm leaf hats.

A Ploughing Match and trial of Working Oxen are likewise to be exhibited, and premiums awarded to the successful competitors.

The notice of this exhibition (of which we could find room for this abstract only) appeared at length in the Taunton Reporter of the 18th inst.; and is signed by James L. Hodges, Jacob Chapin, and Wm. A. F. Sproat.

HORTICULTURE.

MR FESSENDEN—As the season has now arrived for those who delight in the business of gardening to commence operations, I take the liberty of sending you a few observations upon this pleasing employment. And here I will premise, that I

make no pretensions to skill in the art, all the little knowledge I possess having been acquired within a few years past, by personal attention to a small piece of ground attached to my dwelling-house, and to the variety of useful information which has appeared in publications devoted to such objects, and especially to the *New England Farmer*, which, by the way, I think should be taken and read by every man who has a rod of ground which can be cultivated; and I have no doubt he would obtain that information, which would enable him not only to turn his rod of ground to good account, but moreover, by leading his attention to contemplations and employments which are so well calculated to benefit society, would be likely to make him a more useful, and it certainly would a happier man.

I speak now experimentally, for up to the period above mentioned, I had as little taste for a garden as I had knowledge on the subject; and if I ever entered one, I scarcely knew a burdock from a cabbage plant, or a grape vine from a thorn-apple. But as it happened to be my lot to be possessed of a very small garden spot, as before mentioned, I set about cultivating it, though in such a rude manner as for the first year to bring little or nothing to pass. My trees and vines nearly all died for want of proper attention, as well as care in preparing the ground previous to planting them; so that the next year I had a great part of my work to do over again, and all this for want of necessary information. However, having profited by experience, I set about my work anew and proceeded to replace the trees, &c., I had lost; but as I soon found that, for myself at least, much greater profit as well as pleasure was to be derived from the cultivation of the vine, I have turned my attention principally to that, and thus far I have had the satisfaction of being abundantly rewarded for my labor, not only in partaking of its fruit, but still more, I may say, in its cultivation.

And who that knows the luxury of habitually rising with the dawn, and feasting his eyes and regaling his senses with the beauties and varieties of nature, brought into existence by means of his own labor, would envy him who is wasting his health and his time in unnecessary sleep? The former, while engaged in his wonted occupation, enjoys a real happiness; while the latter is perhaps *dreaming* of it and wakes but to feel disappointed.

The employment of gardening had its origin with innocence, and it has in every age occupied the attention of the wisest and best of men. Who does not know that our Washington was a successful and practical cultivator of the soil? And history associates the names of many other eminent individuals with his; it is then one of the most honorable as well as useful and pleasing employments, and to bring into practice what I here recommend, requires but little, if any, of that time which is usually allotted to business. The mechanic, the merchant, or the professional man, may find ample opportunity, if he will, in those odd hours and moments which are too generally spent to little purpose; and he would soon be astonished at the amount which might be accomplished, as well as the enjoyment to be derived from such labor. Neither does it require any considerable extent of ground for the purpose; almost every individual has attached to his dwelling a few feet, at least, that he can spare, and even this should not be neglected. Instead of this, there are undoubtedly many acres of land included

in house lots, within the city and vicinity, that are lying altogether waste.

A man will purchase an ample lot of ground, and erect a spacious house and its appendages, all which will be finished off in a style of convenience and taste, with spacious sidewalks and gravelled yards; but look into what *should be* his garden, and you see it perhaps covered with thistles and bramble bushes, or, if he has attempted at all to alter nature's course, you may possibly see a few cabbage plants here and a few cucumber vines there, and these almost lost among the twitch grass and weeds, which are disputing with them their right to the soil. How much to be lamented is it, that a spot which might, by proper culture, be made to look almost like a second Eden, should be suffered to remain a constant monument of that sentence which was pronounced to the first pair, "Cursed is the ground for thy sake—thorns also and thistles shall it bring forth to thee."

I am sensible we must depend upon our markets for the necessary supply of vegetables and the more hardy fruits, which will always be brought from the neighborhood in sufficient abundance.—But, besides all the variety of flowers, there are many delicate and very delicious *fruits*, which may be more advantageously raised in our sheltered inclosures, in and near the city; among these, the *grape* stands pre-eminent. This delightful fruit has of late claimed much of the attention of cultivators in this region; and I believe it has been clearly ascertained that our climate, though a more northern one, is more suited to this fruit than that of New York and other southern places; this may, however, be partly owing to the nature of the soil; but whatever may be the cause, the fact is certainly a very interesting one; and may we not hope that the time is not far distant, when the grape will become as common a fruit upon our table, as the apple is at the present day?—Half a century ago this would probably have been thought a visionary idea; but such has been the progress within a very few years, in the cultivation of this fruit, that such a supposition will not now be deemed extravagant; indeed, many men of good judgment anticipate with certainty, that our tables will soon be abundantly supplied with *wine* from our own presses.

There is no fruit, probably, of which so great an amount may be raised at so little expense and in so small a space, as that of the grape. The foreign varieties, particularly the White Muscadine, Sweet-water, &c., have till very recently, been the only ones which have been cultivated to any considerable extent in our country; because it has been the general opinion, that our own native grapes were too far inferior to the foreign ever to come into competition with them, but this idea is believed to be erroneous. Many varieties of native grapes have been found of excellent quality, both for the table and the wine press; which, when brought under good cultivation, do not suffer in comparison with the best of the foreign, and by some are even considered superior; of these, the Isabella and the Catawba stand in the highest estimation, and truly these are worthy of an American soil; and it may yet be found that our mountains and our valleys abound with others still, which will ere long be sought out and transplanted to our vineyards, till we shall no longer need to seek in other climes for what has been abundantly bestowed upon us in our own. But still I think

the delicate foreign varieties ought by no means to be neglected as table grapes, nor will they be by those who have had that experience in the management of them, which enables them to overcome the difficulties which attend their culture; these, to be sure, are great, especially from mildew and the cold of our winters, but modern improvements have nearly overcome these formidable obstacles.

Having been for a few years past somewhat successful in the cultivation of the kinds last mentioned, I propose in your next number to submit some things in relation to their management, which my short experience has taught me.

Yours, &c. D. FOSDICK.
Charlestown, April, 1832.

FOR THE NEW ENGLAND FARMER.

DIRECTIONS FOR THE CULTURE OF THE STRAWBERRY.

Dig your ground well; if not rich, put on some well rotted manure before digging and mix it well with the soil. Set the plants in rows, distance from row to row two feet, and the plants a foot apart in the row. Let the roots be firmly put in the earth but not too deep; do not water them unless it is very dry; keep the ground clear from weeds and loose, that the young runners may strike freely.

D. H.

Cure of Fever by Holly leaves.—M. Majendie has made a very favorable report of the use of powder of holly leaves, recommended by Dr Koussean as a cure for fever, it having been tried at the hospitals in thirteen different cases. The doses administered were from one to five *grains* per day, and in every case the patients were cured after about twenty days' treatment. The effect of the holly is not so quick as that of quinia and silicene, but is a sure and excellent febrifuge. The only thing necessary to make it thoroughly useful, was to extract its essential properties, so as to avoid the necessity of administering it in large quantities.—*London Register of Arts.*

Radishes.—To raise good early radishes, first obtain good seed; to do this, sow radish seed the latter part of July, late in the fall take them up, pack them in dry sand and put them in the cellar; next spring set them out and gather the seed as soon as ripe; this seed, if properly managed, will produce fine radishes. But seed obtained the same season they are sown will not give good ones; they will be hard, woody and wormy, and immediately run to seed; and the seed good for nothing but to sell with wooden pumpkin seed.—*Genesee Farmer.*

Maple Sugar.—A correspondent has transmitted to us the following account of an improvement in making maple sugar, first observed by Mr Orlando Brunson of Dundee. He extracts the sap from the root of the tree, instead of the usual way by cutting notches into the body of the tree. The root should be bored with a half inch auger and a crooked tube introduced, by which the sap may be extracted; the end of the tube entering the root, should be round. Mr Brunson thinks that trees tapped in this way, yield more than double the sugar to what they do if tapped two or three feet high; and he also thinks the tree is not injured by this method.—*New York Farmer.*

Agriculture.

BARLEY.

The soil for barley should be such as will grow good turnips, or other green crops, including clovers, and which embrace the varieties of loams and sands that are not wet, or very dry and poor. Indeed, I have taken my crops, and they have been pretty good, from my lightest turnip soils.—Barley cannot be cultivated to advantage upon stiff, heavy and wet grounds, or on such as are of a cold and tenacious quality. This crop occupies the ground but about three months; and it is only in a dry, light, mellow soil, that its roots can extend with sufficient facility, and supply the food necessary to bring the grain to rapid and perfect maturity.

Precious Crop.—Crops that precede this grain should be such as leave the ground mellow, and free from weeds; and for this reason hoed crops are to be preferred, such as turnips, potatoes, peas, beans, &c. Small grains should not precede it; they impoverish the soil, leave it foul, and, besides, it is contravening one of the most salutary maxims of husbandry, to grow two dry crops in succession. It may follow clover; but if the soil is heavy, the ley should be ploughed in autumn.—Barley is successfully sown upon the fallows in England, (not summer, but autumn fallows,) and is sown sometimes after wheat; but in the latter case turnips are pulled, and previously fed upon the stubble; a practice which I think is not likely to obtain here. I have generally sown barley after ruta baga or potatoes, these crops having received a good dressing of long, yard or stable manure.

Manure should not be applied to the barley, but to the preceding crop. The short period that this grain occupies the ground, does not afford time for the manure to decompose and yield its food to the plants; and, if applied in excess, it causes a too rank vegetation, and the straw lodges before the grain is matured. Where a fallow or clover ley is employed and ploughed in autumn, dung may be previously employed and ploughed under.

Preparation of the ground.—Where barley follows a root or hoed crop, one ploughing will generally suffice; but in all cases, a complete pulverization of the soil is necessary; and to effect this a roller is often of material benefit. If sown upon grass leys, ploughed in autumn, the spring ploughing should be shallow, so as to leave the sod reversed. But the preferable way may be to harrow the fallow, plough in the seed with a light furrow, and smooth off with the harrow.

The seed and sowing.—London enumerates six species and sub-species of the barley. The kinds uniformly cultivated here are the two, four and six rowed spring, (*hordeum vulgare*, and *h. distichon*.) Thin-skinned, pale, plump seed, should be selected. I sow as soon as the ground is sufficiently dry in spring. The young grain is not hurt by the ordinary frosts of the latter part of April and May. I sow from six to eight pecks per acre, according to the richness of the soil and the forwardness of the season; the poorest ground and the latest sowing requiring the most seed. In England, the common quantity of seed is from eight to sixteen pecks. Our climate being much warmer than that of Great Britain, barley and other grains till better with us, and consequently we require less seed. We uniformly sow broadcast, generally on the fresh furrow, and harrow in

both ways; and those who have a roller use it in the finishing operation. It gives a smooth surface, breaks down the lumps, brings the earth in contact with the seed, and if grass seeds have been sown, its use is doubly beneficial. I steep my seeds twenty-four hours in a weak solution of nitre, the crude kind of which costs me only eight cents per pound by the quantity. From the analysis and observations of Grisenhwaite, there is reason to believe that this salt is peculiarly beneficial to the barley crop, the grain yielding it on analysis. I have made no comparative experiments, but I think this step serviceable. I have applied to this grain, as a top dressing, with singular success, the powdered dung of pigeons and dunghill fowls, at the rate of twenty to thirty bushels the acre.

The crop admits of no after-culture when sown broadcast. Yet the application of the roller, when the plants are two or three inches high, is no doubt salutary, especially if there has been no considerable rains. Rolling gives a salutary compression to the soil, which in the spring is apt to be loose and porous, and full of cracks, by the alternation of freezing and thawing, or of wet and dry weather; it destroys many insects; and, above all, it partially buries the crowns of the plants, and introduces a multiplication of seed stalks. I can recommend the practice from experience. When grass seeds are sown with barley, the luxuriance of the young grass sometimes chokes the grain, robs it of nutriment, and sensibly diminishes the product. To obviate this evil, it has been recommended to sow the grass seeds after the barley has come up, and to cover them with a light harrow and a roller; and it is said, and I think with truth, that this operation will not materially injure the grain. In dry seasons, the crop is sometimes attacked by worms, while young. In this case, the roller should be applied and sufficient weight added, to require the draught of two or three cattle.

Time and method of harvesting.—When the soil is rich and the season propitious, this grain is very liable to lodge. If this happens after it has blossomed, no material injury is sustained in the product. If before, the crop is greatly diminished. This shows the danger to be apprehended from making the soil too rich, and of applying fresh manure. Barley is known to be ripe by the disappearance of the reddish cast on the ear, or what the English farmers term *red roan*; by the ears beginning to droop, and bend themselves round against the stems; and by the stalks becoming brittle, and of a yellowish color. This is the particular period for cutting, as, if suffered to stand longer, the heads break off and the grain wastes with the slightest touch. And it may be cut with the cradle, sickle, or scythe, according to circumstances. If it stands straight and is not too heavy, the cradle is to be preferred; if heavy, or lodged, the sickle or scythe. But, as the grain is yet soft and the straw contains much moisture, when it ought to be cut, it should be suffered to become well dried in the swath before it is bound in sheaves, or carried to the barn or stack. If cut with the cradle or sickle, it is bound in sheaves; but the more common practice is to cut the crop with the scythe, rake the ground, and load it with the barley fork.

Barley improves for making by lying till October before it is threshed; though it is often threshed immediately from the field. The great difficulty in preparing it for market is to rid it of the

awns. This may be done with flails, after it has passed once through the fanning mill. And, where it is in great quantities, it may be spread from four to six inches upon the barn floor, and trodden with horses.

Produce and profits.—The average product in England is stated by Donaldson at thirty-two bushels per acre. The product in New York varies from fifteen to seventy bushels, according to season and soil; and I think the average is somewhat short of that of Great Britain. Compared with wheat, its product is as two or two and a half to one; compared with oats, about equal, provided the soil is adapted to this grain. It is, however, to be remembered, that neither wheat nor oats are adapted to a barly soil; the first requiring a more still and tenacious and the latter a more cold and moist location. The average price of barley is at least two thirds that of wheat—supposing wheat, then, to be \$1 12 the bushel, and the product fifteen bushels per acre; and barley to be 75 cents, and the product of an acre thirty bushels, and the expense of cultivation equal, the profits of the barley will be nearly as three to two, compared to wheat. Barley, besides, is a less precarious crop, is subject to fewer diseases, and has fewer insect enemies to encounter than wheat.

A correspondent of the Bath Agricultural Society writes—"The last spring being remarkably dry, I soaked my seed barley in the black water, taken from a reservoir, which constantly receives the draining of my dung heap and stables. As the light grains floated on the top, I skimmed them off, and let the rest stand twenty-four hours. On taking it from the water, I mixed the grain with a sufficient quantity of sifted wood ashes, to make it spread regularly, and sowed three fields with it. The produce was sixty bushels per acre. I sowed some other fields with the same seed dry, but the crop, like those of my neighbors, was very poor, not more than twenty bushels per acre, and mixed with green corn and weeds when harvested. I also sowed some of my seed dry on one ridge in each of my fields, but the produce was very poor, in comparison of the other parts of the field."

From the Genesee Farmer.

HOT-BED.

MR GOODSELL.—Most of our books direct these beds to be made from three to four feet high, to be composed of recent stable dung, of tanner's bark, or oak leaves, with frequent linings to keep up the heat, and to impregnate the blossoms by hand, &c.

All this may be proper and necessary, where it is the intention to force fruits or vegetables to perfection during the winter months, but is attended with more expense and trouble than our gardeners and farmers are willing to bestow on the subject.

A hot-bed, however, may be made eminently useful in bringing forward many vegetables, at a season much earlier than can be done in the open air, and when used as a seed bed only, is attended with comparatively little expense or trouble.

I am therefore induced to send you a few directions for preparing and managing such a bed.

About the 20th of March, get into your garden or fence stable manure a sufficient quantity to form the hot-bed; select a spot for your bed open to the sun, set four sticks twenty inches above ground, four feet three inches each way in a square form. Begin to lay on the dung with a fork on the top of

the ground, being careful to shake and mix it well as it is put on, till the bed is raised to the top of the sticks, occasionally heating it with the back of the fork, so as to make it as level and smooth as possible. When this is done, put on the frame immediately and cover it with the sash; in about two days the heat will come on, and the bed will have settled to about sixteen or eighteen inches, when the sash should be removed and the dung made as level as possible within the frame, and about three inches of good garden mould or rich earth from grass ground laid over the dung within the frame, and the sash put on again; let it remain about two days more to warm the earth.

If the heat is too great it should be let off before sowing any seed; this may be done by removing the sash on the back side about an inch, by means of a wooden wedge made as follows: Take a piece of wood about three inches square, cut it to an edge at one end like a wedge; by introducing which, at the back side of the frame, the sash may be at any time raised from half an inch to three inches, to let off the hot steam or to admit fresh air. When the temperature within the frame is between seventy and ninety degrees, the earth should be smoothed and the seed sown. Such as Battersea and early York cabbage, cucumbers and melons, cayenne pepper, lettuce, or any other plant that you may wish to cultivate for early use or curiosity.

In the choice of cucumber and melon seeds, I should always prefer those of three or four years old, as they are much less liable to run to vine, and produce fruit much earlier than recent seed. All these plants may be removed into the open air about the first of May, being careful to select a moist time to transplant them. After the plants come up in the frame, they will frequently want fresh air, and for this purpose the sash ought to be raised an inch or two at the back side every clear sunny day, from the hour of ten, A. M. to three, P. M. being careful to shut it down at night, and in the day time during cold or wet weather. They will also want water about once a week; the water should be kept in the frame from twelve to twenty-four hours before it is used, and then applied moderately about once a week.

The frame for the seed bed should be about four feet square, six inches in front and twelve on the back side, tapering towards the front. The sash should be made to fit tight on the frame, and the outside pieces about three inches wide, the slats about an inch and a half wide, and set at such distance as to admit seven by nine glass, to be laid in a groove on each side lapsing about half an inch at the lower end, like shingles on a roof; this sash should be primed like a window sash before the glass is put in, and should have no cross pieces, as it would tend to obstruct and collect the water on the sash. A frame for the cultivation of sweet potatoes should be deeper, say ten inches in front and about fourteen on the back. These should never be planted in the same frame with other plants, as the vines will soon run so as to fill the frame, and smother every other plant in it.

JERUSALEM ARTICHOKE.—(Common Artichoke.)

This root may be made, under proper management, very beneficial and profitable to our farmers generally. Most of our farms contain gulleys and other broken grounds inaccessible to the plough, but frequently abounding with small spots of rich alluvial soil, which, if planted with artichokes,

would in a few years afford an excellent winter range for store hogs. This root requires little or no attention after the first planting, and will in a few years spread and fill the ground to overflowing with an excellent winter food for lean hogs; and when once well rooted in a loose and rich soil, can rarely if ever be eradicated. They should be allowed about three years to spread and grow before the hogs are turned upon them, after which, the rooting of the hogs will only tend to make them grow and spread faster, as the smallest piece left in the ground will grow. Such is the result of my experience and observation on this subject.

PEAS.

I have found the pea a good summer food for store hogs, and if managed as hereinafter directed, will be found profitable to our farmers generally. About the first of April plough and prepare about one acre of ground, more or less, according to the number of hogs intended to be kept. Sow on this acre about four bushels of common field peas, then, about ten days after, prepare and sow another acre, and so proceed at intervals of ten days each during the month of April; when those that were first sown are in full bloom and beginning to form pods, the hogs may be turned upon them; and so of the after sowings when they come to a similar state, in succession. The hogs will be found to grow and thrive finely. Such is the result of my experience on this subject.

BENE PLANT.

The seeds of this plant seem to have been introduced into our southern States by the negroes from Africa, and is cultivated by them in almost every patch, or negro garden, to a limited extent; and is considered by them as a specific in all cases of dysentery, diarrhoea, and cholera. For this purpose, about two quarts of cold water are put into a vessel, two green leaves are then taken from the bene plant, and the water kept stirring with them for about five minutes, by which time the water will have assumed nearly the consistence of starch, perfectly colorless and tasteless. Of this water the patient is made to drink freely and often, with the most beneficial effects in those complaints. In this climate, the seed should be sown about the first of April in a hot-bed, and may be transplanted into the open air about the first of May, in rows, and about twelve or fifteen inches apart. As it is only cultivated as a medical plant, a few seeds will probably be enough for any one family. Whether it will preserve its medical qualities after it is dried, I am not informed.

Yours, &c. R. M. WILLIAMS.
Middlesex, N. Y. Feb. 24, 1832.

Bag Meadows.—When you have an unproductive bog meadow, that will only produce coarse wild grasses, spread on a thin layer of loam and chip manure; let the weeds spring up; cover them up in the same manner, and at the proper time put on herdsgrass, and you will have a good yield. In mowing, do not pare your meadows too close; the heat of the sun is detrimental in such cases.—*Genesee Farmer.*

Gardens.—Do not spade up your garden ground for beds, until the ground is warm; then let it lie a day or two before you spade again. When the ground smokes in the morning put in seeds; you cannot much mistake.—*Id.*

Cedar Hedges, as ornamental divisions, in a neat farm, are much admired. I would recommend those who have moist farms to attempt the swamp cedar for hedges. Gather the cedar berries in December, rub off the resinous matter, and put them into unsalted ashes; and after two weeks put them in rows like peas, if the ground should open, if not, as soon as the ground is open; if well nursed they can be transplanted in two years, and into a rich light soil formed for the purpose; and in about seven years, by suitable trimming, they will make a most beautiful evergreen hedge.—*Genesee Farmer.*

Salt for Peach Trees.—An intelligent farmer of Brunswick, assures us that the application of common salt to the roots of his peach trees has had a good effect, in keeping the miller from depositing its eggs on the bark, and promoting the growth and the fruit of the tree.—*Long Island Star.*

How to bend Iron Pipe without cracking.—Fill the pipe with melted lead, and immediately on the lead ceasing to be fluid, and while it is yet warm, you will find the pipe bend very kindly in any form you please. By keeping up the warmth, you may adjust the bend into any form you desire, as iron will very readily bend at that heat. After having obtained the desired curve, the lead can be melted out.—*N. Y. Farmer.*

Easy method of fine edging a Razor.—On the rough side of a strap of leather rub a piece of tin, or a common pewter spoon, for half a minute, or till the leather becomes glossy with the metal. If the razor be passed over this leather about half a dozen times, it will acquire a very fine edge.—*Id.*

Potash for Manure.—A practical farmer of West Chester County, who has in the course of his life, given considerable attention to experiments, considers Potash at \$5 per hundred pounds, as cheap a manure as leached ashes at 12½ cents per bushel. Will some of the readers of this paper give a statement of the facts on this subject?—*Id.*

The last number of Silliman's Journal contains the result of some experiments made at Fort Adams, R. I. by Lieutenant T. S. Brown, to ascertain the relative strength of white pine, spruce, and southern or long-leaved pine. It appears from these experiments, that with a given diameter, white pine is about seven eighths as strong as spruce, and southern pine. Spruce is about two thirds as strong as southern pine.

Bees.—In addition to the destruction of fruit trees by cold weather and mice, we learn, that from some unaccountable cause, most of the bees in the neighborhood have perished the past winter, in consequence of which the market has been flooded with honey. We notice this rumor for the purpose of obtaining further information.—*Concord Yeoman.*

The Lowell and Boston Rail Road is in rapid progress. The most difficult places on the route have been broached, and although the work appears so great, that public spirit which characterises our country and which is capable of grasping the most difficult undertaking, will soon furnish us with a Rail Road upon which we may ride to Boston comfortably, before breakfast. We understand it is to be completed next fall.—*Lowell Mer.*

NEW ENGLAND FARMER.

Boston, Wednesday Evening, April 23, 1852.

Mistake Corrected.—In our acknowledgments to correspondents, page 302, 3d column of the current volume of the New England Farmer, we stated that the excellent communication from Mr Wm. Clark, Jr. published in the same paper, contained the first attempt we had seen to form an estimate of the amount of injury resulting from cutting corn-stalks at too early a period. But the N. E. Farmer, vol. viii. page 74, presents a statement quoted from *Lorain's Husbandry*, and sent us, together with other valuable articles, by "S. X.," in which the difference in the produce between rows topped and stripped and one left entire, was ascertained by actual admeasurement; as follows:

"Produce of the row that had *not* been topped and stripped, nine bushels and five eighths of corn in the ear.

"One of the rows which *had* been topped and stripped measured seven bushels and six eighths; and the other topped and stripped row measured seven bushels and three eighths of corn in the ear."

DESTRUCTION OF THISTLES.

Mr Dan Bradley, of Marechal, N. Y. has published in the Genesee Farmer of the 17th ult. "*An Appeal to the Public on the subject of Canada Thistles*," in which he proposes "that a system of measures for destroying the Canada thistles be instituted by government, and be prosecuted under its authority. It is certain that no other system than such as will be authoritative, compulsory, and highly energetic, will avail in the least towards effecting the object. It must also have a general and indiscriminate application to the whole State." He proposes that towns be compelled by law to provide funds for this purpose. That "four or five able and active men, supplied with implements well adapted to the work, should be entirely devoted to this business from the first of June to the first of October," &c.

In speaking of the necessity for adopting some measures for ridding the country of these vegetable pests, the writer says, "The subject is so immensely important, that considerations of expense should scarcely be allowed to have any bearing on the case. The import of the question is little less than whether it be possible to rescue the State of New York from ruin. What then is it worth? and what may be paid for its ransom?"

With regard to the modes of obtaining a remedy for the evil complained of, Mr Bradley observes, "I am aware that this plant is remarkably tenacious of life, and is not to be overcome without persevering efforts. But as I hope ere long to publish another essay on this subject, in which it will be my principal object to exhibit the best means yet known, for destroying the Canada thistles, I shall now waive these considerations. Cutting thistles, if done at proper times and in a proper manner, will at least stop their further spread by the dissemination of seed. This being done, I apprehend it will not be difficult to pursue a system of operations, by which the Canada thistle may in a little time be entirely overcome, and be banished from the country. Such an achievement would be of much greater value to the State of New York, than her celebrated and justly appreciated canals."

The writer observes, that "The Canada Thistle,

known to be chief and generalissimo of the formidable army of deleterious vegetable intruders, has, during a series of years, been making inroads upon the country, and this too at a ratio of increase constantly accelerating. It now prevails to an alarming extent and threatens a speedy and universal conquest of the country. The efforts of individuals against the enemy, can only avail to beat him off for a little while from their own premises. The interposition of government in this case is absolutely necessary."

REVIVING PLANTS, &c.

The London Mechanic's Register gives a method of reviving plants, &c, which may prove useful to those who wish to revive scion buds, &c, when their leaves and buds are faded, and their bark and roots hard and nearly dry. The directions are to dissolve camphor to saturation in alcohol, adding the former until it remains solid at the bottom of the latter; a sufficient quantity of rain or river water is then to have the alcoholic solution added to it, in the proportion of four drops to one ounce of water. As the camphor comes in contact with the water, for a short time the camphor will float on the water in small flocculi, but will ultimately combine with the fluid and disappear."

Plants which have been removed from the earth and have suffered by a journey or otherwise, should be plunged into this camphorated water, so that they may be entirely covered. In about two or at most three hours, the contracted leaves will expand again; the young, faded, and dependent shoots will erect themselves, and the dried bark will become smooth and full. That being effected, the plant is to be placed in good earth, copiously watered with rain or river water, and protected from the too powerful action of the sun until the roots have taken good hold of the ground.

If plants thus treated, are not restored in four hours, their death may be considered as certain, for they cannot be recalled to life by any artificial means. They should, consequently, never be left more than four hours in the camphorated bath; because the exciting action of the camphor, when it is continued for a longer period, may injure the plants instead of doing good to them. It is not necessary to say, that the final prosperity of the plants thus reanimated by camphor water, must depend on the particular properties of the former, the state of their roots, and the pains that are taken with them. The camphor produces no other effect than to restore life to plants nearly dead; after that, all proceeds according to the ordinary laws, and their ultimate state must be left to art and nature.

Thoughts on Flowers.—"Are not," asks the author of *Atherton*, "flowers the stars of earth, and are not stars the flowers of heaven? Flowers are the teachers of gentle thoughts, promoters of kindly emotion. We cannot look closely at a flower without loving it. They are emblems and manifestations of God's love to the creation, and they are the means and manifestations of man's love to his fellow creatures, for they first awaken in the mind a sense of the beautiful and the good.—Light is beautiful and good; but on its undivided beauty and on the glorious intensity of its full strength, man cannot gaze; he can comprehend it best when prismatically separated, and dispersed in the many colored beauty of flowers; and thus

he reads the elements of beauty, the alphabet of visible gracefulness. The very utility of flowers is their excellence and great beauty; for by having a delightfulness in their very form and color, they lead us to thoughts of generosity and moral beauty, detached from and superior to all selfishness; so that they are pretty lessons in nature's book of instruction, teaching man that he liveth not by bread, or for bread alone, but that he hath another than an animal life."

Recipe for Mildew.—A writer in the Gardener's Magazine, (John Hayeroff,) recommends the following composition for fruit trees, as a remedy against mildew. To four gallons of rain or river water add two pounds of soft soap, one pound of flour of sulphur, one pound roll tobacco, one quart fresh shelled lime, and one pint of spirits of turpentine; mix the whole together, and boil the mixture slowly for half an hour.

The writer applied this composition with sponge, where it could be used with effect, and in all the crevices and joints used a painter's small soft sash brush. He does not say how often nor at what times of the year he applied his composition.

To detect stolen posts, pales, fagots of wood, &c—An English newspaper gives us the following: "Bore holes in them and fill them with gunpowder, or crackers; when the thief puts them in the fire they will tell tales."

Blue Color from Buck Wheat.—"The London Literary Gazette gives the following, as a method of extracting blue color from buck wheat:—"The straw should be gathered before the grain is quite dry, and placed upon the ground in the sun, until it becomes sufficiently dry to be taken from the husks with facility. The wheat having been removed, the straw is to be piled up, moistened, and left to ferment till it is in a state of decomposition, when it will become a blue color; this indicates the period when it should be gathered and formed into cakes, which are to be dried in the sun or in a stove. On these cakes being boiled in water it assumes a strong blue color, which will not change either in vinegar or in sulphuric acid. It may, however, be turned into red with an alkali, into a light black with bruised gail nuts, and into a beautiful green by evaporation. Stuffs dyed blue with this solution, which is to be used the same way as vegetable matters of similar species, employed in dyeing, become of a beautiful and durable color."

Paper from Wood.—It has lately been discovered, says an English Journal, that the best paper for wrappers, writing and printing, may be produced from wood shavings boiled in mineral or vegetable alkali. One hundred pounds of wood and twelve pounds of alkali, will produce a ream of paper.

Ashes placed in the wood-house of J. Kent, Esq. Piermont, N. H., caused the destruction of that gentleman's property, and the death of his three daughters—Sophia, aged 28; Mary, 18; and Jane, 15. Their remains were collected and buried in one coffin. Five hundred persons assembled at Mr K.'s barn, where the funeral obsequies were performed!

There is a prospect of a good crop of peaches in the southern States.

Notice.

THE members of the committee of the Massachusetts Horticultural Society on the Products of the Kitchen Garden, are requested to meet at the Agricultural Warehouse, Boston, on Saturday, 28th inst. at 2 o'clock, for the purpose of proposing Premiums for the ensuing season.

DANIEL CHANDLER, Chairman.

Lexington, April 19, 1832.

Winship's Nurseries.

AS the season is so far advanced, that all injury to natural production, occasioned by the severity of the preceding winter, can readily be ascertained, persons in want of Fruit and Ornamental Trees, of various kinds—of flowering and showy Shrubs, Creepers and Vines, including the elegant monthly or ever-blooming fragrant Honeyuckles, eight or ten feet high, and such plants as will produce a fine display of Flowers the ensuing season—with a very superior assortment of Herbaceous Perennials, that will also bloom, with proper management, this summer, if removed within a week or ten days—together with the new and fashionable Scotch Roses, so much admired at the exhibition at Horticultural Hall last season, constituting sixty varieties—are invited to visit the establishment and select for themselves.

Orders may be left with J. B. RUSSELL, or sent via mail, to Messrs WINSHIP, Brighton, and the plants will be furnished, and sent out the following morning in the city, if requested.

3w April 25.

For Sale.

A half blood Durham Short-horn Cow, eight years old, with Calf by a full blooded bull of the same breed. Her calves have been large and uncommonly fine animals.

CHARLES E. NORTON.

South Berwick, Me. April 25, 1832.

A Farm Wanted.

THE Directors of the Boston Farm School, have appointed the subscribers a Committee to select and purchase a Farm suitable for the purposes of that institution. Persons who are desirous of disposing of such property, situated in the neighborhood of the city, are requested to state the terms and annex thereto a description of the land, buildings, &c. addressed to

JOHN TAPPAN, } Committee of the
JOHN D. WILLIAMS, } Directors of the
SAMUEL T. ARMSTRONG, } Farm School.
April 25.

Linnean Botanic Garden and Nurseries.

Flushing, near New York.

WM. PRINCE & Sons, Proprietors, announce that the great extensions made in their establishment, which now covers near 50 acres, completely filled with the choicest TREES, SHRUBS and PLANTS, enables them to offer the various kinds at the reduced prices stated in their new Catalogues, which will be sent to any person who may apply for them. The size and excellence of the Trees exceed all former periods; and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their personal attention. To nurseries they will allow a liberal discount and convenient credit. As many persons are agents for different nurseries, it is requested that orders intended for us be particularly specified. Every invoice sent has a printed heading and our signature, and such proof of origin must be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced.

Their Treatise on the Vine, describes 280 kinds of Grapes and their culture.—Their Treatise on Horticulture contains descriptions of a great variety of Trees and Plants, and directions for cultivating them; and their Pomological Manual, or Treatise on Fruits, contains full descriptions of above 1000 varieties of Pears, Plums, Cherries, Apricots, Peaches, Nectarines, Almonds, and other fruits, so that all persons can make their selections, with knowledge of the qualities.

Their new Catalogues will be sent to all applicants, and orders sent to them per mail, will receive the most prompt attention, and all letters desiring information, will be replied to by the first mail.

4w. March 21.

Fruit Trees.

ORDERS for Fruit, Forest and Ornamental Trees, shrubs, honeyuckles, &c. from Winship, Kenrick, Prince, Buel and Wilson, Davenport's, and any other respectable Nurseries, received by the subscriber, and executed at Nursery prices.

J. B. RUSSELL.

For sale, as above, a few Dwarf Apple Trees worked on paradise stocks, packed in moss—price 25 cents each. New England Farmer Office.

April 25.

Kenrick Nurseries in Newton, near Boston.

FULL Sale at the Kenrick Nurseries in Newton, an extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Mulberries, Quinces, Raspberries, Grape Vines, Gooseberry and Currant Bushes, and ten finest varieties of Strawberries, including Wilmot's Superb, Genuine Keen's Seedling, do.

Also about 200 varieties of the most ornamental hardy trees and shrubs, including the Double Silver Fir and Double Spruce, Horse Chestnuts, Mountain Ash, Gum Aescia, Three Thorned Acacia, Butternut, Albion Pear Tree of Heaven, Elm, Sugar Maples, Flowering Catalpas, Weeping Willows, Napoleon, do. do. Honeyuckles, and a superb variety of hardy Roses, &c. &c. Many of the above sorts of trees of extra sizes.

White Mulberry Trees by the 100 or 1000—for plantations.

Isabella Grape Vines, either singly or by the 100, at reduced prices.

Written orders addressed to John or William Kenrick, Newton, and transmitted by the daily mail, or otherwise, or if more convenient, left at the office of the New England Farmer, where catalogues may be obtained gratis, will be promptly attended to.

But purchasers are invited when convenient, to call and examine the Trees, &c. for themselves, and make their own selections.

Trees, &c. will be delivered in Boston free of expense for transportation, when ordered; and when particularly desired, they will be packed in mats with either clay or moss for sea or land transportation.

March 21

A Stud Colt, and North Devon Bull.

A beautiful Colt, near three years old, dark Bay with black mane and tail—being the first Colt got by the celebrated Horse *Barfleet* in this country, and from a superior and large native mare—price 250 dollars.

A North Devon Bull, near 9 years old, was imported by the subscriber from England, and is a fine animal.—This breed are always in color dark red, therefore easily matched for working cattle and are quick travelers, is a sure Calf getter, in good health and condition, but from his age will be sold for \$50.

Several superior Cows from the best Imported stock, partly *Hollderness*, *Alberney*, and *Durham short horns*, have Calves, or near Calving, by the first of the New Devon Bull, from 35 a 50 dollars. Apply to JOHN PRINCE, Jamaica Plain, March 27, 1832.

Gooseberry and Currant Bushes.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, a good assortment of the finest Large Scotch Gooseberry Bushes, in lots of six roots each, two of a sort; white, red and yellow; imported direct from Glasgow, Scotland. Price \$1 50 per lot of six bushes.

Also, Large White and Red Dutch Currant Bushes, in lots of six and twelve each; packed in moss for transportation. Price of the White sorts \$1 50 per dozen—the Red, 75 cents. Specimens of the fruit preserved, can be seen at the store. Also, cuttings of the Large Red Currants—price 50 cents for a bundle of 200.

Spring Wheat.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street.

A few bushels of genuine Gilman Spring Wheat; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society.

April 4.

Asparagus Roots.

JUST Received at the Seed Store connected with the New England Farmer, 504 North Market Street:

A few thousand Large Early Asparagus Roots, packed in moss, in boxes of one, two and three hundred roots each—will bear transportation any distance—price \$1 per hundred for those 3 years old, 75 cents per hundred for the others.

April 4.

Emerson's Second Part.

OF the North American Arithmetic is this day published by LINCOLN & EDWARDS. The plan of this work is such, that mental and written arithmetic are very happily and conveniently united. Although Rules are not excluded from the book, yet the illustrations which the author has introduced, render the operations on numbers so clear and interesting, that the learner is prepared rather to make his own rules, than to rely on them from his book.

BRIGHTON MARKET—MONDAY, APRIL 23, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 202 Beef Cattle, (including 75 unsold last week,) 10 pairs Working Oxen, 25 Cows and Calves, and 79 Sheep; 8 or 10 beef cattle unsold.

PRICES. Beef Cattle—Sales were quick and a little better prices may have been obtained on some qualities. We quote extra at \$6.25 a 6.50, prime 6 a 6.25, good 5.50 a 5.75, thin 5 a 5.25.

Working Oxen.—Ordinary, sales were effected at \$60, 65, 68, and 72.

Cows and Calves.—We noticed sales at \$16, 18, 21, 24, 26 and 30.

Sheep.—A sale effected, but price not known. Swine.—None at market; they are much inquired for, and a thousand or two would find a ready market at good prices.

New York Cattle Market, April 20.—At market this week, 500 head Beef Cattle; quality rather increasing; sales brisk, prices about the same; fair average of sales \$7.50; we quote 6 a 9. Sheep—about 300 in, prices are coming down a trifle; not sheared \$5 a 8; sheared 2.25 a 5. Hogs—sales at 3.50 a 4.—Daily Ad.

At the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From Porter's Month Almanac.

PREVENTION OF DISEASE.

The following highly judicious precautions, as those proper to prevent the occurrence of cholera, were addressed by the medical authorities of the place, to the inhabitants of one of the Russian cities. They are equally well adapted to ward off an attack of every other prevalent bowe complaint, or indeed, of any epidemic disease; and should be cautiously adhered to by all who inhale or are obliged to visit a sickly district.

1. To avoid, as much as possible, the influence of cold, or a sudden reduction of the temperature of the body. During damp, wet, and otherwise inclement weather, to wear warmer or thicker clothing than usual, and especially to defend the feet and legs by woollen stockings and substantial boots. The feet, in particular, should always be kept dry, and the clothes immediately changed when they have been accidentally wet with rain, or in any other manner.

2. Never to sleep in the open air, or in a draft during the night or day; and especially to avoid sleeping on the damp ground, or in damp beds or apartments.

3. To avoid loading the stomach with an excess of food, especially such as is indigestible;—consequently, it is strictly forbidden to eat crude apples, pines, melons, cucumbers, raw turnips, carrots, mushrooms, and similar species of food.

4. To make as little use as possible of stimulating drinks, and all aliment of a heating nature. Especially to abstain from eating garlic.

5. To be very careful to preserve the body perfectly clean; to change the linen as often as possible, and to observe the strictest cleanliness not only in the houses, but also in the streets, courts and alleys.

6. Never to allow the air to stagnate in any apartment. To prevent this, the windows should be left open during the day, when the weather is fine; and when it is damp or rainy, a fire should be lighted occasionally.

7. Never to go out in the morning fasting; to avoid considerable fatigue in the labors of the day, and to expose the body as little as possible to the direct rays of the sun.

8. To avoid carefully the least despondency or chagrin; and on the contrary, to preserve by all proper means, a tranquil, confident, cheerful disposition. This is all important for preventing an attack of any prevailing disease.

Novel Society.—There is in Albany a Society, in the nature of a mutual insurance, for the relief of the sick. Each member pays one cent daily, and when sick draws four dollars a week. In two years, besides the relief afforded, the society have accumulated \$700. Such a society must greatly benefit the poor, as a small pittance will insure them against dependence in sickness; and sooner or later sickness overtakes all. Societies of this kind should be encouraged, especially in large cities. There are many relief societies of the same character in Philadelphia, which, by monthly contributions of twenty-five to fifty cents, from each member, afford to support him and his family during sickness, besides giving his widow forty or fifty dollars in case of his death.—*Philadelphia Saturday Bulletin.*

From the Exeter (N. H.) News Letter.

MR SLEEPER.—Seeing in your valuable paper a recipe to make boots and shoes water-proof, is the cause of my offering one, as I think, much more valuable, as it will not only render them minutely water-proof, but the materials used will be a benefit instead of an injury to the leather. Put four ounces of India Rubber cut fine into a tight vessel, and add to it one quart of neat foot oil, keep it in some place where it will be moderately warm until the Rubber is dissolved, then apply it to your boots and shoes, and you need not be afraid of wet feet, unless you get into water over the tops.

EXPERIENCE.

Intercourse of the Sexes.—What makes those men who associate habitually with the women, superior to others? What makes the woman who is accustomed to and at ease in the company of men, superior to her sex in general? Why are women in France so universally admired and loved for their colloquial powers? Soberly because they are in the habit of free, graceful, and continual conversation with the other sex. Women in this way lose their frivolity; their faculties awaken; their delicacies and peculiarities unfold all their beauty and captivation in the spirit of intellectual rivalry. And the men lose their pedantic, rude, declamatory, or sullen manner. The coin of the understanding and the heart interchange continually. The asperities are rubbed off, their better materials polished and brightened; and their mellowness, like fine gold, is wrought into finer workmanship by the fingers of woman, than it ever could be by men. The iron and steel of character are hidden, like the harness and armor of a giant, in studs and knobs of gold and precious stones, when not wanted in actual warfare.—*N. Y. paper.*

"No great loss without some small gain."—The prevalence of the cholera in England, has given a new impulse to the cause of temperance in that country; it being a well ascertained fact, that this terrible disease traces out a drunkard without a sure ascent as a blood hound the object of its pursuit. It is indeed a melancholy remedy for intemperance; yet, if Providence sees fit thus to purify the moral elements of society, who shall dare to complain? Let *run-drinkers* in America take warning, while yet the curse is a stranger to our shores!—*Essex Register.*

A Sleepy Hat.—"Isn't your hat sleepy?" inquired a little urchin of a gentleman, with "a shocking bad un" on. "No! Why?" inquired the gentleman. "Why, because it's a long time since it had a nap," was the answer.

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed store, 50 North Market street, by J. B. Russell,

100 lbs. Large Mangold Wurtzel, of the very first quality. 100 lbs. French Yellow Sugar Beet, imported direct from France. 100 lbs. Ruta Baga, of the first quality, European growth; 100 lbs. large White Flat English field Turnip; 150 lbs. Short Top Scarlet Radish, of English growth—very early, and of deep scarlet color. March 28.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:

Fine large Vines of the Isabella (purple); Winne (dark purple); Alexander, (black); and Catawba (red); Grape, with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each. April 4.

Double Dahlia (to).

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market street, a fine collection of roots of the Double Dahlia, or Georgian, viz. Double Scarlet Red, Dark Crimson, I was told, Dwarf pale Purple, Yellow, Naueken, Black, Dark Purple, United Purple, and Black robe, at 75 cents each. Also, Tuber Roses and Anemone, 25 cents each. Large Scotch Gooseberry Bushes, \$1.50, and mix roots of dill cut to 18— with the greatest collection of flowers in England now sold. March 28.

Flower Seeds, &c. per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market street.

Packages of the most showy and rare varieties of Flower Seeds, containing 18 varieties, among which are, Geranium (mixed). Ten Weeks Stock Gillyflower. Sensitive Plant. Mexican Blue Ageratum. Crimson Cypripedium Vine. Forget-me-not. Ivy Plant. Elegant Coropsis, &c. &c.

With directions for their culture. Each sort is labelled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 varieties.

Early Potatoes.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:

A few bushels of the prime, early Potatoes, which have taken the premium at the Massachusetts Horticultural Society's Show the two last seasons; and are considered the earliest variety in this vicinity. March 7.

New American Gardener, sixth edition.

This day published by J. B. Russell and Carter & Hendee:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, Asparagus, &c. &c. By T. G. Fessenden, assisted by several gentlemen. Sixth edition. Price \$1.00.— This we think may be considered the most popular and practical work on Gardening, extant. March 28.

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 50½ North Market street, by J. B. Russell:

A fresh supply of Tall Meadow Oats Grass Seed, so valuable on thin soils for either a hay crop or for grazing. Col. TAYLOR, a distinguished farmer, says of it, "It is the hardiest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It keeps possession of the ground in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and if cut before the seed ripens, its hay is as pleasant and nutritive to stock, as any grass known to me."—See also the opinion of Mr. PHINNEY, a most judicious farmer, in the New England Farmer, vol. vii. page 300.

Also, Lucerne Ordeal Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Broom Corn, Seed Corn, &c. March 28.

Market Man wanted.

A steady and industrious man, who is a good salesman and really prepared to take charge of the present season of a Market Wagon, at Salem, Lynn, and Marblehead Markets. Preference will be given to one who is acquainted with marketing in this vicinity. Application may be made at the Reed farm in Lynn. Lynn, March 28, 1832. 4t

Silkworm Eggs.

FOR sale at the New England Seed Store, 50,000 Silkworm Eggs, warranted good, in packages of 5,000 each. Price \$1 per thousand; with short practical instructions for rearing them. April 11.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

Printed for J. B. Russell, by I. R. Burrs—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. Russell, at the Agricultural Warehouse, No. 52, North Market Street.

INJURED FRUIT TREES.

MR. EDITOR:—Since the publication of Mr. Lowell's remarks upon the destruction of fruit trees, I have been prevented by indisposition, from ascertaining the extent of the calamity in this quarter. As far, however, as my own trees and a few others in the neighborhood may be taken as specimens, I am induced to believe that much less injury has been sustained in this, than in other places reported to you.

The fact noted by several of your correspondents, that the sap wood and inner bark have become already discolored, and in some cases quite black, may be considered as a sufficient confirmation of Mr. Lowell's opinion, as to the time when the mischief happened. Had it been occasioned by spring frosts, a circumstance of frequent occurrence in this climate, no appearance of disease would have been detected at this early day. We may therefore, I think, infer, that when no disease is *now* perceptible, no danger is to be apprehended. Where there is no separation of the bark from the wood in large trees, nor discoloration of the sliver in small trees, they are probably safe.

If this conjecture be well founded, our loss is limited, as far as I have seen, to small engrafted pears in the nursery, which are entirely dead, and to some partial injury to other very fast growing nursery trees. No injury has been discovered among bearing trees of any kind.

Familiar as I have been with the loss of trees by unseasonable heats followed by sudden and severe cold, this is the first case of the kind within my observation, clearly referable to the earliest winter frosts; and is the more alarming as being less easily guarded against, than the dangers incident to the first approaches of warm weather.—In the latter case it is only necessary to preserve an uniformly low temperature about the roots, so as to prevent premature action of the sap vessels, until all danger of severe frosts shall have passed away; and this may be effected by heaping about the tree, after the ground shall have been frozen, some non-conducting substance, such as chip-mature, straw, saw-dust, shaving, turner's chips, or the refuse of flax and hemp.

In our open cold winters, the earth freezes deep and our trees always come out well; but under a covering of several feet of snow the earth does not freeze, and if previously frozen the ice is extracted and the soil kept warm. On the approach of spring, the snow is first dissolved immediately about the trunk, forming a kind of tunnel in which the solar heat is reflected and concentrated, inducing strong action in the vessels and circulating fluids. Sudden and severe cold in such circumstances, is usually fatal to the tree. Not perhaps, merely by a rupture of the sap vessels; but possibly by a more complicated process, in which the wood is violently separated from the bark, and the space filled with a pellicle of ice, which prevents a re-union of the parts in time to repair the ruptured vessels; and the dissolving frost is followed by almost immediate putrefaction. But whatever

may be the particular process, the death of the tree is believed to be certain and past remedy. Heading down, as suggested by Mr. Wheeler, may save the root; but of the trunk there is no hope.

The spring of 1829 was particularly disastrous to the more delicate trees in this vicinity. Of more than fifty bearing plums of the finer kinds, not one was saved. Where the bark was wholly detached from the trunk, I had the trees cut down to the ground, and in many cases young and vigorous shoots were produced. But a row of large and fine green gages, having some stripes of adhering bark about the trunk, and an encouraging appearance of life in the branches, were saved from the axe; the loose bark was removed and Forsyth's composition applied. The consequence was, that a few sickly leaves came out which withered almost immediately; and before midsummer the trees were dead, root and branch.

The following circumstance struck me at the time, as going to prove the utter destruction of the tree from the first touch of the disease. Of a large number of scions taken from all the various kinds, before any indications of disease were perceptible, not one succeeded.

There is, I apprehend, a very important fact connected with this subject, which I do not recollect to have seen distinctly alluded to by either of your correspondents; and that is, that trees and even young grafts, raised in a similar or more northern climate, suffer much less than those of the same variety from farther south. And *least* of all, those grown from seeds on the same farm, and even in the same field.

The same remark is believed to be equally applicable to many other diseases and accidents incident to fruit trees, and so fully am I persuaded of its importance, that I place little value upon southern trees otherwise than as producing scions, which, when engrafted on native stocks and carried safely through two or three winters, may be so far acclimated as to deserve a place among the fruits of the country.

Fine cherries from Kenrick's nursery are sickly and short-lived. The same varieties from Hallowell are less so; and scions from the latter, engrafted on the native stock, are as healthy as our ordinary forest trees.

In the severe season of 1829, several thousand scions from New York and Pennsylvania, set the preceding May, all perished; while those from Montreal and from my own orchard, all came out well, not a bud was injured.

Trees carried from north to south grow slow and ripen their wood early in autumn, which, as well as their hereditary habits, prepares them to encounter all the rigors of their native winter; while precisely the reverse of all this happens to such as are removed from south to north. And hence the disappointment and vexation which have usually rewarded the most judiciously conducted enterprises of the kind.

I would not be understood as contending, that any precautionary measures will protect us from the recurrence of so unusual a calamity, as that described by Mr. Lowell. But I cannot doubt that much may be done to lessen its effects, to guard against many minor accidents and diseases, and to

fill our orchards and gardens with more hardy, healthy, productive, and durable trees.

Most respectfully, I am, Sir,
Your obt. serv't,
JEPH HERRICK.
Hampden, April, 1832.

MOLES.

MR. ESSENDEN:—Will you or some of your correspondents inform me through the medium of your paper, the most effectual remedy to prevent moles injuring fruit trees. Also, if there be any remedy for a tree, whose bark has been entirely taken off by those troublesome animals.

Yours,

Hampden Falls, 1832.

G. D.

Willie's Domestic Encyclopedia observes, that "Various means have been contrived for extirpating moles, such as irrigating the fields infested with them, &c; but the most effectual is that described by Dr. Darwin, in his Phytologia, and derived from the experience of a successful mole catcher. This man commenced operations before the rising of the sun, when he carefully watched their situation; frequently observing the motion of the earth above their walks, he struck a spade into the ground behind them, cut off their retreat and dug them up.

"It is, however, in our opinion, an undecided point, whether these little quadrupeds that live entirely on worms and insects, of which they consume incalculable numbers, are not to be considered as harmless, nay, useful instead of noxious; especially as they have their formidable natural enemies in foxes, martins, weasels, hedge-hogs, serpents, and cats. Farther, it has been observed, that fields and gardens where all the moles have been caught, abounded with vermin and insects. But if these burrowing creatures become too numerous, and hurtful to the vegetation of plants or dangerous to dykes and banks, the most easy method of destroying them is to expose a few living lobsters in a deep glazed earthen vessel, the top of which is somewhat narrower than its basis, so that they cannot escape; such a pot must be buried several inches deep in the ground and covered with green sads, so as to be accessible to the mole which is remarkably partial to that shell fish. No sooner has one of the former entered the pot, than others from the vicinity will hasten to the fatal receptacle, in consequence of the noise made by the captive; and thus meet with inevitable destruction."

An English Magazine says, that "Moles are such enemies to the smell of garlic, that in order to get rid of these troublesome and destructive guests, it is sufficient to introduce a few heads of garlic into their subterranean walks. It is likewise employed with success against grubs and snails."

Some have advised, in order to preserve trees in nurseries, &c, to tread down the snow as fast as it falls or soon after each snow storm, about the stems of trees in nurseries, &c, so as to prevent the vermin from forming their paths or avenues under the snow, for their mischievous purposes. This might answer on a small scale, but would be, perhaps, too troublesome to be put in practice in large collections of fruit trees, &c. It has been likewise advised to smear the stems with Forsyth's

composition, or something of the kind, which is offensive to the depredaters.

As respects a remedy for trees already injured, perhaps nothing better can be done than to head them down, or cut off their stocks near the ground, and train the best shoots or sprouts to form new trees.

REMEDY FOR DISEASED FRUIT TREES.

MR FESSENDEN—I ask leave, through your paper, to communicate to the owners of apple trees, a hint, which may possibly be useful. I observe, that some of my trees which are putting forth leaves, and whose roots appear not to be injured, are nevertheless entirely dead at and near the ground. The tops no doubt will continue alive through a part or all of the season, but they must soon die, unless the method which I am about to suggest will save them. It is the same method which some of your readers know, has been adopted to save trees from which mice have eaten the bark near the earth. Five or six years ago, I had an apple tree which had been stripped in that manner, to the height of eight or ten inches; it was about two inches in diameter. At the season of grafting, I took some twigs, four in number, of the proper length, and cut off the ends obliquely, making a suitable angle. One end was inserted under the bark of the root, and the other under that of the body, immediately above the place injured. They were kept in place by a string which was wound round the tree, and the air was excluded by a plentiful application of clay, which was confined in the usual manner. I had not much confidence of success, though I had heard that such things had been done. All the twigs, however, took, and the circulation of the sap through them was sufficient to prevent the tree from being much retarded in its growth. It is now a flourishing tree. The twigs are from three to four inches in diameter; two of them have grown firmly together, and the others will probably do the same the coming season. The stock within has decayed, and given place to another generation. So much for fact; and the incredulous will be cured gratis, if they should pass through this village, and will examine for themselves.

I have no doubt, there are thousands of trees now considered dead, that might be preserved in the same manner. The number of twigs or scions ought to be increased in proportion to the size of the tree. I should recommend, that they be small, say one quarter or three eighths of an inch in diameter; a larger scion will not easily bend so as to be fitted to its place. It might facilitate the operation, to confine each scion by staples made of wire, before putting on the string, which may be removed before the next season.

If this communication should be the instrument of calling back to life any deceased favorite in the orchards of your readers, it will give me great pleasure. Respectfully, your ob't serv't,

JOSIAH ADAMS.

Frammingham, April, 1832.

By the Editor.—This plan perhaps will answer in many cases, but we fear that in general the stocks or stems are killed or mortally diseased, too great a distance from the roots, to admit of scions forming the proposed channel of communication, between the root and the vital parts of the tree.

CULTIVATING GRAPE VINES.

MR FESSENDEN—Agreeably to my proposal in your last, I now submit a few remarks in relation to the cultivation and management of grape vines.

It should be remembered, that in this as well as all other undertakings, much depends upon a good beginning. And first, grape vines should have a warm and sheltered situation; and it is equally important that the soil should be of a suitable kind; in a cold clayey soil they will never succeed. My vines are in a light gravelly soil, and to this circumstance I believe I owe much of my success; though it is true, that without constant care and attention, this valuable fruit will not be fully matured in any situation.

The best time I think to transplant vines is early in the spring. The ground should be prepared in the previous fall, by digging trenches about three feet wide and two feet in depth, separating the stones from the earth that is thrown out. In the bottom of these trenches should be placed a quantity of the richest manure, eight or twelve inches in depth, and the remainder of the trench filled with alternate layers of earth and manure, and well mixed with a spade or fork. Posts of white cedar for the trellises, should also be set near the centre of the trenches and about six or eight feet apart, but the trellises need not be finished for a year or two.

The best vines for transplanting are those of two or three years' growth, but above all they should be healthy and thrifty, without which, disappointment will be certain. They should be set out with care, about the middle of the trench, and six or eight feet asunder. If they are in good order, several shoots will start the first season, all but two of which should be rubbed off as soon as it can be ascertained which will be the strongest, these two should be trained to a pole and suffered to grow to their full extent, and in the fall, after the wood has fully ripened, they should be cut down to three eyes from the old wood; a good supply of rich manure may now be spread and forked in around the vines; and early in December, they should be prepared for the winter, by covering with sea-weed, straw, or loam, to the depth of three or four inches. The covering should not be removed until the beginning or middle of April, as it has been found that vines are more injured by alternate frosts and thaws in the spring, than by the cold in winter.

The next season, three or four stalks may be permitted to grow, according to the strength and vigor of the vine; and in the fall proceed as before, to cut down, selecting, however, if the growth be vigorous, one stalk for fruit the following season, which may be left two or three feet in length according to the strength of the vine, if too much wood is left the vine will be injured.

A great error, I think, has been in taking away too much wood at a time, in summer pruning, when the vine is in its most rapid growth, and thus a sudden check is given, by cutting off the natural channels of the sap to so great an extent. If all superfluous shoots were taken away when small, and the growth of others more frequently checked at the ends, it seems to me this evil would be avoided.

But the greatest evil which the cultivator of grapes has to contend with, is the *mildew* which makes its appearance more or less every season, and has almost destroyed the crops in this vicinity for the two last years, and though I do not pre-

tend that it can be entirely prevented, I think, that with proper attention much of its evils may be obviated.

I know of nothing better than a free use of sulphur and lime: this is prepared as follows: Put into a firkin or jar, two pounds of flour of sulphur and a lump of good unslacked lime twice as large as a man's fist; upon this, pour a pail-full of hot water, stirring it until the whole is well incorporated; cover it close, and after it is cool pour the whole into a barrel, fill the barrel with water, and in a few days it will be fit for use. When clean it should be thrown upon the vines with a garden syringe, in such quantity as to completely cover the fruit and foliage, and this operation must be performed once in about a week or ten days through the season, commencing as soon as the grapes are well formed and before there is any appearance of mildew, for after it has once appeared the mischief has been accomplished, and all attempts to prevent it, is like "locking the door after the steed is stolen." Whenever it attacks the fruit the effect seems to be to destroy the elasticity of the skin, and the next wet season bursts the grape and it is destroyed. I believe a proper attention to this would prevent much disappointment and loss.

Another thing of importance is to keep your ground rich by applying plenty of manure in the fall and spring, and it cannot well be too rich to insure a full crop and an uninterrupted growth of wood through the season, one of the best preventatives against mildew, which never appears while the vine is vigorously growing.

And now a few words in regard to fall pruning, and I have done.

The time for this operation is when the sap has done flowing and after the wood is thoroughly ripened, which will not be till after several pretty smart frosts; and as scarcely any two vines will admit of the same treatment, it is obvious that no rules can be given which will apply in all cases, some judgment is necessary, which can only be acquired by observation and experience. The greatest error, however, I think has been to leave too much wood, more especially on young vines; the consequence of which is, mildew is encouraged and the vine is exhausted in attempting to support itself and bring to maturity the fruit which it has put forth. There is little danger of pruning too close, regard always being had, of course, to the age and strength of the vine.

Supposing vines to be six or eight years old and in a thrifty condition, my own method has been as follows:—First, to encourage the growth of two or three canes from near the ground, which are carefully trained and permitted to grow to their utmost extent during the season, these, in order to be understood I will call Nos. 1, 2, and 3. Second, at the time of pruning, cut down to the ground all the old wood but one or at the most two stalks, which I will here call Nos. 4 and 5; all the new branches on these last are cut off within two or three eyes of the stalk. No. 1 is then cut down to three or four eyes, and Nos. 2 and 3 are left from three to six feet in length, and I have in a few instances left them eight or ten feet long.—These canes the next season will generally put forth fruit from the ground to their extremity; and in order to insure this, I have found an advantage in tying them round in the form of a hoop, until all the buds have broken, when they are tied up in their proper position. These, together with the spurs left on the old wood, will produce as

much fruit as the vine will sustain, and much more, I think, than can be obtained by the usual mode of trimming, as less wood and more fruit buds are left.

I have had on one vine about four years old, more than a hundred bunches of good size which ripened fully; but this is more than any vine ought to bear, and therefore it would be better in such cases to take off part of the fruit soon after it is formed. Two or three new canes, Nos. 6, 7, and 8, are now trained up as before; and the next pruning season Nos. 4 and 5 are cut down to the ground, and Nos. 2 and 3 take their places and are trimmed as were Nos. 4 and 5 last season; and the new canes, 6, 7, and 8, are cut as before. In this way I proceed from year to year, cutting away the oldest wood and supplying its place with new.

It will be seen that the manner of proceeding I have here stated, applies to strong and thrifty vines; where they are not so, there may not be a sufficiency of new and strong wood from below, in which case a less number may be left and cut shorter; but there is generally enough new shoots when the vines are rightly managed.

Yours, &c., D. FOSDICK.
May, 1832.

FOR THE NEW ENGLAND FARMER.

THE TOAD.

This animal, so odious in its general appearance, is nevertheless a most faithful and devoted servant to the gardener. I have had occasion to remark, while opening and preparing the earth for seed, the activity of the toad in appropriating to its own use the great variety of insects which infest our grounds. From observations which I have made, I have been led to the conclusion that it can distinguish its object at a considerable distance, upon which it fixes its piercing eye and towards which it rapidly advances; and when near enough for its purpose assumes a stooping posture which it preserves for a moment, then, with the quickness of thought, it darts out its long fiery tongue, transfixing its prey, which it immediately conveys to its capacious mouth. Espying some of those worms used in angling, I occasionally threw them to one of these animals near by, whose length compelled it to use its feet for the better disposing of the worm, in order that it might be more easily swallowed.

On another occasion, I observed upon the side of an out-building one of the largest species of red ants, six or eight inches from the ground, which was noticed likewise by my friend, the toad, who generally casts its eye downwards in search of sustenance, but when self-interest requires, can look up and jump too, which it actually did with complete success.

I have never discovered, neither been able to learn, that they are injurious to vegetables, although they frequently burrow into and disfigure our beds. I presume to say, that one half of the labor of the gardener employed in the destruction of bugs and worms, might be saved, if a number of toads were placed in the vicinity of our vines, with a shelter near, under which they could secrete themselves, from which they would issue forth at the approach of evening when our enemies are out committing their depredations, and devour them at their leisure.

PIONEER.

DIFFERENT KINDS OF INDIAN CORN.

MR FESSENDEN.—Should the following be thought worth notice, please to publish it:—

INDIAN CORN.

Perhaps few crops are of more importance than this to the farmer; although an exhausting crop, it still finds an advocate on almost every farm. It is found in a great variety of sizes, colors, &c., and it is of no small consequence to the farmer to select the best. But how shall this be done? By what criterion shall we judge? These are questions I am desirous of having answered. A few years since, I thought I was fully satisfied on this point, having planted for twenty-five successive seasons a particular kind of corn which I then thought equal to any other, and without making a single experiment by way of comparing different kinds.

I have lately compared by weight three different kinds, as follows:—

- 1st. White corn, 8 rows, weight of bushel, 61½ lbs.
Cobs from which it was shelled, 14½
- 2d. Yellow corn, 8 rows, weight of bushel, 62½
do. cobs, 13½
- 3d. Yellow do. 12 rows, weight of bushel, 63½
do. cobs, 12.

These kinds were all of them what might be called middling size.

From this experiment it will appear, that of the three kinds mentioned, the heaviest grain and the largest cob were from the corn of twelve rows. The quantity of cob being less, I have taken it for granted that the fodder will be accordingly, and, of course, the land less exhausted in rearing a given quantity of grain. Should any of your correspondents, Mr Editor, think this subject worth further notice, I should be gratified to learn something of the corn, by some called *Byfield corn*—ears of twelve rows, from which the husks fall before harvesting—particularly respecting the quantity of cob to a bushel of grain. Also of yellow corn, generally, whether in reality it is more nutritious (as many suppose) and of course more valuable than white corn. Yours, respectfully,

E. F. WOODWARD,

Newton, March 30, 1832.

To the Editor of the N. E. Farmer,—

SIR.—In one of the numbers of your valuable publication, last year,* you inserted some particulars respecting *parsnips*, to which you will please to accept of the following, as a sequel.

Yours, respectfully, A. B.

Extracts (from the General View of the Agriculture of Hertfordshire, drawn up by order of the Board of Agriculture, by Mr Arthur Young, its Secretary; printed in 1804;) on the subject of.

PARSNIPS.

"This plant makes a great figure in the experimental ground of the Marchioness of Salisbury; the crop is good and quite clean. Fattening oxen consume them most advantageously; their benefit thus applied, is so great as to nearly equal, in the opinion of Mr Stephenson, oil cake. They are consequently excellent for all stock, but superior in fattening bullocks."

N. B.—Under the head of *beets*, Mr Young adds, "the common red beet and the root of scarcity, are cultivated successfully in the experimental ground of the Marchioness of Salisbury. The former an-

swer greatly in fattening cattle; almost as well as parsnips, and better than carrots."

N. B.—The quantity of *parsnips* under cultivation in the above case was an acre and a half, and the whole of the experiment ground consisted of seventeen acres. pp. 115 and 132.

In the second edition of the *General View of the Agriculture of the County of Kent*, by Mr John Boge, published 1804, we find that *parsnips* sliced and kiln-dried, succeed very well as a sea-store; but by the Board of Admiralty it was decided, that parsnips could not be substituted for any part of the diet of seamen in the British navy; and that in other respects, it was more convenient to serve out *lemna juice* in preference to vegetables, as occupying less room. pp. 227, 223.

SOAKING SEED CORN.

MR FESSENDEN.—I have noticed in your paper, remarks from several persons on the utility of soaking seed corn in copperas-water, to prevent worms. A little experience and practice on any subject connected with agricultural pursuits, is far better than theorising. Last year I soaked my seed corn in very strong copperas-water, as near as I recollect, from twenty-four to thirty-six hours; every kernel was made as black as charcoal; the man who planted the corn, called me a fool and said it would never vegetate. But every hill planted came up well, and during its growth excited the remarks of all who saw it, as being the most even field of corn they ever saw. Not one hill in the whole field of seven acres was injured by worms; and we had often in previous years been compelled to replant several times, when it had been cut down by the worms. We had over sixty bushels to the acre. Yours, respectfully,

J. ELLSWORTH.

Ketch Mills, Conn. April, 1832.

HORTICULTURE.

Perhaps no branch of cultivation, (says the Boston Courier,) is so much neglected in New England as this; though much interest has of late years been created in its favor. If gardens require no exclusive attention, an hour at a time, and that not daily, will amply repay the cultivator's care. The earth is grateful, more grateful than all that inhabit it; and it will speedily reward a little attention, a hundred fold. One half of a farmer's support and more of his pleasure, should come from a garden; and his profits, too, might be much increased by it. He need not raise marigolds and poppies, nor yet turnips or pimps, but he can put in a vine that will give grapes to him and his posterity. He may, with small expense, plant a tree, that will for many years offer him the best gifts of Pomona. There is no country under the fruit ripening sun, in which horticulture is so much neglected as this, except Russia; and in the South East, rich fruits are raised even there.—We not only neglect fruits, but the esculent vegetables, that are so considerable and salutary a part of food in other countries. To all those who, at this season, are it is too late, would turn over a new leaf, we recommend a visit to the Messrs Winslow's nursery, at Brighton, where they will see much both for profit and pleasure.

If you would be rich, think of *saving* as well as getting.

Handle your tools without mittens; as a cat in gloves catches no mice.

* See volume ix, page 406.

AN ADDRESS,

Delivered before the Society of Middlesex Husbandmen and Manufacturers, Oct. 5, 1831.

By JOHN M. CHENEY.

I deem it among the happiest effects that have resulted from the organization of Societies, such as that whose anniversary we this day commemorate, that they have awakened the public to a sense of the dignity and importance of agricultural pursuits; and that the most ancient and useful of the arts of life, that on which all other arts depend, has drawn into its service the genius and talents of the best men of the age, and has had consecrated to its use, the treasures of learning and the discoveries of science and philosophy.

With the interests of agriculture, you have, gentlemen, in the formation of this society, associated those of manufactures—her sister and ally. These two branches of industry are so mutually dependent upon, and reciprocally beneficial to each other, that the improvement of both is naturally and properly embraced within the objects of your Society. To promote these objects, you have come hither today: to witness the result of each other's experiments; to explain each other's views; to interchange thoughts and opinions; and if possible, to learn and communicate some new and useful truth.

Your purpose is a high, a noble, a glorious one—glorious, in the best sense of the term; glorious, because it is good; and because he who discovers the means of increasing a useful product of the earth, or of multiplying and diffusing more widely the comforts of life, is a benefactor of his race.

To him who loves his country or his fellow man, it is a subject of rejoicing, that in a cause like this, the dissensions of party and the revivings of polemic strife are laid aside and forgotten; that a spot is here found, where our ears are no longer assailed with the din of political and religious war; where men of all sects and of all parties, are willing to make at least a temporary sacrifice of their prejudices and their animosities, upon the altar of the public good. It is a subject of rejoicing, that a new field is here presented, where talents and learning may achieve for themselves an honorable and lasting renown; and that when the thousand immortal patriots of the day—those exclusive friends of the people, whose praises are now rung through the land, by the lying heralds of a party fame, the newspapers—are all dead and forgotten—the man who devotes himself to agriculture, and to that literature and science by which it is embellished and improved, may acquire a name that will flourish and grow green through the lapse of ages.

The increasing intelligence and more refined moral sense of the times, is daily rendering more certain and definite the elements of a pure and lasting fame. They are pointing to utility, rather than splendor. The wreath woven by the arts of peace is cherished and honored, while that upon the warrior's brow, is suffered to wither and fade away. The time has gone by, when the occupation of the farmer was deemed mean and servile. The honest and intelligent yeoman has assumed the station in society that belongs to him. He stands erect and unabashed amidst the foremost of the land. An art that was patronized and practised by the kings and emperors of the east—by the princes and senators of Greece and Rome. An art, upon which the most renowned poets and philosophers of antiquity wrote, and which its great

est and best men practised, has associated with it too many cherished and hallowed recollections, to be longer affected by the sneers of that miserable substitute for a man—the creature of the tailor and the dancing master—the self-styled, but misnamed, gentleman.

In the best days of the Roman republic, her learned and powerful men, her statesmen, her generals and her scholars, devoted themselves to the interests of agriculture. That it ever lost the service of such men, and came at length to be esteemed a less honorable employment than some others, is undoubtedly one of the many evils entailed upon the world, by that long night of Gothic barbarity and ignorance, that succeeded the fall of the Roman empire; during which, intolerance and superstition held their revels and performed their orgies; and all that the genius and industry of man in former ages had done, to raise him above the condition of the savage, was lost and forgotten. For when light at length began to dawn, and truth and justice to wake from their long and lethargic slumber, a state of things grew up, altogether hostile to the arts of peace, and especially so to agriculture. A system of military tenures, denominated the Feudal System, prevailed throughout Europe. Its spirit was essentially warlike, and under it no occupation but that of arms was deemed honorable. The successful warrior divided the conquered territory among his followers and vassals, to fill only in the intervals of peace, and upon condition, that at the sound of the clarion they should buckle on their armor and attend him in his wars. He who tilled, had no permanent interest in the soil; the fee remained in the feudal lord or baron of whom he held. The consequence was, on the one hand, a servile and dependent tenantry; on the other, a fierce, haughty and warlike aristocracy; under whose joint influence every species of useful industry was paralyzed. Not only the cultivation of the earth, but every kind of manual labor was despised; and the working man, in the ignorance of a rude and barbarous age, were held in low repute by those whose battles they fought and who lived upon the fruits of their labor. The features of this system may still be traced in many of our laws, customs, and institutions, and to it we look for the origin of those errors and prejudices, that have prevailed till within a few years, with regard to the nature and character of manual and agricultural labor. From these errors and prejudices, principally by the agency of our Agricultural Societies, we are at this day in a great degree exempted; and our farmers and mechanics, the pillars by which the whole fabric of society is sustained, are not only acknowledged by others to be, but themselves feel, that they are "born free as Caesar."

The utility of these societies cannot, it would seem, be longer doubted. The experiment has been fully made. Their effects are known and felt, not only in directing the attention of the public to the subjects with which they are conversant, and in giving to agriculture the respect and consequence which it deserves, but in actual practical results, about which there can be no mistake. So that whatever prejudices may have once existed against the scientific, theoretic and book farming, which it was thought they were alone calculated to promote, none, it is believed, remain to doubt their advantages; none, unless perchance it be that class of sturdy doubters, who always "doubt most where others most believe."

They have wrought a visible change in the appearance of the world around us. Over it, they have thrown an air of neatness, elegance, comfort, and fertility, before unknown. The worn out and exhausted field, by the ploughing in of green crops and other improved modes of cultivation, has been revived and fertilized. The poorest and most unproductive bog-meadow, the nocturnal melody of whose inhabitants (the mammoth frogs) was for years our summer lullaby, has been drained and reclaimed, and is yielding to the enterprising farmer a tenfold reward for his labor. New varieties of grain, and grass, and vegetables are springing up around us; and our granaries, barns and cellars are crowded with new and hitherto unheard of riches. Many of the lean and unprofitable tenants of our stalls and pastures have disappeared, and the firmly built, portly and gentlemanly ox, and the staid and matronly cow, have succeeded to their place. Fruits, that excel in richness the golden apples of the Hesperides, cluster and ripen around us. Inventions and improvements in the implements of husbandry have been multiplied, till in many instances, what was once the painful labor of a day, has become the recreation of an hour; nor are they left suspended in agricultural repositories, like warlike trophies in the halls of a feudal baron, but they are seen upon the farms and in the hands of an active and vigorous yeomanry.

In the midst of all this apparent prosperity, while the earth is rejoicing in renovated beauty, and the labors of the husbandman are crowned with abundant success, what harsh and discordant notes are those that break in upon the general song of joy and gratitude, that is heard along our hills and valleys? And who is he, that with his raven lock, comes to mar the harmony of the scene, with the miserable cry of "*hard times*?" Can it be the industrious and intelligent farmer? No! Look at his fields, they are laden with the rich rewards of a skillful cultivation; at his fences, substantial and in good repair, they protect his crops and insure him quiet and peace in the hours of repose; at his trees, pruned of redundant wood and cherished at the root, their graceful and symmetrical forms not only embellish his grounds, but his fruit spreads cheerfulness around his board and his fireside. His stock, well selected, well housed, well fed, and above all, well treated, are the living proofs and emblems of plenty and content. His tools, all in order and in place, are implements, which in a cheerful hand, rob labor of its sting. His barns and out-houses, conveniently arranged, judiciously constructed, and well filled, are his treasury, wherein he has deposited the fruits of his honest and honorable labors. His house bears no marks of dilapidation or decay; but neatness and taste have fixed their impress upon it, and upon all around it.

Shall we enter and survey for a moment the scene within? Certainly. The wife, who, by her industry and economy, has made the farmer's fireside what nothing else can make it, the centre of his joys, the sanctuary of his happiness, will not refuse to admit us. Not yet sufficiently fashionable nor genteel, to be ashamed to be seen at any useful employment, she will herself bid us welcome. Over her little empire she presides in the spirit of peace and gentleness. All is neatness; all is order; all is quiet. Her family is her care; her children, her jewels. Under her influence, her daughters are growing up in the loveliness of virtue

—her sons, in manliness and strength. "She looketh well to the ways of her household and catcheth not the bread of idleness. Her children rise up and call her blessed; her husband also, and he praiseth her."

And is the man who has drawn all these comforts around him, that complains of *hard times*? Oh, no! It is one of a very different character. It is either the man, who, from ignorance, ingratitude, or cherished discontent, dashes away the cup of good, which a bountiful Providence proffers to his lips; or else, it is that thriftless and beggarly being, who, lagging far behind in the march of improvement, and wholly uninspired by the spirit of the times, is seen at the resorts where loungers most do congregate, "dragging himself lazily about, to the tune of "*hard times, hard times*."

Unbroken look at his farm. A continuous and unbroken line of brush and briars, having intrenched themselves about his walls and fences, are steadily advancing to the centre of his fields, and he looks with dismay upon the narrow extent of territory that remains to him, and upon the stunted and miserable crop that it produces. His fences have decayed or fallen down, and upon their ruins he lops a supple birch or shrub oak, with here and there the half consumed and weather-beaten fragment of a rail or post, the remnant of a better day, and ingeniously contrives to rear a fabric so frail and unsubstantial, that it must fall if even "the winds of heaven visit it too roughly." It only serves to invite and provoke attack; and if his cattle have any decent share of spirit remaining, his stunted and miserable crop is destroyed. The pruning of his orchard has been entrusted wholly to his cows, and if among its scrubby and entangled branches, fruit is found at all, it is of those varieties that will give to the countenance of him that eats it, the expression of an inmate of purgatory. There is seen rambling about his pastures, a beggarly account of nondescript animals, denominated stock—gaunt, lean, houndlike skeletons—emblems of famine, images of leanness, at which Pharaoh would have hung his head and blushed. Scattered about, as chance directs, are found the broken and blunted instruments with which he toils. And in keeping with the rest of the scene, there is exhibited by the wayside, a long array of condemned and superannuated carts, and carriages and ploughs. Through unhinged and disjointed gates we approach his buildings. Our path is obstructed at every step by nameless and useless rubbish; and the mass of vegetable and animal matter, that is decaying around, like the offence of Claudius, "is rank, it smells to heaven." His barn seems to be made with special reference to the accommodation of the four winds. Its contents are neither sheltered nor preserved; and its tenants are left to cringe and curl before the blasts of winter. His house, a strange combination of boards and shingles, gives no promise of comfort within. The winds sigh and howl through its shattered roof and walls. The loosened clapboard flaps mournfully against its side. Ancient and time-worn hats, with garments not to be named, from the scanty and tattered wardrobe of its inmates, are thrust through its broken windows.

Shall we enter here, and contemplate the scene of confusion and discord within? No! The spirit of idleness, ignorance, or intemperance, reigns here, and none are welcome but its votaries. It is the man who calls this place home, that talks of "*hard times*," of the smallness of the

farmer's profits, and of the advantages of emigration to the far West. It is *he* that is forever chanting his Jeremiad over the fallen glories of Agriculture. And well he might, if the evils that attend him were inseparable from his lot. But they are not. They are the consequence of his own bad management. No skillful and enterprising cultivator can be found, who will say, he has not full confidence in the success and profits of his business.

To be concluded next week.

SHEEP.

A writer in the Gardner (Maine) Standard, in answer to an inquiry as to the best mode and the expense of keeping sheep, says:—

"Sheep do best in summer on high, dry, and rocky land. In a pasture which has a more or less northerly aspect and plenty of shade, they may run in large flocks, for they seldom crowd together in hot weather, where the shade is in different parts of the pasture. They should have salt by them to lick when they please. If two or three pastures can be furnished, to change their location once a week, so much the better. Hard stocking keeps the grass short and sweet, and of this they are more fond than after the seed stalk springs. It is hardly possible to keep sheep through the winter on hay alone, in as good condition as they come to the barn; they should have some succulent food daily, and the more the better, or they lose flesh. To judge from my own experience, I should say, give a sheep daily four pounds Ruta Baga, and as much hay as she will eat, which will be about one pound, and she carries her summer fat through the winter, and is much more sure to raise her lamb than if fed on hay alone.

"Indian corn, in quantity of a gill daily, or even half a gill is of great service. Every farmer is more than paid for his corn in the weight of the fleece alone, to say nothing of the benefit to the animal.

"Last winter, as you know, I fed largely with the turnip, there was not a sheep in the flock at all disordered during feeding time. I am well satisfied that a good proportion of succulent food, suits the stomach better than all dry food of any kind.

"An acre of pasture will feed six sheep with their lambs, through the season—most farmers say seven or eight. I have weighed out two pounds of hay per head to my flock, several days in succession, in clear cold weather, and found that alone as much as a sheep will eat. This corresponds with the experiment of Dr Daubenton in France, although he does not inform us what breed his experiment was tried with. We feed about one hundred and forty days on an average. A ton of hay will therefore winter eight sheep. If we estimate the cost per ton at \$2.50, the expense of wintering on hay alone is thirtyone cents. But it is better to winter at more expense, in order to insure a good fleece and the life of the lamb."

DESTRUCTION OF BIRDS, &c.

Among the various examples of improvident legislation, (says the Baltimore American,) may be reckoned the laws in which our State legislatures sometimes think it wise to encourage, by rewards, the slaughter of birds, &c, which have unluckily incurred odium with the farmers. The New York American gives some examples of similar foolish hostility among the people, to these luckless *feræ*

nature, the effect of which is generally to substitute a greater evil, by a supposed removal of a less. The ruinous increase of the Hessian fly some years since, was attributed, and justly, it says, to the great previous destruction of the woodpeckers and other birds feeding on insects. In one district, a war of two or three campaigns was valorously waged against the owls; and straightway the fields were overrun with field-mice. In another, the garter snakes were put under ban, and the consequence was, that the grass-hoppers, on which the garter snake feeds, infested the fields in clouds. It is not out of a mawkish humanity, but from a belief that nature will manage this matter best in her own way, that we recommend to those who would take it out of her hands, the lines of Southey to the spider:—

I won't humbly crush thy bowels out,
Lest thou shouldst eat the flies.

The same journal very properly censures those wholesale *hunts*, to which bushels of squirrels, rabbits, partridges and other game, fall victims in indiscriminate slaughter.

Savings of Temperance.—Before the formation of the Temperance Society in the town of Hector, Tompkins Co. N. Y., it is stated, that there was scarcely sufficient grain raised for the supply of the inhabitants. Now, after two or three years' operation, *sixty thousand bushels* are supposed to sent out of the town. This extra or increased production is not, it is probable, to be attributed to the former drinkers alone, but to that general stimulus to industry and healthy state of the community, which follow such reformations. Will the readers of the Farmer communicate facts similar to the above?—N. Y. Farmer.

To promote the growth of trees.—Some separate the dry bark of fruit and forest trees to promote their growth, and prevent the bark binding too much. This disfigures the tree, making seams in the trunk, and makes it grow in angles. The best way is, when the sap is forced up by warmth of spring, to scrape off all the scaly particles of the dead bark, and wash the trees repeatedly during the week with soap suds, &c. Trees of considerable age will then have a youthful appearance; be more thrifty; and in the case of fruit trees, the fruit will make more cider than that grown on scurvy moss-grown trees.

Put cinders, bones, stones, about the roots of pear trees; it will increase their growth one third and save them from the blight.—*Genesee Farmer*.

Young Peach Trees.—Twenty years ago, peach orchards flourished in many parts of the State of New York; they now seem to decline. The cause may be ascribed to the grub or peach borer. A neighbor of mine found six of these an inch long in a tree near the roots, and the tree dying. He put some of the worms into a strong solution of corrosive sublimate, which did not kill them!—He then removed the dirt from some of his young peach trees, and placed a little box around the tree and filled it with tan bark. These trees did well. It is a cheap remedy—try it.—*Id.*

Feeding Cattle.—When there is a white frost on the grass, keep your cattle in the yard and give them a little dry fodder. When the frost is melted off, turn them out and they will do well.—*Id.*

NEW ENGLAND FARMER.

Boston, Wednesday Evening, May 2, 1832.

DELICATE APPLE.

We have seen and tasted of a fine apple, called the *Crotchfield Apple*, sent from Virginia to Jonathan Winslip, Esq. of Brighton, by George W. Brimmer, Esq. of Boston, now in Virginia, a very respectable, scientific and active member of the Massachusetts Horticultural Society. The apple is fair to the eye as well as pleasant to the taste, and that it has the property of keeping well through winter, is evident from the sound state of those we have seen. We appreciate the exertions of such public spirited men as Mr. Brimmer, and hope he will continue to favor cultivators in this quarter of the country, with specimens of plants and other choice products of the South.

DESTRUCTION OF RATS.

MR FESSENDEN—Permit me to inquire, through the medium of your useful paper, the best method *killing rats*. My object in making this inquiry, is because my barn and corn-house has for some time past been infested by a large number of this very "unprofitable company," and how to get rid of them I know not. Some of my horses are sick almost every week, and I actually believe the sickness is wholly caused by the rats being among the hay and grain. If you or any of your correspondents know of a safe and sure remedy, I should be pleased to have it made known in your paper. By so doing you will greatly oblige

April 21, 1832.

A SUBSCRIBER.

By the Editor.—The following are among the remedies recommended for the destruction of these vermin:—

Take one quart of oat meal, four drops of oil rhodium, one grain of musk, two nuts of nuxvomica powdered; mix the whole together, and place it where the rats frequent; continue to do so while they eat it, and it will soon destroy them.

Another mode of destroying rats.—Take equal quantities of unslacked lime and powdered oat meal; mix them by stirring, without adding any liquid, and place a small quantity in any place infested by rats. They will swallow the preparation, become thirsty, and the water taken will swell the lime and destroy them.

Another mode of destroying rats.—A friend in Salem, Mass. informs us, that rats are easily destroyed by sprinkling a little of the powder of Spanish flies on some buttered bread, or other food of which rats are fond.

SAGACITY OF A CAT.

De la Croix relates the following almost incredible instance of sagacity in a cat, who, even under the receiver of an air pump, discovered the means of escaping death, which appeared to all present inevitable:—"I once saw," said he, "a lecturer upon experimental philosophy, place a cat under the glass receiver of an air pump, for the purpose of demonstrating that very certain fact, that life cannot be supported without air or respiration. The lecturer had already made several strokes with his piston, in order to exhaust the receiver of its air, when the animal, who began to feel herself very uncomfortable in the rarefied atmosphere, was fortunate enough to discover the source from whence her uneasiness proceeded. She placed

her paw upon the hole through which the air escaped, and thus prevented any more from passing out of the receiver. All the exertions of the philosopher were now unavailing; in vain he drew the piston: the cat's paw effectually prevented its operation. Hoping to effect his purpose, he let air again into the receiver, which as soon as the cat perceived, she withdrew her paw from the aperture; but whenever he attempted to exhaust the receiver, she applied her paw as before. All the spectators clapped their hands in admiration of the wonderful sagacity of the animal, and the lecturer found himself under the necessity of liberating her, and substituting another in her place that possessed less penetration, and enabled him to exhibit the cruel experiment."

A plan for removing choice flowers from one pot to another without injury.—A writer in the *Gardener's Magazine*, (M. Saul, Solyard street, Lancaster, Eng.) gives a plan for removing prize flowers from one pot to another without injury to their vegetation, and examine the lower part of the plant, and ascertain whether any slug or other insect is preying on the roots. A small projection round the inside of the sides of the pot, is made for the moveable bottom to rest upon. "When I want to remove the plant, I have a light rim the size of the opening of the pot, with three upright spring legs; these are riveted to the rim and are calculated to bear the weight of the plant and earth; and by pressing on the ledge of the pot, the plants may be raised to any height, or turned out of the pot. By having pots made of certain sizes, the bottoms may be removed along with the plant."

MERRIMACK COUNTY AGRICULTURAL SOCIETY.

At a meeting of the Directors of the Merrimack County Agricultural Society, holden pursuant to notice, at the Inn of John Stickney in Concord, on Wednesday, the 8th day of February, 1832, the following business was transacted, to wit:—

Present, RICHARD BRADLEY, President.

JAMES WILSON, Secretary.

JOSEPH LOW,

JONATHAN AYERS, } Directors.

REUEL JOHNSON,

Voted, That all farms and gardens offered for premiums must be entered with the Secretary or one of the viewing committee, on or before the 20th day of June next.

The following gentlemen were appointed viewing committee on farms, gardens, crops, &c.

JOSEPH M. HARTER, *Chairman*, Canterbury.

JOSUA FIFIELD, Franklin.

AARON WHITTEMORE, Pembroke.

MOSES COFFIN, JR., Rosewau.

MOSES TYLER, Hopkinton.

JOHN J. AYER, Concord.

CHARLES STINSON, Dunbarton.

Voted, To award for the best farm \$8 00

Second do. 7 00

Third best do. 5 00

For the best reclaimed meadow, not less than six acres, 6 00

For the next best reclaimed meadow, not less than four acres, 4 00

Best kitchen garden, \$1 00 and one year's subscription New England Farmer.

Next best do. one year's do. N. E. Farmer.

Best field of corn, not less than one acre, \$1 00 and one year's do. do.

Next best do. one year's do. do.

Best field of rye, one year's do. do.

Next best do. 1 00

Best acre of potatoes, not less than three hundred bushels per acre, \$1 00 and one year's subscription New England Farmer.

Next best, one year's subscription do. do.

Best acre of wheat, one dollar and one year's do.

Next best do. one year's do. do.

Best mulberry orchard, one dollar and one year's do.

Next best do. do. one year's do. do.

Best milk cow, 3 00

Second do. do. 2 00

Third do. do. 1 00

The owners of cows presented for premiums, will be required to specify what keeping they have had through the winter; whether anything more than grass through the summer; the quantity of milk given per day, and the quality, to be ascertained by the quantity of butter made from said milk, say at least seven days, either in June or September, particularly stating the keeping during said time.

JAMES WILSON, Secy.

From the Worcester Eags.

WORCESTER AGRICULTURAL SOCIETY.

At the Annual Meeting of the Worcester Agricultural Society, on the 19th of April, 1832, the following officers were elected for the current year, viz:

LEVI LINCOLN, President.

AARON TUTTS, 1st Vice President.

SILAS HOLMAN, 2d Vice President.

THEOPHILUS WHEELER, Treasurer.

OLIVER FISKE, Cor. Secretary.

WILLIAM D. WHEELER, Rec. Secretary.

TRUSTEES.

Jonathan Wheeler and John Batcheller, *Grafton*; Daniel Bacon, *Barre*; James Draper, *Spencer*; Jacob Conant, *Sterling*; Samuel Daman, *Holden*; William Eager, *Northborough*; Jacob Fisher, *Lancaster*; Stephen P. Gardner, *Bolton*; Jerome Gardner, *Harvard*; Jonathan P. Grosvenor, *Paxton*; Isaac Southgate, *Leicester*; Benjamin Davenport and William S. Hastings, *Mendon*; William Williams and Silas Allen, *Jr. Shrewsbury*; Samuel Mixer, *Vue Braintree*; Daniel Tenney, *Sutton*; Lovett Peters, *Westborough*; Eli Warren Upton; Samuel Read and Bezael Taft, *Jr. Uxbridge*; Sylvanus Hollbrook, *Northbridge*; Salem Towne, *Charlton*; Edwin B. Taintor, *Brookfield*; Rufus Barton, *Millbury*; Jacob W. Watson and Benjamin Harrington, *Princeton*; Stephen Davis, *Orford*; Asaph Andrews, *Boylston*; David Willet, *Leominster*; Silas Brooks, Thomas Chamberlain, John Davis, Nathan Heard, John W. Lincoln, Rejoice Newton, Samuel B. Thomas, and Benjamin Butman, *Worcester*.

It appears by the Treasurer's account, exhibited at this meeting, that the funds of the Society, well secured on interest, amount to more than \$6,600, and the Society is entirely free from debt.

It was voted unanimously, that it is expedient to have a Cattle Show and Exhibition of Manufactures, on Wednesday the 10th day of October next, at Worcester; and the Trustees were authorised to offer Premiums for Stock, &c, which it is understood will soon be before the public.

The Secretary was directed to prepare and publish in a pamphlet form, a correct list of all the members of the Society, arranged by towns.—Those gentlemen who have not yet availed themselves of the privilege of becoming members of this flourishing institution, and who intend to join, by leaving their names and fee of admission with either of the officers of the society, previous to the 21st June, will have their names in the catalogue.

DIRECTIONS FOR THE CULTURE OF SWEET POTATOES.

(Convolvulus batatas.)

The slips, as they are called, of sweet potatoes should be placed in a hot-bed, to force out the sprouts; or, if no hot bed is attached to the premises, the following simple method will answer:—Dig a hole two or three feet deep, which should be filled with horse manure and well pressed down, to give a bottom heat; on this place about four inches of loam; in the loam place the slips, which in a few days will throw out numerous sprouts. The slips should then be taken up and planted out wherever wanted, in a light and rather sandy soil—*taking care to place them on the top of the ground, and draw the earth over them.* But little care is requisite afterwards, excepting to keep the weeds down, and occasionally give the vines, which run like squash vines, a twist round the hill, to prevent them striking root at the several joints, by which the size of the potatoes in the hill is increased.

The slips are so perishable in their nature, that they must be immediately placed in a hot-bed as above directed, or they will soon be lost by rotting.

BRIGHTON MARKET.

We understand that the market-day at Brighton will be changed after the 1st of May, from Monday to Wednesday. This arrangement will remedy the evil to society, that has existed from the trafficking which has heretofore been carried on in the vicinity of Brighton on the Sabbath. The importance of the Brighton market is not generally understood. It has been said by an observing traveller, that "it ranks as a cattle market second only to that of Smithfield in England."

We are requested to give notice, that there will be a quantity of Pear Scions of the celebrated *Dir Pear*, and some other varieties, for distribution on Saturday next, at 12 o'clock, at the Horticultural Hall.

Notices of Dr Brown's *Silva Americana*, and *Purton's and Harrison's Horticultural Register*, were prepared for this paper, but are unavoidably deferred to our next.

Sweet Potato Slips.

This day received at J. B. Russell's Seed Store, 51 and 52 North Market Street, Boston, a good supply of Slips of the Carolina Potato, in good order, and of superior quality. Printed directions for their culture and management furnished gratis. Price 62½ cents per hill peck.

May 2.

Winship's Nurseries.

AS the season is so far advanced, that all injury to natural productions, occasioned by the severity of the preceding winter, can readily be ascertained, persons in want of Fruit and Ornamental Trees, of various kinds

—of flowering and showy Shrubs, Creepers and Vines, including the elegant monthly or ever-blooming fragrant Honeysuckles, eight or ten feet high, and such plants as will produce a fine display of Flowers the ensuing season—with a very superior assortment of Herbaceous Perennials, that will also bloom, with proper management, this summer, if removed within a week or ten days—together with the new and fashionable Scotch Roses, so much admired at the exhibition at Horticultural Hall last season, constituting sixty varieties—are invited to visit the establishment and select for themselves.

Orders may be left with J. B. RUSSELL, or sent via mail, to Messrs WINSHIP, Brighton, and the plants will be furnished, and sent out the following morning in the city, if requested. 3w April 25.

Linnean Botanic Garden and Nurseries.

Flushing, near New York.

WM. PRINCE & Sons, Proprietors, announce that the great extensions made in their establishment, which now covers near 50 acres, completely filled with the choicest TREES, SHRUBS and PLANTS, enables them to offer the various kinds at the reduced prices stated in their new Catalogues, which will be sent to any person who may apply for them. The size and excellence of the Trees exceed all former periods; and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their personal attention. To insure they will allow a liberal discount and convenient credit. As many persons are agents for different nurseries, it is requested that orders intended for us be particularly specified. Every invoice sent has a printed heading and our signature, and such proof of origin must be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced.

Their Treatise on the Vine, describes 280 kinds of Grapes and their culture;—Their Treatise on Horticulture contains descriptions of a great variety of Trees and Plants, and directions for cultivating them; and their Pomological Manual, or Treatise on Fruits, contains full descriptions of above 1000 varieties of Pears, Plums, Cherries, Apricots, Peaches, Nectarines, Almonds, and other fruits, so that all persons can make their selections, with knowledge of the qualities.

Their new Catalogues will be sent to all applicants and orders sent to them per mail, will receive the most prompt attention, and all letters desiring information, will be replied to by the first mail. 4w. March 21.

For Sale.

A half blood Durham Short-horn Cow, eight years old, with Calf by a full blooded bull of the same breed. Her calves have been large and uncommonly fine animals.

CHARLES E. NORTON.

South Berwick, Me. April 25, 1832.

A Farm Wanted.

THE Directors of the Boston Farm School, have appointed the subscribers a Committee to select and purchase a Farm suitable for the purposes of that institution. Persons who are desirous of disposing of such property, situated in the neighborhood of the city, are requested to state the terms and annex thereto a description of the land, buildings, &c. addressed to

JOHN TAPPAN, } Committee of the
JOHN D. WILLIAMS, } Directors of the
SAMUEL T. ARMSTRONG, } Farm School.
April 25.

Fruit Trees.

ORDERS for Fruit, Forest and Ornamental Trees, shrubs, honey-suckles, &c. from Winslip, Kenrick, Prince, Buell and Wilson, Davenport's, and any other respectable Nurseries, received by the subscriber, and executed at Nursery prices. J. B. RUSSELL.

For sale, as above, a few Dwarf Apple Trees worked on paradise stocks, packed in moss—price 25 cents each. New England Farmer Office. April 25.

Asparagus Roots.

JUST Received at the Seed Store connected with the New England Farmer, 52 North Market Street:

A few thousand Large Early Asparagus Roots, packed in moss, in boxes of one, two and three hundred roots each,—will bear transportation any distance—price \$1 per hundred for those 3 years old, 75 cents per hundred for the others. April 4.

Emerson's Second Part.

OF the North American Arithmetic is this day published by LINCOLN & EDMANES. The plan of this work is such, that mental and written arithmetic are very happily and conveniently united. Although Rules are not excluded from the book, yet the illustrations which the author has introduced, render the operations on numbers so clear and interesting, that the learner is prepared rather to make his own rules, than to rely on them from his book. Boston, April 23, 1832.

Spring Wheat.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street, A few bushels of genuine Gilman Spring Wheat; this sort is the most valuable one cultivated in New England, is very productive, seldom if ever attacked by blight, and is the kind which has for many successive years obtained the premium from the Massachusetts Agricultural Society. April 4.

BRIGHTON MARKET—MONDAY, APRIL 30, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 32 Beef Cattle, 6 pairs Working Oxen, 11 Cows and Calves, and 225 Swine. About 30 Beef Cattle unsold at the close of the market.

PRICES. Beef Cattle.—Last week's prices were not supported, as will be seen by quotations. Extra sold at \$6 a 6 25, prime 5 75 a 6, good 5 25 a 5 75, thin 4 75 a 5.

Working Oxen.—No sales noticed.
Cows and Calves.—Sales of ordinary at \$16, 18 and 23.
Swine.—Sales brisk—several lots were taken at 25 for sows, and 6 25 for barrows; one lot to close at 5c for sows and 6c for barrows; at retail 6c for sows, and 7c for barrows.

New York Cattle Market, April 27.—Market this week rather dull, and a general depression in prices has taken place; still stock of every description sells well. Beef Cattle—500 head at market and all sold from \$6 a 8, averaging 7; a few first rate 8 25. Sheep—200 in sales for those not sheared 3 50 a 8; sheared 2 50 a 5 50; lambs 2 50 a 4.—Daily Adv.

In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

The following is from the Edinburgh Literary Journal, which vouches for its having been written by the noble author some years ago.

HYMN.

BY THE LORD CHANCELLOR.

"There is a God," all nature cries;

A thou-and tongues proclaim

His Arm almighty, Mind all-wise,

And bid each voice in chorus rise

To magnify his name.

Thy name great Nature's Sire divine,
Assistuous we adore;

Rejecting godheads, at whose shrine

Blighted nations blood and wine

In vain libations pour.

You countless worlds in boundless space,

Myriads of miles each hour

Their nightly orbs as curious trace,

As the blue circle studs the face

Of that enamell'd flower.

But Thou, too, mad'st that flowret gay,

To glitter in the dawn;

The hand that fired the lamp of day,

The blazing comet launched away,

Painted the velvet lawn.

As falls the sparrow to the ground,

Obedient to thy will,

By the same law those globes move round

Each drawing each, yet all still bound

One order to fulfil.

FOR THE NEW ENGLAND FARMER.

BROTHER JONATHAN'S ADVICE TO HIS SON.

Well, Charles, the long wished for day has arrived; from this time you are no longer under my care and control; you are now your own man, and the world is before you. Such has been your obedience, industry, and deportment, during your minority, that I have full confidence that you will never willingly place a thorn in my pillow; but that you will, by industry, integrity and honesty, play the man, and thereby establish a character for yourself.

As you have been educated in the habits of temperance and industry, I need not say much on that score; yet it cannot be too often repeated, that at all events, shun the haunts of idlers, dram shops, and all places of dissipation, as it is not reputable to be seen at such places except on imperative necessity.

For your general conduct in society: be pleasant and obliging to your equals and inferiors; respectful to your superiors and seniors; sincere and upright with all. Avoid contention and strife, and shun all bad company. Despise not the poor and decrepit; show pity to the unfortunate, and extend charity to the needy, especially to those who are worthy to receive it. Small injuries treat with silent contempt—never retaliate, but manfully defend yourself when necessary.

Regard virtue as the great ornament of man; govern your passions. Let your language be pure and speak with deliberation. Shun the unfruitful works of darkness of every kind, and let your conduct be such as will bear the light of day.

Should you be in the employment of another,

be faithful to the man; remembering, always, that his business is your business and that his interest, in a sense, is your interest. Try not into the secrets of your neighbors, but keep your own and the man's with whom you may live.

Should you go into any business yourself—pursue it early and late with resolution, and never put off anything to be done tomorrow, that ought to be done today. Never be above your business, nor let your business drive you; personally superintend it; and let your uniform industry be a pattern for those whom you may employ or have under your care. Let your commands be understood and promptly obeyed.

As to dress—let it be decent and according to your employment. Be not anxious to follow the fashion, but remember that cleanliness is a cardinal virtue. Never judge the character of a man by his external appearance.

Punctuality is of the utmost consequence; by it you may draw money (should you wish) at any time from your neighbor's pockets.

Let your accounts be accurately kept, both debt and credit, and settle often. Reckon with yourself once a year, perhaps about the first of January is the best time. Make a close calculation and see in what latitude you are sailing; see where you have missed a figure, and let those errors be as beacons and landmarks to warn you in future. For the neglect of such reckoning, and running on in a supposed prosperous course, many have been shipwrecked and ruined. Small debts and interest are too often overlooked by debtors, but creditors never forget them; hence bring them all into the reckoning, whether for or against; they often make a large item in the general account.

Should you build a house, let it be no larger than is necessary for the purpose designed; for buildings in the country larger than are necessary are poor property; but in any case, let the cellar be as large as the frame.

Have an opinion of your own, but ever keep your mind open to conviction. Never despise a man because he differs in opinion from you. As to religious matters—be no stranger to your Bible, and form your creed from its pages, but not from the opinions of men. As to politics—endeavor to understand in some measure, the government in which you live, and the character and motives of the men who direct it. Never give your vote to a man who is unworthy to receive it; and disdain the man who would so disgrace human nature, as to sell his vote for a glass of rum.

Should you have the misfortune, by miscalculation, treachery of others, or otherwise, to fail, compound with your creditors, be honest, deliver up all and begin the world anew. But remember, Charles, that a debt is not morally paid when the creditor relinquishes, reluctantly, a part to save the remainder; therefore, I say, be honest, and should you ever after be able, pay those creditors both principal and interest to the last cent; and show to the world that you have acted the man and not the knave.

Lastly, Should you, some time hence, think of entering into a family state, be not in a hurry; let judgment control fancy. A thorough understanding of the business of the kitchen is of the greatest importance to any lady; to say the least, the lady who is unacquainted with this important accomplishment, is continually liable to imposition by her servants. The sound of the gridiron to a hungry

man, is better music than that of the piano. Seek one who is prudent and discreet, in whom there is neatness and good sense; such a one is of "great price." "Dignity and honor," in domestic life, are her clothing and on her tongue is the law of kindness." But mark the reverse: "It is better," said the wise prince, "to dwell in the corner of the house top," or, if you please, in one end of the garret, where motherwort and tansy and many useless combustible matters are promiscuously thrown together, than with a howling woman in a wide house," where all the capacious rooms are richly garnished with the best of furniture.

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 50, North Market-street, by J. B. Russell:

A fresh supply of Tall Meadow Oats Grass, seed, so valuable on thin soils for either a hay crop or for grazing. Col. TAYLOR, a distinguished farmer, says of it, "It is the hardest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It keeps possession of the ground in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and it cut before the seed opens, its hay is as pleasant and nutritive to stock, as any grass known to me." See also the opinion of Mr. PUTNEY, a most judicious farmer, in the 'New England Farmer,' vol. vii. page 300.

Also,—Lucerne Orchard Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Broom Corn, Seed Corn, &c. March 28.

New American Gardener,—sixth edition.

This day published by J. B. Russell and Carter & Hendler:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, A-pargius, &c. &c. By T. G. Fessenden, assisted by several gentlemen. Sixth edition. Price \$1 00.—This we think may be considered the most popular and practical work on Gardening, extant. March 28.

Market Man wanted.

A steady and industrious man, who is a good salesman and ready reckoner, to take charge the present season, of a Market Wagon to Salem, Lynn, and Marblehead Markets.—Preference will be given to one who is acquainted with marketing in this vicinity. Application may be made at the Reed farm in Lynn. Lynn, March 28, 1832. 4t

Early Potatoes.

FOR Sale at the Seed Store connected with the New England Farmer, 52 North Market Street:

A few bushels of the prime, early Potatoes, which have taken the premium at the Massachusetts Horticultural Society's Shows the two last seasons; and are considered the earliest variety in this vicinity. March 7.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If no paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

SEASONS, PRODUCTIONS, &c, IN THE STATE OF OHIO.

MR FESSENDEN—Through the medium of the New England Farmer I have learned with sincere regret, the ruinous effects of the past winter on the fruit trees in the Eastern States. A combination of unfavorable circumstances would seem to have been concerned in producing this wide spread ruin; a very warm and moist summer and autumn, and sudden, severe, protracted cold in the winter. The wood of last year's growth must have been as little prepared for enduring frost in November, as it usually is in August and September of common years. Vegetable nature was completely deluged by the elements; and contrary to her usual custom, continued to eliminate sap and put forth fresh leaves, when she should have been curtailing her supplies and preparing to harden the new formed lathum for the coming winter. The climate of these United States is marked with strange vicissitudes; the seasons sometimes sport with their own productions, and fruits and flowers of indigenous plants, to say nothing of exotics, are often brought forth merely for destruction.

The past winter, in Ohio, has been one of unusual severity, and the whole year of strange and altered features. The summer of 1831 was cool and extremely wet, more so than ever was known since the settlement of the State. The mean temperature of the summer months was $71\frac{6.9}{10.9}$ degrees of Fahrenheit; greatest elevation $91\frac{1}{2}$ in June. The mean temperature of the autumnal months was $52\frac{1}{2}$. In the year 1830, the mean temperature of summer was $72\frac{4.8}{10.8}$ degrees, and that of autumn $57\frac{5.5}{10.5}$ degrees; making a difference of five and a half degrees in favor of the autumn of 1830.

The mean of the winter months in the year 1830 was $33\frac{6.6}{13.6}$ degrees, while that of 1831 was 26 degrees, being seven and a half degrees colder than the winter of 1830. The mean, for the last six years, being $33\frac{3.3}{13.3}$ for the winter months. In the summer months of 1831 there fell $26\frac{7.9}{10.9}$ inches of rain; $12\frac{1.9}{10.9}$ inches of which fell in July. In the autumnal months there fell $8\frac{8.3}{10.3}$ inches of rain; and in the whole year $53\frac{3.3}{10.3}$ inches, or nearly four and a half feet; a quantity equal to that of the West India islands. In the summer months of 1830 there fell 10 inches of rain; in the autumnal months $9\frac{9.9}{10.9}$ inches; and in the whole year $37\frac{2.6}{10.6}$ inches; making a difference of $16\frac{2.8}{10.8}$ inches in favor of the year 1831. The mean annual quantity of rain and melted snow being for eleven previous years $42\frac{7.9}{10.9}$ inches, and may be fairly assumed as the average quantity for this climate, or about three and a half feet per year. In the winter of 1831 there fell 48 inches of snow; the greatest quantity at any one time being 15 inches. In 1830 there fell only 13 inches, which is about the mean quantity for one winter. The mean temperature for the year 1831 was $50\frac{8.7}{10.7}$ degrees; while that of 1830 was $54\frac{3.3}{10.3}$ degrees, and is about the annual temperature for this part of the State.

The past winter commenced the latter part of November, which is nearly a month earlier than usual; the whole month was cool, the mean temperature being $40\frac{7.5}{10.5}$ degrees. We had but a few days of that beautiful weather called "Indian summer," instead of the four or five weeks commonly allotted to us. Snow fell as early as the 21st of the month, and with high winds from the west and northwest, continued to fall in small quantities almost every day, to the end of the month. The 28th and 29th of November the mercury fell to 12 degrees; the rivers became filled with ice, and navigation by steam-boats soon after ceased. Hundreds of flat boats laden with the produce of our farms, became frozen to the shores or forced by the ice on the heads of islands, and their cargoes, mostly composed at this early season of apples, cider, and potatoes, were destroyed by the intensity of the frost. The harvesting of corn and potatoes had but just commenced, and nearly half the crops of both these articles were undug and ingathered at the setting in of this Siberian winter. The whole month of December was uniformly cold, and for several mornings the mercury was at and below zero. On the 18th it was 10 degrees below for a short time in the morning, which is the greatest degree of cold we have had for several years. The fore part of January the weather became moderate, and on the 8th of the month, after a heavy rain, the ice, now from twelve to eighteen inches thick, was broken up by a rise of eight or nine feet in the Ohio river, wrecking and destroying nearly every boat not secured in some safe harbor. The weather became very cold after the 25th of the month and the mercury sunk below zero; the 26th it was nine below. February commenced with mild and pleasant weather, attended with frequent showers of rain and considerable thunder; the thermometer rising on several days to $65\frac{1}{2}$. There fell ten inches of rain in this month, eight of which were between the 3d and 12th of the month, occasioning, together with the melted snow on the high lands, the greatest flood in the Ohio and western rivers ever known since the settlement of the State; the bottom lands were covered from eight to twelve feet deep, and the Ohio appeared a vast sea rolling its proud waves from hill to hill, and bearing on its bosom the floating ruins of fences, stacks of hay and grain, and numerous frame and log buildings. Very few lives were lost either of man or beast. The rise of water was so gradual, from three to five inches per hour, that the inhabitants had sufficient time to prepare for their own safety and that of their domestic animals. The water was five feet and three inches higher than at any former flood.

The spring, so far, has been cold and vegetation backward. Pear and plum trees are now in full bloom, and contrary to my expectation, the peach tree in situations a little sheltered and on a light loamy soil, is full of living blossoms; I find that soil has considerable influence on the constitution of trees and their ability to resist cold. The fruit buds of peach trees on a clayey soil are generally killed, and the wood much injured. It has been conceded by writers on the subject, that a degree of cold equal to seven or eight degrees below zero, is fatal to the blossom buds of the peach

—and eighteen or twenty, ruinous to the tree itself. In February, 1818, the latter degree of cold destroyed all the peach trees in the western country, killing them to the surface of the snow, which was then two feet deep. By heading them down to the sound wood, fresh vigorous shoots were thrown up, producing fruit in one or two years. Cherry trees are beginning to blossom and bid fair for an abundance of fruit. Apple trees are full of fruit buds, already opened in warm exposures and appear not to be injured by the severity of the winter. The apricot has suffered more than any other tree, the branches being generally killed. The foreign grape vines in my garden are ruined, excepting such as I took the precaution to lay down in the autumn and cover with straw. Even the Bland grape is killed down to the old wood; it is not more hardy than the Madeira, and has every appearance of being a seedling from that grape, although Mr Prince, who is high authority, is of the opinion that it sprung from our native stock.

I made numerous experiments the last season, for protecting the fruit of my plum trees from the depredations of the "curculio," that feeble but irresistible enemy to all horticulturists; one was to suspend small bunches of rags dipped in Seneca oil and sulphur, under the branches of the tree; to these they paid no attention, but deposited their eggs in the fruit not an inch from the rags. Another tree was sprinkled frequently with soap suds mingled with sulphur, but with little better success. On a third tree which grew near a shed, a mixture of equal parts of fine flour of sulphur and wood soot, was scattered from a sieve over the leaves and fruit, when they were moist with dew or wet with a shower—this proved a complete protection. The fruit was not attacked by the little destroyer, but attained nearly its full size and began to change its color for ripening. I had calculated on the fine eating we should have shortly, when, lo, a new calamity appeared in the form of numerous cracks and fissures, first appearing on the upper surface of the fruit and in a few days spreading to the stem, and extending the gum of the tree in small drops; they rotted and fell to the earth without affording me a single ripe one. The trees were the Orleans plum and blue gage. The application had no influence in causing the cracks, as the same thing happened to some branches which were covered with millinet, and to which none of the powder was applied. It must arise from an exuberance of sap, produced by a soil too rich for the healthy growth of the plum. It does best in a poor hard soil, while mine is rich and mellow. It is the same with the pear tree. The only healthy trees within my knowledge are growing on a poor clayey, or dry gravelly soil.

As the welfare of the honey bee is deservedly a favorite theme with many of the writers in your paper, I will close this long communication by a few lines on that subject. They have flourished exceedingly with us for the last thirty years, and so congenial is the climate to their health and propagation, that the woods and prairies west of us are filled with wild bees, unprotected and unassisted by the fostering hand of man; indeed he is there their only enemy. Until the last season the *bee moth* was unknown in this part of the State. Last

autumn the larvae of the moth were first noticed amongst the comb, but few people had ever heard of them. Three years ago, I heard of their appearing amongst bees, thirty miles above Marietta, on the Virginia side of the river; so that they have been three years in travelling that distance. But Mrs Griffith's hives with careful attention, I trust, may yet preserve to us some of this industrious race, whose labors afford so much profit and satisfaction.

The canker worm, so destructive to your orchards, has not yet found its way west of the Alleghenies; at least, I have not heard of any on this side the mountains.

Very respectfully, your obt^d serv^t,

S. P. MILDRETH.

Marietta, Ohio, April 16, 1832.

T. G. FESSENDEN, Esq.—In the New England Farmer of the 2d inst. is a note from Mr Adams of Framingham, on the subject of treatment of apple trees injured by mice eating the bark near the ground. I think his method of using the *scions whole* is not so good as the one first recommended by the late Luther Richardson, Esq. of Roxbury, in June, 1810, and published in the memoirs of the Massachusetts Agricultural Society of that year, and which I now send you, recommending its republication in your next number, as now is the season for attending to it. I have for some years tried the method with full success.

Having suffered much the past winter in losing very many trees, particularly some new sorts of pears which were planted in the fall of 1830, and made but little growth last year; the bodies are killed from a few inches above the ground for three or four feet; the tops are alive and pushing out to appearance, but knowing they could not live, and the roots being perfectly good, I have cut them off just below the surface of the earth, and taken scions from their own tops and grafted them, covering them nearly over with earth. As the trees are well fixed in the ground, I shall save some years rather than planting new trees, besides saving the sorts. In haste, Yours, very truly,

JOHN PRINCE.

Jamaica Plain, May 5, 1832.

To the Hon. JOHN LOWELL, Esq.—

SIR—The very great destruction of fruit trees, occasioned by mice and moles, during the winters of the two or three last years, has made it an object of the utmost importance to discover the best means of preventing the mischief; or to invent a remedy for the evil after it has taken place. So prodigiously have these pernicious vermin multiplied late, in some places, as to threaten the destruction, not only of fruit trees, but also of forest trees and the grass of our best mowing fields. During the winter of 1808 and 1809, they were known in some places to attack a whole copse of small trees, leaving scarcely one ungnawed; and in many mowing fields to gnaw almost the whole surface of the ground, for many acres together, with their burrows and paths. Instead of molesting only the small trees in our orchards, as usual, they have of late completely girdled apple trees, in some instances, of nearly three feet in circumference, and destroyed them.

As this mischief is seldom done but in the severity of winter, when these vermin are driven to the roots of trees for shelter, and are deprived of their ordinary subsistence by the frost and snow,

the most effectual way to prevent this injury is, in the month of November, just before the winter sets in, to clear away all the rubbish and furze from around the roots of young trees, leaving the ground bare, and then to put a coat of dry ashes all around. The roots of the tree then affording them no shelter above ground, and they having a natural aversion to burrowing in ashes, they will be driven for shelter to some other place, and your trees will thereby in a great measure be preserved from their mischief. The ashes, also, will abundantly compensate you for the trouble and expense, causing your trees the year following to thrive and flourish exceedingly.

Another method of some use is, in the early part of winter after the first snow, to shovel snow around the roots of trees, and then tread it down hard, by which it will freeze and become solid like ice, through which they cannot easily penetrate. But this method is by no means sure, as they will frequently burrow under the ice and sometimes injure the roots underneath, and in the least thaw pass up and injure the tree.

But after the injury has been done, and your tree is completely girdled, and all the bark eaten off round the tree to the hard wood, I know of but one remedy to preserve the tree alive, although many experiments have been tried. A tree girdled in this manner, having no means of conveying the sap and nourishment from the roots up into the body and branches above, must wither and die. The usual way among farmers is, in such cases, to dig up the trees and set out new ones. Sometimes they are cut off and headed down below the place eaten, and new wood in length of time will shoot out and make a second tree.

But it occurred to me, that if any artificial way could be discovered, to renew or make a communication of the circulating vessels of the lower sections of the bark and sap eaten off, with the upper, so as to convey up the juices and nourishment from the roots into the branches, the tree might be made to live and flourish.

Accordingly, choosing a fine thrifty tree about twelve inches in circumference, as soon as the snow was off the ground in the spring, which had been completely girdled by the mice and the bark eaten off all round to the hard wood, more than four inches wide, like a belt: I took a sharp knife and evened the edges of the lower and upper circle of the bark eaten off; then took a scion from the tree, about the bigness of a pipe stem, and an inch longer at each end than the space where the bark had been eaten off around the tree, split the scion lengthwise, and shaved the split side down so as to fit to the body of the tree, being very careful not to disturb the bark of the scion; then cutting away the lower circle until it came to fresh bark, made a perpendicular slit one inch down towards the root of the tree, then crossed this at the bottom with a horizontal slit, half an inch on each side, as in building; then gently pecked up the bark on each side, and fitted the lower end of the scion in and squeezed the bark down around it; then fitted the upper end of the scion into the upper circle of the bark eaten off, in all respects as I had done the lower. In this manner I placed six scions all round the body of the tree; then covered it over, an inch or more thick, with Forsyth's composition, and hoed the dirt up all around the roots of the tree to keep it moist.

The tree did not put out its leaves so soon nor so vigorously at first, as the other trees; but by

the middle of summer it flourished very well, and in the fall there was no apparent difference between it and the surrounding trees. It bore some fruit the last year, and is now covered with young fruit, and appears as healthy and flourishing as any tree in the garden.

In the fall of the year, after this operation, I opened the roots of this tree and tore away the plaster, and to my surprise, I found that four of the six scions had taken and grown to the size of nearly an inch in diameter. The other two did not take, by which means the tree is a little flat on one side. I lately opened the tree again, and have found that it will soon be covered with bark again, except the side where the scions did not take.—This experiment I have known to have been tried several times since, with equal success. Mr Isaac Davis, of Roxbury, a very intelligent and respectable farmer, in the spring of the year 1809, treated in the same manner a large apple tree of more than twentyseven inches in circumference, which had been eaten off all round, for a space of more than four inches. The tree flourished and bore fruit the last year, and is now covered with a great abundance of fruit; and is extremely thrifty, having recently examined it for the purpose of ascertaining its present state. Mr Davis made use of common clay mortar in his experiment, instead of Forsyth's composition, which he thinks, answers as good a purpose.

Knowing, Sir, the interest you feel in everything that tends to improvement in agriculture and husbandry, I have taken the liberty to address to you the foregoing experiments and observations, which, if in your opinion should be deemed of public utility, you are requested to communicate in any manner you think most useful to society.

I am, with the highest sentiments of respect,

Your most obedient and very humble serv^t,

LUTHER RICHARDSON.

Roxbury, June 10, 1810.

DIRECTIONS

For sowing the seed and rearing the plants of the White Mulberry Tree. Prepared in pursuance of a Resolution of the New York State Agricultural Society.

1. Prepare a piece of good garden soil, by digging and pulverizing it. Lay it out into beds three or four feet broad, and rake it off smooth—do this early in May.

2. With a hoe, stick, or other instrument, proceed to make shallow drills across the bed thus prepared, from twelve to fifteen inches apart, and scatter the seed in the drills as thick as you would onion or parsnip seed, then cover half an inch with fine mold and press it moderately down with a hoe; or, when the first drill is sown and covered, place upon it a narrow strip of board and stand upon this board to sow the second drill, upon which, when sown, place the board in like manner and sow the third drill, and proceed thus until the whole is completed. The pressure of the earth upon the seeds is to bring it in close contact with them, that they may be kept moist and germinate readily. If the weather be dry or the soil very light, an occasional watering at evening will be beneficial.

3. The only further care required the first season, will be to keep the ground free from weeds and the soil moderately loose.

4. Strong plants of one year's growth may be transplanted in April, into nursery rows; or the whole may be left to grow a second summer, in the seed bed; the ground, as before, being kept free from weeds and occasionally stirred.

5. After two summers' growth, all the strong healthy plants should be placed in nursery rows—which may be done thus: The ground being prepared as for a crop, draw a line and proceed to open a trench of sufficient breadth and depth to admit the roots freely, leaving the side next to the line straight and perpendicular. Having assorted the plants, and cut off the bruised and shortened the tap roots, a man proceeds to place them in the trench in their proper position, the heel of the plant towards the line and at the distance of a foot apart; while another man with a spade, or the planter with a gardener's trowel, throws in earth to hold them in their place. The trench is then to be filled, the plants set upright and tread about them. The other rows are planted in like manner, three feet apart. The ground to be kept clean during the season.

6. After standing two years in the nursery, the plants will have acquired a sufficient size to plant out in the ground where they are to stand; and if intended to be grown in hedges or in bushes, they may be taken earlier, even at two years old from the seed bed. For hedges, plant the same as for nursery rows, at eighteen inches, the ground having been previously prepared by an ameliorating crop, as potatoes. The precautions are necessary with mulberry as with other fruit trees intended for standards, as to distance in planting. A broad and deep hole partially filled with good surface mold, will always repay for extra labor. When intended to be cultivated as bushes, they may be planted thick and left untrimmed, so as to occupy the entire ground. The mulberry is generally grown in the latter way in India and in some parts of Italy. It facilitates the gathering of the leaves and affords an earlier product.

The mulberry grows well on almost any soil and particularly in one that is stony. Upon poor dry soils it affords the best materials for silk. An ounce of seed will give some thousand plants, and requires a bed four feet broad and forty to fifty feet long.

Although it might be prudent to give the seed sent to you to a trusty individual, who would take care of it and the plants which it produces, yet as it is designed for general benefit, it would be proper to require a stipulation, that no greater charge should be made for the plants than would afford a liberal remuneration for the labor bestowed in cultivation. And I have it in charge from the Executive Committee, to request that you will advise me, in the communication which you are expected to make in autumn, of the disposition of the seed and the condition of the plants.

J. BUEL, Cor. Sec'y.

Albany, March 15, 1832.

From the Massachusetts Agricultural Repository and Journal.

LIVE HEDGES FOR NEW ENGLAND.

It is not my intention to recommend live hedges for this rocky part of the U. States. Our own stones furnish the best divisions we could ask for or desire; and on most farms the removal of them from the soil would be economical, and the placing them as partitions for fields is the cheapest and most natural mode of disposing of them. Still, in

New England, there are extensive tracts of country of alluvial or diluvial soil; in which no rocks are found, and in which a stone wall could not be obtained without great expense. Such is the state of the greater part of the old colony below Plymouth, and of some parts of the county of Middlesex. But wherever wood fences are required, it may be useful to substitute live hedges. The question is, what has been our experience as to the comparative value of the various plants employed in New England for live hedges? In the remarks which follow, I beg it may be understood, that I do not intend to oppose the opinions expressed by a learned and judicious horticulturist, Judge Buel; nor those expressed by practical gentlemen at the south; but simply the results of my own personal experience and observation, during the last 18 years, since the subject of live hedges attracted the attention of our cultivators. Nothing which I may say can in any degree impeach the correctness of their statements, because the causes of the failure of certain plants with us, may have been entirely local. This would not appear remarkable, when we consider that the locust, (*Robinia Pseudacacia*) is absolutely interdicted to us, while it is the favorite and one of the most valuable trees of the south.

Suffice it then to say, that the Virginia thorn, introduced here by Mr Quincy, with whom it appeared to succeed, is in most cases utterly useless as a fence. This is chiefly owing to the ravages of a worm at its root; whether it be the same which attacks the apple and the quince, is a point not settled. The same objection is applicable to the English hawthorn. And to this fatal one is superadded another, the appearance of a fungus of a yellow color on the leaves, which utterly disfigures them and strips them of their foliage in September. The *Glodischia triacanthos* is not suited for hedges with us. If left to grow they soon grow out of all reach, if checked they are winter-killed. We are indebted wholly and entirely to the experiments of Mr Ezekiel Hersy Derby, Esq. for the possession of a plant, the buckthorn (*Rhamnus catharticus*), which, from ten years' trial, seems to afford every desirable quality for a healthy, beautiful, and effectual hedge. We refer the public to Mr Derby's account in the New England Farmer, for particulars.

I can only say, and I feel it a duty to say, that I have tried this plant for six years. It is hardy and rapid in its growth, of impenetrable thickness, and so far as that extent of experiment enables me to judge, not subject to any disease, or the visitation of any insect whatever. As it is very provoking as well as expensive to cultivators, to be led astray, and to find after five or ten years, that they have been deceived, they would do well to examine the growing hedges of the buckthorn, or *Rhamnus catharticus*, at Mr Derby's, Mr Brooks', Dr Jackson's, or at my place.

JOHN LOWELL.

STILTON CHEESE.

There is scarcely an article in which a greater variety of appearance and taste exists than cheese; the inhabitants of almost every valley on the face of the globe, make a different kind. A very good anecdote lately originated in a Worcester paper, which has gone the rounds, of Gen. Knox, an Englishman, and others, who were deceived at a boarding-house in this city some years ago, in a piece of cheese actually made in Worcester coun-

ty, but which their incredulity would not allow them to consider any other than the celebrated imported Stilton cheese. This story may excite a desire in some of our enterprising agriculturists to imitate an article, which ranks so high among professors of gastronomy; and we will tell them how we have ever understood the famous Stilton cheese is made.

It is in fact cream cheese, the cream of the night's milk being added to the morning's milk, along with the rennet. The curd is not broken, but put into a sieve to drain and very gently pressed; when the cheese is sufficiently firm, it is put into a wooden ring and kept on a dry board.—These cheeses are mostly made in Leicestershire, and weigh from six to twelve pounds. They are not marketable until they become blue and moist, which requires about two years' keeping. A little wine is sometimes added to the curd, to bring forward the blueness earlier; others place the cheese in buckets and cover them with some moist substance. Individuals have buried their cheeses separately in the shore below high water mark, to produce the desired qualities. A thicker sort of this is called Cottenham cheese.—*Boston Traveller*.

STRAWBERRIES AND RASPBERRIES.

Mr Theodore Sedgewick, in a communication in the New England Farmer, says, "Neither Baltimore nor Albany are supplied even with garden raspberries or strawberries. I speak of these cities because I know the fact."—If Mr Sedgewick will pay us a visit at the strawberry and raspberry seasons, he will find our markets as well supplied with both these fruits, as those of any other city in the Union, we will not except any. So plentifully are they supplied, indeed, it is a common thing for large quantities of strawberries to be taken hence to Philadelphia. We do not hesitate to say, that for both quantity and quality, there is no city better supplied than Baltimore with any kind of fruit. During the strawberry season, we can find at the different stands, as many as a dozen varieties on the same day, pines, lambtoes, scarlets, &c, with their numerous sub-varieties. And as to raspberries, there is not a variety cultivated in the Union with which our market is not supplied, Antwerps, English, and indigenous. How Mr S. should have made such a mistake, in so positive a manner, ("I know the fact,") we cannot conceive. We know that such an impression prevails "down east," and extends even to our vegetable market; and it has been the cause of gardeners coming here to commence business—when they have found that they would only be "carrying coals to Newcastle"—and had to return where they were more needed.—*American Farmer*.

POTATOES.

Let us call the attention of our good agriculturists, to the importance of choice varieties of this valuable crop. It is not every kind that will yield the most per acre, that is the most profitable.—The price in this market at this time, varies from twenty-five to fifty cents per bushel. Those who raise potatoes for this market, would do well to inquire into the cause of this difference, and regulate their crops accordingly. The pinkeye, Soult St Marie, Mercers, and Foxites, at present are considered the most valuable.—*Genesee Farmer*.

May day.—We understand several parties were prevented from going out Maying for want of snow shoes.—*Augusta Courier*.

AN ADDRESS,

Delivered before the Society of Middlesex Husbandmen and Manufacturers, Oct. 5, 1831.

By JOHN M. CHENEY.

Concluded from page 333.

Rough as much of our land is, and barren and unproductive as it appears to be, I do not believe there is in Middlesex an acre, upon which there is any soil exposed to the action of the sun and air, that by some mode of culture, known or unknown, may not be profitably tilled. It has been said, that "we have yet to learn the immense productive power of a single perfectly cultivated acre." We have also yet to learn, what and how much many an acre that now lies waste may be made to produce. And while all this remains to be learnt and profitably learnt, here in this country, a spot blessed above all others by its moral, social and literary advantages, let not our young men sigh for the luxuriant prairies of the West. Let them remember, that a hard and stubborn soil is favorable not only to the development of the physical powers, but to the growth of manly sentiment and moral virtue; that it is along the steep and precipitous sides of the mountains of Switzerland, or on the rough and misty summits of craggy Scotland, or among the rock bound and forest clad hills of our own New England, that a stern but merciful necessity has brought nearest to perfection the physical and moral man; that the ease and luxury of a milder climate and a richer soil, so far from being the blessings that they are imagined to be, induce languor and disease, and often prove fatal, not only to the vigorous and healthy action of the body, but still more fatal to the growth and expansion of the intellectual and moral nature. Again, therefore, to the young and enterprising sons of New England, I would say, desert not this your native land. Industry, intelligence and virtue, will make you respectable and happy here; without them, you can be so nowhere.

Do you complain of labor, as a burden too grievous to be borne—remember it is an immutable and eternal law of our nature, that no permanent and substantial good can either be obtained or enjoyed without labor; that when man was first placed upon the newborn earth, then all fresh from the hands of its Creator, it was not, that he might stand an idle spectator of nature's operation, for merely to contemplate and admire the beauty and grandeur of the works of God; but in the very morning of his existence, and before the "primal curse" was pronounced upon him and his posterity, it was made his duty to till and cultivate the earth from which he sprang. If you ripen at labor, therefore, the common lot of all our race, you do but murmur at the decrees of Providence. Besides, it is an undoubted truth, that agricultural labor is more conducive to human happiness than any other. The voice of cheerfulness and health is heard most frequently within the dwellings of the farmer. To the peace and quiet of rural life, men of all professions have turned their eyes as an asylum, where they might escape the evils of a vexed and disordered world.

I know that the laboring man sometimes looks with envy upon the favorite of fortune, who need not toil for the means of gratification, and whose life seems to be passed in a round of pleasures—but he knows nothing of the thousand nameless and imaginary ills, the legion of diseases, the intolerable listlessness and ennui, that torment the

miserable slave of pleasure or devotee of fashion. I know that he sometimes contemplates with feelings of discontent, the exemption from manual labor of the professional man and the scholar, but could he know what sacrifices of health they make, what fearful responsibilities they incur, what intellectual throes and pangs and anxieties they endure, and

"How hard it is to climb

The steep, where Fame's proud temple shines afar,"

sure I am, he would be satisfied that the labor of the mind was no less severe and painful than that of the hands, and that the heights of professional eminence or learned renown, are not reached, but at the price of many a sleepless night and of many an anxious and wearisome day.

There is, however, another objection to agricultural pursuits, of a different and more important character, that is frequently urged upon our notice. It is said that the profits of the business are so small, that there is no inducement to engage in it. A well estimated principle in Political Economy furnishes a different answer to this objection. "The rate of profit in agriculture is the standard rate, or the average rate of profits obtained from capital employed in agricultural industry, must always govern the average rate of those obtained from capital employed in every other department." And this, for the simple reason, that agriculture is that branch of industry upon which all others depend, and therefore must and will be carried on at all events. Yet, in a community where there is a free and unrestrained competition in every kind of business, it will be easily seen that it would not long be carried on, if its profits were permanently below the average of those in other departments of industry. The reason, I believe, that this objection is so often heard is, that we are in the habit of looking back to those golden days, when from extraordinary causes, we were placed beyond the reach of the ordinary principles of Political Economy. When the neutrality of our flag, and the necessities of Europe, growing out of its successive, destructive and desolating wars, gave such an impulse to commercial enterprise and created such a demand for our agricultural produce, that the world seemed tributary to our success, and its wealth was poured in upon us without parallel and without measure. We retain, I fear, the extravagant notions and expensive habits, induced by an age of unexampled but fortuitous prosperity, while we forget the changes that have taken place in the state of the world and in our own condition, while we forget that the immense profits of the era to which I have alluded, were but treasures accidentally driven to our shores by the storm of a continued and universal war; and that now, in the sunshine of a universal peace, while foreign nations are busy in supplying their own wants, and our commerce is controlled by their restrictions and their competition, we must rely upon our own internal resources, and in every kind of business be content with moderate profits. The age of dazzling successes has passed. The evils that grow out of great changes in the objects and applications of national industry have, we trust, been mostly endured;—and nothing remains for us, as a nation or as individuals, but with moderated expectations and steady efforts, to develop and improve our national and individual resources.

To this object should the attention of the farmer

now be directed. It will avail him nothing to cast back "a longing, lingering look," to the unexampled advantages that were enjoyed for the accumulation of wealth, from the adoption of the Federal Constitution until the peace of 1815. Let him look forward, rather, to the sure and certain rewards of an improved state of agriculture. And let him not stand all the day idle, nor call on Hercules to help him, but put his own shoulder to the wheel, and do what he can to render his art more scientific and more perfect, and consequently, more pleasant and more profitable.

It would ill become me, to attempt to give instruction to an assembly of intelligent and practical farmers, upon subjects with which they are already familiar. But, gentlemen, you will indulge me for a moment, while I attempt to give a little of practical and useful character, to this otherwise rambling and idle discourse, while I suggest a few simple improvements and recommend to your notice a few new objects of attention.

The first suggestion that I would make, relates to the introduction of hedge fences. One of the most considerable expenses of the farmer arises from building and keeping in repair his fences. If his land happen to be rocky or if timber remain abundant and cheap, perhaps the materials now in common use may be the best that he can employ. But in some parts of the country these materials are so scarce and costly, that the expense of a fence constructed of them, bears no inconsiderable proportion to the value of the land inclosed by it. Now, repeated experiments have proved, that from the hawthorn, Virginia thorn, and other shrubs, with a few years' growth and proper attention, one of the most perfect and durable as well as most beautiful fences in the world, may be formed at a comparatively trifling expense. A great variety of trees and shrubs have been successfully employed for this purpose. So that whatever may be the nature of the soil, some one may be found adapted to it. If then, you can, for one half of what you now pay, have a better and a handsomer fence than you now have, it is certainly worth your while to inquire into this matter and see if these things are so.

In the next place, I would have more attention paid to rural architecture. Our farm houses are many of them constructed with little regard to convenience or economy. They have been built without first sitting down to count the cost, and of dimensions altogether disproportioned to the wants of the occupant. The expense of the first erection and of keeping in repair, (if they happen to be kept in repair,) often consumes the hard earnings of a life of toil. They become objects of derision to the traveller, and their appearance is such as to afford a fit theme for the satirist. So injudicious and extravagant is the expenditure upon them, that it is no uncommon thing for the whole farm, with all the buildings upon it, to be sold for a less sum than the buildings alone cost the owner. Now I am no advocate for mud-cabins nor log-huts. I would have the farmer's dwelling neat, comfortable, and in a certain sense, elegant. But I would have it understood, that this does not depend upon the quantity of boards and shingles, that are heaped together in its construction, but in the adaptation of the parts to the purposes for which they are designed; a proper regard for architectural proportions, and a correct taste in the application of a few simple architectural embellishments.

It was my intention to speak somewhat in detail of the culture of silk and of the vine, but the wasting hour will permit me to give these subjects but a passing notice. Is it not strange, that while we are sending to the four quarters of the earth for new varieties of fruit, and importing exotics from every climate under heaven, we should suffer to perish upon its branches, that rich and delicious product of our own soil, the *grape*, which nature has scattered around us in almost wasteful profusion? That we should, age after age, send our millions to the foreign vintager for his wines, and trample under our feet the purple clusters of our native vine, from which it may be made equal in richness and flavor to the choicest that France, Spain, or Italy can boast? Yet this is the fact—and I speak with confidence when I say, that wine of as good a quality as any imported, and much better than most that is imported, may be made at a trifling expense, from our common wild grape. It seems to me, that this is a subject that well deserves the consideration of the enterprising farmer; not only because he may thereby turn into his own coffers a large amount of money that is now sent to foreign countries, but for the moral effects that might follow from substituting a pleasant and salubrious beverage, in the place of those villainous compounds, the distilled spirits, whose pernicious effects we have so much reason to deplore. For although the man who uses wine to excess, deserves, perhaps, to be as severely censured as he who makes the same use of distilled spirits, yet, experience has shown, that intemperance very seldom originates in the use of the former alone. In fact, in all those countries where the vine is cultivated to the greatest extent, the people have been found to be the most temperate on earth.—Its cultivation may, therefore, well be urged as one of the surest means of driving from the land, that subtle enemy, that men are fools enough to "put into their mouths to steal away their brains."

The importance of the culture of silk, in a national point of view, may be estimated from the single fact, that we annually import and consume silk for which we pay ten millions of dollars; and the established certainty, that this article of a better quality and to an indefinite amount, may be produced at home. The mulberry tree flourishes in every part of our country; and the silk-worm thrives as well here, as in the more sunny climes of France and Italy. Will the American farmer any longer consent to pay any part of this heavy tax for a foreign luxury? Or will he not rather, not only supply himself and the home market from his own farm, but make it, as he easily may, a staple article of exportation? Especially does it become the farmer of New England to attend to this matter. The only agricultural products that are exported from this country, to any considerable amount—cotton, rice, and tobacco—his lands will not produce. Of grain and the bread stuffs, New England does not grow enough for her own consumption. Its exigencies seem, therefore, to demand some new application of its agricultural industry. To what can it be more profitably applied, than to the culture of silk? The man who has made the experiment, the farmer of Mansfield, shall answer. He will tell you, that from a mulberry orchard of a few acres only, silk may be obtained, which, at a moderate estimate, will be worth more than the average profits of our small farms. He will tell you, that with a soil not well adapted to the purposes of agriculture, that little

town, alone, receives an income of about \$25,000 annually, from its silk; while the labor by which it is produced, is performed almost wholly by children and females. These are facts, and to these I demand your attention. It is not a mere theory, *a farming upon paper*, that I am urging upon you notice. I ask you to rest your faith in this matter upon nothing short of well-tried experiments and incontestable facts. Nothing, it seems to me, could be more nicely adapted to the situation of our smaller farmers. All their present crops might be cultivated as they now are, while this, a rich and valuable one, might be added to their number without any additional expense for labor. It would afford to his children, and especially to his daughters, a pleasant and profitable employment; and this too, at home and by his own fireside, the spot most favorable to moral improvement and to the growth of the domestic virtues. And this is a consideration not to be slighted, when from the establishment of factories, the music of the spindle and the loom has ceased to be heard in our dwellings—and our daughters are many of them subjected to the hard alternative of going into a disagreeable and dangerous service abroad, or of remaining in a useless and burdensome idleness at home.

The numerous specimens of household manufactures, and the exhibitions of female taste, ingenuity, and industry, which we have this day witnessed, prove that the daughters of Middlesex would not willingly be idle; that they have a higher ambition than to bedeck and bedizen themselves, according to the ever varying caprices of a French milliner, or the barbarous and unnatural mandates to the tyrant, fashion—the ambition of being *useful*; and they will readily avail themselves of the opportunity which the culture of silk will afford, to make with their own hands, as of old, "coverings of tapestry, and clothing of silk and of purple." Then, as has been well said, "our fair might, with something more of palliation, contemplate themselves in the mirror, in the splendor of a vesture, wrought and colored by their own industry."

Finally, gentlemen, in view of what has been done and of what remains to be done, let me congratulate you upon the past and urge you to persevere for the future. Go on in the path upon which you have entered—the path of usefulness and honor. The earth is yours, with all its boundless capacities and endless resources; and their development and application will afford full scope for the exercise of all your powers. No effort shall be lost, but of the increasing and exhaustless treasures of the earth you shall be liberally rewarded. The blessing of the Almighty is upon the labors of the husbandman; and you have His assurance, that while the earth endures, the seasons shall continue to dance their round, and that seed-time and harvest shall not cease.

Do you ask for a higher motive for your exertions? Let it be found in your patriotism. Know that every improvement you make upon your lands, adds to the permanent riches of your country. The State has an interest in your success. In proportion as your farms are well fenced, stocked and cultivated, its resources are multiplied and its strength augmented, and you thereby lay the foundation of its greatness and its power. Its destinies are in your hands. With an industrious, intelligent and independent yeomanry, it has nothing to fear. Without them it has nothing to hope,

Dependent on no man's patronage for support—above the rich man's scorn, or "the proud man's contumely," the farmer is, in a great degree, beyond the corrupt influences that beset the paths of other men. His daily toil leads him forth from the haunts of men, into the peaceful and tranquil solitude of the fields. The fierce and frenzied impulses which faction imparts to a crowded population, reach him not. The demagogue in vain declaims to him of abuses, which his understanding teaches him do not exist. The clamorous radical, or reckless partisan, though he come in the guise of an apostle of retrenchment and reform, in vain preaches to him of the political millennium that would follow, if only the present incumbents of office could be removed, and he and such as he, put in their places. "Corruption of morals," says Jefferson, "in the mass of cultivators, is a phenomenon of which no age nor nation has furnished an example."

And here, gentlemen, strongly impressed as I am, with the belief, that the fate of our country must depend upon the substantial virtues of its yeomanry, let me seize the moment to exhort you to interpose, to save us from the perils with which we are threatened. The existence of faction you cannot prevent. It is a weed that will naturally and inevitably spring up in the rich soil of our republic. It is yours, as political farmers, to check its growth and see that it does not overtop nor root out the salutary and useful plant. But there is abroad in the land, a spirit of wild speculation, rash experiment, and reckless innovation. The Constitution, the charter of our liberties, is assailed, rudely assailed, for unallowed and factious purposes. Truth and justice are shamelessly trampled under foot, in the career of a mad ambition. The press has betrayed its trust, and become an engine of falsehood and corruption. Virtue is scoffed at in our high places. Religion is becoming a by-word. Sects and parties are multiplied at the call of every man, or woman either, that has impudence enough to assume the attitude of a leader. Political and religious emissaries are in every corner of the land, to rally partisans and proselytes, to any and every system of intolerance and proscription. It has just been discovered, that all the wisdom of past ages is folly, and that all their institutions are radically vicious, fundamentally wrong. And the beardless boy, in this school of modern philosophy, has learnt to sneer at the credulity and bigotry of his hoary-headed father.

Are not these things so? And if so, to whom shall we look to shield us from the storm of political and religious elements, that threaten to sweep away in its fury, the whole fabric of society? To whom but the substantial yeomanry of the land—the men, whose cool, unbiassed judgment and good common-sense, will enable them to distinguish between the clamor of the demagogue and the eloquence of the patriot; between a fair and dispassionate exhibition of existing evils, and a sweeping denunciation of all established institutions; between needful and salutary improvement and reform, and the utter demolition of all law and order. To them we must look in every hour of peril to our country. And that we may do it with an unwavering confidence, let me urge upon you the importance of fixing in the minds of your children, the elements of knowledge and the principles of virtue. It is not right, that those to whom is intrusted the fate of this republic, in

whose hands is "the keeping of the last hopes of liberty," should grow up in ignorance and vice. It will be of little avail that you attempt to throw beauty and fertility over the face of the earth, if the mind and the heart are left uncultivated and waste. Intelligence and virtue are the vital principles of this republic; and if you would perpetuate its existence, you must make those on whom you devolve the responsibility of its preservation, intelligent and virtuous. Then, to whatever dangers we may be exposed, from the complicated and jarring interests, the local prejudices and sectional jealousies of an increasing wide spread population, the yeomanry of the land, the proprietors of the soil, will form a phalanx for our safety and defence, firm as their own hills, and immovable as the oaks that crown them. "Corruption will shrink at their kindling, indignant glance; and tyranny in the ruler and licentiousness in the people, equally find in them an inexorable foe."

NEW ENGLAND FARMER.

Boston, Wednesday Evening, May 9, 1832.

LIST OF OFFICERS

Of the Massachusetts Society for Promoting Agriculture, dated June, 1831.

HIS HONOR THOMAS L. WINTHROP, President.

HON. PETER C. BROOKS, First Vice President.

HON. JOHN WELLES, Second Vice President.

HON. RICHARD SULLIVAN, Cor. Secretary.

JOHN HEARD, Jr. Esq., Treasurer.

GORHAM PARSONS, Esq., Recording Secretary.

BENJAMIN GUILD, Esq., Assistant Secretary.

TRUSTEES.

John Lowell, Esq.; E. Bersy Derby, Esq.; S. G. Perkins, Esq.; Hon. William Prescott; Israel Taunton, Jr. Esq.; Hon. John C. Gray.

FARMER'S WORK FOR MAY.

We propose to utter some common-place admonitions relative to the management of certain rural affairs, in which *utility* rather than *novelty* will be our object. If in *Salomon's* time there was "nothing new under the sun," we may well suppose that in our time every useful topic will be as common as a highway to a mill, or a meeting-house. Still, as no man is so well versed in the lessons of life, as never to need nor be benefitted by a *prompter*, we shall go on with our three repeated lectures on rural economy.

Mitology.—Make a war of extermination with noxious insects. The following substances, sprinkled over plants with a watering-pot, a syringe, a garden engine, or other proper implements, are all destructive to these destroyers, viz. The juice pressed out, or decoctions of elder, especially of the dwarf kind; tobacco; wormwood; walnut leaves; pepper, and other plants which are bitter and biting. Water alone, heated to about from 120 to 150 degrees, will, it is said, destroy insects without injuring plants. Careful experiments on this subject, to ascertain how hot the water may be made, to what insects its affusion would prove fatal, as well as at what temperature it would best promote the growth of vegetables, if their results were published, (in our paper of course,) would be of more use than alterations about polemics or politics. The pop-gun of the political partisan we should be glad to see metamorphosed into the syringe of the bug-destroyer.

With regard to the application of soap-suds for the destruction of insects, it seems that simply sprinkling plants is not always sufficient.

The *aphids* or *plant lice*, for example, attach themselves to the under sides of leaves, where they remain "stung as a bug in a rug," as a certain (not very sublime) poet hath it. But if you can contrive to dip the leaves infested into the liquor, so that it may be sure to accommodate the parasites with wet lodgings, they either die or resign without more ado.

Perhaps some practical cultivators, who may have the good fortune to read and profit by our *effusions* about *effusions*, may not be so fully aware, as of regard to their interests we wish they were, of the importance of soap-suds for the purposes of rural economy. The Rev. Mr. Falconer, one of the correspondents of the Bath Agricultural Society, strongly recommended this liquid both as a manure and antidote against insects. He observed, "This mixture of an oil and an alkali has been more generally known than adopted, as a remedy against the insects which infest wall fruit trees. It will dislodge and destroy the insects which have already formed their nests and bred among the leaves. When used in the early part of the year it seems to prevent the insects from settling upon them." This writer prefers soap-suds to lime-water, because lime soon "loses its causticity and with that its efficacy, by exposure to air, and must of course be frequently applied; and to the drying of the leaves with the fine dust of wood ashes and lime, because the same effect is produced by the mixture without the same labor, and is obtained without any expense." He directs to make use of a common garden-pump for sprinkling trees with soap-suds, and says, if the water of a washing cannot be had, a quantity of potash dissolved in water may be substituted; and that the washing of trees with soap-suds twice a week, for three or four weeks in the spring, will be sufficient to secure them from the aphides.

Manure.—We have been visited this season, with so much uncommon, ungenial, uncomfortable, and unheard-of weather, that we are apprehensive many diligent cultivators have not yet cleared their barn yards, to manure their fields and gardens. This object of course demands immediate attention; and permit me to give you a word by way of reminding you of some indispensable, relating to the *food of plants*.

In primis, the man who *pretends* to be a *farmer* and pays no attention to saving and making the most of manure, is a fair candidate for an almshouse, or on his way to a debtor's apartment with closed doors.

Manure is as necessary to agriculture as light to vision, air to respiration, water to navigation, food to population, letters to education, language to conversation, and so on through as many *sine qua non*s as you can find words for in Webster's Dictionary. Manure, (or, more philosophically, *food for plants*), has three particular enemies which you will please to look out for and guard against—to wit, the sun which exhales it, the air which imbibes it, and the rain which washes it away. To prevent any robberies from these elements, you must either *cover* your manure, or put your manure *under cover*. In the former case you throw earth over it, and in the latter case you throw it under a shed, into a barn-cellar, or some such place,

* See New England Farmer, vol. III. p. 9.

where "the garish eye of day," as Milton says, cannot *peer* upon it. "He who is within the scent of a dung-hill," says the celebrated Arthur Young, "smells that which his crop would have eaten if he would have permitted it. Instead of manuring the land he manures the atmosphere; and before his dung hill is finished he manures another parish, perhaps another country." It is well, likewise, if the effluvia arising from rotting manure heaps has not poisoned the family of their owner, and instead of giving life to vegetables taken life from animals. Some farmers' premises require as much chloride of lime to make them tolerable, as would serve to sweeten a pest-house. All this might be prevented by proper *topical applications*, as a doctor would phrase it, of fresh earth to the sources of contagion, as we shall prove by what follows:

The author of "Letters of Agricola" tells us, that "Earth is a powerful absorber of putrefaction. Put a layer of common soil along the top of a fermenting dung-hill, from twelve to eighteen inches thick, and allow it to remain there while the process is carrying on with activity, and afterwards separate it carefully from the heap, and it will be impregnated with the most fertilizing virtues.—The composts which of late years have attracted so universal attention, and occupied so large a space in all agricultural publications, originated in the discovery of this absorbing power." Here then, instead of chloride of lime or of soda, both excellent articles, we have, in common earth, a substance at the command of every cultivator, which will convert poison for animals into food for plants; and make you healthy as well wealthy, provided you are wise enough, and not too indolent to profit by its application.

THE GREAT NEW HAMPSHIRE STEER.

A very large and beautiful animal of the Ox kind, is exhibiting in a temporary shed at the west end of Faneuil Hall, Boston. He is now but four years old, and it is said, weighs nearly *four thousand pounds*! He was bred in Greenland, New Hampshire, is called *Americus*, and is the finest as well as the largest animal of American growth, we recollect ever to have seen. If he continues to increase in size till fully grown, at the rate he has done, he will very much surpass every creature of his species, of which the animals of oxen have taken honorary notice. No man that is worth nine pence and has a cent's worth of curiosity, will hesitate to walk in and take a survey of the greatest ox of his years that ever existed.

THE SILVA AMERICANA.

Or a Description of Forest Trees indigenous to the United States, practically and botanically considered; illustrated by more than one hundred engravings. By D. J. Browne. Boston: published by William Hyde & Co.

This work was announced in the New England Farmer of October 9, 1831, as being in contemplation. It is now completed and before the public in a handsome volume of more than 400 pages, royal 8vo. The subject of the work is of the highest interest. "Trees," as the author observes, in a well written preface, "independent of ornamenting the earth and of furnishing us with timber and fuel, arrest the progress of impetuous and dangerous winds; maintain the temperature of the air, by diminishing extreme cold and regulating extreme heat; oppose the formation of ice, and

shelter the earth from the scorching rays of the sun; produce an abundance of water in the stream and oppose a barrier to washing away or undermining their banks; preserve and enrich the soils on hills and mountains; discharge the electricity of the atmosphere; and serve as laboratories for purifying the air we breathe."

Few people are aware of the importance of trees to a country. War, famine, and pestilence, singly or united, raging to any extent with which they have hitherto visited civilized countries, would inflict less calamitous and enduring evils than would originate in the total want of trees, for shelter, shade, buildings, ships, machinery, utensils, fuel, bridges, &c., &c., &c. The surface of a country barren of trees, would soon become like the deserts of Arabia and the wilds of Africa, moveable and restless sand heaps, as easily agitated as the waves of the sea, and filling the air at every breeze with clouds of dust, similar to those which always annoy and sometimes overwhelm whole caravans of African and Asiatic travellers.

We have not yet been able to give Mr Browne's book a *thorough* perusal, but have read enough to speak well both of its objects and execution; and propose hereafter to give such extracts as our limits will allow; together with specimens of a useful and much wanted work, on one of the most important topics of individual and national economy.

HORTICULTURAL REGISTER,

And General Magazine of all the useful and interesting discoveries connected with Natural History and Rural Subjects. By Joseph Paxton and Joseph Harrison.

We have received eight numbers of a work with this title. It is a monthly publication, printed in London, and conducted as above mentioned. Mr Paxton is principal gardener to the Duke of Devonshire, and has the care of a very large and magnificent establishment belonging to that nobleman, at Chatsworth. We shall, from time to time, *transplant* for the use of American cultivators, such articles as bid fair to promote their interest and benefit the public.

The Massachusetts Agricultural Repository and Journal, Vol. X, No. IV, has just issued from the press of Stimpson & Clapp, 72 Washington street. From a cursory view of its contents we think it highly worthy of a diligent perusal. The "Introductory remarks" are well written, and the "Official reports," miscellaneous matter, &c., abound with topics of interest, handsomely discussed, and meriting careful attention from all who practise or wish well to profitable and scientific husbandry.

Transactions of the Essex Agricultural Society for 1831, Vol. II, No. 1. Published by order of the Society, March, 1832. Press of Foote & Browne, Salem, Mass.—This is another useful pamphlet of upwards of 120 pages, large 8 vo. An excellent address, by HENRY COLMAN, is placed at the commencement, and the whole tract is replete with instruction based on experiments, which appear to have been conducted with judgment and detailed with precision.

Preventing Onions from sprouting or germinating.—A writer in the Gardener's Magazine says, that this may be effected by simply applying a heated iron for a few seconds, to the nozzle of the onion whence the roots protrude.

BRIGHTON MARKET—MONDAY, MAY 7, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 280 Beef Cattle, 6 pairs Working Oxen, 30 Cows and Calves, 35 Sheep, and 76 Swine.

PRICES. *Beef Cattle*—The quality of Beef Cattle to-day was not so good as last week, but about the same prices were paid; considering the quality, the market was a little higher. Extra sold at \$6 a 6 25, prime at 6, good at 5 50 a 5 75, and thin 5.

Working Oxen—We noticed sales at \$58, 62 and 75. *Cows and Calves*—We noticed sales of several, ordinary at \$17, 20 and 22; one at \$21, one at 25, and one at 40.

Swine—One lot was taken at 5 cents for sows, and 6 cents for barrows; at retail 5½ cents for sows and 6½ for barrows.

[Having seen in different journals an "intimation" that the day for holding Brighton Market would be changed from Monday to Wednesday, commencing the first Wednesday in May, and as it may mislead some, we state for the benefit of those concerned, that no cattle were brought to Brighton Market on Wednesday last, nor did the Butchers appear to buy. Should such a change take place, (which we now think will not, judging from the number of persons concerned opposed to it,) sufficient notice will be given in the public journals, signed by some of the most influential Drovers and Butchers.]

New York Cattle Market, May 4.—350 head of Beef Cattle in market, which is a short supply, and these were generally inferior; good cattle scarce, but all were sold, some few at \$8 50; we quote from 6 30 a 8. Sheep, not shorn, \$5 a 8 for good; shorn 2 25 a 5. Lambs scarce and bring 3 a 4. Swine 5 a 4 25.—*Daily Ad.*

[In the N. York market only the quarters of Beef are weighed, the hide and tough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.]

Gentleman's Pocket-farrier.

THE Gentleman's Pocket-farrier, showing how to use your Horse on a journey, and what remedies are proper for common accidents that may happen on the road. By F. TUFFNELL, Veterinary Surgeon. The remedies this little tract prescribes are simple and easily obtained, and never fail of cure where the disorder is curable; therefore no man who values his horse should presume to travel without it. For sale by J. B. RUSSELL at the New England Seed Store, North Market Street. Price 17 cents. May 9, 1832.

Fresh White Mulberry Seed.

JUST received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the past season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Winslip's Nurseries.

AS the season is so far advanced, that all injury to natural productions, occasioned by the severity of the preceding winter, can readily be ascertained, persons in want of Fruit and Ornamental Trees, of various kinds—of flowering and showy Shrubs, Creepers and Vines, including the elegant myrtle or ever-blooming fragrant Honeysuckles, eight or ten feet high, and such plants as will produce a fine display of Flowers the ensuing season—with a very superior assortment of Herbaceous Perennials, that will also bloom, with proper management, this summer, if removed within a week or ten days—together with the new and fashionable Scotch Roses, so much admired at the exhibition at Horticultural Hall last season, constituting sixty varieties—are invited to visit the establishment and select for themselves.

[To orders may be left with J. B. RUSSELL, or sent via mail, to Messrs WINSLIP, Brighton, and the plants will be furnished, and sent out the following morning in the city, if requested. 2w April 25.]

Fruit Trees.

ORDERS for Fruit, Forest and Ornamental Trees, shrubs, honeysuckles, &c. from Winslip, Kenrick, Prince, Buell and Wilson, Davenport's, and any other respectable Nurseries, received by the subscriber, and executed at Nursery prices. J. B. RUSSELL.

For sale, as above, a few Dwarf Apple Trees worked on paradise stocks, packed in moss—price 75 cents each. New England Farmer Office. April 25.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:—Fine large Vines of the Isabella (purple); Wines, (dark purple); Alexander, (black); and Catawba (red) Grape, with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each. April 4.

Flower Seeds, \$1 per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street. Packages of the most showy and rare varieties of Flower Seeds, containing 18 varieties, among which are, Ten Weeks Scotch Gilliflower. Sensitive Plant. Mexican Blue Ageratum. Forget-me-Not. Ice Plant. Elegant Coreopsis, &c. &c.

With directions for their culture. Each sort is labelled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 sorts.

For Sale.

A half blood Durham Short-horn Cow, eight years old, with Calb by a full blooded bull of the same breed. Her calves have been large and uncommonly fine animals. CHARLES E. NORTON. South Berwick, Me. April 25, 1832.

INTEMPERANCE.

From the Newburyport Herald.

An esteemed friend has placed in our hands a copy of an Address, delivered by Rev. Henry Ware, Jr. now a professor in Harvard University, and a distinguished gentleman of the Unitarian persuasion; and has called our attention to one or two passages which he is desirous of seeing republished. They are as follows; and the present question as to the principle of total abstinence and the pledge to abstain. The writer asks, "Is there reasonable objection to either?" and then proceeds to reply, as follows:—

"To the principle, certainly there can be none. No one, who knows anything of the nature of the evil in question, will dream of finding a remedy in anything short of the absolute prohibition of the intoxicating article. All experience proves, that no man can be accounted safe who allows himself to drink moderately. Dr. Johnson once said, 'I know what intemperance is, and I know what is abstinence; but I never yet could learn what is moderation.' 'Thousands may say the same. They can abstain; but they cannot drink moderately.—In abstinence there is no difficulty, comparatively no self-denial, and there is safety. But to drink a little, and stop as soon as the appetite is provoked; to deny an increasing gratification to a growing thirst; this is, for many men, too hard; and to all it is fearfully dangerous. There is no safety but in resolute abstinence. What objection then can there be to the principle? Especially since it is one of the demonstrated truths, that not a drop is needed by any man in any circumstances, and that in most cases it is actually deleterious. How indeed should it be necessary, when the world went on till within three hundred years without the invention of ardent spirits? And its use has been common in New England less than ninety years.

"But it is not only this personal consideration which justifies the principle. Every man must recollect his relation to others. However impossible that he should fall, he must consider, that it may be essential to the very salvation of some weaker neighbor, that he altogether abstain. But he sees you take a *little*. Why should not he? It is as innocent in him as in you; and he is ashamed to betray a greater distrust of his own virtue, than you of yours. If you risk it, he will; if you leave the devil, he will not be so cowardly as to retreat. Shall he alone turn potroom, and run away from a seasonable glass? Not he! and so, for fear of being thought to think himself in danger, he drinks on and dies. Now, what right had you to contumace and abet the ruin of that man? What right had you, by a foolish and unnecessary gratification, to tempt him to sin and destruction? Remember the magnanimous declaration of Paul: 'If meat cause my brother to offend, I will eat no meat while the world standeth, lest I cause my brother to offend.' This should be the maxim of every man; and there can be no doubt, that if the strong will act on the principle, they would confirm the moral courage and strengthen the moral efforts of thousands, who would otherwise be lost. For how many thousands are there, who have no strength to run counter to example!

"Indeed it will not do to give up this principle of entire abstinence; it is the corner stone of the cause; on it rests all the success in which we rejoice. Abandon it—allow men to drink moder-

ately and to judge for themselves, as you must, what is moderate drinking, and you restore the dominion of the demon at once.

"But the *pledge*. Is that necessary? Is that expedient?

"On this point, I am aware, there is great difference of opinion. Many of the true friends to the cause, advocates of the great principle, hesitate about the pledge. I know their objections, conscientiously and religiously entertained; they are to be treated with respect. But after the most careful consideration I have been able to give the subject, I am constrained to say, that I think them founded in error, and such as offer no sufficient reason for refusing to join the combination.

"The error seems to be twofold: First, in supposing that the pledge is always designed for his sake who takes it, whereas it is often intended chiefly for the sake of others; and secondly, in fancying that it contains a snare to his conscience, by inducing him to act from unworthy motives.

"First, these persons say: We do not use these articles; why is not this enough? Why pledge ourselves to that restraint which we already practise?

"I answer, for the sake of others; for the sake of extending the knowledge and influence of your example. There is a large class of men almost persuaded, who think on the whole, it would be better to abandon to cup altogether, who yet continue to drink habitually, though soberly, and who thus encourage the intemperate, because they are not called to make an immediate decision. Your private example does not urge them to it any more today than next year; and they think that next year will be more convenient. But when you sign a paper and pass it to them, they are brought to a decision on the spot. And it is precisely in this way, that thousands, without a moment's hesitation, have been made practical advocates of the cause. They were advocates at heart before; yet they might never have become so openly, so as to exert a wholesome influence, except they had thus been called on for an immediate decision. In this way, therefore, your written engagement may make your practice known to many, and thus tend to influence many who never would otherwise have learned what your practice is.

"But again, they say: We lay snares for conscience, in thus surrendering our liberty. We do not think a little occasional indulgence injurious to us, though we do not desire it; and why should we tempt ourselves by the prohibition?

"It is not strange that some should be affected by this mode of viewing the matter. They religiously dread to tamper with conscience and to put its delinquency in jeopardy. But after all, are they not mistaken as to the amount of the risk? If they are accustomed to act on principle, is there much danger that appetite or civility will get ascendancy over it, because they have told their neighbors that it shall not? for this is the amount of it. Or suppose it amounted to something more, yet should they not be ready to incur the risk for the sake of the good which they may thus do to others? For this is the point to be considered. It is a question between a single regard to one's own good, and a benevolent sacrifice to the good of others. On the one side is a possible evil to one's self; on the other, an inevitable evil to others. Which is to be chosen? To a conscientious man who walks circumspectly, the personal danger is nothing; and he certainly cannot feel justifi-

fied in refusing to do what might prove an essential office of benevolence, on the selfish plea, that possibly he might thereby injure his own mind. The duty then seems obvious. It is determined by the maxim of holy writ, 'Let no man seek his own, but every man another's good;' and by that already cited, 'I will eat no meat while the world standeth, lest I cause my brother to offend.'

"I would ask, also, why this objection should be thought so peculiarly strong in this case, when it is equally applicable to many other occasions on which it is never brought forward? 'We are principled against making promises to do our duty; we choose to do it because it is our duty; otherwise we set snares for our consciences.' But you do not act on this principle in other cases. It is your duty to speak the truth in a court of justice, yet you make a solemn engagement to do so. It is your duty to pay your debts, yet you do not hesitate to give a note of hand, promising payment. It is your duty to be faithful to your wife, yet you did not refuse, when you took her hand for better, for worse, to engage to be so. And did you ever find yourself less likely to speak the truth, pay your debts, and honor your wife, because of these promises? Have you found them snares to your conscience? Certainly then there is no force in the objection. It cannot stand before a candid examination.

"It is to be said further, in defence of this requisition, that experience has proved it essential to the prevalence of the cause; we can expect its complete triumph only through the power which is by this means imparted to its operations. It is undoubtedly a fact, that the vigorous and rapid spread of just sentiments on this subject, has been mainly owing to their having been pressed upon the notice of society, by the steady and persevering pledge of temperate men. It is through this means, that such multitudes have been led, not only to reflect, but to act, to act promptly, decidedly, fearlessly, unitedly; and if the former course of simply reasoning on the subject, and acting silently, as insulated individuals, had been continued, nothing approaching the same results could have been witnessed, nor could we now look forward with so confident assurance to complete success. Whatever objection, therefore, may seem to be against this part of the system, a little examination proves it to be unfounded; while to admit it in practice would be ruinous to the enterprise.—No; so long as we require our magistrates to bind themselves to fidelity in office, we must not think it unreasonable to bind ourselves to this duty. If every sober man would do it, not all the obligation assumed and discharged by the officers of state, would effect so much for the virtue and prosperity of the nation. We should then speedily witness the results at which we aim."

Silkworm Eggs.

FOR sale at the New England Seed Store, 50,000 Silkworm Eggs, warranted good, in packages of 5,000 each. Price \$1 per thousand; with short practical instructions for rearing them. April 11.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NO paper will be sent to a distance without payment being made in advance.

ON SUPPORTING NEWLY-PLANTED TIMBER TREES.

By MR STAFFORD, Gardener to Richard Arkwright, Esq., Willersley-Cutley, near Cromford, Derbyshire, England.

GENTLEMEN—Various have been the methods resorted to, for supporting newly-planted forest trees, but none that I have ever met with, seem to equal the system I am about to explain; all the usual methods have proved partly ineffectual, as they have invariably caused either a partial or total destruction of the trees they were intended to preserve. To prevent the evils arising from the friction of stakes and bandages, many plant their trees so deep, that to avoid destroying them one way, they actually do it another. By this improved method, the trees are not only freed from that danger, but the unsightliness of stakes, &c, about a nobleman's or gentleman's ground, is entirely done away; the stem appearing as free from any prop and yet standing as firm as though the tree had been planted fifty years. Nothing can give a clearer proof of the utility of this method, than the newly planted trees I observed at Chatsworth, which are six times larger than any I ever before saw removed; and yet these trees stand as erect and are as completely covered with foliage, as though they had continued there many years—and all this, without the least particle of a support to be seen. This, at once, gives the system a decided advantage over every other: for what could have looked more objectionable than to have seen them propped up with a parcel of huge stakes, to say nothing of the extra expense and trouble which such stakes and bandages would cost. The method, I understand, has already been sent into the world as a new one, and I give the publishers of such a system credit for so doing. My motive in writing is to substantiate what they have made known, and to show it as plainly as I can to your numerous readers.

About twenty years ago, I was employed to remove some trees that had been planted and supported in this way, about thirteen years before, when I found the wood perfectly sound and the support as firm as ever. For five succeeding years, I was present at the removal of great numbers of large trees, which were planted in an open lawn, as detached objects; and I had the satisfaction of seeing every tree keep its erect position; nor did I, during the whole of the five years, ever meet with an instance in which the system failed. I made every inquiry as to the origin of so complete a plan, and found that the person employed as the manager of the woods, had practised it for upwards of thirty years before at several noblemen's and gentlemen's seats, to which he went as an instructor in the art. Whether the invention originated with Sir Henry Cavendish, of Dove-ridge, or not, I am not prepared to say; but he certainly introduced it into Derbyshire about that time, and to his lasting credit, gave an entire new feature to his domain by beautifying his grounds with large trees, as erect and independent of the storm as if they had been raised on the spot.

I have inclosed a sketch of the support, which consists of three straight pieces of wood, laid in a triangular form, [fig. 1.] These pieces must be

proportioned according to the size of the tree, and the three hooked stakes, [fig. 2.] When the tree is placed in the hole, the roots spread out, and the earth, after being broken and pulverized, well shaken amongst them; the three straight pieces are placed in a triangular form round the stem of the tree, [fig. 3.] on the top of the ball; and the triangle made large enough for a hooked stake to be driven in at each angle, (a) so as not to injure the ball of earth at the root. The support thus completed, the earth is filled in, and the tree stands perfectly fast. In some situations, it is advisable to make holes for the hooked stakes with an iron bar. The stakes must be driven down sufficiently deep for the turf to be laid evenly over the top.

It appears to me, to be of little consequence what kind of wood the supports are made of; I have always found that any sort would last as long as it was necessary.

Nothing, however, that I can advance in favor of so excellent a system, will be half so convincing as the planting of a single tree; and by properly applying the materials, no person could have the shadow of a doubt of the tree standing as securely as when growing in its original situation.

I remain, gentlemen,

Yours, very respectfully,

GEORGE STAFFORD.

Willersley, Dec. 10, 1831.

From the Bucks County Intelligencer.

LIME AS A MANURE.

Mr C. Miner of the Village Record, some time ago addressed a letter through the columns of the Village Record, to the Hon. S. Van Rensselaer, of New York. The letter contained a number of facts in relation to the profitable use of lime as a manure, among the farmers of Chester County, and some suggestions about introducing the practice to the more general notice of the New York agriculturists. To this letter Professor Eaton replied for his friend Mr V. R., and notices the fact of carbonate of lime or pulverized limestone, being used instead of the burnt lime. The fact was new to us, and may be to some of the farmers of Bucks County, for whose information we extract the letter. We believe Sir Humphry Davy in some of his writings, recommends unburnt lime for particular soils.

To the Editor of the Village Record, West Chester, Penn.—

Your address to the Hon. Stephen Van Rensselaer, in relation to the subject above named, we thankfully receive. But one who has a million and a half acres of land to supervise, who gives many thousands per year in aid of charitable institutions, education, &c, cannot attend to every department embraced in his vastly extended correspondence. I have taken charge of the agricultural department for the last twelve years. Therefore you will please to accept the following:—

Mr V. R. is familiar with the use of quick lime, to hasten the progress of the decomposition of vegetable manures. He knows, also, that it operates as a stimulus to vegetable organic action, like gypsum. But his two manors do not abound in limestone. Near the eastern side of his west manor, limestone is abundant; but the Hollanders who occupy it, are not disposed to vary from their fathers' habits.

Perhaps the Pennsylvanians, to whom we refer, are not aware that more recent trials have proved, that unburnt lime (common carbonate of lime) is more economical as a manure than burnt lime, (quick lime.) Quick lime is more efficient for above three years; common unburnt limestone is equally efficient from the third to the thirtieth year, or longer. A manufacture of tabular spar (a delicate variety of carbonate of lime) was set up on lake Champlain two years ago; more than one hundred tons are now called for. I have no doubt but quick lime will soon be abandoned, and unburnt carbonate of lime be substituted. But it is not a true substitute; quick lime should be used on what is called cold sour soil; though it is neither cold nor sour. But pulverized limestone will supersede all manures, when it is well understood.

Calculation.—Four times the quantity of ground limestone is required to equal quick lime, the third year; but it will continue its effects unabated at least ten times as long. Quick lime loses its effect in about three or four years; carbonate of lime improves the first ten years, and diminishes but little the next ten years; and its effects may be perceived fifty years.

Correct reasonings.—Farmers will never reason

correctly until they submit to the established maxim, that their cultivated vegetables receive their chief nutritious matter from the atmosphere.—That, for example, the thick tuberous roots of red clover (*trifolium pratense*) is transmitted from its herbage to its roots, from the atmosphere, in the form of minute atoms of carbon, oxygen and hydrogen; also nitrogen, in the case of the cruciferae, as mustard, radish, turnips, cabbage, &c. Plaster of Paris (sulphate of lime) stimulate vegetable action, as a glass of brandy stimulates a hardy laborer to eat an unusual quantity, but it affords no nutritious matter. Therefore, Indian corn, buck wheat, &c, impoverish land, by seizing greedily upon all its food, when plaster of Paris is used. But red clover improves the land, by absorbing nutritious matter from the atmosphere and depositing it in the earth in the form of clover roots.

Most respectfully,
AMOS EATON,
Senior Prof. Rensselaer School.

UTILITY OF TOADS.

A writer (Mr J. Stafford) for the Horticultural Register observes, that he has found no method so effectual for destroying ants, as that of giving every encouragement to the common toad. "I have for several years paid attention to these reptiles and so has every person under my control, inasmuch, that I have had as many as three or four dozen; some of which have become so domesticated, that I have taken them in one hand and exhibited their food in the other, which they have taken with the greatest composure. So much do my family, as well as myself, set by them, that my two little girls are in the habit of bringing them home in their hands, from the roads and fields, with as much delight as they would the choicest objects. Those I recommend are about three ounces in weight, and, from observations I have made of their progress, I should calculate about five years old. This size appears more lively than the larger ones, and I have often known them to remain for several days together, at the mouth of the hole where the ants congregated; and such is their agility, that they will take the ants when on the wing, as quick as they come within reach; and their instinct is so great, that if you erect a habitation for them, contiguous to the resort of the ants, they will remain and consider it their dwelling; and should they be taken and placed in another part of the garden or house, they will endeavor to return to their old station again. The quantity of insects they devour is immense, as they have a very quick digestion.

"I have preserved and protected them for more than twenty years. My reason for commencing it, originated from the circumstance of a friend of mine calling on me, who, on observing the hot-beds so much infested, and concluding the crops would be destroyed, advised me to introduce toads as a certain remedy; and to my great surprise and satisfaction, I observed them the next day devouring the ants as fast as I was able to count them. From that time, I have observed with satisfaction, that wherever toads are encouraged, ants will disappear. I much regret that these useful creatures should meet with the ill treatment they often do, even from gardeners. I have often been almost insulted for harboring them myself, and I have scarcely met with one individual that half appreciated their value. When trees are infested with ants, confine the toads behind a board set on one edge, until they become habituated to the spot."

Another writer for the same paper, with the signature "H. S.," says, "I have known common frames for cucumbers and melons completely cleared of ants which infested them, by merely confining a toad in them."

QUICK LIME FOR THE DESTRUCTION OF INSECTS.

Mr John Plant, a writer for the Horticultural Register, informs, that "During the last six years, I have made use of quick lime in the spring, just when the buds are opening. I take the advantage of the trees being moistened with rain or dew, otherwise I sprinkle the bushes with water by a syringe or engine, and then with a quantity of fresh, well-fallen lime, I give each a strong dusting over the branches; I repeat the operation in the course of four or five days.

"Supposing that at the time the buds were beginning to expand their foliage, the insects were then hatching or about creeping from their hiding places, I was induced to adapt the application of lime, judging that it would not only destroy the young insects, but should any escape, it would, by adhering to the green buds or young foliage, render the food of the insects poisonous. By attention to the mode described, I have never had any Caterpillars on the bushes at a later season of the year. It is my practice to prune the bushes in autumn, and to have the ground about their roots manured and dug.

"I have likewise found lime to be an excellent preservative of small seeds, as broccoli, turnip, radish, &c, from the ravages of birds. When I sow a bed with seeds, I immediately give it a strong dusting all over, to prevent the birds taking what seeds may accidentally be uncovered, as they will not eat the seeds when strongly covered with the lime. When I observe the plants coming up, I water the bed or take advantage of dew, and give the bed another dusting. If the weather be rainy, I repeat it, if required, till I perceive the plants have got into rough leaf."

From the Horticultural Register.

Remarks on the Garden of T. A. Knight, Esq., President of the London Horticultural Society, at Downton Castle. By F. H. S.

GENTLEMEN.—On a visit this autumn to Downton Castle, our highly respected and worthy President was so kind as to show me many of his experiments under operation, as well also as to state his experience in other things, some of which may be worthy a place in your Register.

First then, *Hot Water*, (don't be alarmed, though I wish you and hot water were better friends.) Mr Knight says, water heated to the degree of 150 will kill any insect on the pine—his gardener has proved it under his own (Mr Knight's) observation. I understand they are watered with a syringe, and repeated two or three times. Though Mr Knight has had very little trouble with insects on his pines, his fruiting house being a curvilinear, I believe with him that the insects will not increase so readily under a strong light.

The varieties of the Persian melons were very fine, growing in a small house in pots, placed on the flue in front, and trained up trellis work near the glass; the fruit of course resting on the trellis. I was surprised at the weight of one of the fruit I lifted up, and have no doubt they were much

* See the current volume of the N. E. Farmer, p. 161.

superior in flavor to those grown in dung heat. Mr Knight has holes in the front walls of his pine and melon houses, to admit air, which coming in near the flue drives up the heat and causes a circulation of air in the house, which passes off near the top of the back wall; of course more heat is required by keeping a constant circulation of air. The melons also, in frames, heated with dung linings, have air admitted through the linings up to the bed to the frame.

Mr Knight's potatoes are worthy of notice;—the crop in the field was very strong, planted nearly three feet from row to row; whole potatoes planted, and pretty thick in a row. The soil seemed very shallow, as nearly all of it was taken up in earthing. Mr Knight said that he expected seven hundred bushels to the acre.

Watering celery, at Downton, is done by causing a stream to run through the trenches; and Mr Knight's fine marrow peas I found attended by the same kind of watering, a drill drawn out on one side of the row, by which means they are kept longer in bearing.

F. H. S.

Remarks by the Editor of the New England Farmer.—The application of hot water for the destruction of insects, is not uncommon among European gardeners. London says, "Water heated to 120 or 130 degrees will not injure plants whose leaves are fully expanded, and in some degree hardened; and water at 200 degrees or upwards may be poured over leafless plants."

With regard to Mr Knight's mode of raising potatoes, we doubt whether it would succeed in our climate. In a moist climate, a dry and a shallow soil aid in ridges, is suitable for that plant; but in a dry and hot climate, every precaution is requisite to guard against drought. Ridges and protuberant hills are generally improper here, though well adapted to a shallow soil and British climate, where excess of moisture is often unfriendly to this prime article of produce.

PRESERVATION OF BACON.

It cannot be supposed, that any mode of preserving hams can alter the original quality of the article. All that can be anticipated is to prevent its being injured by the heat of the warmer part of the season. One mode is to pack it in *oats*; for that purpose, the chest or cask in which it is preserved should be perfectly tight, and raised about six inches from the surface of the ground, and the oats packed in quite tight.

Another mode of preserving hams and all kinds of smoked meats, recommended by T. Gould, Esq. formerly President of the Berkshire Agricultural Society, is this:—Take a tierce or box, and cover the bottom with charcoal reduced to small pieces but not to dust; cover the legs or pieces of meat with stout brown paper, sowed around so as to exclude all dust; lay them down on the coal in compact order, then cover the layer with coal, and so on till your business is done, and cover the top with a good thickness of coal.

Another mode is as follows:—A piece of canvas, cotton, or other suitable cloth is sewed tightly about the ham, and this is overlaid with two or three coatings of lime white-wash, which is said to thoroughly preserve the inclosed article.

A writer in the American Farmer states, that he tried many ways to preserve ham from bugs, worms, and rancidity, but succeeded in none; though perhaps the methods he tried might an-

swer in colder climates. He then tried charcoal and succeeded perfectly. It is of great importance to have the hams, &c. dried as early as possible, that they may be packed away in dry charcoal made moderately fine. He observes, that the "difficulty of getting the charcoal off, may be made an objection by the neat housewife, &c. But if the legs or pieces of meat are covered with stout brown paper, as recommended above, the difficulty is obviated."

DISEASES IN SHEEP.

I hear complaints of great mortality among sheep, particularly among those which are in the best condition, and late dropped lambs of last year, without satisfactory cause being assigned for such mortality. I beg leave, therefore, to suggest the cause and to recommend a remedy for the evil.

The winter has been uncommonly severe, the ground almost covered with snow, and sheep have consequently been precluded their ordinary exercise, their usual supply of green food, and debared also from access to the ground. They are much in the condition of a ship's crew who have subsisted, in a long voyage, wholly upon salted provisions. I will not say that earths constitute a food for sheep; yet I am satisfied, that in the absence, at least, of green food in a long winter, they are essential to their health. I will not attempt to explain their physical effects; but it is evident they take them in, in considerable quantities, from the analysis of their dung, by Kirwan, who found in 105 parts, 37 parts lime, sand and clay, while cow dung gave but 13, and horse dung 16.

I am told on credible authority, that a gentleman who was losing his sheep without apparent cause, had occasion to use some clay about his house in the winter, and observed that his sickly flock ate it with avidity; he caused a load to be placed in their yard, much of which was devoured and his sheep speedily recovered.

As a cure, therefore, I would recommend clay to be placed in the sheep yard, which can, at worst, do no harm, as the animals will not eat it unless prompted by instinct; or when it is practicable, the boughs or branches of resinous trees, as the pine and hemlock, may be given to the flock in limited quantities. Roots of any edible kind will also be highly serviceable. As a preventative in future, I advise sheep-farmers to raise and lay in, a good stock of ruta baga or other turnips, which are not only the healthiest but cheapest food for the winter consumption of sheep.—*New York Farmer.*

From the New Hampshire Sentinel.

MESSRS EDITORS—I have lately passed some examination among my fruit trees, having trimmed some of them, and examined others, for the purpose of ascertaining the effect of the cold on them the past winter. I have heard it remarked, by persons much older than I am and many years since, that late in the fall of the year, the buds on trees which would blossom the next spring, would be swollen much larger than those that would not blossom. Last fall I made some observations, for the purpose of ascertaining the probability of a blossom this spring, but was unable to satisfy myself at all on the subject.

The result of my examination this spring, does not satisfy me as respects the blossom, although I am inclined to think the trees are not much more

injured than usual. I find the inside bark is not dried on more limbs or twigs this spring, than is commonly the case; but the buds are much smaller than usual for this season of the year. I can perceive, however, that the buds have grown some this spring, although remarkably slow. The above relates to apple trees, of which I have perhaps five or six hundred, located on different kinds of soil and on what we call hill land.

Of pear and cherry trees, I do not find any more dead limbs of last year's growth than usual; neither do I find the inside bark turned dead and black, as is the case with those limbs which are dying.

Of peach trees we have a few, some of which have suffered from some cause or other and some are not injured, although the trees of about two years from the stone, I think are mostly if not all dead or dying. What I have written relates to my own farm.

A partial examination in some of my neighbors' orchards of apple trees, convinces me that they are similar to mine. It must be evident to all who are in the habit of making observations of the kind, that trees of every description are more backward this spring than they have been for many years. At any rate, I think it cannot be satisfactorily determined whether we shall have many or few blossoms the present season. MARLBOROUGH.

From Porter's Health Almanac.

DISINFECTING AND PURIFYING AGENTS.

The antiseptic and consequent preservative, disinfecting and purifying properties of the chlorides of soda and lime, render them highly important agents in the preservation of health, and applicable in various ways to the promotion of public and domestic comfort. It is principally, however, in the preservation and promotion of public hygiene, that these salts become in the highest degree valuable, by decomposing putrid miasmata of every kind and preventing the generation of epidemic diseases, or arresting their progress when they already exist. They are effectual in destroying the poisonous exhalations from privies, sewers, docks or ponds, left bare at low water; the putrid materials accidentally admitted or incautiously allowed to accumulate in vaults and cellars, store houses, &c.—for disinfecting hospitals, prisons, market-houses, gutters; for purifying the air of wells, mines, the rooms where silkworms are reared, the manufactories of glue, starch, catgut, &c; slaughter-houses, drains, stables, the holds of vessels, amphitheatres, churches, theatres, hospitals, infirmaries, the rooms of the sick, &c; for the preservation of dead bodies previous to burial, or for removing the fetor and injurious exhalations from bodies that have been disinterred for the purpose of judicial investigation; for washing the linen and bedding of the sick; for destroying the fetid emanations from filthy clothes, and disinfecting the stores and ware-rooms where second-hand clothing and rags are kept.

The chloride of soda, which is liquid, is rather more expensive but more powerful than the chloride of lime, which is in form of a white powder; and hence the former is applicable to disinfecting and purifying operations on a small scale. They are both used, mixed with more or less water, according to the intention in view. If a body is to be preserved before burial, add about a pint of the

concentrated chloride of soda to a bucket-full of water, and cover the body with a sheet dipped in the solution, which must be sprinkled occasionally over the corpse. Or if the chloride of lime is employed, make a mixture of about a pound of the chloride with two buckets-full of water, and proceed as before.

For vaults, cellars, &c, take two ounces of the chloride of lime to three or four pints of water, and sprinkle them from time to time, by means of a watering-pot.

The solution should be thrown into the sink of a privy, or into a well, the foul air of which it is desirable to neutralize.

To preserve the health of workmen employed in common sewers, a pound of the chloride of lime should be dissolved in three buckets-full of water; and a bucket-full of the solution should be placed by the side of the workmen, to be employed by them in washing their hands and arms, and moistening their nostrils, and for sprinkling on the filth.

For ships, take a spoonful or more of either chloride, add it to a bottle of water, and sprinkle the solution freely on every part of the hold and over the decks.

For purifying offensive water, mix it with the chloride of lime in the proportion of one or two ounces of the latter to about sixty-five gallons of the former. After being thus disinfected, the water must be exposed to the air, and allowed to settle for some time, when it becomes fit to drink.

In domestic economy. The chlorides may be used for the preservation in summer of eggs, meat, game, poultry, and other articles of aliment; to deprive vegetables, which are kept during winter, of the unpleasant odor they frequently acquire, and, finally to disinfect spoiled meat, fish, &c. To preserve eggs, they are to be put into a solution of one part of the chloride of lime in thirty-two parts of water, their place being occasionally changed. Meat, &c, may be preserved sweet by wrapping it in cloth, wet with a weakening mixture of the chloride of soda and water. To deprive vegetables and meat of any disagreeable smell or taste they may have acquired, they are to be immersed several times in water containing one fortieth or sixtieth part of chloride of soda, and then well washed in pure soft water.

The manner of disinfecting articles in a state of putridity, is by using a mixture of thirty or forty parts of water to one of chloride, and enveloping them in pieces of linen or cotton soaked in this solution, or by sprinkling them freely and at short intervals with it. By these means, the disgusting odor and poisonous exhalations given out by putrid matters are promptly destroyed, and the danger which may result from them is entirely removed.

The chlorides of lime and soda may be procured of all our principal apothecaries; the expense attendant upon their free use, is so trifling as to place them within the reach of almost every individual. As a means of removing the sources of disease in cities and villages, these salts demand the attention of those who are constituted by law the guardians of public health.

DRINK.

Rarely drink but when thou art dry; the smaller the drink, the clearer the head and the cooler the blood, which are great benefits in temper and business.—*William Penn's Works.*

selections.

From the Naturalist.

THE CRANBERRY.

The cranberry, which is so much esteemed in tarts, is a native of the turf, mossy bogs, in the mountainous and ferny parts of Europe, New Holland and America, flowering from May to July. Few plants are more elegant. Its wiry, shrubby stems, creep among the bog moss with long, branching, fibrous roots, which often appear to imbibе nourishment from the clear water alone.

There are four species of cranberry enumerated in the *Hortus Britannicus*, the most important of which are the long-fruited cranberry, *Oxycoccus macrocarpus*, and the red-fruited cranberry, *Oxycoccus orthocarpus*, both indigenous to the United States. They are the produce of damp swampy lands only; but the idea that they will not bear transplanting is erroneous, for they have been transplanted from this country to England, and produced fruit beyond calculation. Mr B. Hall, of Barnstable, Mass. has been engaged for twenty years or more in the cultivation of this fruit; and his grounds have averaged for the last ten years, seventy bushels per acre, and some seasons he has had one hundred bushels. Mr F. A. Hayden, of Lincoln, Mass. gathered from his farm last year four hundred bushels of cranberries, which he sold in this city for six hundred dollars. It is well known that cranberries are capable of being transplanted to Europe, without suffering by the voyage. American cranberries are frequently sold in London at eight dollars a bushel, as fresh as when first gathered from the marshes. This information may be worth the attention of those who have marshy or brook land, as a matter of profit; and to those who have ornamental water in their gardens or parks, it would be found an embellishment to the banks, it being an elegant little fruit on the ground, where it trails and spangles the ground with red and variegated berries.

Cranberries are of an astringent quality and esteemed good to restore the appetite. They were formerly imagined efficacious in preventing pestilential diseases.

Cranberries may be preserved perfect for several years, merely by drying them a little in the sun, and then stopping them closely in dry bottles. The red-fruited cranberry yields a juice which has been employed to stain paper or linen, purple.—These berries are of great value and importance for different culinary and well-known purposes, as in pies, tarts, &c.

Cranberries may all be raised from seeds or off-set root suckers, creeping roots and trailing rooting stalks. Those also growing with several rooted stalks and branches, may be divided in the root and top into separate plants, in which way they succeed very well. The seeds should be sown, where that method is pursued, in autumn, as soon as they are ripe and gathered, in a shady border or in the places where the plants are to grow and remain; and when the young plants are up they should be kept clean, and be removed with earth about their roots, as there may be occasion. The off-sets and root-plants may be set out in the same season, in a soil resembling that in which they naturally grow. It may likewise be advisable, in many cases, to take the plants from their natural situations with balls of earth about their roots. Some, however, succeed in the common

borders and other parts. They may in some cases be removed in the spring season, but the other is the better way.

From the Genesee Farmer.

TO DESTROY RATS.

MR GOODSELL.—In your paper of January 28, your correspondent, Unius, complains bitterly of the depredations and trespasses of the rats, upon his property. He is welcome to my experience on the subject, without the reward or inducement of a patent right held out by him.

About the year 1803, I removed on to a farm near Savanna, in the State of Georgia, where I was very much annoyed with rats, which in that climate harbor in the woods in immense numbers, and are drawn in swarms round every out building where they are likely to get food. I tried arsenic in every form mentioned by Unius and many others, but all was without any effect. At last I procured a quart of opened oysters, to which I added about an ounce of arsenic, stewed them well together; then divided them, two or three oysters in each separate shell, and placed them under and about the house. The oysters all disappeared in about fifteen or twenty minutes. In the course of two or three days after this, I observed several rats very much swelled and their hair rough and standing; but I have no recollection of seeing a single dead rat, nor were they materially thinned about the out-house; from which I conclude that arsenic, although it may sicken, will not destroy rats.

The ensuing spring, I was troubled with immense flocks of a bird called a Corbeau, in size between our large corn black-bird and the crow. These with the field rats and the squirrels, threatened to destroy, totally, my cornfield and garden. I procured two ounces of *nux vomica*, which I bruised or pounded in an iron mortar and then added two or three quarts of hot water, let it stand to soak all night. In the morning I took about a peck of corn and poured the water from the *nux vomica* on it, and left it to soak till near sundown. Towards evening I scattered the corn all around the fences, and crossed the fields from corner to corner, scattering a little of the corn as I went. After which I had no further trouble with the birds, no one of them venturing to alight on the field after that day. I found a number of dead rats and squirrels near the fences. Such is the result of my experience, and if it will be of any benefit to Unius or any other of your readers, I shall feel myself sufficiently paid for any trouble in communicating the same. I remain yours,

R. M. WILLIAMS.

Middlesex, Feb. 12, 1832.

ZINC WARE.

At a regular meeting of the Albany Institute, held the 28th ult. Dr T. Roney Beck read a paper on the danger to health in employing articles manufactured from Zinc, for culinary and domestic purposes. The author stated, that his attention had been recently called to the subject, from the fact, that articles of zinc ware are at present advertised as well adapted for cooking rice and all kinds of sweetmeats; also for the dairy, being recommended as producing from twenty to twenty-five per cent more cream or butter, than any other way, and for preserving butter sweet, &c.

The patentee, (if his patent be tenable,) could not have been aware, that this subject had been made a matter of investigation with European governments, and the result a most unfavorable one.

The following are among the facts stated in corroboration of this assertion:—

The French government, in 1813, were desirous of substituting zinc caucous in the army, instead of tinued ones, as neater and more durable. Previous to introducing them, the minister of war referred the subject to the following eminent chemists and medical men: Chaussier, Gay Lussac, Thénard and Chenev. They reported against their use most decidedly, and for the following (amongst other) reasons: Zinc is readily and powerfully corroded by vinegar. Common urine dissolves a portion of it, with a disengagement of hydrogen gas. Even water, standing a considerable time in vessels of zinc, acquired a disagreeable taste, and by its oxygen dissolved a portion and formed an oxide. [An abstract of this report, is contained in the New York Medical Reports, vol. 17, p. 188.]

During the same year, both the ministers of War and of the Interior, referred the subject of zinc vessels for culinary purposes, to the French Institute. The report was unfavorable. Cuvier says, they found "that zinc was too soluble even in the weakest acids, in fat and even in water; that the salts which it forms are too acrid, and in certain cases, act too violently on the intestines to allow the employment of the metal for any such purposes, without inconvenience." Say found, that even distilled water kept in vessels of zinc, acquired a decided styptic taste, and that the *juices of fruits*, when boiled in similar vessels, dissolve a portion of them and form a sufficient quantity of salt to render their taste disagreeable." [Annals of Philosophy, edited by P. Thompson, 1, 310.]

Proust, an eminent Spanish chemist, was about the same time ordered by his government to investigate this subject. His report, which is a very elaborate one, fortified by numerous experiments, is equally unfavorable. It may be found in the first series of the English Repository of Arts.

The medical faculty of Paris requested Vanquelin and Deyeux to examine this subject. They found, besides the effects of vinegar and water, already mentioned, that citron juice on being boiled in zinc vessels, dissolved the metal and formed a salt. Common salt in solution, furnished a liquor which, on being tested, gave a precipitate of oxide of zinc. Even butter heated in a zinc sauce-pan destroyed the polish of the vessel, and a small hole was formed in its bottom. It is therefore impossible, they remark, to employ it for kitchen utensils, without incurring the hazard of its being united, either in the state of oxide or salt, with domestic viands.

After reading these authorities, Dr B. submitted to the members, whether the experiment of introducing such vessels in this country, should not be discontinued. He exhibited a zinc kettle in which about a gill of vinegar had stood for two days in the cold air. The acid had become dark and colored, and bitter to the taste; and the surface of the vessel where it had rested had oxidized. Here no heat had been applied. What then must be the result where sweetmeats are prepared in them, all of which contain more or less acid?—The same remark must undoubtedly apply to a sufficient extent, to all other articles proposed to be kept in zinc vessels.

From the Massachusetts Agricultural Repository and Journal.

IMPORTED STOCK.

To the Publishing Committee of the Massachusetts Society for promoting Agriculture.

GENTLEMEN—It is certainly to be regretted, that some respectable farmers show a disposition not only to indulge prejudices against the imported breeds of cattle, but to excite these impressions on the minds of others. They appeal to a popular feeling, and a very natural one, which too easily besets us—"our own superiority." "The true worth of our ancient breed," says one, "as to their competition, is much neglected." Again—"our old accustomed breeds are unnoticed." In the most approved practices of breeding of stock, perhaps no better reason need be given for a change, than this very fact, that it is *our old accustomed breed*, on which a cross would be beneficial for that cause only. As the disadvantage of breeding "in and in" for a length of time, has been long admitted, the principle of a change of breed or cross, by judicious selections, has, it is believed, induced almost universal assent and practice.

Some contend, that a given weight may be placed on any part of animals, to correct a deficiency; and others, that every disposition and property may be improved by a skillful observation and practice herein. The attention of agriculturists in Europe, has been for the greater part of the last century, engaged in this process. In England more especially—if we can believe all we see, or all we hear, or any part of it—animals of extraordinary production, as well as those of great beauty, size and power, with a favorable disposition to fatten, have been brought to view. Instances might be here quoted, but they are too well known to need it! Wherever, in any country, a judicious selection of stock has been in careful continued practice, we must shut our eyes and seal up our senses not to perceive the beneficial result. And why should we doubt our power in this particular? It seems the all-wise intention in our condition, that we should cultivate and improve everything about us! And do we not so do? How is it with the horse and various other animals? Are they not bred and reared, for various uses, by careful selection and attention? And why should we easily and indolently admit that nothing is to be effected in our cattle, farming, as they do, the great sources of our comfort and support?

But though our efforts in this country may have been less strenuous and uniform, and for a shorter period of time, still we do not want proofs of what may be done at home. Our cattle are susceptible of improvement, as the Sutton race will show. Those who most dislike the imported breed, tell of some native stock in their neighborhood which is superior. Be it so! Our stock was mostly derived from Great Britain, and is doubtless as capable of improvement.

All that is to be said, is, that when *that* which time only can produce, has for nearly a century been in careful progression, a prudent consideration will avail of the advantage.

It is further complained, "that much is said of the imported and little or nothing of our native stock." If this alludes to any general expression or opinion, it will have its due weight and no more. But the object of the Massachusetts Agricultural Society has been, to promote a *judicious selection*, as the *great thing necessary*, and so their committees have uniformly urged. The premi-

ums on milch animals have been mostly given to native stock, it is believed; some to the imported breed to be sure; the far greater number of the former makes this natural. In many cases the richness of the milk in the imported breed, has been remarkable; and their general size, proportion and beauty, has been thought to exceed our old races.

The disappointment of a farmer, who has paid a large price for an animal (as has occurred) that has long legs and "a bag that is difficult to be found," is to be regretted—but these things will sometimes happen. But it is earnestly contended for in Europe and by many here, that where there has been a long transmission of improved blood in stock, this occurs much more rarely!

The improved short-horns are not generally esteemed a long-legged race; many of them are great milkers; though for this property they are thought by some to have too great a tendency to become fat. By this facility they often disappoint those who wish to increase their breed. This disposition to fatten is so felt in England, that in their Southfield cattle-show last year, it was proudly said, "Foreigners may boast of their sunny climes, of the spontaneous produce of their soil, of their grapes, and their wine, and their olive yards, but no land but England can boast of their fat cattle-show."

The object of the trustees of the Massachusetts Agricultural Society, is to encourage whatever is connected with the great staples of the country—not to write down one race of cattle and set up another. Whatever means are at hand, let them be made use of. But if others and superior, can be had from abroad, brought home and used to greater advantage, let us not be too steadfast in our old habits and practices, lest we should perceive too late, that we have stood still while others have advanced. I am yours, JOHN WELLES.

Boston, March 22, 1832.

From the Genesee Farmer.

MOSSY LANDS.

MR GOODSELL—In your paper of the 25th ult. your correspondent, Timothy, inquires what he shall do to cure mossy lands. I answer, there are three ways in which such land may be helped.

1st. If it is occasioned by too much water, and the land has sufficient descent, then ditching is the obvious remedy.

2d. If the land lies too low to be cured by ditching, then I should recommend to cart on a plentiful dressing of pit-sand and chip-dirt, to be dropped in alternate heaps, to be spread so as to raise the surface about an inch; plough it, harrow it, and seed it anew. But lands of this kind are sometimes miry, and cannot be ploughed; in that case, I should recommend,

3dly. To haul on a plentiful dressing of pit-sand only. Let it be spread over the surface, scatter on some timothy and red-top grass seed; in a few years the sand will subside and the rich mold below it will rise to the surface, and the land will be permanently cured of its disposition to become mossy. If the land be naturally dry, and the grasses merely run out, then simply ploughing and re-seeding will be sufficient; but where it is too low and wet, I think ploughing can afford no permanent benefit, because the land will in a few years settle to its former level, bringing with it the water and moss. Such is the result of my obser-

vation and experience on this subject—and I remain, Yours, &c., R. M. WILLIAMS.
Middlesex, March 6, 1832.

From the Literary Gazette.

NEW BOILING APPARATUS.

Mr Perkins, the celebrated engineer, has recently discovered and obtained a patent for a new mode of boiling, by a process so simple that it is a subject of surprise to all who see it, that it has not been earlier among our useful improvements. It consists in placing within a boiler, (of the form common to the purpose to which it is applied, and of all capacities, from coffee pots to steam-boilers,) a vessel, that may, by slight stays, be kept at equal distances from the sides and the bottom of the boiler, and having its rim below the level of the liquid; the inner vessel has a hole in the bottom, about one third of its diameter. On the application of the fire to the boiler, the heated liquor rises in the space between the two vessels, and its place is supplied by the descent of the column in the inner vessel, or as Mr Perkins calls this part of apparatus, the circulator; for the ascending portion having the space it occupied supplied by the descending liquid in the centre, and the level of the centre being kept up by the running in of the heated portion which has risen on the sides, a circulation rapidly begins and continues; thus bringing into contact with the heated bottom and sides of the boiler, the coldest portion of the liquid.

By this process, the rapidity of evaporation is excessive, far exceeding that of any other method previously known; whilst the bottom of the boiler having its acquired heat constantly carried off by the circulating liquid, never burns out, nor rises in temperature many degrees above the heat of the liquid. In many manufactures this is a most important discovery, especially in salt-works, brewers' boilers, and for steam-boilers; and applied to our culinary vessels, no careless cook can burn what she has to dress in a boiler by neglecting to stir it, as the circulation prevents the bottom of the boiler from ever acquiring heat enough to do mischief. We need hardly add, that this discovery is esteemed by men of science to be one of the most useful and important of the present day.

Curious fact in the economy of bees.—When two or three distinct hives are united in autumn, they are found to consume together scarcely more honey during the winter, than each of them would have consumed singly if left separate. In proof of this remarkable result, the author states a variety of experiments to which he had recourse, and all of which led uniformly to the same conclusion. And indeed he shows positively, by a reference to upwards of thirty hives, six of which had their population thus doubled, that the latter do not consume more provisions during winter than a single hive does; and that, so far from the bees suffering from this, the doubled hives generally send forth the earliest and best swarms.—*Arc. of Sci.*

Those who wish to get good lettuce and tender radishes, should plant in April the best of seeds, for they may as well expect a good breed of cattle from the common scrubs, as good vegetables from bad seed. The earth should be stirred once in two days at least about radishes, as soon as they are as large as a goose quill, and they will well repay the labor bestowed upon them.—*Genesee Farmer.*

NEW ENGLAND FARMER.

Boston, Wednesday Evening, May 16, 1832.

MUNIFICENCE.

Admiral Sir ISAAC COFFIN, Bart. a native of Massachusetts, now in London, to whom this country has been oftentimes heretofore indebted for valuable donations of cattle, horses, &c, presented through the medium of the Massachusetts Agricultural Society, has recently exhibited new proof of his patriotism and liberality. He has forwarded to Jonathan Winship, Esq. of Brighton, Mass. two large boxes of scarce and estimable plants, including several hundreds of the choicest productions of English gardens. These are accompanied by a letter, requesting Mr Winship to "please to accept them as a mark of my regard for my native land, and respect for you." We wish this benefactor of his country may long continue to enjoy life, health, and the happiness which results from having contributed to the happiness of others, and receiving the merited acknowledgments of respect and gratitude, from his fellow citizens on this side of the Atlantic.

LIME FOR INDIAN CORN.

MR FESSENDEN—Will you or some of your correspondents inform me, through the medium of your paper, the method of applying lime in growing Indian corn? If placed under the corn at planting, how much may with safety be placed under each hill, when slacked? To this query an answer is of importance. Or is it better to apply it at the first or second hoeing?

In the present volume of the New England Farmer, pages 186, 187, there is a communication from Charles Bugbee, of his method of growing Indian corn, by spreading his manure and placing in the hill, lime, plaster of Paris, and ashes. He does not say, but I conclude they were mixed together, being in the whole thirty bushels.

N. B. As planting time is at the door, an answer is solicited. A FARMER.

May 7, 1832.

By the Editor.—Mr Bugbee says, "Last spring I ploughed up a piece of green sward, measuring about five acres, and prepared it for corn as well as the means would permit. After ploughing, thirty loads of manure to the acre were spread over the ground, and thoroughly mixed with the earth by the harrow, without disturbing or breaking the sward. The ground being now prepared, on the 30th of May I planted my corn. A small quantity of ashes, lime, and plaster of Paris, mixed together and prepared for the purpose, was introduced at the time of planting, or put in the hill. Of this mixture or composition, there were two and a half bushels of lime, the like quantity of plaster, and twenty-five bushels of ashes, for the whole five acres."

It should seem, then, that thirty bushels of manure, probably from the barn-yard, was spread over the whole surface of five acres; and two and a half bushels of lime, two and a half bushels of plaster of Paris, and twenty-five bushels of ashes, making a mixture of thirty bushels more, was put in the hills. Thus the whole quantity applied was sixty bushels—thirty from the barn-yard, and thirty of lime, ashes and plaster, mixed as above.

The farmers of Rensselaer County, New York, say, that ashes or quick lime ought always to be applied to the top of a corn-hill immediately after

planting, if it follow sward, to prevent grub larvae from destroying it. The same application will have a similar effect, if applied to the top of potato hills. But neither unleached ashes, nor lime in its caustic state, should in any case come in contact with the seed corn or the young plants.

THE SEASON.

Extract from a letter, dated Ketch Mill, Conn. May 14, 1832.

Apple and pear trees are now putting forth blossoms, and appear tolerably promising. Peach trees have been much killed. Cherries show some blossoms; but the winter or something else has killed and injured very many fruit trees in this vicinity. Apricots have not blossomed. Vegetation has come forward rapidly within three or four days, and we trust are all putting forth their foliage.

To preserve vegetables from degenerating.—Many persons experience great disadvantage from the changing of their garden seeds and other seeds into a worse kind, or into those of a quite different sort. In this way, pumpkins and squashes, cabbages and turnips, gourds, and even cucumbers and musk-melons, have injured one another, and produced a mingled sort unfit for use.

To preserve the purity of seeds, the following rules are recommended:—Never plant gourds near squashes, lest you make the squashes bitter. Never plant squashes near pumpkins, lest you cause both sorts to degenerate. Never place different sorts of seed cabbages near each other, lest you create a mixture, nameless and not worth naming. Never plant seed turnips near seed cabbages, lest both should be spoiled. Never plant different sorts of seed beets, seed radishes, &c, near each other; and as a general rule, never plant near one another vegetables which resemble each other in some respects, but having qualities which should be kept distinct.

Louden says, the great art of the seed gardener is to grow seeds true to their kind, for which purpose, one grower must not attempt too many varieties of the same species; but he may grow a number of different species, and of varieties of the same species, provided they do not come into flower at the same time.

Preserving Seeds, &c.—Mr Thomas Short, in the Horticultural Register, says in substance, sugar, salt, and paper have been used for the purpose of preserving seeds, but have proved insufficient; but the following method will answer perfectly well:—Let the seeds which are to be preserved be immersed in a strong solution of gum Arabic; then let them be carefully dried, and without any further preparation, they will become perfectly secured against the injurious consequences of a humid and variable atmosphere, and not subject to mildew, and therefore enabled to retain their vitality after the most protracted voyage.

To preserve Wood from decay.—W. Claughton, of Chesterfield, Eng. gives the following method of rendering garden sticks secure from rotting:—"First, they are made of red deal, they are then placed in a situation in which they become very dry; when in this condition they are soaked in a quantity of linseed oil, allowing them to remain in it some time; when removed from this they are again dried for a week or two, or at least as long as is necessary to dry up all moisture occasioned by the soaking in of the oil. When they are com-

pletely dry, they are painted over with Verdigris paint, which entirely preserves them, as it completely prevents any wet from possibly penetrating." A similar process, no doubt would preserve wooden implements of any kind.

Acclimating Plants, or accommodating half-hardy exotics to climates colder than those to which they naturally belong.—H. Groom, in the Gardener's Magazine, states, that "From the observations I have made on early-flowering plants placed against south walls, I am decidedly of opinion, (where the fruit is not the object,) that we are in an error; and that, instead of being planted against a south wall with the idea of their receiving the sun in the winter and spring months, thereby forwarding them unduly, all early-flowering plants should be placed against north walls; as it must be quite clear to persons acquainted with such plants, that the grand object is to retard their blooming, as much as possible, until the season is sufficiently advanced to enable them to expand, without the liability of being destroyed by frost."

Roofs of Buildings.—It is stated in Brewster's Journal, that Zinc, rolled into large plates, is now a good deal employed as a substitute for lead and slates, in the roofing of buildings, both in Britain and on the Continent. The great advantage of these plates of lead, is their lightness, being only one sixth part of the weight of lead. They do not rust, which is another great advantage, and has led to the employment of zinc pipes, both for cold and hot water.

The Weevil.—Salt is said to be a complete preventative against the destruction of wheat by the weevil. Mix a pint of salt with a barrel of wheat, or put the grain in old salt barrels, and the weevil will not attack it. In stacking wheat, four or five quarts of salt to every hundred sheaves, sprinkled among them, will entirely secure them from the depredations of this insect and render the straw more valuable as food for cattle.—Horticultural Register.

MASSACHUSETTS HORTICULTURAL SOCIETY.

Mr Hovey, of Cambridge, exhibited the following fine Hyacinths, on Saturday, May 12, 1832:—

- Don Gratuit, (white.)
- Gold of Ophir, (yellow.)
- La Bien Aimée, (blue.)
- Statens General, (single blue.)
- Lord Wellington, (single red.)
- Velout Pourpre, (dark blue.)

The following letter was received from General Wingate, and the scions of — pear, (the fruit of which was exhibited last season,) distributed among the members of the Society.

PORTLAND, May 7, 1832.

DEAR SIR—Accompanying this, I have sent a small bundle of scions from the pear trees of Mr William McLaughlin, of Scarborough. Some of the fruit of the trees from which these scions were taken, was exhibited last autumn at the rooms of the Horticultural Society in Boston. You will please to present these scions to the Society, for the purpose of being distributed among its members. I am, very respectfully, your ob't serv't,

J. WINGATE, Jr.

MR ZEBEDEE COOK, JR.

Young Barefoot.

THIS very handsome Colt, just three years old, (was the first colt ever got in America, by the truly celebrated full blood horse Barefoot, sent from England by Sir Isaac Collins.) was raised by John Prince, Esq. at Jamaica Plain, near Boston, out of a large and superior mare of American breed. He is a beautiful dark bay, with black nose and tail, and is considered an animal of great promise. He will be kept for the usual season at the stable in Brighton, where Barefoot and Cleveland have heretofore stood.

Terms.—\$12 to be paid before the mare is taken away; and should the mare not prove to be in foal, the money will be returned. Pasturage can be furnished for mares, they to be, however, at the risk of the owners.

JOHN PARKINSON.

Brighton, May 16, 1832.

Garden Compound.

For the preservation of Peach and other Fruit Trees.

THIS is thought to be an infallible preservative of the Peach, Plum, and other fruit trees, from the destructive worms and insects which in the spring attack and endanger the vitality of the tree. By a proper application of the compound, insects will not deposit their eggs in the bark. This article will not harden in the sun, but remain liquid for several months, in this respect it is vastly superior to any other composition in use.

Prepared and sold, wholesale and retail, by **JOHN M. IVES, Salem;** and **JOHN B. RUSSELL, No. 50½ North Market Street, Boston.**

Price, 33 cents per bottle, with directions for its use. May 16, 1832.

Davis' Improved Dirt Shovel.

FOR sale at the Agricultural Warehouse, No 50½ North Market Street, *Davis' Improved Dirt Shovel* for excavating or leveling dirt

This may certify that I have been using Shadrach Davis, Jr.'s patented Scraper, and am fully satisfied that it is much better than any other scraper of the kind, for digging and clearing cellars, that I have before used or seen. Fairhaven, July 12, 1831. **ANSEL WHITE.**

This may certify that I have used Shadrach Davis, Jr.'s patent Scraper on the roads in this town, and find it a machine superior to any other I ever used before, for removing earth; and would hereby recommend it to public patronage. New Bedford, Aug. 23, 1831. **LEVI SHAW.**

Conqueror.

THE entire horse Conqueror will stand the ensuing season at the Ten Hills Stock farm in Charlestown, two and a half miles from Boston, at ten dollars, to insure a mare in foal, secured by a note at ten months, to be valid and payable in case the mare proves to have been in foal, and one dollar to the groom at the time of covering.

Conqueror was bred near Montreal (Canada) foaled in May, 1825, and sired by a noted Normandy horse out of a blood Mare—he is rising 15 hands high and remarkably well grown, combining great power, generous spirit, good action, very docile in his temper, and of that hardy color, iron gray. This horse has taken three premiums in Canada, as the best horse in that country. He has probably as much, or more than any other horse now living, of the strains of blood so well known in N. E. by the name of "the Morgan breed"—from the best accounts the original Morgan horse was made up of the same strains of blood as Conqueror. Conqueror has proved a sure foal-getter, and is recommended to the public by **SAML. JACQUES.**

The full blood horse Sportsman also stands as above—for pedigree see late Nos. of the Farmer. May 16.

Pickering's Tree or Caterpillar Brushes.

For sale at the Agricultural Warehouse, No 50½ North Market Street, **Pickering's Improved Tree Brushes.**—This article, (which is likely to be in greater demand this season, than for many previous years,) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use. May 16.

Millet.

A liberal price will be paid at the Agricultural Warehouse, Boston, for 50 bushels of fresh, clean Millet, for seed. May 16.

Sylvia Americana.

JUST published, and for sale by **J. B. RUSSELL, Nos. 51 and 52 North Market Street, Sylvia Americana**, or a description of the Forest Trees indigenous to the United States, practically and botanically considered. Illustrated by more than one hundred engravings. By **D. J. Browne.** Price \$2.50. May 16.

Gentleman's Pocket-farrier.

THE Gentleman's Pocket-farrier, showing how to use your Horse on a journey, and what remedies are proper for common accidents that may happen on the road. By **F. TREVISEL, Veterinary Surgeon.** The remedies little tract prescribes are simple and easily obtained, and never fail of a cure where the disorder is curable; therefore no man who values his horse should presume to travel without it. For sale by **J. B. RUSSELL** at the New England Seed Store, North Market Street. Price 15 cents. May 9, 1832.

Grape Vines.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:—**Five large Vines of the Isabella (purple); Winne (dark purple); Alexander, (black); and Catawba (red) Grape,** with good roots, packed in moss, for transportation any distance, all hardy and productive sorts—price 50 cents each. April 4.

Flower Seeds, \$1 per Package.

FOR Sale at the Seed Store connected with the New England Farmer, 50½ North Market Street:—**Packages of the most showy and rare varieties of Flower Seeds,** containing 18 varieties, among which are, **Ten Weeks' Seed Gilliflow.**
Sensitive Plant.
Mexican Blue Ageratum.
Forget-me-Not.
Ice Plant.
Elegant Coreopsis, &c. &c.

With directions for their culture. Each sort is labeled with its English and botanical name, its native country, and mode of culture. Price \$1 for the 18 sorts.

For Sale.

A half blood Durham Short-horn Cow, eight years old, with calf by a full blooded bull of the same breed. Her calves have been large and uncommonly fine animals.

CHARLES E. NORTON.

South Berwick, Me. April 25, 1832.

Mangold Wurtzel, Sugar Beet, &c.

Just received at the New England Seed store, 50½ North Market street, by **J. B. Russell,**
100 lbs. Large Mangold Wurtzel, of the very first quality.
100 lbs. French Yellow Sugar Beet, imported directly from France. **100 lbs. Ruta Baga,** of the first quality. **European growth;** **100 lbs. large White Flat English Field Turnip;** **150 lbs. Short Top Scarlet Radish,** of English growth—very early, and of deep scarlet color. March 28.

Wool.

JAMES VILA, Wool Broker and Commission Merchant, Nos. 3 and 4, Phillips' Buildings, has for sale a general assortment of
Russian, Saxony Lambs,
Smyrna, do. Sheep,
Jutland, Buenos Ayres,
Also, a large assortment of Domestic Fleece, Sorted and Pulled Wools.

Cast Steel Scythes.

JUST received, a few dozen of extra Cast Steel Scythes, which were highly approved of the last season. Likewise, a few dozen of Cass' and Baker's Patent Scythes Smiths, the most approved article now in use.

J. N. NEWELL,

April 11. No. 51 and 52 N. Mar. st.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No 110 State street, by **ALBERT FEARING & CO**

Nuttall's Ornithology.

JUST received by **J. B. Russell, No. 50 1-2 North Market Street, Boston—**

A Manual of the Ornithology of the United States and of Canada. By **Thomas Nuttall, A. M., F. L. S.;** with 53 engravings. Price \$3.50. Jan. 18.

BRIGHTON MARKET—MONDAY, MAY 14, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 251 Beef Cattle, 8 pairs Working Oxen, 26 Cows and Calves, 14 Sheep, and 145 Swine.

PRICES. *Beef Cattle*—The market today for Beef was rather quicker, and perhaps a little better. We quote extra at \$6 a 6.25; prime at 6; good at 5.75; thin at 5 a 5.50.

Working Oxen.—Several sales were effected, but we could not obtain the price.

Cows and Calves.—We noticed sales at \$19, 21, 22, 23, 25, 29, and 30.

Sheep.—Those at market were a lot of fine cosset wethers, and were taken at about \$9 each.

Swine.—Prices continue high. A lot of 67 fat hogs were taken at \$4.60 per hundred; 53-4 c was refused for a small lot of shoats, half barrows. A few were retail at 6 c for sows and 7 c for barrows.

New York Cattle Market, May 11.—800 head of Beef Cattle in market this week, and all sold quick; average \$7; we quote \$6 to 8; we did not hear of any selling over 8. Sheep and Lambs quite scarce—sales of sheep sheared 2.50 a 5; lambs 2.50 a 4. Swine, sales at 4 a 4-1-4.—*Daily Ad.*

In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

FOR THE NEW ENGLAND FARMER

THE BIRDS.

Of all the inexcusable wantonness of men and boys, that manifested in the destruction of the various beautiful birds which visit us in this delightful season, is the most unaccountable. Who can look upon them with pain? To whom can they be offensive? Whom do they injure? On the contrary, who can behold them perched upon the trees, or winging their way from garden to grove and shrub to flower, without inexpressible emotions of delight? What ear attuned to harmony is not charmed with their simple melody? and who can enjoy a walk or a ride in town or country, or that has a taste for beauty and happiness, can feel unwilling to see our trees and gardens animated with the presence of these gentle visitors? Why then hunt and destroy them? Why should it be allowed to kill them at any season?

If they could be protected for two or three years, they would become so numerous as to destroy all our most injurious insects, and in that way greatly benefit the community, by increasing the quantity and improving the quality of our fruit. They would also become much more tame, and would approach more nearly to our dwellings and public walks. How enchanting would our rural shades be rendered thereby; and how happy would those murderous boys be made, to see them playing around our mails and alighting on every shrub in town or country.

Do, Mr Fessenden, implore the boys, young and old, to obey the dictates of taste, sense and interest, and desist from the further destruction of those amiable songsters.

J. L. A.

SPANISH INQUISITION.

When Gen. Lasalle entered Toledo, he immediately visited the palace of the Inquisition. The great number of the instruments of torture, especially the instrument to stretch the limbs, the drop baths (already known) which cause a lingering death, excited horror even in the minds of soldiers hardened in the field of battle. Only one of these instruments, (singular of its kind, for refined torture, disgraceful to reason and religion in the choice of its object,) seems to deserve a particular description. In a subterranean vault, adjoining a secret audience chamber, stood in a recess in the wall, a wooden statue made by the hands of the Monks, representing, (who would believe it?) the Virgin Mary! A gilded glory beamed round her head, and she held a standard in her right hand. It immediately struck the spectator, notwithstanding the silk garments which fell in ample folds from the shoulders on both sides, that she wore a breast plate. Upon a closer examination it appeared, that the whole front of the body was covered with extremely sharp nails and small blades of knives, with the points projecting outwards. One of the servants of the Inquisition, who was present, was ordered by the General to make the machine *manœuvrer*, as he expressed himself.

As the statue extended its arms and gradually drew them back, as if she would affectionately press somebody to her heart, the well filled knapsack of a Polish grenadier supplied for this time the place of the victim. The statue pressed it closer and closer, and when, at the command of the General, the director made it open its arms and

return to its first position, the knapsack was pierced two or three inches deep, and remained hanging upon the nails and knife blades. It is remarkable, that the barbarians had the wickedness to call these instruments of torture "Madre Dolorosa"—not the deeply afflicted, pain-enduring; but by a play on words, the pain-giving—Mother of Grief!

Whitewashing.—It is a very common practice to whitewash rooms, walls and fences, with simple lime and water. The result is, that a touch brings it off upon the hands or clothes, and a few successive rains leave almost bare the materials upon which it has been laid, and which are exposed to the weather. On in-door work, a little glue will fix it so that it will not easily rub off, nor when the press that happens to come in contact with it. Out of doors, glue alone will not answer; skimmed milk is probably the cheapest and best ingredient that can be easily procured. Those who put on whitewash without anything of this kind to retain it, act on the same principle as if they should fill a sieve with water, or cover a house with boards without nailing them.—*Lynn Messenger.*

To promote the growth of trees.—Some separate the dry bark of fruit and forest trees, to promote their growth and prevent the bark binding too much. This disfigures the tree, making seams in the trunk, and makes it grow in angles. The best way is, when the sap is forced up by warmth of spring, to scrape off all the scaly particles of the dead bark, and wash the trees repeatedly during the week with soap-suds, &c. Trees of considerable age will then have a youthful appearance, be more thrifty; and in case of fruit trees, the fruit will make more cider than that grown on scurvy moss-grown trees.

Put cinders, bones, stones, about the roots of pear trees; it will increase their growth one third and save them from blight.—*Genesee Farmer.*

Love, Law and Physic.—In London, last February, a young woman was brought before the police by a young Bunline, a sailor, lately paid off from a British man-of-war on the South American station, who charged her with stealing a sovereign from him. Bill stated, that he had written letters to her and intended to make her his wife, but was sorry to find on his return that her flame was not very fair. This he did not mind so much as that she was a drunkard, and on his first meeting urged him to treat. They had half a pint of rum between them, and when he had a sovereign on the counter to pay for the same, she seized it and put it into her mouth, as if to swallow it. She refused to disgorge, and he took her in his arms to carry her to an apothecary to have an emetic administered! She struggled violently in the street, which drew a great crowd of persons, who thought she had been seized with the true Asiatic Cholera, especially as the sailor was taking her into an apothecary's shop. Arrived there, the man of physic refused his aid in the case, and Bill had to take her to the Police, where on search, *secundum artem*, the sovereign was found under the lady's tongue.—*Boston Patriot.*

Pride breakfasted with plenty, dined with poverty, and supped with infamy.

Pride is as loud a beggar as want, and a great deal more sly.

Lying rides on debt's back.

Morus Multicaulis.

FOR Sale at the Seed store connected with the New England Farmer, 503 North Market street:

A few very fine and vigorous plants of the celebrated Chinese Mulberry, so valuable for Silk worms, originally from the elevated regions of China—and introduced into France from the Philippine Islands a few years since. These plants now offered for sale, have been received direct this spring from Paris, and were selected by Mons. Andre Méchain, author of the North American Sylva, and are much larger than any that have heretofore been offered here. Packed in moss separately for transportation, price 1 dollar each. A particular account of this tree by Gen. Deaubon, will be found in the New England Farmer, vol. ix. page 28. April 11.

Tall Meadow Oats Grass, &c.

THIS day received at the New England Seed Store, 503 North Market street, by J. B. Russell:

A fresh supply of Tall Meadow Oats Grass Seed, so valuable on thin soils for either a hay crop or for grazing. Col. Taylor, a distinguished farmer, says of it, "It is the hardest grass I have ever seen; and bears drought and frost, and heat and cold, better than any I have ever cultivated. It keeps possession of the ground in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, and in drought, than any grass known to me; and if cut before the seed ripens, its hay is as pleasant and nutritive to stock, as any grass known to me." See also the opinion of Mr. PHINNEY, a most judicious farmer, in the New England Farmer, vol. vii. page 300.

Also, Lucerne Orchard Grass, White and Red Clover, Fowl Meadow, Barley, Buck Wheat, Spring Rye, Spring Wheat, Bloom Corn, Seed Corn, &c. March 28.

New American Gardener, sixth edition.

This day published by J. B. Russell and Carter & Hendler:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, Asparagus, &c. &c. By T. G. Fessenden, assisted by several gentlemen. Sixth edition. Price \$1.00.—This we think may be considered the most popular and practical work on Gardening extant. March 28.

Prince's Pomological Manual.

The second volume of this work is now ready for delivery, and the third volume is nearly completed.

These three volumes contain all the Orchard and Garden Fruits described by DuRoiel, and other French writers of high authority, and also all that are described in the transactions of the London Horticultural Society, the Pomological Magazine, the Pnyx Malus Bretonnensis, and Landley's Guide to the Orchard and Kitchen Garden, as well as the numerous choice varieties which have originated in our own country. In the preface to Vol. II. the "Introduction" given by Mr. Lindley has been inserted entire, and great care has been taken, in republishing his descriptions of Fruits, to extend the synonyme, and to correct the errors which exist.

WILLIAM PRINCE & SONS.

Flushing, Feb. 21, 1852. 21.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed by J. B. RUSSELL, by J. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

CABBAGE.

By the Editor.

Brassica oleracea capitata.—Among the varieties of the cabbage, which have been introduced into this country, the following are enumerated in Mr. Russell's catalogue:—

Early Salisbury dwarf,	Late Sugarloaf,
Early York,	Large Scotch, for cattle,
Early Dutch,	Green globe Savoy,
Early Sugarloaf,	Red Dutch, for pickling,
Early London Battersea,	Large Cape Savoy,
Large Bergen, or great A-	Yellow Savoy,
Early Emperor, American,	Early Wellington,
Large late Drumhead,	Late Imperial.

Soil and Situation.—Every variety of cabbage grows best in a strong, rich, substantial soil, inclining rather to clay than sand; but will grow in any soil if it be well worked and abundantly manured with well-rotted dung. But, according to London, "the soil for seedlings should be light, and, excepting for early sowings, not rich. Where market gardeners raise great quantities of seedling cabbages to stand the winter, and to be sold for transplanting in the spring, they choose in general the poorest and stiffest land they have got; more especially in Scotland, where large autumnal sowings of winter drumhead and round Scotch, are annually made, and where the stiffness of the soil gives a peculiar firmness of texture and hardness of constitution to the plants, and prevents their being thrown out of the soil during the thaws which succeed a frosty winter. Transplanted cabbages require a rich mold, rather clayey than sandy; and, as Neill and Nicol observe, it can scarcely be too much manured, as they are an exhausting crop. Autumnal plantations, intended to stand the winter, should have a dry soil well dug and manured and of a favorable aspect. The cabbage, whether in the seed-bed or final plantation, ever requires an open situation. Under the drip of trees, or in the shade, seedlings are drawn up weak, and grown crops are meager, worm-eaten and ill-favored."

Sowing cabbage seed.—McMahon says, "The proper period for sowing cabbage in the Middle States, to produce early summer cabbages, is between the sixth and tenth of September, if intended to be transplanted into frames in October for winter protection, which is the preferable method; but if they are designed to remain in the seed-beds till spring, the period is between the fifteenth and twentieth. However, it will be very proper to make two or three sowings within that time, as it is impossible to say whether the fall may be favorable or otherwise, and therefore the better way is to be prepared in either case by successive crops."

"The consequence of having crops too early is, that they are subject to run to seed in the spring soon after being planted out; and if the seeds are sown too late, the plants do not acquire sufficient strength before winter to withstand its rigor, without extraordinary care. But in either case there is a remedy; that is, if the plants are likely to become too luxuriant and strong, transplant them once or twice in October, and if too backward and weakly, make a slight hot-bed towards the latter end of that month, and prick them out of the seed-bed thereon; this will forward them considerably."

Mr McMahon thinks, that in the Eastern States, the fore part of September will be a suitable time to sow cabbages intended to be grown the succeeding summer. The seeds should be covered about a quarter of an inch, and if the weather prove dry should be watered occasionally in the evening, till they come up. According to Abercrombie's seed estimate, "for a seed-bed to raise early York and similar varieties, four feet wide by twenty in length," two ounces will be required; for a seed-bed to raise the large sugarloaf and other luxuriant growers, four feet by thirtysix in length, two ounces. The same writer directs to "sow at three different seasons, that is, spring, summer and autumn, and cover from an eighth to a quarter of an inch. Under a deficiency of winter-standing young plants for final transplanting in the spring, or in order to have some spring-sown plants as forward as possible, a moderate portion of some best early sorts may be sown between the middle of February and the middle of March, in a slight hot-bed or frame, to nurture the plants till the leaves are an inch or two in length. Then prick them into intermediate beds in the open garden, there to gain strength for final transplanting."

Planting in New England.—"Some drop the seeds where the cabbages are to grow. By this they escape being stunted by transplanting; for winter cabbages, the latter part of May is early enough to put the seed into the ground, whether the plants are to be removed or not. I have tried both ways, and, on the whole, I prefer transplanting. They are otherwise apt to be too tall and to have corked stems. Covering plants with leaves is not a good practice. They will be much heated through some sorts of leaves, the free circulation of air about them will be prevented, and their perspiration partly obstructed. If a hot sun cause them to droop, a shingle, stuck into the ground, will be sufficient shelter, if it be on the south side of the plants. I commonly allow each plant two shingles, one on the southeast side, and one on the southwest, meeting at the south corner."—Deane.

The act of planting should be performed carefully. Holes of sufficient depth and width, should be dibbled, for the smaller sorts of cabbages, at the distance of two feet and a half, and for the larger sort of three feet every way. In these the earth should be placed up to the lower leaves, and brought closely about the roots, which is best done by pushing down the dibber, at a small angle with the plant, and then bringing it up to it with a jerk. This leaves no chambering, (as the gardeners call it,) no vacancy between the plant and the soil.

"The state of the weather when these operations are performed, is not a matter of indifference, and has been a subject of controversy; some recommending dry weather, others wet. As in many other cases of disputation, the truth lies between them; that is, moist weather is neither dry nor wet, and is precisely that which is best for setting out cabbages, or any other vegetable. We ought not, however, to wait long for even this most favorable state of the atmosphere, since, with a little labor, we have the means of making up for its absence."—Armstrong.

"Dig the plants up, that is, loosen the ground under them with a spade, to prevent their being stripped too much of their roots. The setting stick should be the under part of a spade or shovel handle. The eye of the spade is the handle of the stick. From the bottom of the eye to the point of the stick, should be about nine inches in length. The stick should not be tapering, but nearly of equal thickness all the way down to within an inch and a half of the point, where it must be tapered off to the point. If the wood be cut away, all round, to the thickness of a dollar, and iron put round in its stead, it makes a very complete tool. The iron becomes bright and the earth does not adhere to it as it does to wood. Having the plant in one hand and the stick in the other, make a hole suitable to the root that it is to receive. Put in the root in such a way, that the earth, when pressed in, will be on a level with the butt-ends of the lower or outer leaves of the plant. Let the plant be rather higher than lower than this; for care must be taken not to put the plant so low as for the earth to fall or be washed into the heart of the plant, nor even into the inside of the bottom leaves. The stem of a cabbage, and the stems of all the cabbage kind, send out roots from all the parts of them that are put beneath the surface of the ground. It is good, therefore, to plant as deep as you can without injury to the leaves. The next consideration is, the *fasteining* of the plant in the ground. The hole is made deeper than the length of the root, but the root should not be bent at the point, if it can be avoided. Then, while one hand holds the plant with its root in the hole, the other hand applies the setting stick to the earth on one side of the hole, the stick being held in such a way as to form a sharp triangle with the plant. Then, pushing the stick down so that its point go a little deeper than the point of the root, and giving it a little twist, it presses the earth against the point or bottom of the root. And thus all is safe, and the plant is sure to grow."—Cobbett.

After-culture.—Little more is necessary than to stir the ground pretty frequently, and keep it clear of weeds. It is recommended to hoe the ground while the dew is on, once a week, till they begin to head.

Diseases and Insects.—Cabbages are liable to a disease in the roots, in which they become swelled and knobby, and the plants of weak and imperfect growth. This disorder is called stump foot, fumble foot, &c. It has been supposed to be caused by the attacks of grubs, below the surface of the ground; and the disorder is said to be chiefly prevalent where the same sort of cabbages have been raised on the same ground, several years in succession. Lovett Peters, Esq. of Westborough, Mass. says, the cause of the stump foot is in the soil:—"Few pieces of land, I believe, that have been for several successive years under the plough, will produce a good crop of cabbages, though there may be exceptions. My method of raising them, which I have practised for several years with complete success, is the following: In the spring, take a piece of green sward of a good soil and free from stones, and turn it over with the plough as flat as possible; then spread on a large quantity

of good manure; if it has been previously mixed with leached ashes, the better. Then barrow greatly and early in June; if for winter cabbage, cut holes through the turf, with a hoe, as near together as the cabbages ought to grow; fill the holes with fine earth and manure, and then set the plants, or put in a small number of seed. I prefer the latter, however,* since it saves the labor of setting and is much more sure of success, if it happens to be a time of drought. They will need no more hoeing than is necessary to keep down the weeds. In this way, I have raised cabbages of the largest size in a green sward potato field, without more hoeing than was necessary for the potatoes."

Cabbage plants are liable to be attacked by a grub or black worm, in the night, which eats off the stalks just above the ground, and buries itself in the ground as soon as the sun rises. Dr Deane observed, that a little circle of lime or rock-wood round the plant, will preserve it, and recommends digging for the worm near the place which shows the marks of its ravages, and destroying it. Scalding the hills with boiling water and then inclosing them with boards, bark, or shingles, would be an effectual but troublesome mode of guarding against worms. The "Economic Journal of France" gives the following method, which, it states, is infallible, to guard against not only caterpillars, but all other insects which infest cabbages or other vegetables: Sow with hemp all the borders of the ground where the cabbage is planted; and, although the neighborhood be infested with caterpillars, the place inclosed with hemp will be perfectly free, and not one of the vermin will approach it. Watering the plants with water which had been poured boiling hot on elder leaves, or walnut leaves, and suffered to stand till cool, has been recommended. The following mixture is also said to be a preservative against all kinds of insects:—Take a pound and three quarters of soap, the same quantity of flour of sulphur, two pounds of puff balls, and fifteen gallons of water; when the whole has been well mixed by the aid of a gentle heat, sprinkle the insects with the liquor, and it will in-

stantly kill them. To get rid of the *aphides* or cabbage lice, watering the plants with soap-suds or a solution of salt in water, (not too strong, lest it kill the plants,) is said to be efficient.

Use.—The culinary uses of the cabbage are too well known to need description or recapitulation. If they grow near a yard where cattle are kept, the under leaves, when they begin to decay, may be stripped off and given them. The plants will not be injured, and they are excellent food for cattle, and will much increase the milk of cows; but the least decayed alone should be given to cows, lest they give the milk a bad taste. Much account is made of cabbages in England, for feeding cattle in the winter; but the difficulty of preserving them renders them less valuable for that purpose with us. Cabbages are also eaten by swine and horses, and are thought to be excellent food for ewes that have newly dropped their lambs, and for calves.

Preserving cabbages.—Mr McMahon recommends the following method for preserving cabbages for winter and spring use: "Immediately previous to the setting in of hard frost, take up your cabbages and Savoys, observing to do it in a dry day; turn their tops downward and let them remain so for a few hours, to drain off any water that may be lodged between their leaves; then make choice of a ridge of dry earth, in a well-sheltered, warm exposure, and plant them down to their heads therein, close to one another, having previously taken off some of their loose, hanging leaves. Immediately erect over them a low, temporary shed, of any kind that will keep them perfectly free from wet, which is to be open at both ends, to admit a current of air, in mild dry weather. These ends are to be closed with straw when the weather is very severe. In this situation, your cabbages will keep in a high state of preservation till spring; for being kept perfectly free from wet, as well as from the action of the sun, the frost will have little or no effect upon them. In such a place, the heads may be cut off as wanted, and if frozen, soak them in spring, well, or pump water, for a few hours previous to their being cooked, which will dissolve the frost and extract any disagreeable taste occasioned thereby."

The principal gardener in the Sinker establishment, in New Lebanon, Columbia county, N. Y. directs not to pull up cabbages in autumn, till there is danger of their freezing too fast in the ground to be got up. If there happens an early snow, it will not injure them. When they are removed from the garden, they should be set out again in a trench dig in the bottom of a cellar. If the cellar is pretty cool, it will be the better."

The London Monthly Magazine give the following method, by which cabbages may be preserved on board ships, &c: "The cabbage is cut so as to leave about two inches or more of the stem attached to it; after which, the pith is scooped out to about the depth of an inch, care being taken not to bruise the rind by this operation. The cabbages then are suspended by means of a cord, tied round that portion of the stem next to the cabbage, and fastened at regular intervals to a rope across the deck. That portion of the stem from which the pith is taken, being uppermost, is regularly filled with water."

To save cabbage seed.—"The raising of the seed of the different sorts of cabbage," Neill observes, affords employment to many persons in various parts of England. It is well known, that no plants are more liable to be spoiled by cross breeds than

the cabbage tribe, unless the plants of any particular variety, when in flower, be kept at a very considerable distance from any other; also in flower, bees are extremely apt to carry the pollen of the one to the other, and produce confusion in the progeny. Market gardeners and many private individuals raise seed for their own use. Some of the handsomest cabbages of the different sorts are dug up in autumn, and sunk in the ground to the head; early next summer a flower stem appears, which is followed by abundance of seed. A few the soundest and healthiest cabbage-stalks, furnished with sprouts, answer the same end. When the seed has been well ripened and dried, it will keep for six or eight years. It is mentioned by Bastien, that the seed-growers of Aubervilliers have learned by experience, that seed gathered from the middle flower-stem produces plants, which will be fit for use a fortnight earlier than those from the seed of the lateral flower stem; this may deserve the attention of the watchful gardener, and assist him in regulating his successive crops of the same kind of cabbage."—London.

Field culture.—The variety cultivated in the fields for cattle is almost exclusively the large Scotch, or field cabbage. The land is prepared the same way as for other hoed crops. "The preparation given to the plants," says London, "consists in pinching off the extremity of the tap-root, and any tubercles which appear on the root or stem, and in immersing the root and stem in a puddle or mixture of earth and water, to protect the fibres and pores of the roots and stem from drought. The plants may then be inserted by the dibber, taking care not to plant too deep, and to press the earth firmly to the lower extremity of the root. If this last point is not attended to, the plants will either die, or, if kept alive by the moisture of the soil or rain, their progress will be very slow. When the distance between the ridglets (or rows) is twenty-seven inches, the plants are set about two feet asunder in the rows, and the quantity required for an acre is about six thousand plants." The after-culture, preservation, uses, &c, have been sufficiently detailed in the preceding columns, under this head.

NOTICES OF THE SEASON.

To the Editor of the N. E. Farmer,—

I have observed in your paper, accounts of the twigs of fruit trees being killed in the Eastern States. My residence is some six or seven miles south of 42° north latitude—have examined the fruit trees very carefully, and find no such appearances. The twigs are all budding out as usual.

The winter with us has been very tedious, severe and changeable. The first snow fell early in November, before the ground was at all frozen; it continued snowing and settling till the greatest average was about four feet deep. Several people kept accounts of the depth of the snow, and say that if it had not settled at the bottom, by the warmth of the ground, it would have been twelve or fourteen feet deep. Several severe spells were followed by warm rains. The Delaware river with us, was frozen over strong enough for teams to cross three several times, and as often broke up in high freshets, with great damage on the banks, in places. We had one dry hail-storm of about nine inches deep, followed with rain; and it was then frozen so as to bear a horse, which caused great destruction to the poor deer, by wolves and dogs. The ground began to appear in the latter

* Cultivators do not agree on the subject of transplanting cabbage plants, or sowing the seeds in the spots where the plants are to grow. Dr Deane, as has appeared above, after having tried both methods, gave the preference to transplanting. Mr Peters, we have seen, prefers the other mode. Mr Bordley relates an experiment, in which he compared cabbages transplanted with others not once moved. The unmoved grew, and were better than the moved." Mr Cobbett says, "to have fine cabbages of any sort, they must be twice transplanted. First, they should be taken from the seed-bed, (where they have been sown in beds near to each other,) and put into fresh-dug, well-loosen ground, at six inches apart every way. This is called *pricking out*. By standing here about fifteen or twenty days, they get straight, and stand strong, erect, and have a straight and stout stem. Out of this plantation they come all of a size; the roots of all are in the same state, and they strike quicker into the ground where they stand for a crop." According to Reeves' Cyclopaedia, it was the practice of the celebrated Bakewell and other cultivators who followed his example, to drill cabbage seed where the plants were to remain. Perhaps there would be no necessity of transplanting cabbages, in order to make the stems "straight and stout," according to Mr Cobbett's directions, if the plants were not originally sown too thick, or were properly thinned at an early period of their growth. An English writer says, "Much injury frequently arises to young cabbage plants from the seed being sown too thick; care should therefore be taken to have them properly thinned out, whenever they come up in too thick a manner. Probably, if the plants were sown in the hills in which they are intended to grow for a crop, and thinned out in due season, they would grow as straight and stout as if they had been several times transplanted."

part of April, when it had been closely covered with snow full five months. The consequence is, that the winter grain which grew so flourishing last fall, appears to be totally dead and rotten, supposed to have been smothered.

Some modern naturalists say, that vegetables respire and cannot exist without fresh air. From what I see in the papers, it appears, that the loss of winter grain may be general in this State.—Some accounts say, that the farmers in the Southern States are ploughing up their fields sown with wheat, intending them for oats and Indian corn.

I hope to see in your paper, the observations of gentlemen in different places on the effects of the late winter.

SAMUEL PRESTON.

Stockport, Pa., May 9, 1832.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At a meeting of the Massachusetts Horticultural Society, held this day, Saturday, May 19, 1832, the following letters were communicated and ordered to be printed in the New England Farmer and Horticultural Journal.

FLORENCE, Dec. 1, 1831.

M. A. S. DEARBORN, President of the Mass. Hort. Soc., Boston,—

SIR—In compliance with the request contained in your favor of August 13th, 1829, and December 6th, 1830, I have procured and now transmit to the Massachusetts Horticultural Society, a collection of garden seeds of Tuscany. Happy, if I can contribute my mite to the advancement of your useful institution, whose object is of common interest to every country.

I transmit, likewise, to your Society, some flower seeds which I have procured at the request of Capt. Matthew C. Perry, commanding the United States Ship Concord, in the Mediterranean.

I have the honor to be, with great respect, your very humble and obedient servant,

JAMES OMBROSI,
Consul of the United States at Florence.

{ United States Consulate,
PUERTO CABELLO, Feb. 11, 1832.

To ZEEBEE COOK, Jr. Esq., 1st Vice President of the Mass. Hort. Soc., Boston,—

SIR—I do myself the pleasure to acknowledge the receipt of your letter, under date of the 12th of December last, accompanied with a diploma, advising me of having been elected an honorary member of the Massachusetts Horticultural Society, Boston, as also with a pamphlet containing the charter, constitution, &c. of the Institution.

I beg of you to tender to the Society my most sincere thanks for the honor conferred; and I shall be happy from time to time to communicate such information as I may possess or acquire here, on the interesting subject of rural economy. It will also afford me much satisfaction to forward the Society any seeds, plants, scions, or trees, that I can procure, and may deem worthy of its attention—and in return, will be obliged for a few of the scions of some of your select grapes, as well as a few of the spruce, white and pitch pine, cypress, apple, apricot, and pear trees.

I have the honor to be, very respectfully, your most obedient servant, FRANKLIN LITCHFIELD.

CHARLESTON, Feb. 29, 1832.

To the President of the Horticultural Society of Boston,—

SIR—A Society having been lately formed in this city, with designs similar to your own, I have been instructed to communicate with you, and to solicit your aid in furthering the common object in which we are engaged. With you, it would be unnecessary to enlarge upon the importance of this undertaking, and of the many benefits it bestows upon the human family, not only in improving their physical but their moral condition. Fully impressed with this belief, we request from you, as our elders, from time to time, such information as may be suited to our situation, as well as any pamphlets, communications, &c. you may think proper to send to us; and shall be happy to reciprocate in such exchanges as our climate, soil, and progress in improvement will afford.

I am, Sir, very respectfully, your obedient servant,

H. R. FROST,
Cor. Sec'y Charleston Hort. Society.

{ Horticultural Hall,
Boston, March 16, 1832.

DEAR SIR—I have great pleasure in acknowledging the receipt of your respected favor of the 29th ult, and take leave to assure you, that the Massachusetts Horticultural Society will be happy to form and cherish a correspondence with their brethren of South Carolina, who are engaged in the pleasing and useful pursuits of horticulture.

It will at all times afford me pleasure to communicate anything connected with the objects of our common labors, and to transmit such publications as may from time to time be made under the directions of the Society. I would take leave to recommend to your special notice the New England Farmer and Horticultural Journal, a weekly publication of great merit, which is devoted to such subjects as are interesting and instructive to all persons engaged in agriculture, &c. &c. The proceedings of the Massachusetts Horticultural Society are given to the public through the medium of the columns of this paper.

Will you do me the favor to transmit to me a list of the names comprising the government of your Society. I had proposed to myself the pleasure of requesting a friend in your city, to obtain this information, for only two days prior to the receipt of your letter, that I might present such of them as come within our prescribed rules, touching officers of other societies, to the honors of ours.

Indulging the hope of hearing from you at an early period, I have the honor to be, dear Sir, very respectfully, your most obedient servant,

ZEEBEE COOK, Jr.,

1st Vice President of the Mass. Hort. Society.

H. R. FROST, Esq.

Cor. Secretary Charleston Hort. Society, Charleston, S. C.

BOSTON, March, 1832.

Z. COOK, JR. Esq., Vice President of Horticultural Society—

SIR—I send you herewith a box containing forty-two pots of flower seeds, received by the Alert, from China, through the obliging attention of Mr. Forbes, resident at Canton. He has not sent, nor could he probably obtain the English or botanical names of the seeds; each pot contains the seed of different plants; as the seeds appear to have been packed with care, I am in hopes that through your agency, some of them at least will be successfully cultivated. They will all require the aid of the greenhouse, and you will make such disposition of them as you may judge best.

Your obedient servant,

T. H. PERKINS.

HAVANA, April 2, 1832.

To ZEEBEE COOK, JR. Esq.—

DEAR SIR—I send you herewith four labelled papers of seeds, which were given me by the Bavarian Baron de Karvinski, a botanist who lately arrived from Mexico, where he has resided several years. The Cacti may never succeed in our climate, and perhaps also the Thiboma or Cocoa tree, which, however, have been planted here; and of the latter, I have sent some of the seed to Key West. But the Indian corn may be an acquisition to the country; the ear from which these grains were taken was at least eighteen inches long, and the Baron tells me the stalk or plant is like a small tree, it therefore merits your attention. I know little or nothing of these things, Sir, but I am ever ready to give all the aid in my power towards the promotion of science.

I remain, very respectfully, dear Sir, your most obliged servant,

WM. SHALER.

The flower and vegetable seeds presented to the Massachusetts Horticultural Society, by the Hon. Thomas H. Perkins, M. C. Perry, Esq., Wm. Shaler, Esq., and James Ombrosi, will be distributed to members of the Society on Saturday next, the 26th inst. at 11 o'clock, at the Horticultural Hall.

CURE FOR GLANDERS.

In looking over a late number of the Lancet, a medical work published in London, we find an article devoted to the treatment of the above disease, which is so frequent and fatal among horses.

The first medical measure recommended is a pure atmosphere. It is said that glanders is the peculiar disease of stable horses, and it is urged that the horse must be turned out where he can at all times be surrounded by pure and cool air.—

This must constitute the foundation of hope, in all attempts to remove the complaint. It is in vain to use local or other medicines upon the horse, while he is confined in the stable. No sound horse should be permitted to be in the pasture or enclosure where the glandered horse is. A field should be devoted to the infected animal, and neither cattle nor sheep should feed in the same ground with him, because the virus may be communicated even to them.

Local applications, such as injections, &c. to the nostrils, are deemed useless if not prejudicial, because they only serve to increase the morbid irritation already existing in the affected part.

Counter irritants, such as blisters or setons along the nasal bones should not be omitted, provided the animal gives indications of pain when pressed there by the fingers.

Tonics, particularly the sulphate of copper, (blue stone,) have been found efficacious where the strength of the horse is considerably reduced. The copper will act as a general tonic, and at the same time with peculiar local determination. Its effects in healing nasal abrasions and arresting nasal discharges, is thought to be unquestionable. It may be given in doses of sixty grains once or twice a day. It may be dissolved in a bucket of water.

Feeding Swine.—The London Horticultural Register says, "Those who wish that these animals should have a sharp appetite, whilst they are fattening, must give them a couple of handfuls of dried oats once a day; taking care to have a supply for some days forward constantly on hand. For this purpose, a layer of oats must be placed in a pan; salt must then be strewed over it, and the whole moistened with a little water; taking care, however, not to fill the pan to the brim, as the moisture will swell the grain."

Mushrooms.—To ascertain whether what appears to be mushrooms are so or not, a little salt should be sprinkled on the inner or sponge part—if in a short time afterwards they turn yellow, they are a poisonous kind of fungus; but if black, they may be considered genuine mushrooms. They should never be eaten without this test, as the best judges may be occasionally deceived.—*Horticultural Register.*

Rival to the "Alkaline Drops" of Dr Granville.—The Exeter (N. H.) News Letter states, that it is a remarkable fact, that not an individual in Europe has been attacked with the cholera, who has been in the habit of subscribing and paying for a newspaper!

Meadow Land.—Mowing land in Hatfield meadow has recently been sold at two hundred and seventy-five dollars per acre, and arable land at one hundred and thirty dollars. The highest price ever given for mowing land in Northampton meadow is one hundred and sixty dollars, and for ploughing land about one hundred dollars. The price of lands in the meadows of Northampton, Hatfield and Hatfield, was never higher than at the present season. For many years, the price of land has been considerably higher in Hatfield than in the other two towns.—*Hampshire Gazette.*

A gentleman in Tennessee advertises, that he has discovered, that strewing Indian meal on cucumber hills will prevent insects and reptiles from approaching the vines.

Agriculture.

AN ADDRESS

To the Essex Agricultural Society, delivered at Andover, Mass. Sept. 29, 1831, at their annual Cattle Show. By Henry Colman. Published at the request of the Society.

Mr. President, and Gentlemen of the Agricultural Society,—

I am not insensible to the honor of your appointment on this occasion. I should not, however, have undertaken this duty, but from the consideration that every man is bound to render any practicable service, which the community demands of him. You do not expect an oration. Agriculture has little concern with rhetorical flourishes. Determined principles, plain matters of fact and the results of well conducted experiments, are most useful. These will be the subjects of my address.

I. The first object of a farmer should be to produce as much as he can. We are not speaking of mere amateur farmers, who do not need the products of a farm as a means of subsistence or profit, and who are at liberty to farm as much or as little as they please; nor of our mongrel farmers, a sort of "jack-at-all-trades," who farm a little, and trade a little, and manufacture a little, and jockey a good deal; but of those husbandmen, whose whole dependence is on their farms for their own and the support and comfort of their families. The object of such farmers should be to produce from their farms as much as they can, and of that which is most needed or most profitable. We lay this down as a great principle, and shall presently come to the qualifications which belong to it. Every man should obtain from his farm all that he can. This will require labor and care; but the necessity of labor and care, where they are not excessive, is a blessing, not an evil. Occupation is enjoyment. Idleness is always hazardous to virtue, and renders a man a nuisance to his neighborhood. There is a satisfaction in a farmer's gains, not to be found in many of the occupations of life. The increase of his products impoverishes no other man; but confers a benefit upon the community, by extending the means of human subsistence, rendering the land which he cultivates more fertile, and inciting others to emulate his example of good husbandry.

There are three modes of increasing the produce of a soil, within the reach of every farmer: draining, ploughing, and manuring. I can only glance at these topics, for it is not my intention to give a treatise on agriculture.

1. First, of draining. There are extensive tracts of low and wet land in the country, enriched by the decay of their own native growth and the copious washings of centuries from the surrounding hills, which require only to be drained, to produce, instead of a worthless herbage, the best of English hay and corn. In many cases, removing the water by opened or covered drains, so formed as to cut off the springs at the sides of the meadow, is all that is necessary. In other cases, the addition of some firmer substance, such as sand, or gravel, or loam, is needed to give it consistency. This in general is to be found in the neighborhood, and may be placed on the meadow at a season when such labor can be easily applied. In most cases, the materials for manure obtained from the ditches, and the first or the two first crops will defray the expense of the improve-

ment.* Sand contributes to the improvement of such lands, by dividing the soil into fine parts, and rendering it favorable for cultivation and the growth of the finer grasses; both sand and gravel serve to give it firmness; but probably the best mode of managing such meadows, after being well drained, would be to invert the sod, and, after rolling, to cover it with a coating of good loam mixed well with manure, to the depth of about two inches; or to apply such a covering without inverting the sod, and to sow the grass seeds immediately upon this. Some lands have been managed in this way with great advantage. A mistake is frequently made in the too copious application of sand or gravel to meadows. So much has been put on as to prevent in a great measure the benefits expected from it. Such applications do nothing towards enriching the soil; but are required only to aid in dividing, drying and giving it firmness. Beyond what is required for these purposes, the application would be hurtful. The first object must be to lay these lands as dry as possible; and it suggests itself as an important improvement, where it is practicable, to erect a small embankment at the outlet of such meadow, with a sluice-way and gate, so that the meadow may be flooded at pleasure. Thousands of acres in this country admit of these improvements. They may be effected at an expense which, by their increased products, would be soon remunerated.

2. The next means of improving land is ploughing. We do not cultivate land enough; not nearly enough. Several farms in the country contain hundreds of acres, with not more than six or ten under the plough. This is not farming; this is only seeing how we can get along without farming; it is, in fact, going to sleep in the cart and leaving the cattle to find their own way. But the land, says the farmer, will not pay for cultivation.—there is some such—in general, however, most land will much more than pay for cultivation. But it costs labor; so does everything else in life, that is worth having. It requires manure—true! but cultivation is the great means of obtaining manure. Cultivation increases the products of the land. The more products, the more stock; the more stock, the more manure; and land in general, under generous cultivation, and frugal management of its products and manure, is capable not only of maintaining but increasing its own fertility. The great law of divine providence holds in this as in other cases, the more you do, the more you can do; to him that hath shall more be given.

The late Col. Taylor, of Virginia, one of the most distinguished farmers in the country, could at one time scarcely manure five acres of his land; but in eighteen years, he so increased the products of his farm as to be able to manure one hundred and fifty, from the resources of the farm itself! This improvement was chiefly effected by the extended cultivation of Indian corn, and a most careful application of the fodder or offal. Cultivate your farm to the extent of your power of manur-

ing and keeping it clean; and the power of manuring may by judicious management be increased to an almost indefinite extent. Land, which, when it is manured, will not more than pay for the labor of cultivation, should be abandoned.

There is a material distinction between ploughing too much land and ploughing land too much. For garden culture and tap-rooted vegetables, the land cannot be in too fine tilth; but for other crops it is not so important; and the great object should be to preserve all the vegetable matter in the soil, that by fermentation and decomposition it may supply food to the growing plants. The common mode of ploughing green sward, for example, is to tear it in pieces in a rough and careless manner, to leave the sods loose on the surface and then by harrowing to break them fine, and if possible, to bring all the grass and vegetable matter to the top to be exhaled by the sun and air—a more wasteful process cannot be pursued. Mr. Phinney, an intelligent and practical cultivator in Lexington, Mass. had the curiosity to weigh the vegetable matter in a single foot of sward land, taken from a field which had been mown for a number of years, the soil a light loam with a gravelly bottom, and thinly set with red top and herds grass; and found it to contain nine ounces of vegetable matter, consisting of the roots and tops of the grasses; giving at this rate upwards of twelve and a quarter tons to the acre. This itself would be a very considerable manuring; but this by the usual management is entirely lost. It is therefore of the last importance, in breaking up land, to turn the sod as completely as it can be turned, and at a season when there is the greatest quantity of vegetable matter on the surface; to roll it that the air may be excluded, and all the benefit of the decomposition of the vegetable matter retained in the soil; and afterwards to cultivate the crop as far as possible without disturbing the sod. My own authority is of little importance in the case, though I have for several years practised on this system and been satisfied of its utility; but in addition to the testimony of the gentleman referred to, whose opinions are entitled to great respect, you have the experience in its favor of two as eminent farmers as the country has produced, John Lorain of Pennsylvania, and Earl Stimson of New York, who have strongly recommended it.

The depth of ploughing and the number of ploughings to be given to land, are to be determined by circumstances. Ploughing is too deep when it buries all the richer parts of the soil, and brings to the top only a cold, gravelly substance, unless you have manure in such abundance that you can create a new vegetable surface. Frequent ploughing in heavy and tenacious soils is useful with caution only, that it must not be done when the land is wet. Frequent ploughing injures light soils, by bringing all the vegetable matter contained in them to the surface, to be exhausted by the sun and air. Ploughing among growing crops is often useful in time of drought. By some well conducted experiments of John C. Curwen, an accurate observer and intelligent farmer, with glasses contrived for the purpose to ascertain the quantity of evaporation from the land, it was found to amount on the fresh ploughed ground to nine hundred and fifty pounds per hour on the surface of a statute acre; whilst on the ground unbroken, though the glass stood repeatedly for two hours at a time, there was not the least cloud upon it, which proved that no moisture then arose from

* A successful experiment of this kind has been made by Asa T. Newhall, of Lynnfield, where at least ten acres of a sunken and useless bog have been, at a moderate expense, brought into productive English mowing. He has furnished the Committee with ample details on the subject, which will be found appended to their Report on Reclaimed Meadows. An improvement of this sort is likewise to be found on the farm of Isaac Osgood, of Andover, where, by good judgment and labor, meadows of some extent have been redeemed and made productive.

† Albany Ag. Tracts, No. 11. p. 56.

the earth. The evaporation from the ploughed land was found to decrease rapidly after the first and second days, depending on the wind and sun. These experiments were carried on for many months. The evaporation after the most abundant rains was not advanced beyond what the earth afforded on being first turned up.*

Few operations of husbandry among us, are executed in general, in a more slovenly way than ploughing. The half-finished manner in which the sod is turned, the frequent banks, the ragged and uneven ends of the fields, and the utter disregard of all straight lines, show the importance of our ploughing matches, which it is hoped, with the introduction of better constructed ploughs, will eventually correct these habits and introduce neatness, care and regularity, as convenient and useful in saving labor as they are agreeable in the appearance.

3. I proceed to the third operation upon the land, manuring. Manure is the great means of all successful agriculture. My remarks on this as on other topics, must be brief; and will relate to matters which are not generally considered, rather than to those which are familiar.

The first means of enriching the soil is that to which we have referred, that of ploughing in the vegetable matter, already on the surface. Late ploughing in the spring is doubtless preferable to early, by which means you have the advantage of the early growth of the grass. Ploughing in green crops, which were sowed expressly for this purpose, is another mode of enriching land, successfully tried and warmly recommended by some persons, but it is little known among us.† It is objected by many persons, that in this way you return to the land no more than what is taken from it; this would be true, if it were not that plants derive much of their support and growth from the atmosphere. Another object with every farmer, should be his compost heap. Nothing which is susceptible of decay and so of forming manure, should be lost. There are few farms among us which do not contain upon themselves, either by the road-side or in their meadows and swamps, the materials for forming compost manure in great abundance; and farmers will permit me to remind them, that the summer and autumn are the best seasons for making this provision. The saving of liquid manure upon our farms is little attended to. Universally in Flanders, one of the best agricultural countries in Europe, water-tight vaults are constructed under all their stables, and their liquid manure is considered of as much or greater value than their solid manure. Such a practice among us would be of great utility; and by constructing cisterns under our stables to be filled with mud or loam, and by littering our cattle abundantly, this valuable manure which is now lost, might be turned to the best account. But the great means of obtaining manure is from consuming our produce upon the place, in the form of hay or vegetables; where this can be done, and to the extent to which it can be done, we may be sure of the means of increasing the fertility of our farms. Here we come back again to the great circle of reciprocity and mutual connexion and benefit.

Increasing your products will enable you to increase your stock; increasing your stock will increase your manure; increasing your manure will help you to increase your cultivation; increasing your cultivation will increase your products.

This is the golden chain of comfort and wealth which Divine Providence has formed, every link of which is essential to the perfection of the whole. I will remark, in passing, upon the application of manure, it is the opinion of many farmers, that it is better to keep their stable dung until it is a year old and becomes thoroughly rotted; but this practice is condemned by the fullest experiments. — Animal manure cannot be applied to the land in too fresh a state, though it would often be beneficial to mix it with other substances. "By fermentation," says Curwen, a practical farmer already quoted, "dung is reduced to one half its bulk, and its quality is reduced in greater proportion. The evaporation from dung is five times as much as from earth and is equal on the surface of an acre to 5000 pounds per hour, and this is losing its most valuable gases. By making use of dung in its freshest state, the farmer may extend his cropping to one third more land with the same quantity of manure." "The experiments of Arthur Young and other practical and scientific farmers have demonstrated," says Judge Buel, as competent an authority as I can quote, "that animal and vegetable manures, which undergo a complete process of fermentation in the cattle yard, or upon the surface of the ground, lose from thirty to sixty per cent of their fertilizing properties, and if properly spread and buried under the soil, that this loss is prevented, and that a decomposition does immediately take place, even of dry straw, sufficient to answer valuable purposes to the first crop." "Experiments show," says Mr Young, "that every atom of vegetable matter in the soil begins to be decomposed immediately, and to want no previous fermentation to enable it to feed plants." The application of fresh stable manures cannot properly be made to crops of small grain, because they tend to increase too much the haulm or stalks of the plant, and expose it to rot and mildew; and because the seeds of weeds will in this way be carried into the fields. But such manures may be most properly applied to hoed crops, and in a sufficient quantity to prepare the ground without further applications, for a crop of small grain.

II. The second great topic to which I ask your attention is the consumption of the produce upon the farm. This should be the object of every farmer. He should produce as much as he can, and should strive so to use up his produce upon his place as to have the means of increasing its productiveness. This suggests two topics of inquiry: the kind of crops to be raised and the mode of applying them.

I. English hay is considered among us as the great crop. The average yield cannot be rated at more than one ton and a half to the acre; a ton in the opinion of many farmers would be a more accurate estimate. This, at the price which it has borne for several years past, can hardly be considered a valuable crop. It is the crop on which most of our farmers in the neighborhood of large towns, depend for obtaining ready money. But the sale of hay from a farm is subject to serious abatements. For every ton of hay sold from the farm, in order to preserve its fertility, the farmer should return a cord of manure; this, delivered at the farm, cannot be rated at less than two dollars. To this, you are to add the expense of marketing

the hay, which in any situation is at least a dollar. A ton of hay, then, consumed on the farm, is worth three dollars more than if sold from the place, i. e. if it bring only ten dollars in the market, and by any mode of consuming it upon his place the farmer can realize that amount from it at home, he may consider it as better worth thirteen dollars on the farm, than ten dollars carried from the place; or, to state the case differently, it is better for the farmer to use it at home, if he can there make it worth seven dollars per ton to him, than to convey it any considerable distance to market and obtain ten for it. At this rate, however, and I can see no fallacy in the calculation, hay at present prices and yielding one or one and a half ton to the acre is not a profitable crop. Indeed, unless where there are extraordinary resources for obtaining manure, such as on the sea-shore or in the vicinity of bog mud, the sale of hay must be considered as a wasteful kind of husbandry. It is, properly speaking, in many cases, killing the hen that lays the golden egg.

To be concluded next week.

THE SHIFTLSS FARMER.

A writer in the Genesee Farmer thus describes some farmers in the western country, "whose only god is the whiskey bottle, and whose sole study is how to live in the most shiftless manner."

"In describing one or two, it will be a tolerable sample of the whole. In the first place, they all keep an old sow which is suffered to run at large, and of course more than half starved; about three times a year, and that makes up in the aggregate all the time, she has a litter of coach-backed, sharp-nosed, and long-tailed pigs at her heels, always ready the moment a gate is opened, to drive into my yard and commit any depredation that offers. Ask him why he keeps so many hogs, he will tell you, 'to have pork.' The truth is, he never has any pork in his house. He may have for four months in the year a small quantity of hog-meat, made at much expense, with double the amount of corn that would have fattened and kept constantly in the pen, a hog that would have weighed him twenty score. But he thinks he made a saving, because his hogs were in the street, and plundering a miserable existence out of his better neighbors.

"In most cases, for I have had one each side of me, a paltry cur bitch is kept, and of consequence, a nest of ill-blooded, unmannerly whelps are prowling about my back door half the time.—The profits of this last trade I need not detail to you. The ill-bred curs will of course sell for nothing; for who ever knew one of these shiftless beings to keep a dog of anything but scoundrel blood? The same may be said of his chickens, a contemptible, streaked, blue-legged, bug-eating breed, that will scratch up even potato hills faster a common man can plant them; never fit to eat, and the very eggs which they lay, not half full of meat, from their wretched poverty. Not a country sleigh or wagon can be driven into town or stop near them, but their crooked-backed, sharp-horned cows, are forthwith plundering the vehicle of the little straw or hay within it, put there for the convenience of the driver. If perchance a horse belong to the establishment, and often one of those unfortunate broken down animals gets into such hands, he is worried about and beaten over his rattling ribs by the unlucky cubs of boys, that always crib about such a concern. These form

* Curwen's Hints, p. 273.

† The Massachusetts Agricultural Society the last year, gave a premium to William Buckminster, of Framingham, for a successful experiment in turning-in two crops of Buck Wheat to the acre, greatly to the improvement of his land. The account is given in their Repository for 1831, vol. x. number 111.

their domestic stock, and as for their manner of living and their own habitations, it is useless to describe them. The many crazy, rickety shanties, with windows composed of old hats, breeches, bits of paper, and no windows at all, with crevices open to every wind and storm of heaven, show where they stay; and on entering it, the open-mouthed, retreating fire-place, with a few half-rotten sticks, surrounded by a squad of half-naked, mop-headed, shivering children, destitute of the ordinary comforts of a wigwam, will tell you how they live.

"Now, Mr Editor, there is not one of your readers, but is familiar with more or less such cases. And is it any wonder why so many people are criminally poor, whose only god is the whiskey bottle, and whose sole study is how to live in the same shiftless manner? In truth, I have very little charity for such folks."

NEW ENGLAND FARMER.

Boston, Wednesday Evening, May 23, 1832.

BREMEN GEESSE.

The editor of the *Genesee Farmer* requests us to "give a general description of Bremen geese, also the prices at which they could be furnished." We cheerfully comply with his request by giving all the information we are possessed of, respecting these valuable animals.

The following is an account of their first introduction into this country, by Mr James Sisson, of Warren, R. I. contained in a letter to Mr James Deering, republished in the *New England Farmer*, vol. iv, page 44. "In the fall of 1826, I imported from Bremen, (north of Germany,) 3 full blooded perfectly white geese. I have sold their progeny for three successive seasons; the first year at \$15 the pair, the two succeeding years at \$12. Their properties are peculiar; they lay in February; set and hatch with more certainty than common barnyard geese; will weigh nearly and in some instances quite twice the weight; have double the quantity of feathers; never fly; and are all of a beautiful snowy whiteness. I have sold them all over the interior of New York; two or three pairs in Virginia; as many in Baltimore, North Carolina, and Connecticut, and in several towns in the vicinity of Boston. I have one flock half-blooded that weigh on an average, when fatted, thirteen to fifteen pounds; the full blooded weigh twenty pounds."

Mr Sisson has received a premium from the "Rhode Island Society for the encouragement of domestic industry" for the exhibition of geese of this breed. They are said to possess the following advantages over other varieties of their species: They grow to a greater size, may be fattened with less food, and their flesh is of a superior quality.

They can be had at \$6 per pair, of Col. JACQUES, of the Ten Hills Stock Farm, Charlestown, Mass.; of Mr T. WILLIAMS, of Chelsea; and of Mr J. B. RUSSELL, publisher of the *New England Farmer*, at the same price.

POISONOUS ROOTS.

The *Andover Journal* gives a statement of the disastrous consequences resulting from eating the roots of the Water Hemlock, *cicuta virosa*. On the 18th of May, Samuel Allen, of Andover, with two others, in ploughing, met with this root which tasted sweet and pleasant. Allen swallowed a

considerable quantity of it, and the other two followed his example. Allen fell into convulsions, which in less than an hour proved fatal. The others, after taking powerful emetics, administered by Dr Kittredge, escaped.

The root is, at this season of the year, the most virulent poison of all the narcotic vegetables, and ought to be more generally known, lest similar accidents recur. In the early stage of its growth it resembles small potatoes or arichokes, but when advanced branches off in different directions, except the central part, which resembles the parsnip, and is sometimes called the cow parsnip.

BUCKTHORNS FOR LIVE FENCES.

Buckthorns should be set in a single row, from seven to nine inches apart; as soon as they begin to vegetate, they should be headed down to about six inches from the ground, which will cause the hedge to become thick from the bottom. By keeping the ground clean, and occasionally shortening the stray shoots, it will soon make a beautiful and efficient fence. It is an extremely vigorous, free growing plant, and in our opinion superior to any plant we are acquainted with in this country, for making a hedge.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The standing committee on fruits and fruit trees, respectfully propose the following premiums, for the year 1832, viz.

- | | | |
|--|--------------|---------|
| For the best Apples, not less than two dozen, | a premium of | \$4.00. |
| For the best summer Pears, not less than one dozen, | | 4.00. |
| For the best autumn Pears, not less than one dozen, | | 4.00. |
| For the best native Pears, | do. | 4.00. |
| do. Peaches, | do. | 4.00. |
| do. Apricots, | do. | 4.00. |
| do. Nectarines, | do. | 4.00. |
| do. Plums, | do. | 2.00. |
| do. Cherries, do. one quart, | | 2.00. |
| do. Native Cherries, do. | | 2.00. |
| For the best foreign Grapes, cultivated under glass, not less than three clusters, | | 5.00. |
| For the best foreign Grapes cultivated in open ground, not less than three clusters, | | 5.00. |
| For the best foreign Grapes by girdling, not less than three clusters, | | 5.00. |
| For the best native Grapes, not less than three clusters, | | 3.00. |
| For the best seedling Grapes, to be presented by the grower of the same, not less than three clusters, | | 5.00. |
| For the best Gooseberries, not less than one quart, | | 2.00. |
| do. Strawberries, | do. | 2.00. |
| do. Raspberries, | do. | 2.00. |
| For the best Quinces, not less than one dozen, | | 2.00. |
| For the best method of cultivating foreign Grapes in open ground, which shall be superior to any other now practised in this country, with reference to planting, training, shelter, &c. and for a length of the trellis to be exhibited, not less than thirty feet, | | 20.00. |

The committee will be at the hall of the Society, on Saturday of each week, during the season of fruits, from ten to twelve o'clock, to inspect such specimens as may be offered; those fruits for which a premium is claimed, must be so designa-

ted, otherwise they will be considered as offered for exhibition only. Per order.

E. VOSE, Chairman.

The standing committee on ornamental trees, shrubs, flowers, and green-houses, beg leave respectfully to submit the following list of premiums for the year 1832:

For the most successful cultivation of the American Holly, the number of plants must not be less than four, which have been transplanted at least three years, \$10.00.

For the four best flowering plants of the Magnolia Glauca, which have been transplanted at least three years, 10.00.

For the most successful cultivation of the Rhododendron Maximum, the number of plants not less than four, which have been transplanted three years, 5.00.

For the five best plants of the Kalmia Latifolia, which have been transplanted not less than three years, 2.00.

For the best seedling plants of either of the above, not less than ten in number, of three years growth and upwards, 5.00.

For the five best variety of Chinese Chrysanthemums, in pots, 5.00.

For the best half dozen of Tulips, 4.00.

For the best half dozen of Hyacinths, 3.00.

For the best half dozen of Ranunculuses, 4.00.

For the best pot of Auricles, 3.00.

For the best pot of Anemones, 3.00.

For the best pot of Pinks, 3.00.

For the best pot of Carnations, 4.00.

For the best half dozen of cultivated native flowers, 2.00.

For the finest Roses of five different varieties, 5.00.

For the finest Dahlias, five varieties, 5.00.

For the finest specimens of Camellia Japonica, 5.00.

For the best varieties of Paeonies, 4.00.

Discretionary premiums will be awarded by the committee, on flowers not enumerated above.

Per order.

R. L. EMMONS, Chairman.

N. B.—The committee will attend at the Hall on Saturday of this and the next week, to examine such Tulips as may be offered for premiums.

May 23.

Cumberland Agricultural and Horticultural Society.—This Society was formed by the Legislature of Maine, at their last session. By the act, Joshua Wingate, Jr.; John Mussey; Henry Hisey; Seth Clark; Ebenezer D. Woodford; John Perley; Thomas Seal; Tappan Robie; Ebenezer Webster, Jr.; Nathaniel Warren; Moses Quimby; and Enoch Prebble; together with their associates, are constituted a body, corporate and politic, by the above title, with the powers and privileges usually granted in such cases.

Agriculture.—The farming business, in this neighborhood, has undergone a great change within the last twenty years. Positive idleness, here, has no excuse. Scarcely any man is too poor to get land and seed;—if he is willing to work he may live comfortably; and if contented, he will live happily.—*Portsmouth (N. H.) Journal.*

A spoonful of horse-radish put into a pan of milk, will preserve it sweet for several days.

Seed Corn, etc.

FOR sale at the New England Seed Store, No. 50½ North Market Street, several kinds of Seed Corn in ears, the finest varieties cultivated in New England, 8, 12, and 16 rowed.

Also, a few seeds of the Early Lemon Squash, from the western part of this State, which is considered one of the finest varieties of Summer Squash cultivated, being a week earlier than the Scroop or Warded Squashes, and of much superior flavor, drier, and somewhat resembling the Canada Squash in taste; producing abundantly till killed by frost. Price 12½ cents per paper.

May 23.

Straw and Palm-leaf Splitting Machine.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Gould's Improved Palm-leaf and Straw Splitting Machine, calculated for fine and coarse straw.

Also, Cast Steel Seythes of superior quality, warranted genuine.

May 23.

Barefoot.

THE celebrated English Horse Barefoot will return from New York to the Brighton stable about the latter end of June. Barefoot has proved one of the most successful riders of his day, at York, Doncaster, Newmarket, Ascott, &c., and his pedigree exhibits the best blood known.

May 23.

Willis' Improved Brass Syringes.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Willis' Improved Brass Syringes for using Johnson's solution as a remedy against mildew on grapes, destruction of vines from bugs and flies, and insects on trees. See New England Farmer, vol. 8, p. 5.

May 23.

Quarterly Review.

THE 934 No. of this work has just been republished by LILLY & WATTS, and contains articles on the following subjects:—Life and Writings of Hesiod; Domestic Manners of the Americans; Poetry by Mary Colclough; Lyell's Geology, vol. 2; Changes in the organic world now in progress; Naval and Military Memoirs; Lord Munster's Campaign of 1809; Capt. Hall's Autobiography, second series; Punishment of Death; Wakefield on Newgate; English Fox Hunting; Milton Mowbray; Francis the First, by Miss Kemble; The Revolution of 1640 and 1630; True Causes of the Riot at Bristol and Nottingham.

Republished quarterly from the London edition, at \$5 per annum.

May 23.

The Art of Being Happy.

JUST published by CARTER & HENDREE, the Art of Being Happy: from the French of D'IZ. 'Sur L'Art D'Être Heureux'; in a series of letters from a father to his children; with observations and comments. By Timothy Flint.

May 23.

Young Barefoot.

THIS very handsome Colt, just three years old, was the first colt ever got in America, by the truly celebrated full blood horse Barefoot, sent from England by Sir Isaac Coffin, was raised by John Prince, Esq. at Jamaica Plain, near Boston, out of a large and superior mare of American breed. He is a beautiful dark bay, with black mane and tail, and is considered an animal of great promise. He will be kept for the usual season at the stable in Brighton, where Barefoot and Cleveland have heretofore stood.

TERMS.—\$12 — to be paid before the mare is taken away; and should the mare not prove to be in foal, the money will be returned. Pasturage can be furnished for mares, they to be, however, at the risk of the owners.

JOHN PARKINSON.

Brighton, May 16, 1832.

Gentleman's Pocket-barrier.

THE Gentleman's Pocket-barrier, showing how to use your Horse on a journey, and what remedies are proper for common accidents that may happen on the road. By F. TUFFNELL, Veterinary Surgeon. The remedies this little treat prescribes are simple and easily obtained, and never fail of a cure where the disorder is curable; therefore no man who values his horse should presume to travel without it. For sale by J. B. RUSSELL at the New England Seed Store, North Market Street. Price 15 cents.

May 9.

Garden Compound.

For the preservation of Peach and other Fruit Trees.

This is thought to be an infallible preservative of the Peach, Plum, and other fruit trees, from the destructive worms and insects which in the spring attack and destroy the vitality of the tree. By a proper application of the compound, insects will not deposit their eggs in the bark. This article will not harden in the sun, but remain liquid for several months, in this respect it is vastly superior to any other composition in use.

Prepared and sold, wholesale and retail, by JOHN M. IVES, Salem; and JOHN B. RUSSELL, No. 50½ North Market Street, Boston.

Price, 33 cents per bottle, with directions for its use.

May 16, 1832.

Davis' Improved Dirt Shovel.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Davis' Improved Dirt Shovel for excavating or leveling dirt.

This may certify that I have been using Shadrach Davis, Jr.'s patented Scraper, and am fully satisfied that it is much better than any other scraper of the kind, for digging and clearing cellars, that I have before used or seen. Fairhaven, July 12, 1831.

ANSEL WHITE.

This may certify that I have used Shadrach Davis, Jr.'s patent Scraper on the roads in this town, and find it a machine superior to any other I ever used before, for removing earth; and would hereby recommend it to public patronage.

LEVI SHAW.

New Bedford, Aug. 29, 1831.

Conqueror.

THE entire horse Conqueror will stand the ensuing season at the Ten Hills Stock farm in Charlestown, two and a half miles from Boston, at ten dollars, to insure a mare in foal, secured by a note at ten months, to be valid and payable in case the mare proves to have been in foal, and one dollar to the groom at the time of covering.

Conqueror was bred near Montreal (Canada) foaled in May, 1825, and sired by a noted Normandy horse out of blood Marc—he is rising 15 hands high and remarkably well grown, combining great power, generous spirits, good action, very docile in his temper, and of that hardy color, iron gray. This horse has taken three premiums in Canada, as the best horse in that country. He has probably as much, or more than any other horse now living, of the strains of blood so well known in N. E. by the name of "the Morgan breed"—From the best accounts the original Morgan horse was made up of the same strains of blood as Conqueror. Conqueror has proved a sure foal-getter, and is recommended to the public by

SAML. JAKES.

The full blood horse Sportsman also stands as above—for pedigree see late Nos. of the Farmer.

May 16, 1832.

BRIGHTON MARKET.—MONDAY, MAY 21, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 192 Beef Cattle, 5 pairs Working Oxen, 8 Cows and Calves, 61 Sheep and Lambs.

PRICES. Beef Cattle.—Supply short, consequently prices were much higher. Beef Cattle today were sold higher (considering the quality) than we have noticed since we reported the market. We quote extra at \$7, prime at 6.50 a 6.75, good at 6 a 6.25, thin at 5.50 a 6.

Working Oxen.—No sales were noticed.

Cows and Calves.—We noticed sales at \$25, 26, 28 and 30.

Sheep.—We did not learn the price of the Sheep. The Lambs were taken at \$2.25 a 2.50.

Swine.—We noticed several lots of barrows taken at 6 cents; a lot of about 100 at 6 c for barrows and 5 c for sows; at retail, 6 c for sows and 7 c for barrows.

New York Cattle Market, May 18 — 450 head in market this week, generally fair cattle, all quick at prices averaging full as much as last week, the fair average being \$7. We quote \$6 a 8, not hearing of any sales over 8. Sheep—sales are made very quick of all that comes in, from 2.50 a 6; Lambs 2.50 a 4. Live hogs—what few come in sell quick from 4 a 4.50.—Daily Ad.

In the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

Pickering's Tree or Caterpillar Brushes.

For sale at the Agricultural Warehouse, No. 50½ North Market Street, Pickering's Improved Tree Brushes.—This article, (which is likely to be in greater demand this season, than for many previous years,) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use.

FANUELL HALL VEGETABLE MARKET.—Radishes 6 cents a bunch; Asparagus 8 cents; Lettuce 5 cents; new Onions 6 cents for a bunch of half a dozen roots; old Onions 2 dollars per bushel; Potatoes 62 to 75 cents per bushel; Rhubarb stalks 8 cents per pound; Cranberries, best quality, 3 dollars per bushel; Sea Kale, but little in the market, 12½ cents a root; long Cucumbers forced, 25 cents each. The stall of Mr Wm. E. Otis is supplied with fine Squashes from the West Indies, at 3 cents per pound.

Wool.—Our wool market is in a very inactive state, and prices have been declining for some months past. As there is an ample supply in the country, and shearing will go off in hand, it is generally expected that prices will go still lower, after the next dip comes into market; it is probable that prices will be at least 10 per cent lower for the finest kinds, and from 15 to 20 per cent for the lowest.

Miscellany.

From the New England Magazine, for April.

THE COMET.

The Comet! he is on his way,
And singing as he flies;
The wizzing planets shrink before
The sceptre of the skies.
Ah, well may regal orbs burn blue,
And satellites turn pale,—
Ten million cubic miles of head!
Ten billion leagues of tail!

On, on by whistling spheres of light,
He flashes and he flames;
He turns not to the left or right,
He asks them not their names;
One spurn from his demoniac heel,—
Away, away they fly,
Where darkness might be bottled up
And sold for "Tyrian dye."

And what will happen to the land,
And happen to the sea,
If, in the bearded devil's path,
Our earth shall chance to be?
Full hot and high the sea should boil,
Full red the forests gleam—
Methought I saw and heard it all
In a dyspeptic dream.

I saw a tutor take his tube
The comet's course to spy;
I heard a scream; the gathered rays
Had stewed the tutor's eye;
I looked—his curious organ rolled
Like a long perished clam;
I listened—all I heard him say
Was "parallax" and "d—mn."

I saw a poet dip a scroll
Each moment in a tub;
I read upon the warping back
"The dream of Beelzebub;"
He could not see his verses burn
Although his brain was fried;
And ever and anon he bent
To wet them as they dried.

I saw a pillow and a cur—
He silently drew near,
And snatched from off the blackened frost,
His master's broiling ear.
I saw a beggar and a wolf,
Each watch the other's eye;
Each fainted for his morning meal,
And both were loath to die.

I saw a roasting pullet brood
Upon a baking egg;
I saw a cripple scorch his hands
Extinguishing his leg.
I saw nine geese upon the wing
Towards the frozen pole,
And every mother's gosling fell
Crisped to a crackling coal.

Strange sights! strange sounds! O ghastly dream!
Its memory haunts me still;
The streaming sea, the crimson glare,
That wreathed each wooded hill.
Stranger! if o'er thy slumbering couch
Such fearful visions sweep,
Spare, spare, O spare thine evening meal,
And sweet shall be thy sleep. O. W. B.

From the Journal of Health.

INJUDICIOUS TREATMENT OF THE SICK.

Nothing can be more ridiculous, more detrimental, or more likely to prove fatal, than the manner in which officious friends endeavor to figure the sick, by cramming them with what they foolishly call "light nourishing food." An individual no sooner complains of feeling unwell or is obliged to keep his bed, than it is, what nice thing shall I prepare for you? what food do you think you would like? as if the disorders were to be actually removed by tickling the palate, instead of, as in general, by observing for a short time, entire abstinence. Even during health, our greatest enemy is our stomach; we cram it to a surfeit, and we are, in consequence, made to feel the effects of our imprudence, by the derangement of the system—and when we are no longer inclined to continue the error, when nature itself revolts at our absurd procedure, some officious friend readily steps forward to aid us in the work of folly. It is in this manner, also, that children are often made to suffer unnecessarily; they are petted and stuffed with food or with sweetmeats and other trash, by their parents and nurses, who adopt that method of proving their affection. "I have not the heart," exclaims the tender mother, "to refuse the child food when it asks me." In the majority of cases, by this course, the child is made sick, or its stomach is reduced to a condition in which it refuses every kind of plain and wholesome aliment; and though the cause of the malady is fully explained, and the necessity for rigid abstinence or for a proper selection of food is made manifest, yet still the vile practice of cramming it with all kinds of unwholesome trash, and at all hours of the day, is persisted in. If the child happens to have an uncommonly vigorous constitution, and is not entirely deprived of exercise, it may perchance recover, even under a treatment of this kind; if not, the result can easily be imagined. And yet this is called attention, care, anxiety, parental fondness, and a variety of other misplaced appellations. It is in truth, cruelty, folly,—nay, madness. Every reasonable, every feeling parent will avoid carefully the imprudent indulgence in so selfish a gratification, and the unnecessary and cruel experiments upon the health of their helpless offspring.

HINDOO SHOPKEEPING.

Moderation seems to be the order of the day in India. This may be illustrated by what occurs every day in Calcutta. Two, three or four men generally rent one shop, in which they have their different wares. Each shopkeeper has his own lock and key, and when the business of the day is over, every man puts his own lock on the door. It is no unusual thing in going through the bazaar early in the morning, to see four or five locks hanging to one door. In the morning, when one man comes, he takes off his lock and sits down on the steps and waits for the others. Perhaps in an hour, another man may come and take off his lock and sit down with the first; and thus they do till the last man comes, and then the door is opened and they go to work. This may be at twelve or two o'clock. If anything happens to one man that he is prevented from coming, the shop is not opened for the day. The others put on their locks again, and go home and wait till the next day. The one who may have been delayed will not trust

the others with his key. So little confidence have they in one another, and so wholly indifferent are they as to the value of time.—*Jour. of Mr Ramsey.*

Progress of Temperance among United States Seamen.—An extract of a letter from Com. Bidle, (in command of the Mediterranean squadron,) to the Secretary of the Navy, is published in the *Globe*, in which it is stated that the number of persons in the squadron, exclusive of commissioned and warrant officers, is eleven hundred and seven; and that of this number, eight hundred and nineteen have stopped their allowance of spirits, receiving money for it under the general order of the 15th of June last. To encourage these men to persevere, and to entice others to follow their example, the grog money is paid regularly and at short periods. On board the sloop of war John Adams, one of the squadron, not a man draws his allowance of spirits.

Mormonism.—The Warren, Ohio, News Letter states that some persons, disguised, lately entered the room where two leaders of the Mormonite fanatics slept, and tarred and feathered them.

[These Mormonites are no doubt very ignorant and fanatical, but those who applied the tar and feathers are much greater fanatics.]—*Boston Cen.*

A member of this singular sect, ("Gabriel Crane, Son of Righteousness, Witness, and Organ of the Lord,") has made his appearance in Philadelphia, and issued his "denunciations, and anathemas, and woes," against that city and Washington.

A Rochester paper states, that on the 7th ult. several members of the Baptist church in Mendon, Monroe county, made a public profession of *Mormonism*, and were baptised. The elder who officiated, stated to the assembly that he should not die; that he should be translated to Heaven, like Elijah; that he had power to raise the dead; that in eighteen months the Mormon creed will be the only religion extant, and that all sinners will then be destroyed.

New American Gardener.—sixth edition.

This day published by J. B. Russell and Carter & Hendee:

The New American Gardener, a treatise on the culture of Fruits, Vegetables, Flowers, Grape Vines, Strawberries, Asparagus, &c. &c. By T. G. Fessenden, assisted by several gentlemen. *Third edition.* Price \$1 00.—This we think may be considered the most popular and practical work on Gardening extant. March 23.

Morus Multicaulis.

FOR Sale at the Seed store connected with the New England Farmer, 503 North Market street:

A few very fine and vigorous plants of the celebrated Chinese Mulberry, so valuable for Silk worms, originally from the elevated regions of China—and introduced into France from the Philippine Islands a few years since. These plants now offered for sale, have been received direct this spring from Paris, and were selected by Mons. Andre Michaux, author of the North American Sylva, and are much larger than any that have heretofore been offered here. Packed in moss separately for transportation,—price 1 dollar each. A particular account of this tree by Gen. Deauborn, will be found in the New England Farmer, vol. ix. page 28. April 11.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[No paper will be sent to a distance without payment being made in advance.]

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

DESTRUCTION OF FRUIT TREES.

The extraordinary destruction of the last year's wood in fruit trees, and the probable causes of it.

To the Publishing Committee of the Massachusetts Society for promoting Agriculture.

GENTLEMEN—I shall assume as a fact, founded on my own experience and the information derived from various extensive inquiries, that the last winter has most injuriously, possibly destructively, affected every variety of fruit trees. The extent of the evil cannot be accurately settled until we have more information than we possess at present—neither can the extent of the injury be ascertained even where we have the most perfect means of examination, until we shall know with what vigor nature may exert itself to restore or repair its losses. I perfectly recollect, that about forty years since, there occurred a frost late in May, which wholly destroyed the young shoots of every species of fruit and forest trees. They recovered from that loss in one or two years. But the case differed in many very material respects from the present. The injury in that case only extended to the young and green shoots of the existing year, but it did not affect the last year's shoots; this is a very important distinction. The last year's shoots were not deprived of their functions; the numerous latent buds, which were not developed, instantly shot forth and supplied the place of those which were destroyed. In the present case, the whole of the last year's wood, all that part of the tree which was designed to extend its growth, is wholly destroyed in very many if not in a majority of cases. The vegetative or conservative power has been destroyed in its natural source; it is precisely as if you had pruned back all the growth of the last year. I have no doubt that the root and the stock still retain their powers of renewal, and that the trees will send forth new and vigorous shoots from the older limbs. It is interesting to the cultivator to inquire, what will be the probable effect of this new and extraordinary demand on the powers of the plant. I mean to state only what appears to my mind to be its probable effects.

As to plants which are herbaceous and perennial, and which do not shed their leaves, the effects of destruction or excision of the last year's growth are very trifling. To some of them, such as the geranium, it seems to be questionable whether any serious injury results from such a loss. It is also true, that many woody plants which are deciduous, possess a power of reproduction which renders them almost insensible to the effects of the constant and repeated deprivation of the last year's growth. It is from this law or principle, that the plants which we select for hedges, will endure for an almost unlimited period the barbarous clippings and privations to which, for use or ornament, they are annually subjected—nay, more, they seem even to thrive the better under this treatment. This, however, is only deceptive. The plant does in fact suffer as much as its more noble and more useful congeners—as the finest fruit tree. But as its use is of a different character; as we value it not for its fruit, but for ornament and protection against cattle, we

disregard the mutilation of its natural powers; we treat it as the Italian connoisseur treats his cunuch, we deprive it of its power of reproduction, in order to gratify our taste; but we as truly and effectually mar the designs of nature in the one case as in the other. Let me exemplify this by a simple case. The white thorn of Great Britain is kept as a dwarf; it rarely flowers; it is a feeble, helpless plant. I have one which was left in my meadow by an English gentleman, who owned the estate I now possess, sixty-five years since; it stands alone; no rude hand has disturbed it; it is as large as a pear tree, and flowers and ripens a bushel of fruit every year. It is man, who has dwarfed it for his own purposes, as he has improved the button pear to the Beurré and St Michael, by his attention to it; as he has raised the black cattle of the north of Europe, and the wild sheep of the steppes of Asia, to the noble short-horned bull, and the Saxony buck. It is not distinctly understood, except in China, where they raise the oak, the noblest oaks, to eighteen inches in height, that it is as much in the power of man to degrade as to improve that vast realm of nature, over which God has given him the absolute dominion.

To return to our principal inquiry, after an illustration which some may consider a rhapsody, but which, I hope, more reflecting minds may view in a very different light, as exhibiting some sound and philosophical views of a subject which has as yet received no very definite development. What will probably be the effect of the late destruction of the last year's growth of fruit trees? Will it not, at least, the prostration of fruit? May it not result in permanent disease? Will it not be the policy of those who are younger than I am, to set about planting new trees? Why should they be discouraged? If for two hundred years no such calamity has occurred, why should they dread its recurrence? No. It would be as unmanly as it would be irrational, to despond.—Pears, apples, plums and peaches, will decorate our tables ten years hence in as great a profusion as now. Those who escape the evil will obtain greater profits. The nursery-men, though immediate sufferers, will be greater gainers in the end. After all, we may be deceived as to the extent of our losses. Nature is more powerful than we are aware of and she may restore what now seems to be irreparable.

To what cause is this extensive destruction to be attributed? Most certainly not to the extremity of the cold. The trees affected are subjected every winter, in Holland, Germany and Russia, to a lower state of the thermometer. To what, then, is it to be ascribed? It is painful to be obliged to offend our national pride, by saying, as we believe to be the fact, that it is owing to the variations of our climate—to our proximity to the gulf-stream, which, within twelve hours, throws upon us the temperature of spring in the midst of winter. Am I singular in this opinion? By no means. Writers in this country and in Europe, of great intelligence, have long since attributed the destruction of fruit trees, not to the cold, but to the occasional heat of winter. I have many important facts in my possession, to prove this to be true. I will select one among one hundred: The ivy of Great

The following should have appeared sooner in our columns, but was by accident mislaid.

DESTRUCTION OF FRUIT TREES.

MR L'ESSENDEN—The effect produced upon my fruit trees by the past season, I regret to find, is very similar to that mentioned by your other correspondents. My peach trees, of which I had about fifty, varying from three to fifteen years of age, are all killed, with the exception of about half a dozen small trees which grew in the shade of large ones. My pear trees, all of them small and thrifty, appear to be about one fourth part dead, the remainder apparently not much injured.

I find my young apple trees, (some of which were just beginning to bear,) which were situated on land that had been tilled for several years past, have uniformly suffered severely; I fear they are all killed. While those situated on grass ground, in a tough green sward, and which were no less thrifty than the others, have mostly escaped.

But what is no less remarkable and for which I shall not pretend to account, is, that my tender ornamental trees and flowering shrubs have suffered less by the severity of the winter, than I have before known them for several years. A small umbrella tree, (*Magnolia tripetala*), which for several seasons previous to the last the most prominent buds have been winter-killed, has withstood the last uninjured. This tree is in a cold soil and in a very bleak place. In the same exposure, two year old plants of the *Althea frutex*, which by reason of the abruptness of the winter were left without protection, are apparently uninjured.*

In common, I presume, with some other of your readers, I should like to be informed to what extent those flourishing nurseries in the vicinity of Boston, have suffered from the severity of the past extraordinary season. I hope we shall not be under the necessity of sending to the South to replenish our gardens.

Having somewhere seen the statement, that *thin sheet lead* placed around the trunks of trees was a sure protection against the ravages of the field mouse, and having a few apple trees in an exposed situation, I was induced in the fall of 1830 to make trial of it. Through forgetfulness, the lead was suffered to remain on the trees till haying-time; when upon removing it, I found the bark of the trees, under the lead, to be in a damp, cold and unhealthy situation; all of them had evidently received some injury in consequence, and one of them, a fine thorny tree, was entirely ruined. No doubt the sheet lead is an effectual protection, but it should be removed before the trees begin to vegetate. Truly, yours, P. WARE.

Franklin, April 16, 1832.

To ripen fruit.—To lovers of gardening it may not be unacceptable to know, that painting the walls black greatly forwards the ripening of fruit.

* Our correspondent is referred to a note to a communication, by "Agricola," published in the New England Farmer, page 318, col. 2, of the current volume, for what appears to us to be a solution of this mystery.

Britain, a vivacious plant, will stand, *has stood* this very winter, on the north side of an edifice, while on the south it uniformly perishes to the ground.

JOHN LOWELL.

Boston, March 20, 1832.

From the Transactions of the American Philosophical Society.

DESCRIPTION OF A METHOD

Of cultivating Peach Trees, with a view to prevent their premature decay; confirmed by the experience of fortyfive years, in Delaware State and the western parts of Pennsylvania. By Thomas Costler, Esq., of Bedford County, Penn.

The death of young peach trees is principally owing to planting, transplanting, and pruning the same stock, which occasions it to be open and tender, with a rough bark; in consequence of which, insects lodge and breed in it and birds search after them, whereby wounds are made, the gum exudes, and in a few years the tree is useless. To prevent this, transplant your trees as young as possible, if in the kernel it will be best, as there will then be no check of growth. Plant them sixteen feet apart. Plough and harrow between them for two years without regard to wounding them, but avoid tearing them up by the roots. In the month of March or April, in the third year after transplanting, cut them all off by the ground, plough and harrow among them as before, but with great care to avoid wounding or tearing them. Suffer all the sprouts or scions to grow, even if they should amount to half a dozen or more; they become bearing trees almost instantaneously, on account of the strength of the root. Allow no animals but hogs to enter your orchard, for fear of their wounding the shoots; as a substance drains away through the least wound, which is essential to the health of the tree and the good quality of the fruit.

If the old stock is cut away the third year after transplanting, no more shoots will come to maturity than the old stump can support and nourish; the remainder will die before they bear fruit, and may be cut away, taking care not to wound any other stock. The sprouts, when loaded with fruit, will bend and rest on the ground in every direction for many years; all of them being rooted as if they had been planted, their stocks remaining tough and their bark smooth, for twenty years and upwards. If any of the sprouts from the old stump should happen to split off and die, cut them away, they will be supplied from the ground by others, so that you may have trees from the same for one hundred years, as I believe. I have now trees from one to thirtysix years old, all from the same stump. Young trees, formed in this manner, will bear fruit the second year; but this fruit will not ripen so early as the fruit on the older trees from the same stump. Three years after the trees are cut off, the shoots will be sufficiently large and bushy to shade the ground so as to prevent the growth of grass, that might injure the trees; therefore ploughing will be useless, and may be injurious by wounding them.

It is also unnecessary to manure peach trees, as the fruit of manured trees is always smaller and inferior to that of trees which are not manured. By manuring, you make the peach trees larger and apparently more flourishing, but their fruit will be of a bad kind, looking as green as the leaves, even when ripe, and later than that of trees which have not been manured. Peach trees never require a ch soil; the poorer the soil the better the fruit;

a middling soil produces the most bountiful crop. The highest ground is the best for peach trees, and the north side of hills is most desirable, as it retards vegetation, and prevents the destructive effects of late frosts which occur in the month of April, in Pennsylvania. Convinced by long experience, of the truth of these observations, the author wishes they may be published for public benefit, and has been informed, that Col. Luther Martin and another gentleman, in the lower part of Maryland, have adopted a similar plan with great advantage.

From the Journal of Health.

FLOWERS.

The interest which flowers have excited in the breast of man, from the earliest ages to the present day, has never been confined to any particular class of society or quarter of the globe. Nature seems to have distributed them over the whole world, to serve as a medicine to the mind, to give cheerfulness to the earth, and to furnish agreeable sensations to its inhabitants. The savage of the forest, in the joy of his heart, binds his brow with the native flowers of the woods, whilst a taste for their cultivation increases in every country in proportion as the blessings of civilization extend.—From the humblest cottage inclosure to the most extensive park and grounds, nothing more conspicuously bespeaks the good taste of the possessor, than a well cultivated flower garden; and it may very generally be remarked, that when we behold a humble tenement surrounded with ornamental plants, the possessor is a man of correct habits and possesses domestic comforts; whilst, on the contrary, a neglected, weed-grown garden, or its total absence, marks the indolence and unhappy state of those who have been thus neglectful of Flora's favors.

Of all luxurious indulgences, that of flowers is the most innocent. It is productive not only of rational gratification, but of many advantages of a permanent character. Love for a garden has a powerful influence in attracting men to their homes; and on this account, every encouragement given to increase a taste for ornamental gardening is an additional security for domestic comfort and happiness. It is likewise a recreation which conduces materially to health, promotes civilization, and softens the manners and tempers of men. It creates a love for the study of nature, which leads to a contemplation of the mysterious wonders that are displayed in the vegetable world around us, and which cannot be investigated without inclining the mind towards a just estimate of religion, and a knowledge of the narrow limits of our intelligence, when compared with the incomprehensible power of the Creator.

Flowers are, of all embellishments, the most beautiful; and of all created beings, man alone seems capable of deriving enjoyment from them. The love for them commences with infancy, remains the delight of youth, increases with our years, and becomes the quiet amusement of our declining days. The infant can no sooner walk than its first employment is to plant a flower in the earth, removing it ten times in a hour to wherever the sun seems to shine most favorably. The school boy, in the care of his little plot of ground, is relieved of his studies, and loses the anxious thoughts of the home he has left. In manhood our attention is generally demanded by more ac-

tive duties, or by more imperious and perhaps less innocent occupations; but as age obliges us to retire from public life, the love of flowers and the delights of a garden, return to soothe the later period of our life.

To most persons, gardening affords delight as an easy and agreeable occupation; and the flowers they so fondly rear, are cherished from the gratification they afford to the organs of sight and of smell; but to the close observer of nature and the botanist, beauties are unfolded and wonders displayed, that cannot be detected by the careless attention bestowed upon them by the multitude. In their growth, from the first tendershoots which rise from the earth, through all the changes which they undergo to the period of their utmost perfection, he beholds the wonderful works of creative power; he views the bud as it swells, and looks into the expanded blossom, delights in its rich tints and fragrant smell, but, above all, he feels a charm in contemplating movements and regulations before which all the combined ingenuity of man dwindles into nothingness.

FOR THE NEW ENGLAND FARMER.

REMOVING FLOWERS.

MR EDITOR—In your publication for May 2, a plan is given for removing choice flowers from one pot to another with ease; and you may, perhaps, admit into your paper a plan for a corresponding object. It is contained in a

MEMORANDUM

As to the preference of *wicker baskets*, as compared with *pots*, (and it may be added, as compared with *bases*), for the conveyance of young plants, in certain cases, from place to place; employed by the Hon. Joseph Robley, president and commander in chief on the island of Tobago.* The memorandum is as follows:—August, 1801.

Mr Robley stated, in favor of wicker baskets, that they are light and easily removed from place to place; and that when plants are to be set out where they are to remain, the plants need not be shifted from the baskets; but, if suffered to continue in them, the baskets will soon rot in the ground; and in the meantime, the roots of the plants will extend themselves into the adjacent soil, without impediment.

Yours, with respect,

A. B.

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS HORTICULTURAL SOCIETY.

The standing committee on the products of the Kitchen Garden, respectfully submit the following list of Premiums for the year 1832:

Asparagus, two largest and best bunches,	\$4.00.
Beets, half a dozen, the best Blood,	3.00.
Beans, Lima, two quarts, the earliest and best,	4.00.
Cucumbers, best pair raised in open ground on or before the 2d Saturday in July,	3.00.
Carrots, half a dozen the best long orange,	3.00.
Celery, two roots the earliest and best,	4.00.
Cauliflower, two best heads,	4.00.
Corn, sweet, one dozen the earliest and best,	3.00.
Lettuce, two best heads,	2.00.
Melons, water, the largest and best,	3.00.
Melons, musk, the best and finest flavored,	3.00.

* Mr Robley obtained a gold medal for his plantation of bread-fruit trees.

Peas, one peck, the earliest and best, 4.00.
 Peas, one peck, with reference to quality and yield, 4.00.
 Potatoes, one peck, the ripest and best on or before the first Saturday in July, 4.00.
 Savoy Cabbage, two best heads, 3.00.
 Squash, crooked neck, two of the largest and best, 4.00.
 Squash, Canada, two of the earliest and best, 4.00.
 Turnips, one dozen of the earliest and best for the table, 2.00.
 Turnips, one dozen of the best for stock, 2.00.
 The discretionary premiums will be awarded by the committee, on any new or fine vegetable not named above.

The committee will generally be at the hall of the Society on Saturday, during the season of vegetables, from 11 to 12 o'clock, A. M., to inspect such specimens as may be offered for a premium. A particular description of the method of planting and growing, will be required of those who send in vegetables for a premium.

DANIEL CHANDLER,

May 24, 1832.

Chairman.

The flower and vegetable seeds presented to the Society by the Hon. Thomas H. Perkins, M. C. Perry, Esq., William Shaler and James Om-brosi, Esq's., together with some grape cuttings sent from Malaga and presented by Mr William Worthington, were distributed among the members of the Society. Mr Thomas Mason exhibited some fine tulips for premium.

Saturday, May 26, 1832.

FOR THE NEW ENGLAND FARMER.

PLANTING FRUIT SEEDS, STONES, &c.

MR FESSENDEN—In a communication in answer to an inquiry respecting "the proper course to pursue in planting fruit seeds and stones," published in your paper, No. 21, of the current volume, I attributed the failure of their vegetation, mentioned by your correspondent, to the deficiency of the necessary action of frost in the preceding winter; I considered the suspension as the loss only of one year's growth. This, in my ground, is demonstrated by the abundant germination of seeds, which lay dormant through the last season. I have renewed my experiment, as proposed, of planting them protected from frost, but without success.

In my nursery and fruit grounds, I have shared in the general calamity, but in a much lighter degree than has been felt or predicted by others. The indication of total destruction was not to me so manifest in but few of my bearing trees, as to justify their immediate extirpation. Some, however, of my large and most vigorous apple trees, which did not excite early apprehension, are now found enveloped in their shroud.

The action of an early and severe frost on the redundant fluid, distended the body so far as to open fissures in the bark for its corresponding enlargement. As the wood contracted, the bark was left detached, and the trees consequently lost.—My young trees are apparently as healthy as usual. My pear trees indicate the severest suffering; many, thirty years in bearing, are in fact past recovery; a larger proportion, pronounced equally hopeless by scientific inspectors, are exhibiting flattering symptoms of convalescence. In many cases, should my trees not survive, it may be a

question whether their destruction is more to be imputed to the season, than to the experiments of the curious, to test their vitality. Many in my nursery, recently grafted or budded, have perished at their union with the stock. These I have grafted as far below the injury as practicable.

Young peach trees come out much as usual; more indeed are dead, and the buds inserted last season more sparingly vegetate. Those in bearing, generally from eight to ten years old, have a sickly cast, but not more so than at the last season. The young shoots in their last year's progress were gummy and spotted, and their extremities decayed. Having my ground too much crowded, I have taken out a large proportion of them, giving more liberal space to the remainder, which I have headed down. Topping the branches, particularly in this tree, I have found beneficial in restoring health and vigor, more especially after a full bearing. This process will occasion no loss of fruit the present season, and will probably be the means of an abundance the next, if the tree is not past recovery. It will be a test of its value in its capacity to renovate itself; should it continue to exhibit symptoms of disease, the next application should be at its root.

I have found it a good practice with all trees when the circulation to the extremities appears to be impeded, to lead them down to some healthy point, a few inches above a forked branch, if the place be favorable; by this method a better top is reproduced and the amputation much less injurious. If this course was more generally practised in our orchards, with prior judicious treatment on the first appearance of decay, instead of their sickly appearance and early exit, they would continue to yield better and more abundant fruit; they would also retain their vigor and beauty to a good old age; our apple orchards would then become an ornament instead of what they now are, the most unsightly blotch on most of our farms, exhibiting the appearance of feeble exotics, instead of the healthy character of native productions.

Respectfully, yours, O. FISKE.

Worcester, May 28, 1832.

From the New York Farmer.

SMALL BEER.

MR EDITOR—I noticed in your paper, several communications giving directions for making small beer for family use; none of which met my views of the subject. The following, I know from experience, will furnish a very pleasant beverage:—Take a five gallon keg; take out one head, and insert a small brass cock, about three inches above the lower head. In this keg put three quarts of wheat, rye, or corn meal, ground rather coarse, as for stilling; on this pour about three quarts of boiling water; add a pound of honey, sugar, or molasses; one tea-cup full of ginger or ground alspice; stir all intimately together, and add three gallons of water, heated to about seventyfive or eighty degrees of the thermometer. To this add about a quart of lively yeast. Stir it well together and set it in the sun; a fermentation will soon ensue and continue all day. By the next morning it will be settled clear, and should then be drawn off into bottles, corked, and set away for twentyfour hours, when it will be fit for use. This, if repeated daily, will furnish a very pleasant family drink. Yours, etc. R. M. W.

Middlesex, May 1, 1832.

THE SEASON.

A gentleman of this village, who has been a close observer of "the times and seasons," (says the *Battleborough, Vt., Messenger*.) assures us, that during the last twenty-six years the apples trees in this vicinity have been in full bloom but six times, at an earlier period than they were the present season, which he has recorded in his horticultural journal as being on the 12th inst. He also states, that in those earlier seasons the fruit was small in quantity, having been more or less injured by frosts. According to his theory, the present season promises an abundant crop of apples. The severity of the past winter has been somewhat destructive to peach trees, though it is believed the injury is not so extensive as was a few weeks since generally apprehended.

It is now the 9th of May, (says a *Quebec paper*), and no sowing has been done in this vicinity. The snow still lies along the fences, and in the woods about two feet deep. Gardening is hardly commenced. Some potatoes were, however, put in the ground last week in the new settlements on the south shore; and it is thought that wheat sowing will be general before the 14th inst. After the 20th it is generally considered too late to sow wheat, and the chance of a good crop is diminished by the late period of sowing. Great distress prevails throughout this district, for want of fodder for the cattle. Hay is selling in Quebec from twenty to twenty-five dollars per hundred bundles of sixteen pounds each. Many horned cattle have died for want of proper food and by disease.

Mohawk and Hudson Rail-Road.—This road has now been in operation to the river, or to the west side of Pearl street, for a week; and the accuracy and sufficiency of the power and construction of the stationary engine at the head of the inclined plane, at this end of the road, satisfactorily tested. The number of passengers on the road last week, considerably exceeded previous calculations. The locomotives are in fine order, and the company have purchased and have now in use some of the fleetest and finest horses in the country. The trip over the road, with the locomotives, is usually made in from thirtyfive to fortyfive minutes, including the ascent and descent of the planes; and with horse power, from an hour to an hour and ten minutes. We are informed that in two or three instances, last week, the cars drawn by horses came from Schenectady to the half-way house in twentyfour minutes, being at the rate of about a mile in three minutes. Present indications promise the stockholders a rich harvest this season.—*Many Argus.*

Manure for Grasses and Asparagus.—Dr J. W. Smith, of Lockport, N. Y. in a communication to the *American Farmer*, says, he has "found from experience, that the coal dust cinders, and scales of iron, from the blacksmith's forge, when properly mixed with fine garden mould, to be incomparably the best manure for the grape that can be used. For asparagus, I have also made use of finely pulverized oyster shells, well incorporated with the earth in which it is planted, or well dug in about the roots of old beds. Its effects are astonishing, especially on old beds."

Rats.—It is said, that chloride of lime, placed in cellars, closets, garrets, &c, will free them from rats.

Agriculture.

AN ADDRESS

To the Essex Agricultural Society, delivered at Andover, Mass. Sept. 29, 1831, at their annual Cattle Show. By Henry Coleman. Published at the request of the Society.

Concluded from page 357.

Next, let us compare the value of hay with other crops for the feeding of stock. An acre of hay yields one ton and a half of vegetable food; an acre of carrots or Swedish turnips will yield from ten to twenty tons, say fifteen tons, which is by no means an exaggerated estimate. Crops at the rate of twentyfive tons of carrots and twentytwo of Swedish turnips to the acre, have been raised among us, and much larger crops than these are upon record.

By an experiment it has been ascertained, that three working horses fifteen and a half hands high, consumed at the rate of two hundred and twentyfour pounds of hay per week, or five tons one thousand five hundred and fortyeight pounds of hay per year, besides twelve gallons of oats each per week, or seventyeight bushels by the year. An unworked horse consumed at the rate of four and one quarter tons of hay by the year. The produce therefore of nearly six acres of land in this mode of feeding, is necessary to support a working horse by the year; but half an acre of carrots at six hundred bushels to the acre with the addition of chopped straw, will, while the season for their use lasts, do it as well if not better. These things do not admit of doubt; they have been subjects of accurate trial.

It is believed, that the value of a bushel of Indian corn in straw and meal, will keep a healthy horse in good condition for work a week. An acre of Indian corn, which yields sixty bushels, will be ample for the support of a horse through the year. Now it is for the farmer to consider, whether it be better to maintain his horse upon the produce of half an acre of carrots, which can be cultivated at an expense not greatly exceeding the expense of half an acre of potatoes; or upon half an acre of ruta бага, which can be raised as a second crop at less expense than potatoes; or upon the grain produce of an acre of Indian corn; or, on the other hand, upon the produce of six acres in hay and grain, for six acres will hardly do more than to yield nearly six tons of hay and seventyeight bushels of oats. The same economy might be as successfully introduced into the feeding of our neat cattle. I have known a yoke of oxen engaged in the ordinary labor of a farm, to be kept three months in winter, in good working condition, upon one bushel of Indian meal and about twentyfive cents' worth of straw per week; and my own team has never been in better condition both for appearance and labor, than when fed wholly upon a liberal supply of ruta бага and the coarsest fodder. But it has been ascertained by accurate measurement, that an unworked ox put up on good old hay, consumed at the rate of thirtythree pounds per day or two hundred and thirtyone pounds per week, which is upwards of six tons per year of two thousand pounds to the ton. There must then be a great saving between feeding in the way referred to, or upon English hay; and English hay alone, in any quantity, without grain or vegetables, is not sufficient for any hard-working animal.

We come next to the great article of produce, the prince of vegetables, the bread fruit of our climate, *Indian corn*. In an agricultural view, that country is signally blest, which has the capacity of producing Indian corn. There is no crop of more simple and easy cultivation; none is subject to fewer casualties; only in a single instance for many years, (the year 1816,) has the crop among us been generally cut off. There is none that yields a greater quantity of food, or of better feed to man and beast; which will make more flesh; which returns so much to the land; and bears more frequent planting upon the same ground.

Crops exceeding one hundred bushels to an acre have been raised in this country. No farmer ought to be satisfied with a less crop than fifty bushels to the acre; and, while pork is worth six cents a pound, he may estimate his corn as equal to seventy cents per bushel. Fifty bushels to the acre, then, may be safely valued at thirtyfive dollars; and the fodder from an acre of corn, if well saved, would do much towards paying for the labor of cultivation. It will do more, when carefully managed, than any other crop, towards supplying its own manure. I do not speak at random. Mr W. F. Livingston, of New York, gives it as his opinion, that the fodder will pay for the cultivation. Lorrain, of Pennsylvania, obtained from an acre yielding sixty-six bushels to the acre, (and the ground was planted with potatoes as well as corn,) of

	Ton.	Cwt.	lbs.
Blades, husks and tops,	1,	6,	13.
Stalks or butts,	1,	7,	00.
Total,	2,	13,	Excess.*

Mr Phillips, an intelligent farmer of Pennsylvania, says, "that he is fully of opinion, that a field of good corn will yield as much fodder and contain as much nutriment as a field of the best clover of equal size."

The saving of corn fodder ought to be much more matter of attention than it is. It is a slovenly and wasteful practice to leave our corn butts in the field, to be browsed by cattle and so to serve no use as manure, rather than carefully to gather and feed them out in winter in our barn yards, where what is not consumed by the stock, will go at once to increase the compost heap.

Of potatoes, as a profitable crop, I have great distrust. Beyond what is wanted for marketing or family use they afford small returns. One hundred and fifty bushels to the acre is more than an average crop throughout this country. These can hardly be rated on the farm at more than one shilling per bushel, which would be equal to twentyfive dollars, out of which the expense of four or five dollars for seed is to be deducted. For feeding beef stock it is doubtful if they should be rated so high. I have made no experiments with them in this way, upon which I can rely. When steamed they are represented as excellent feed for horses. Many persons speak well of them in fattening beef; but the best grazing counties in the State do not deem them a very profitable object of culture. "To mix potatoes in the food of fattening pigs," says an English agriculturist, "is deceptive, deteriorating the pork in exact proportion. Hence the Irish pork and bacon are generally inferior to the English, and the market price is in proportion.

* Lorrain's Husbandry, page 201.

† N. Y. Memoirs, vol. 111. page 374.

The inferiority was some years since stated at three ounces per pound or upwards, by an eminent dealer in Irish provisions." But deducting the expense of seed, the labor of manuring, planting, hoeing and gathering, which is always troublesome business, the profits of such cultivation must be very small. They likewise return but little to the ground, for the tops of potatoes can scarcely be considered as of any value.

Carrots are a more profitable crop than potatoes. This crop is of great value. "A bushel of carrots for any stock, is equal to two thirds of a bushel of potatoes, or of equal value, weight for weight." It is little more expensive to raise six hundred bushels of carrots than two hundred of potatoes. Again, land which will produce fifty bushels of corn to the acre, will produce six hundred bushels of carrots, or twelve for one; and a New York farmer, by the name of Waring, says, that "two and a half or at most three bushels of carrots will make as much beef, pork, mutton, milk, or horse flesh, as one bushel of corn. This seems to be an extravagant estimate, but if they will do half as much, the advantage is greatly in favor of carrots.

Of the value of English turnips I shall not say much. They are very easily raised. Cattle and sheep are very fond of them, and will thrive upon them. In Great Britain many of their cattle are entirely fattened upon them, and English beef is celebrated all over the world. Upwards of eleven hundred bushels have been raised to an acre, by Mr Featherstonhaugh, of New York; and premiums have been given, in Scotland, to crops of seventyfive and ninety six tons to the Scotch acre, which is one fourth larger than ours. As a second crop they may be raised to great advantage.

The ruta бага is a highly valuable crop. I have raised nine hundred bushels to the acre at a less expense than the same extent of potatoes could be cultivated; and four hundred and six hundred bushels have been produced on sward land, from which a crop of grass has been taken the same season. A crop of four hundred bushels to the acre was raised on a grass ley, and sowed on the 15th of July. But I am inclined to believe that the best mode of culture is to raise the plants in a seed-bed, and transplant them either with a short stick or by running a single furrow at the distance at which it is desired the row should be made, dropping the plants on the land side of the furrow and letting a man follow, to set them up and draw the earth to them with a hoe. Where they are transplanted a much longer season is obtained, as this need not take place until the last of July or even as late as the middle of August.

They are said to be excellent food for horses; and, when steamed, valuable for swine. I know them to be of great value for oxen and all dry stock; and for cows, abating unpleasant taste which they give to the milk; and both carrots and ruta бага may be applied with great advantage to the feeding of sheep intended for the butcher. — The manure which has been made from sheep or cattle fed on turnips, with their yards well littered, from the extraordinary secretions of urine which turnips produce, is of a superior quality. The value of carrots for milch cows is well understood, not increasing the quantity of milk so much as potatoes, but giving it richness and sweetness, and contributing to keep the animals in the best condition.

* British Farmer's Magazine, vol. 1. page 594.

It is my conviction, therefore, that on the extended cultivation of Indian corn, carrots, and ruta bage, the Essex farmer may lay the foundation of a profitable husbandry. Of the cultivation of other crops and particularly of the smaller grains, wheat, barley and rye, I have not time to speak. In respect to wheat, much of our land is unfavorable, probably from a deficiency of lime; and this might be remedied by the application of lime to the soil, either in a crude or composite state, as it exists, for example, in the spent leaches of soap boilers. The prejudice generally entertained, that the vicinity of barberry bushes will occasion a blast of the grain, deserves farther inquiry; as I have for the two last years, had sound crops of wheat directly in their neighborhood.

2. I propose next to speak of the application of the produce of the farm.

The raising of live stock cannot be pursued to any great extent by the Essex farmer. The scantiness of our pastures forbids it. Yet in a small degree, by producing large crops of succulent vegetables, by a careful saving of his corn-fodder and straw, and by sending his young animals to another part of the country for pasture in summer, he may at least keep his stock good and often go beyond this with advantage. Every farmer should have young stock sufficient to consume his coarse fodder; and he can often purchase stock brought from the interior at a low rate, the growth of which in this way will be more than equivalent for their feed.

The dairy is another object with the Essex farmer. Butter and cheese always find a ready market in the towns and villages, which are accessible to every part of the county. It should be an object with him to extend this part of his husbandry as much as possible, and to obtain a milking stock of the best qualities. This requires that his animals should be well kept. The produce of a cow in the summer will be materially affected by the manner in which she has been kept in the winter; and our scanty pastures may be greatly assisted by clearing up, draining, and the application of ashes to the surface; besides which we should find great advantage in the cultivation of green summer feed for our cows, such as Indian corn sown for this purpose, and especially lucerne, which bids fair to become a valuable auxiliary to our dairy husbandry.

Essex county has the honor of having possessed some cows, whose produce has scarcely been exceeded; but we are certainly deficient in attention to the good quality of our milking stock, and, from ignorance or indulgence, keep animals which are comparatively worthless. In a comparison of the quality of the milk of two of my own cows, in order to ascertain the proportion of cream given by each, I found in milk taken on the same day and in the same quantity, and allowed to stand in the same place for the same length of time, an extraordinary difference, the milk of one giving only two tenths of an inch of cream and the other giving an inch and three tenths; and yet this inferior cow was most promising in appearance, and the most expensive cow in the yard.

Essex county has one small dairy, which presents a fine example of successful management in this branch of husbandry, not exceeded by any within my inquiries. I refer to the dairy of Mr Jesse Curtis, of Marblehead, all of native cows and most of them raised by himself.

In 1824, from 6 $\frac{1}{2}$ cows, he made 732 lbs. of butter.	
1825, " 7 " "	886 "
1826, " 6 " "	745 "
1827, " 6 $\frac{1}{2}$ " "	836 "
1828, " 8 " "	1272 "
1829, " 7 " "	1175 "
1830, " 6 " "	1090 lbs. 13 ozs.

Which last yield is at the rate of one hundred and eighty-one pounds to a cow, and this without any extra feed.

The next mode of consuming your produce on the place is by stall feeding sheep, to be put up in autumn and turned off to the butcher in the spring. My own experiments in this way, though conducted under many disadvantages, have been favorable to its continuance, since it has furnished a home market for my produce, at the current rates, without the trouble and loss of carrying it from the farm; and the manure has been an equivalent for the attendance. To stock of this description, carrots, ruta bage and common turnips are a valuable feed, and for this purpose may be raised to advantage. Mutton fattened in the immediate vicinity, certainly deserves and will command the preference with the butchers, over that which is driven a great distance or which is brought down in a half-frozen state.

Pork is another article, which, even at the present low prices, may, I believe, be fattened without loss and perhaps to a very small profit; at least, it furnishes a market for our produce without the trouble and expense of carrying it from the farm, and it leaves a valuable manure for its benefit. I need not say anything of the important differences in the breeds of swine. Some will scarcely repay the trouble of attendance, while from an improved stock I have had a gain for weeks and months together, of two pounds, two and a quarter pounds, three pounds, and three and a half pounds, per day. Cooked food for swine is greatly to be preferred to raw food; Indian meal is more fattening than any other feed; the growth of the first year is a much greater gain than that of any subsequent period; and I believe it is best to keep them from the first not merely in a growing but in as fat a state as we can get them.

In regard to the fattening of beef animals, my experience has been little and that by no means encouraging. In a single experiment, where an exact account was kept, it was attended with a great loss, as in general the profits in such cases go to the butcher. I have wished to make further trials; and I should express the hope, that a Society distinguished for the judicious selection of its subjects of premium, will deem it of particular importance to encourage various and exact experiments, to determine what may be profitably done in this way, and to devise other successful modes of consuming the produce of a farm, so that what is carried away may not impoverish it.

Next to the importance of cooking food for swine, and I believe it would be found of almost equal advantage for all other animals, is the cutting up of all long feed for neat cattle and horses. My own experience has been considerable in this way, and always strongly in its favor; so has that of many other persons within my knowledge; but I shall refer you only to the testimony of a Mr Phillips, of Pennsylvania. He says, "I have fixed a moveable shaft upon the top of my cider mill, on which is a large drum, and with another small

drum connected by a strap, the chaff-cutter is worked by one horse, the fodder is cut of any size from one quarter to an inch long and with ease, from 120 to 110 bushels an hour are turned out, one boy only attending the machine. Since I have used fodder thus prepared, I have kept from twenty-six to thirty-five head of cattle, besides horses and sheep, during the winter, and have used at least ten loads of hay less than when I kept only twelve. This spring (1824) my cattle were in better order than usual."

I owe an apology to the Society for detailing my own experience, and so often speaking in the first person. It would be affectation in me to pretend ignorance of an art in which I have been more or less interested and occupied for many years, and with a strong feeling of its great and essential importance to human comfort and good morals; but I am not unaware that I stand in the presence of many, of much more experience and knowledge than myself; and in speaking of what I have done, I am prompted by a feeling of the duty of every farmer to communicate to his brethren the results of his own experiments, whether favorable or otherwise, as the best means of advancing an art, where facts and experience are the safest instructors.

There were other topics upon which it was my wish to have remarked; but I fear I have already trespassed too much upon your patience. Agriculture cannot be looked to as a source of wealth; but money is far from being one of the greatest goods of life. Its profits, under the most favored circumstances, must be small and can only be secured by hard labor, persevering industry, and extreme frugality. Yet the situation of every sober and diligent farmer in our country, may always be one of substantial independence. A comfortable dwelling, a sufficiency of wholesome food and good clothing, the means of rearing a family, the opportunity of procuring the best education for his children, the power of gradually improving his property and condition, and of accumulating some humble resources against the time of old age and sickness; and above all, the quiet and comforts and endearments of home, and the perfect enjoyment of his religious rights and privileges; are blessings as much within the reach of the industrious and honest farmer in New England, as of the richest man in the world, and are sufficient to satisfy any but an inordinate avarice and ambition. The farmer's gains are honest gains. What he gets, he gets not at the expense of suffering or loss to others, but as the lawful fruits of his own industry and toil. He above all others should be a religious man; for the fruits which he gathers seem to be poured at once into his lap from the divine bounty; and the various domestic animals which depend on his care and are to be daily fed from his hand, remind him that he is the almoner of a merciful and kind Providence. Every operation of husbandry, with all its beautiful and miraculous results, admonishes the thoughtful mind of that unseen but omnipresent and beneficent agency on which all creatures subsist, and which is everywhere diffusing life and happiness and good. The flowers of the field in their splendor

* Memoirs of N. Y. Agriculture, vol. 111, page 374. — [I have myself tried various cutting machines; where much work is to be done, I can strongly recommend the machines invented and patented by Jonathan Eastman, of Baltimore, which are now made in Boston, as the best within my knowledge.]

* One cow for half the season.

and beauty: the birds of the air, who, though they have neither store-house nor barn, are fed by a paternal kindness: the invigorating sunshine and the fertilizing rain: the fields glistening with the enriching dew, or yellow with the ripened harvest, and the cattle upon a thousand hills, all speak to the husbandman, of God, in tones which find their way at once to the feeling and pious bosom. Let his heart and life pour forth a grateful response. In the exercise of an honest industry, who can feel a juster claim to the peaceful enjoyment of its bountiful returns! The possession of these gifts of divine goodness should remind him of his duty to those whom it gives him the power and privilege to succor and relieve. When the peace and contentment and comfort which reigns in his habitation, are thus enjoyed in charity to his fellow men and in humble piety to God, this earth presents no condition more privileged and enviable.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, May 30, 1832.

CULTURE OF POTATOES.

A writer for Paxton and Harrison's Horticultural Register, with the signature of "G. J. T." and author of the Domestic Gardener's Manual, observes, that "our enlightened President, Mr Knight, has placed me in possession of directions for planting that noble root [the potato] in his own hand writing." They are as follows:—

I obtained from the ash-leaved kidneys, last season, (a bad one, 1830,) a produce equal to six hundred and seventy bushels, of eighty pounds each, to the statute acre; and I entertain no doubt of having as many this year. To obtain these vast crops of the ash-leaved kidneys I always plant whole potatoes, selecting the largest I can raise; and for a very early crop, those ripened early in the preceding summer, and kept dry. I usually plant them on their ends, to stand with the crown end upwards, and place them at four inches distance, from centre to centre in the rows; the rows two feet apart and always pointing north and south.

I plant my large potatoes much in the same way, but with wider intervals, according to the height which the stems attain: thus, one which grows a yard high, at six inches distance from centre to centre, and three feet six inches or four feet between the rows, never cutting any potato, nor planting one of less weight than a quarter but generally half a pound. By using such large sets, I get very strong and large plants with widely extended roots, very early in the summer.

The blossoms take away a good deal of sap which may be better employed in forming potatoes; and whenever a potato affords seed freely, I think it almost an insuperable objection to it. As a general rule, I think that potatoes ought to be planted in rows, distant from each other in proportion to the height of the stems. The height of stems being full three feet, the rows ought to be four feet apart; and the sets, of the very largest varieties, planted whole, never to be more distant from centre to centre than six inches. By such mode of planting, the greatest possible quantities of leaf (the organ, by which alone blood is made,) are exposed to the light.

The philosophy of these able and simple directions may be shortly explained: It consists in the exposure of the utmost possible surface of the

respiratory organs, (the leaves,) to the agency of the electrifying principle of the solar light, and of corresponding breadths of soil to the influences of air and heat: so that the roots may be enabled to extend right and left to a distance somewhat exceeding that of the height of the stems and foliage.

The potato called the *early champion*, was that with which I began my experiments, early in March, 1831. The soil was that of a pasture, a deep and brown sandy loam, upon a chalky subsoil, approaching to marl. This soil had been trenched in the autumn to the depth of two feet, and the turf inverted at the bottom of each trench. About eighty pounds of these potatoes were planted whole, in rows two feet asunder, running north and south, the sets about six inches apart, crown from crown. But as I could not obtain a sufficiency of the variety at the time, I was constrained to employ such as I had, and therefore the size of the potatoes was not attended to. The rows were weeded early, and the stems advanced regularly till the fatally destructive 6th of May, when the frost destroyed and blackened every leaf that had fairly emerged from the surface. Thus I lost all the benefit that would have been otherwise derived from the early developed leaves; and consequently, a considerable weight of the advancing crop. In a week or ten days, however, fresh shoots were protruded, and as the stems advanced they were deeply cut up, that is, till the whole piece of ground had the appearance of so many ranks of ridges, the intervening spaces being twelve inches deep in the centre. This one effectual earthing-up sufficed, and the crop attained perfect maturity in due time. The total yield of potatoes (which were for the greatest part of a fair average size and of most excellent quality, mealy and fine in flavor,) was five hundred and seventy-six pounds.

The *early frame potato*, planted the first week in March, was the subject of the second experiment. I had procured one peck weighing fourteen pounds, and the tubers were cut into small sets with from one to three eyes each. The sets were planted in rows, pointing north and south, two feet asunder, the sets being four inches apart in the rows. The site was a garden plot, four yards by seven yards and a half, i.e., thirty square yards. The subsoil was a strong, stiff loam, and this was brought to the surface by deep trenching, just before it was cropped. This plot suffered also from the frost above alluded to. The final yield was very great, (two hundred and fifty-nine pounds,) but the potatoes were far from being regular as to size; a great proportion were small, weighing little more than one or two ounces each, occasioned, I doubt not, by cutting the tubers into small sets.

The third experiment commenced the 25th of March, when I was enabled to procure a small supply of a variety styled *early champions*, but was evidently far from true to its kind. The potatoes were planted by the side of the first plot of champions, in rows two feet six inches asunder; the sets six inches apart, crown from crown. The total yield, digged up between August 25 and September 18, 1831, was one thousand two hundred and nine pounds.*

General deductions from facts.—First—I find that little or nothing is gained by planting before

* The blossoms of every sort which produced any, were mostly pinched off as they appeared.

the middle of March [in England]; for if the frost destroys the leaves as it did those of my first-sown champions, a great loss in the product of the tubers must inevitably be experienced. Secondly,—early ripened potatoes will yield an earlier crop than others of the same variety, which have come to maturity at a later period of the preceding season. My first champions were produced by myself, from a few roots given to me by a neighbor in June, 1830. The land required to be trenched, and therefore the potatoes were not in the ground till the last week in the month; hence they scarcely ripened before the frost set in. The eighty-four pounds planted in April, had been produced at the usual season by a farmer, and they came in very early and yielded almost double the quantity of those first planted. It is but just, however, to state that we commenced digging the latter, as early young potatoes, in July; and therefore, scarcely two thirds remained to attain perfect maturity. Thirdly, ash-leaved kidneys, above all others, require to be planted whole; if they are not, many of them may not germinate at all. I tried an experiment during last year and it was decisive in its results. Henceforward I never intend to plant a cut set of this potato, nor a whole one of very small size. I trust that my experiments on each variety that I plant during the current season, will be conducted with a degree of precision and exactitude, that may enable me on a future occasion, to announce their particular routine and final results, in a way that shall leave no doubt of the efficacy of Mr Knight's mode of culture.

CANKERWORMS AND CATERPILLARS.

H. Van Voorhis, Esq. of Malden, has communicated to us the following method of exterminating the above mentioned insects from fruit trees, the efficacy of which he assures us he has tested by successful experiments.

He procures a sheet-iron vessel of the shape of the frustum of a hollow cone or a sugar loaf, with a part of the top cut off, which is large enough to hold six or seven quarts. This has a door or opening near its bottom, a number of holes punched near its top, and a socket at its bottom, to receive the end of a pole by which it may be elevated when in use. Within this vessel a fire is made of tobacco stems, oil, and sulphur, moistened a little with water, so as to cause a slow combustion with much smoke. This apparatus is held by the pole to the windward of a tree infested, in such a position as to cause the smoke to spread over the branches to which the insects are attached, by which means they are soon fumigated into noisunity.

THE BIRDS.

We are apprehensive that among other evils which are the consequences of the last winter's severity, and its long "lingering in the lap of May," may be the destruction of birds, and the consequent predominance of worms and other insects, which furnish food for the farmer's feathered laborers.

We have received verbal accounts from several towns in this vicinity, that the songsters are missing from the groves, which they had been accustomed to render vocal in the vernal months; and thousands have been found dead under trees, &c, cut off by the inclemency of an unprecedented and frightful season.

Notice.

The Massachusetts Society for Promoting Agriculture have just published No. 1 of the 10th volume of their Repository and Journal. Members of the Society are entitled to a copy, which they can obtain by calling at the Seed Store of Mr J. B. Russell, No. 50½ North Market Street.

Notice.

A stated meeting of the Massachusetts Horticultural Society will be held at the Room of the Society on Saturday, June 2d, at 11 o'clock, A. M.

R. L. EMMONS, Sec'y.

Young Cleveland.

THIS truly beautiful and valuable Horse is of the Cleveland bay breed of horses, of fine even temper, five years old the 20th of May, fifteen and a half hands high, and of a beautiful dark bay color, with black mane, tail and legs. He walks and trots remarkably easy and fast; and is equalled by very few for muscular strength, elegant movement, and perfect symmetry of form.

He has proved himself a sure and first rate foal getter. The colts sired by him possess a great share of bone and muscle.

The pedigree of Young Cleveland:—He was sired by the celebrated bay horse, Sir Isaac, the son of the noted horse, Molinieux. Sir Isaac was presented to the Agricultural Society of this State, by Sir Isaac Coffin, and was selected under his order as superior of his breed, and the breed recommended by him as the most highly esteemed for gentlemen's carriages, and all draft, farming, and saddle purposes, of any horses in New England.—His dam was a first rate and high spirited native mare. He will stand the ensuing season, at the stable of the subscriber, in Franklin.

Terms.—Three dollars the single leap; five for the season; and eight to insure the mare with foal; the money to be paid when the mares are taken away, on notes given payable the 1st October next. Those persons who put mares to the Young Cleveland and have them warranted, and part with them before foaling time, or neglect to bring their mares regularly to the horse through the season, will be considered holden for insurance money.

ELI M. RICHARDSON.

Knowledge for the People.

LILLY & WAIT have just published Knowledge for the People, or the Plain Why and I Because, No. 10, comprising Arts and Manufactures—price 12½ cents.

May 30.

Wanted.

THE following numbers of the New England Farmer, for which the subscription price will be allowed: No. 1 of vol. iirs. Nos. 2 and 19 of vol. iv. No. 13 of vol. vi. Index to vol. vii. No. 2 of vol. viii.—Apply at the N. E. Farmer office.

May 30.

Seed Corn, etc.

FOR sale at the New England Seed Store, No. 50½ North Market Street, several kinds of Seed Corn in ears, the finest varieties cultivated in New England, 8, 12, and 16 rowed.

Also, a few seeds of the Early Lemon Squash, from the western part of this State, which is considered one of the finest varieties of summer Squash cultivated, being a week earlier than the Scollup or Warted Squashes, and of much superior flavor, drier, and somewhat resembling the Canada Squash in taste; producing abundantly till killed by frost. Price 12½ cents per paper.

May 23.

Straw and Palm-leaf Splitting Machine.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Guild's Improved Palm-leaf and Straw Splitting Machine, calculated for fine and coarse straw.

Also, Cast Steel Scythes of superior quality, warranted genuine.

May 23.

Willis' Improved Brass Syringes.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Willis' Improved Brass Syringes for using Johnson's solution as a remedy against mildew on grapes, destruction of vines from bugs and flies, and insects on trees. See New England Farmer, vol. 8, p. 5.

May 23.

Quarterly Review.

THE 93d No. of this work has just been republished by LILLY & WAIT, and contains articles on the following subjects:—Life and Writings of Hesiod; Domestic Manners of the Americans; Poetry by Mary Colling; Lyell's Geology, vol. 2; Changes in the organic world now in progress; Naval and Military Memoirs; Lord Munster's Campaign of 1809; Capt. Hall's Autobiography, second series; Punishment of Death; Wakefield on Newgate; English Fox Hunting; Milton Mowbray; Francis the First, by Miss Kemble; The Revolution of 1610 and 1830; True Causes of the Riot at Bristol and Nottingham.

Republished quarterly from the London edition, at \$5 per annum. May 23.

Garden Compound.

For the preservation of Peach and other Fruit Trees.

This is thought to be an infallible preservative of the Peach, Plum, and other fruit trees, from the destructive worms and insects which in the spring attack and destroy the vitality of the tree. By a proper application of the compound, insects will not deposit their eggs in the bark. This article will not harden in the sun, but remain liquid for several months, in this respect it is vastly superior to any other composition in use.

Prepared and sold, wholesale and retail, by JOHN M. LIVES, Salem; and JOHN B. RUSSELL, No. 50½ North Market Street, Boston.

Price, 33 cents per bottle, with directions for its use.

May 16, 1832.

Conqueror.

THE entire horse Conqueror will stand the ensuing season at the Ten Hills Stock farm in Charlestown, two and a half miles from Boston, at ten dollars, to insure a mare in foal, secured by a note at ten months, to be valid and payable in case the mare proves to have been in foal, and one dollar to the groom at the time of covering.

Conqueror was bred near Montreal (Canada) foaled in May, 1825, and sired by a noted Normandy horse out of a blood Mare—he is rising 15 hands high and remarkably well grown, combining great power, generous spirits, good action, very docile in his temper, and of that hardy color, iron gray. This horse has taken three premiums in Canada, as the best horse in that country. He has probably as much, or more than any other horse now living, of the strains of blood so well known in N. E. by the name of "the Morgan breed"—from the best accounts the original Morgan horse was made up of the same strains of blood as Conqueror. Conqueror has proved a sure foal-getter, and is recommended to the public by

SAML. JACQUES.

The full bred blood horse Sportsman also stands as above—for pedigree see late Nos. of the Farmer.

May 16, 1832.

Davis' Improved Dirt Shovel.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, Davis' Improved Dirt Shovel for excavating or leveling dirt.

This may certify that I have been using Shadrach Davis, Jr.'s patented Scraper, and am fully satisfied that it is much better than any other scraper of the kind, for digging and clearing cellars, that I have before used or seen.

Fairhaven, July 12, 1831.

ANSEL WHITE.

This may certify that I have used Shadrach Davis, Jr.'s patent Scraper on the roads in this town, and find it a machine superior to any other I ever used before, for removing earth; and would hereby recommend it to public patronage.

LEVI SHAW.

New Bedford, Aug. 22, 1831.

Pickering's Tree or Caterpillar Brushes.

For sale at the Agricultural Warehouse, No. 50½ North Market Street, Pickering's Improved Tree Brushes.—This article, (which is likely to be in greater demand this season, than for many previous years,) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use.

May 16.

The Art of Being Happy.

JUST published by CARTER & HENDEE, the Art of Being Happy: from the French of Droz, 'Sur L'Art D'Etre Heureux,' in a series of letters from a father to his children; with observations and comments. By Timothy Flint.

May 23.

BRIGHTON MARKET—MONDAY, MAY 28, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 225 Beef Cattle, 11 pairs Working Oxen, 16 Cows and Calves, 35 Sheep, and 560 Swine.—14 Beef Cattle remained unsold at the close of the market.

PRICES. Beef Cattle.—Last week's prices on the best qualities were well supported; perhaps a little better prices were obtained, but on the thinner qualities (of which there was a large proportion) a depreciation. We quote extra at \$7 a 7.25, prime at 6.50 a 6.75, good at 6, and thin at 5 a 5.75.

Working Oxen.—We noticed one sale at \$68 and one at 75.

Cows and Calves.—We noticed sales at \$23, 28, 35—two were sold at 45, and two (without calves) for 20.

Sheep.—Those at market were sheared, and were taken at \$3 each.

Swine.—Former prices were well supported, but sales not so brisk. We noticed several lots taken at 5 c for sows and 6 for barrows; at retail, 6 c for sows and 7 c for barrows.

NEW YORK, May 25.—In market this week 350 Beef Cattle, a short supply, and all sold quick at an advance of 25 c per hundred on last week's prices; the average this week \$1.61 a 7.25. We quote 6.50 a 8; a few prime cattle sold over this amount. Cows and Calves—sales at \$18 a 35. Sheep scarce and sell quick at \$3 a 6; lambs 2.50 a 4. Live Hogs—the few that arrive sell quick at 4 a 4.25 per hundred.—Daily Ad.

Miscellany.

From the Greek.

WOMAN.

O thou! by heaven ordained to be
Arbitress of man's destiny!
From thy sweet lip one tender sigh—
One glance from thine approving eye—
Can raise or bind him at thy will,

To virtue's noblest flights, or worst extremes of ill.

Be angel-minded! and despise
Thy sex's little vanities;
And let not passion's lawless tide,
Thy better purpose sweep aside;
For we await the evil hour,

That lends to man's annoy thy heaven entrusted power.

Woman! 'tis thine to cleanse the heart
From every gross, unholy part;
Thine in domestic solitude,
To win him to be wise and good;
His pattern, guide, and friend, to be,

To give him back the heaven he forfeited for thee!

MODE OF USING NEWSPAPERS IN SCHOOLS.

It has been more than once proposed that newspapers should be introduced into our schools;—their indiscriminate use would be far from profitable; but the following extract from "Alcei's historical description of the first public school in Hartford," illustrates a method of conducting this exercise, which cannot fail to do good.

"Scholars, what is the latest news from Europe? 'The British Parliament is prorogued.' Prorogued! what does that mean? 'Adjourned.' Who did this? Who prorogued the Parliament? 'The king.' Who is the king of Great Britain? 'William IV.' Is he a popular king? 'Yes.' What do you mean by popular? 'In favor with the people.' Why did the king prorogue the Parliament? 'Because he was friendly to the Reform Bill.' And who are opposed to that Bill? 'The Peers, or House of Lords.' How many Houses are there in the British Parliament? 'Two.' What are they called? 'The House of Lords, and House of Commons.'

"How has the war between Russia and Poland terminated? 'The Russians have taken Warsaw and conquered Poland.' What is to become of Poland now? 'It will probably come under the yoke of Russia again.' Who has most distinguished himself in this war? 'The Polish General, Skrzynecki.'

"What was the last news of Greece? 'The Count Capo d'Istria has been assassinated.' Who was Count Capo d'Istria? 'The President of Greece.' Is Greece in Asia? 'No, sir.' Where is it then? 'In the southern part of Europe.'

"What is the most important news in the United States? 'Congress has just assembled at Washington.' For what purpose does Congress meet? 'To make laws.' Of whom does Congress consist? 'How many Senators from each State, and how often appointed? How many Representatives, and how long do they hold their office?'

This will serve as a specimen of the method of studying newspapers. This plan is rather novel, and well calculated to excite a taste for reading and a love for general information. But this is not all. The conversation about Poland and

Greece, enkindles a desire in the minds of the pupils to understand the geography and history of those countries, and of those near them, to which they sustain important relations. The history and geography thus taught will hardly ever be forgotten. — *Annals of Education.*

FAULTS OF ANNIVERSARIES.

To be perpetually calling out "Mr President!" or "Sir!" "Sir!" in the most animated and emphatic parts of the address, as if the speaker would overwhelm the unfortunate chairman with a flood of eloquence that had been directed towards the audience.

To have everything so "cut and dried" before hand as to appear too formal; resolutions being printed and seemingly a matter of course, for which the audience have little care. Concealed method would no doubt improve this defect and afford the audience the pleasure of novelty.

To speak in a measured, oratorical manner—sentences swelling with the pomp of Johnson and Burke—while an audience of three thousand people are hungry for simple facts, and are prepared to hail an anecdote well told, if it be the truth and have a bearing on the subject, with greater joy than they would all the sonorous eloquence that ever was belloyed from the forum, or the bar, or the desk.

To compliment a previous speaker, who no doubt has his hands full to keep down the risings of pride which his promptings nearer home.

To speak of being unexpectedly called upon to take a part in the exercises, when every word of the speaker's address had been written more than a year before, and safely deposited in the recesses of a cranium too thick to have suffered a single sentence, word, or comma, to make its escape.

To overstate the importance of favorite objects; and thus lay a temptation before an audience, that may swerve from a true judgment. — *Badger's Weekly Messenger.*

Enormous Stones at the Temple of Balbec.

There is a curiosity of this place, which a man had need be well assured of his credit before he venture to relate, lest he should be thought to strain the privileges of a traveller too far. That which I mean is a large piece of old wall which encompassed a number of structures. A wall made of such enormous great stones, that the neighbors thereabouts (as it is usual in things of a strange nature) ascribe it to the architecture of the devil. Three of the stones which were larger than the rest, we took the pains to measure, and found them to extend sixtyone yards in length; one was twentyone, and the other two each twenty yards; in depth they were four yards each, and in breadth of the same dimensions. These three stones lay in one and the same row, end to end. The rest of the wall was made also of great stones, but none I think so great as these. That which added to the wonder was, that these stones were lifted up into the wall more than twenty feet from the ground. — *Mandrell's Journey to Jerusalem.*

"Johnny, where's my razor," bawled out an Eastern shoreman, as he stood before the looking-glass duly prepared for the operation of shaving. "Why, daddy, I've jist done opening oysters with it." "Well, tarnation take the boy, run and rub it on a brick-bat; and by gosh, if ever you do the like again, if you shan't grind it!"

The full blooded Horse Sportsman.

THE Subscriber has secured the full-blooded horse Sportsman, to stand the ensuing season at the "Ten Hills Stock Farm," commencing April 10th, and ending August 10th.

Terms—One Dollar to the Groom, and ten dollars for the season,—cash, or a note on demand, or fifteen dollars to insure a mare in foal, by a conditional note at eleven months.

Good keeping for mares, at one dollar per week, at the risk of the owners.

Sportsman is not surpassed for spirits, and has as good strains of blood, as any horse in this country. His dam was a direct descendant from the best blood in England, his sire, the full-blooded imported Arabian Horse "Bussorah." It is with these strains of blood that England has bid defiance to the world on the turf and in the field, for more than a century past.

Sportsman's get are very promising, and may be seen on the farm.

Satisfactory proof of the pedigree of this horse as given below, is in my possession.

PEDIGREE.

Sportsman was foaled in 1823, the property of the late Gen. Coles of Dorset, Long Island, and sired by the "Bussorah Arabian," out of Sportsmistress by Hickory, her dam the famous racing mare Miller's Danse (the dam also of American Eclipse) by Messenger Grand Dam, the imported Potos mare, G. G. dam by Gimerack, &c.

Hickory was by Whip, his dam, Dido by Dare Devil, G. G. dam by Wildair, G. G. dam by Clockfast, G. G. G. dam the dam of the celebrated Virginia, "Bucephalus" and Lady Teazle.

"Messenger" by "Mambrino." Dam by Turf, G. G. dam by Regulus, G. G. dam by Starling, Fox, Bay Bolton, Duke of Ancestor's Turf, Byerly Turk, Taffolet Barb, Phoe's white Turk, Native barb mare, Potos was by Eclipse, Dam Sportsmistress, by Warren's Sportsman, G. G. dam Golden Locks by Oronoko, Pantan's Crab, Partner, &c. See 1st and 2d volume of English stud book.

PERFORMANCE.

At three years he won the sweepstakes on the Union course, Long Island, against five horses. On the same course, the same season, he won a match race against Mr. Stevens' "Rattle." In the autumn of 1827, he ran upon the same course, and won at three heats, (three mile heats) beating Richard 3d from Virginia, Misfortune and American Boy. He has never given way in his limbs or wind. These are all his public performances, and he never was beaten.

Ten Hills Stock farm, on the Medford Turnpike, two and a half miles from Boston.

SAMUEL JAKUES, Jr.

Ten Hills Farm, April 3.

Young Barefoot.

THIS very handsome Colt, just three years old, (was the first colt ever got in America, by the truly celebrated full blood horse Barefoot, sent from England by Sir Isaac Coffin.) was raised by John Prince, Esq. at Jamaica Plain, near Boston, out of a large and superior mare of American breed. He is a beautiful dark bay, with black mane and tail, and is considered an animal of great promise. He will be kept for the usual season at the stable in Brighton, where Barefoot and Cleveland have heretofore stood.

TERMS—\$12—to be paid before the mare is taken away; and should the mare not prove to be in foal, the money will be returned. Pasturage can be furnished for mares, they to be, however, at the risk of the owners.

JOHN PARKINSON.

Brighton, May 16, 1832.

Barefoot.

THE celebrated English Horse Barefoot will return from New York to the Brighton stable about the latter end of June. Barefoot has proved one of the most successful racers of his day, at York, Doncaster, Newmarket, Ascott, &c, and his pedigree exhibits the best blood known. epw May 23.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for Printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52, North Market Street.

Rural Economy.

MAKING CHEESE.

The Massachusetts Agricultural Repository gives the following directions for this process:—

"Breaking the curd is done with the hand and dish. The finer the curd is broken, the better, particularly in thick cheeses. The best color of this kind of cheese is that of bees' wax, which is produced by Arnotta, rubbed into the milk after it is warmed. The dairy woman is to judge the quality by the color of the milk, as it differs much in strength.

"Setting the milk too hot inclines the cheese to heave, and cooling it with cold water produces a similar effect. The degree of heat varies with the weather. The curd when formed is broken with what is called a treple cheese knife. The use of this is to keep the fat in the cheese; it is drawn the depth of the curd two or three times across the tub, to give the whey an opportunity to run off clear; after a few minutes the knife is more freely used, and the curd is cut into small pieces like chequers, and is broken fine in the whey with the hand and a wooden dish. The curd being allowed about half an hour to settle, the whey is ladled off with the dish, after it is pretty well separated from the curd.

"It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added and stirred a few minutes; some make use of hot water in preference to whey, and in both cases heated according to the nature of the curd; if it is soft, the whey or water is used near boiling; but if hard it is only used a little hotter than the hand. After the curd is thoroughly mixed with the hot stuff, it is suffered to stand a few minutes to settle, and is then separated as at the first operation. After the scalding liquor is separated, a vat or what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hands and pressed into the vat, to squeeze out the whey. The vat being filled as full and as firmly as the hand alone can fill it, and rounded up in the middle, a cheese cloth is spread over it and the curd is turned out of the hoop into the cloth; the vat is then washed and the inverted mass of curds, with the cloth under it, is returned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out and the cloth is taken off, washed and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and salted, the cheese is placed on a board and a handful of salt is rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewn on the upper side, and as much left as will stick to it; afterwards it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press; here it continues one night; and the next morning it is turned into the vat, and continues till the succeeding morning, and the curd is taken out and placed on the dairy shelf; here they are turned every day or every other day, as the weather may be. If it is hot and dry, the windows and doors are kept

shut, but if wet or moist the doors and windows are kept open night and day.

"*Cleaning the cheese.*—The cheeses having remained about ten days after leaving the press, are to be washed and scraped in the following manner: A large tub of cold sweet whey is placed on the floor, the cheeses are immersed in it, where they continue an hour, or longer if necessary, to soften the rind. They are then taken out and scraped with a common case-knife, with great care, so as not to injure the tender rind, till every part of the cheese is smooth; they are after the last operation rinsed in the whey and wiped clean with a coarse cloth, and placed in an airy situation to dry, after which they are placed in the cheese room. The floor of the cheese room is generally prepared by rubbing it with bean or potato tops, or any succulent herb, till it appears of a black wet color; on this floor the cheeses are placed and turned twice a week, their edges are wiped hard with a cloth once a week, and the floor is cleaned and rubbed with fresh herbs once a fortnight. They must not lie too long or they will stick to the floor. This preparation of the floor gives the cheese a blue coat, which is considered of great consequence."

From the *Tablets of Rural Economy.*

PINUS CEMBRA.

This elegant and valuable species of ornamental evergreens, has not yet, as far as we are informed, been cultivated in this country, although it may be had, we presume, at some of our principal nurseries, as we observe its name in the catalogue of the Messrs Prince, of Long Island. It deserves attention, not only on account of its majestic appearance upon bleak and barren mountains, but likewise from the excellence of its timber, and from the circumstance of the kernels in the cone, being eatable, in which point it resembles the *Italian stone pine*.

The trivial name applied to it is *Aphernousli*, or *Arvenusli*, incorrectly however, we should think, as in a note to a description of this tree, lying before us, it is said to be derived from the German word *Apher*, a pine, and *nousli*, a small nut. — These are not German words, but the words in that language which in sound come nearest to this appellation, would be *Alpen Nüsslein*, the little Alpine nut.

It grows on the coldest and most mountainous parts of the following countries: Switzerland, Piedmont, Savoy, Dauphiny, Tartary and Siberia.

The *Aphernousli* pine, according to Mr Harte, (see Harte's *Essays in Husbandry*), is of an healthy vigorous nature, grows very tall, and will bear removing when it is young, even in warm dry weather, but I do not, he adds, recommend the practice. We italicise the last sentence in order to connect it with the following remarks. The proper time for transplanting evergreens seems not to have been determined. They differ so much in habit and constitution from our other trees, and fail so generally when removed in the spring and fall, that it is apparent these are not the fitting seasons for the operation. It may be done in winter by digging around and taking up a ball of frozen earth with

the plant, but this method is expensive and will not answer where they are to be transported to any considerable distance. We recollect hearing August mentioned as the best time, but have made no experiment to test it. The *Rhododendron maxima* we have transplanted at various seasons, and without success in every instance, but where it was done in June when the new leaf buds were just expanding. In this state we have brought them in an open wagon a distance of fifty miles, and not a leaf has shrivelled. There are some herbaceous plants, also, which are best removed when in full flower, as many species of the *Orchideous* family, such as the *Cypripedium pubescens*, *Orchis spectabilis* and *fimbriata*. But to return to the *Pinus Cembra*.

"Its timber is large and has many uses within doors or under cover; its grain is finer and more beautifully variegated than deal, and the smell is more agreeable; it is useful for wainscoting, flooring, and other joiner's work, and the wood makes excellent firing for stoves, ovens, and kilns. The peasants of Tyrol, where this tree abounds, make various sorts of carved works with the wood, which they dispose of in Switzerland among the common people, who are fond of the resinous smell which it exhales. The bark of the trunk of the tree is of a whitish cast and the branches resemble those of the spruce fir. They are long, smooth, and are produced by fives."

"The cones are of a purplish color, shaded with black, about three inches long, the same in circumference, and grow erect; a dozen weigh fifteen ounces, or about one ounce and a quarter each; under each scale there are two kernels, and from a hundred to a hundred and fifty in each cone."

The husks, or sort of a shell which incloses the kernels, is easily cracked, and the kernels are covered with a brown skin which peels off; they are about as large as a common pea, triangular like buckwheat, and white and soft as a blanched almond, of an oily agreeable taste, but leaving in the mouth that small degree of asperity which is peculiar to wild fruits and not unpleasing. These kernels make a part sometimes in a Swiss dessert, and supply the place of mushroom buttons in ragouts, and on account of their balsamic oil, are recommended in consumptive cases. A writer says it ought to be distinguished as the king of all forest plants, as its fruit is not only a nourisher of health but a promoter of population; and we are informed by a traveller, that he has seen trees of this species ninety feet high and near ten feet in circumference at their bases.

From the *Swiss Mercury*.

WANTON DESTRUCTION OF BIRDS.

Messrs Editors.—At this season, during the vacation of the different schools, there is a class of boys who are in the habit of treading down the grass of our fields and pastures, and injuring the branches of the fruit trees, in the wicked and wanton habit of shooting birds. The insectivorous kinds, viz. the swallows, martins, redstarts, king birds, &c, which, previous to the wet weather of the last fortnight were abundant, have many of

them perished. The few that now remain are of infinitely more use than we have opportunity to discover, by the destruction of grubs, worms, and eggs of vermin. The black-birds, or grackles, will at this season follow in the furrows of the plough and catch up large quantities of the yellow-headed grub worm; and of those birds complained of by the industrious farmer, for the mischief committed on his corn, one of the most correct observers of nature remarks, that "were he placed in his situation, he should hesitate whether to consider these birds most as friends or enemies, as they are particularly destructive to almost all the noxious worms, grubs and caterpillars that infest his fields, which, were they allowed to multiply unmolested, would soon consume nine tenths of all the production of his labor, and desolate the country with the miseries of famine." But with regard to a great proportion of our summer birds, they are insectivorous, destroying countless multitudes of destructive bugs and caterpillars, that infest the fruit trees in spring and summer, preying on the leaves, blossoms and embryo of the fruit. The oriole, or golden robin, destroys hundreds of them without offering the slightest injury to the fruit that may encompass his nest.

I would therefore caution every boy against trespassing upon our fields and pastures with this murderous intent, particularly, as at this season birds are engaged in the business of incubation, and by cruelly taking away the parent, they destroy a helpless brood of young.

I trust, therefore, that every honest farmer and horticulturist will avail himself of the law of trespass, should he find young men shooting upon his lands, and thus put a stop to the indiscriminate slaughter of this beautiful part of animated nature, particularly this spring, as their services are much needed in destroying the small travelling caterpillar, which is now in great abundance.

A SUBSCRIBER.

From the American Farmer.

PLEASURES OF AGRICULTURE.

The employments of agriculture, independently of their profit, are more congenial and pleasing to human nature. An uncorrupted mind sees, in the progress of vegetation, and the habits, and dispositions, and uses, of those animals which man has subjected to his sway, charms and beauties which the objects of art can seldom afford. The occupations of husbandry are most favorable too, to health, to plenty, to repose, and to innocence. Can the pursuits of low and vicious gratifications, can luxurious indulgences, can the restless cares, the fears and anxieties of the ambitious, be compared with the labors and enjoyments of him whose days are spent in superintending the culture of his fields, his nights in quiet and refreshing sleep. Such a life is not inconsistent with a highly cultivated and polished mind. It is by no means necessary that they who engage in rural labors, should contract a coarseness of manners or vulgarity of sentiment.

The superintendence of a garden is another source of simple and innocent pleasure. Nothing is better calculated to gratify the inherent passion of novelty, for nature is always renewing her variegated appearance. She is infinite in her productions, and the life of man may come to its close before he has seen half the beauties which she is able to display.

Short excursions in the country are, of themselves, the source of very sensible and innocent pleasure. But he who is engrossed by vice or by business, will live half a life without admiring the beauties of a blue sky, basking in the vernal sunshine, or inhaling with any consciousness of real delight, the balsam of a western gale.

In a proper intercourse and behavior among our fellow creatures, will be found, however, to consist our principal and most constant delight. To do good and to prevent evil, as far as the sphere of our influence, or activity extends, is an infallible method of inspiring in ourselves pleasurable emotions. And if we consult what passes in our breasts, before our youthful sensibilities are blunted, we shall find that nature has taught us to find exquisite pleasure in relieving distress and in communicating enjoyment.

FEEDING CATTLE.

It is stated by M. Dubuc, president of the Agricultural Society of Rouen, that three measures of oats, pounded or broken up and moistened, are equivalent, as aliment, to four measures given in the grain.

It is observed, also, that four parts of different kinds of forage, coarsely chopped and deprived of dust, will go as far as five parts of the same forage given entire and separately.

There exists in Paris, an establishment where mixtures of food are prepared on this principle, for horses. It is that of M. Payen. The kinds most generally mixed are clover and lucerne. They are then cut up, so that the horses are obliged to chew and masticate them in the most perfect manner.

The mixture of vegetables which is considered as the most suitable for draught horses, is composed of equal parts of cut straw, clover, and common hay. Barley and oats, coarsely ground and mixed, answer a better purpose than when eaten separately.

M. Dubuc visited this establishment, and found that the horses which worked the machinery are fed in this manner, and that they looked well and are vigorous, though kept at work ten or twelve hours a day. He cites, also, the teams of M. Sevin, mail contractor at Orleans, whose horses are fed on cut straw, mixed with one fifth of clover and lucerne, and sometimes a little hay—they were fat, strong, and substantial. They give them, also, barley or oats crushed and moistened. Care must be taken to place this food in deep mangers, so that it may not be wasted. Oats are frequently mixed with the last portion given them prior to their being harnessed.

M. Dubuc was assured by both these proprietors, that there was a saving of one fifth, at least, by this method; and that, besides, the horses were in a better condition, and endured more labor than those fed on common unprepared materials.—*Bib. Univ. for June, 1831.*

BEETS.

Beets furnish from a given surface of ground, a greater quantity of nutriment for horses and cattle, than any other kind of forage. Wherever its cultivation is understood, it has the preference over all other roots. It succeeds in almost all soils, is but little affected by the vicissitudes of seasons, does not much fear drought, and prepares the ground very well for a succeeding crop.

Throughout Belgium and Germany, the leaves

are from time to time stripped off and given to cattle, which eat them with avidity and easily fatten upon them. Fowls are also fed upon them. They are first hashed up and then mixed with bran. Pigs eat them with a good relish. Milk-cows, when fed upon them, fatten at the expense of their milk. The leaves are equally valuable in the fattening of cattle and sheep.

Beets should be gathered when the weather is dry, and put away in a dry state; and when prepared for cattle, they must be cut up fine with some suitable instrument, and may be given either alone or mixed with straw or hay.

They are equally fit for horses, with the precaution of adding a variety of cut straw and hay, well mixed together. This food will preserve them strong and vigorous, as is well ascertained in Germany, where beets are much cultivated for this purpose.

For the fattening of a bullock, forty or fifty pounds of beets per day, mixed with five or six pounds of dry fodder, will accomplish the object in the space of four months. Care must be taken to give it in three separations, since by feeding often and in small quantities at a time, the same amount of nutriment goes farther.

Finally—by facilitating the means of stable fattening, throughout the year, beets furnish a very important addition to this means of augmenting the mass of valuable manure.

They may serve also, on occasion, for the food of men; they are less subject to the vicissitudes of seasons, than turnips, and their leaves supply for several months, an excellent food for cattle. The root may be easily preserved during eight months of the year. They give to milk an excellent taste and quality. Cattle eat them with avidity and are never tired of them. The culture of no forage root can compare with that of the beet in the number of advantages which the industrious cultivator may derive from them. We cannot too strongly recommend the introduction of them into places where they are not already in vogue.—*lb.*

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At a meeting of the Massachusetts Horticultural Society, held the 2d of June, 1832, the following papers were read by Zebecde Cook, Jr. Esq., Vice President of said Society, and ordered to be printed in the New England Farmer and Horticultural Journal.

United States Ship Concord, }
Harbor of Syracuse, Island of Sicily, Feb. 21, 1832. }

MY DEAR SIR—I had the pleasure, some time since, of receiving your letter of the 18th of July last, accompanied by a note of thanks of the Horticultural Society of Massachusetts. The few articles which I send to the Society are so trifling and of so little value, that they certainly do not deserve such particular notice.

By my friend, Lieut. Dupont, who is about returning to the United States, in the sloop of war Ontario, I send to the Society a box containing a variety of grape cuttings, selected with great care by the British Consul at this place, who is himself an experienced horticulturist and extensive cultivator of the vine. The cuttings are of seven different kinds, each kind in a separate row, with their respective names marked opposite to the rows.

Accompanying this letter you will receive a description of the vines from which the cuttings are taken, also the translation of a paper furnished at my request by the Chevalier Landolino, a scientific agriculturist of this island.

I have duly noticed your remarks in relation to "the roses which are cultivated on the shores of the Dardanelles, and in the environs of Smyrna." Expecting soon to sail on a cruise to the Levant and the coast of Egypt, I shall endeavor, in compliance with your request, to procure for the Society some of the most approved plants of that beautiful shrub.

Lieut. Shidell, who will probably visit Tunis this summer, has been requested by me to procure and forward to the Society, some plants of the rose and jessamine from that neighborhood.

The Tunisians manufacture considerable quantities of the extract of the rose and jessamine, the oil of that part of Barbary being considered peculiarly adapted to the cultivation of those plants.

I am, dear Sir, very respectfully,

Your obedient servant,

M. C. PERRY.

GEN. DEARBORN, Pres. Mass. Hort. Soc'y.

P. S.—Will you do me the favor to present my respects to Mr Cook.

Since writing the foregoing, I have received and had packed in a box directed to your Society, a few seeds from this island. They are of the white cauliflower, the red broccoli, and a sort of large red turnip highly esteemed by the Sicilians and called by them the turnip-cabbage. You will also find in the box three sorts of the flint wheat of Sicily, considered the best kind for the manufacture of macaroni, the favorite food of the Italians.

[The wheat was by a vote of the meeting sent to Gorham Parsons, Esq.]

DESCRIPTION OF GRAPE CUTTINGS FROM SICILY.

Albanillo. A small oval white grape, the bunches are of a moderate size with a thin skin, and when ripe nearly transparent; esteemed the best grape for eating and making wine in Sicily, but very easily injured by the hot winds, and on that account not so much planted as many other kinds.

Corniola. A very large oval black grape, much esteemed for eating, but not good for wine; the bunches very large and rather firm in the mouth when eaten.

Tokay. A small round black grape, excellent to eat, and the very best of all the black grapes in Sicily for wine, but soon injured by the hot winds; the bunches small, with a thin skin.

Possolana. A moderate sized oval white grape, firm in the mouth when eaten, excellent for the dessert, and makes very fine wine, but does not yield so much juice as any of the others; owing to its firmness it requires from eight to ten days longer to ripen, than the other kinds; the bunches moderate size, with a thick skin.

Occhio di Bove, or Ox's Eye. A very large round white grape, the berries very close in the bunch, which cause them to press one another, and on that account as soon as ripe are subject to decay, particularly if wet weather; a fine looking grape, excellent to eat, and makes fine wine, gives out more juice than any of the others, and ripens a week sooner; the bunches very large, and skin very thin.

Nero Grosso. A very large round black grape,

very fine for eating, and good for wine; the bunches very large, and skin thin.

Pollia. A very large oval black grape, good for eating, but not for making wine; very late in ripening, say five or six weeks after all the others, and as this vine is trained round very large and high trees, from this cause it is still later in ripening, say another three weeks. Some of these trees are as high as eighty feet and the vines run to the very top, and descend again about thirty feet, and the quantity of fruit that some of these vines produce is quite astonishing. The bunches are very large, some of them more than two feet; very firm in the month when eaten, with a thin skin. I know of no other grape in Sicily being trained round trees, and I have not the least doubt but the fruit would be much finer if grown in the regular way of Sicily, that is, on very low vines, say when pruned late in December, about eighteen or twenty inches high. This is the best time for pruning in Sicily, and which on no account ought to be delayed after January, for if left much later the vines will bleed very much, which injures them considerably. The ground ought to be well dug, the deeper the better, four or five times every year. If good wine is the object, never use any manure after the two first years of planting, and if the land is very good use no manure at all. The soil best adapted is a rich, light, dry, and flinty soil. The vine does not do well in a moist, thick, close earth. On examination of some of the soil, it has been found to contain in nine parts, five of flinty earth, two and a half of clay, and one and a half calcareous earth. Always prune the vines so as to leave only one or two eyes, at most, if you wish to make good wine; but if the grapes are to eat, you may leave a great number more. Never plant vines in ground subject to much moisture. The vintage in Sicily begins about the first of September and terminates about the end of October, according to the different situations; but the best wines are made about the middle of September, a little sooner or later, according to the season, which, however, seldom varies above a few days.

[The above was written by the British Consul at Syracuse, at the request of Capt. Perry. He has promised Capt. Perry to send to the Society at Boston, a more full and interesting description of the mode of cultivating the vine in Sicily.]

Description of the manner of planting and cultivating the cuttings of the Muscat vine of Syracuse.

—These cuttings are taken in the month of January, from a vine that must be at least twelve years old, and are cut off near the trunk.

As these shoots are to be sent to America and will arrive there in the spring or soon after, they should, upon their arrival, be placed about three feet deep in the ground, in a northern exposure, and transplanted in the autumn, to a situation exposed to the south, in a soil nearly similar to that of Syracuse, after the following manner:

Should the shoots be numerous, the ground must in the first place be well worked. The holes are made with an iron bar of the thickness of four thumbs, having a wooden handle. The shoots are then inserted in the holes, the lower extremity being first cut off and the mud cleaned from the shoot; a little dry earth is then put into the hole and rammed down; a little water being added at intervals, so that the dirt may adhere to and protect the buds or eyes, and help them to take root. The part of the branch that remains out of the

ground must be cut off, leaving only four eyes above ground, the two lower of which must also be removed.

In the month of January, (while the moon is in the wane,) the vines are to be pruned; the lower shoot being entirely removed, and but one eye or bud left on the upper shoot; should, however, the upper shoot be weak, then this must be taken off and an eye or bud of the lower one left. These operations are to be continued during five years; after which period two branches may be left, and when the vine is stout, three but not more, which are to be pruned every year.

Cultivation.—After the first rains of October, form the earth in a square concave hill, about one foot deep around the vine; as the surface of the concavity becomes hardened by rain, break it up around the trunk of the vine with a small spade.

When the vine is pruned, which must be done in January, it is to be supported with reeds, the shoots being tied at their lower part.

In March, the earth is to be broken up transversely.

In the month of April, the vine is cleared by pulling off the lower leaves, which must be done when the shoots are two feet long.

In May, the vine must be pruned and the ground broken up again in the opposite direction, diagonally; but before this is done, the young branches should be twisted together and tied to the supporting poles, in order that the trunks may be kept upright and more room given to the cultivation.

In June, the shoots must be twisted together again, bent upwards, and sustained at the height of four feet from the ground, to prevent their spreading about.

After three years are elapsed, the vine begins to bear a little grape. Pluck off the grape of the first year as soon as it makes its appearance, to prevent the waste of the sap needed by the mother vine.

In June, the ground must be again broken up transversely and levelled.

In August, when the vine is five years old, the ripe grape is gathered, and a few days after, the remainder. If the grapes happen to be dried by the sun, place them in the great tub in small heaps, leaving them there about two days; should they be fresh, they should be spread on mats and exposed to the sun until dry, taking the precaution to cover them with other mats and remove them within the house at night. The grapes are trampled in a large tub and afterwards pressed in the mill; the juice expressed is put into small tubs, and when one year old, may be bottled off.

[The above is the translation of a paper furnished at the request of Capt. Perry, by the Chevalier Landolino, a considerable land-holder in Sicily.]

Hemerocallis Flava, Yellow day-lily.—This is a very beautiful flower, perfectly hardy, of a bright gold yellow, and of a delicious fragrance. The flower is of the form of the common white lily.

Rhododendron Ponticum.—Now in full bloom. This is a most splendid shrub, either for the garden or parlor, being sufficiently hardy for either. The flowers are light purple and clustered in large heads. The buds open successively, so that the various stages from the commencement to the full expansion of the flowers, exhibited by the different parts of the shrub, have a beautiful effect.—*American Farmer*.

Agriculture.

MASSACHUSETTS AGRICULTURAL SOCIETY.

Report of the Committee on the best culture of Farms.

The committee appointed by the trustees, to examine and consider the claims for premiums for the best cultivated farms, submit the following report:—

The committee, with much regret, find that the premiums offered by the trustees, for the best cultivated farms, have not received the attention from our respectable farmers, that was expected. Only three applications have been made this year; and although they all have merit, and appear to come from skilful agriculturists, your committee do not perceive in either of them such superiority, either in their processes or results, as would justify them in recommending a premium. They had hoped that the encouragement offered, and the desire which they knew was generally felt by that respectable class of citizens, to promote the interests of agriculture, would excite a generous competition among our most intelligent and practical farmers, which would prove useful to themselves, and more useful to their brethren who had less experience and skill than themselves, by enabling the trustees to communicate, through their statements, their methods of cultivating their farms, with results—the most satisfactory tests of good husbandry. The information communicated in this way, would be founded on and accompanied by a history of the experiment, the best foundation of all science, and more especially of improvement in agriculture. To answer this end, or indeed any other valuable purpose, it is indispensable that the applicant should state with much particularity, the kinds and qualities of the soil of his farm, his manner of tilling, manuring, planting, sowing, and gathering his crops; of manufacturing his butter and cheese, and making and preserving his cider; his rotation of crops, and the quantity of produce of every kind, and indeed all his processes and operations in carrying on his farm. To prevent misapprehension and insure this benefit from their statements, the trustees, in their proposals, specified with minuteness the particulars which they deemed necessary to render their account useful to the public, and which they required to be stated as the condition on which the premium would be allowed; and although it was perceived that this particularity might occasion some trouble to the farmers, it was hoped that the benefit they might derive from a more accurate record of their own proceedings, the consciousness that they were benefiting the public and the premium offered, would be deemed an adequate compensation. The committee, although twice disappointed, do not relinquish the hope they at first entertained, nor feel a doubt of the benefits that will accrue to our farming brethren from this measure, if they see fit to co-operate in carrying this into effect.

It is well known that the trustees, for many years past, have given premiums for the encouragement of the cultivation of nearly all the different agricultural products, vegetable and animal, that are grown in our country, and thereby materially promoted improvements in most of them; the judicious management and cultivation of a farm, it is thought, requires a combination and practical exercise, by the farmer, of all the knowledge and skill necessary for the cultivation of the

articles separately, that are produced on that farm. It is obviously a different science, more complex, more difficult to learn; requiring judgment, experience and observation to carry it into successful practice. A man may know how to cultivate any or all of those vegetables separately, and yet not understand how to carry on a farm for the best advantage. Next to an individual's own experience, is a true and particular account by others, of a judicious and skilful cultivation and management of farms like his own, where the expense of labor, markets for crops, and habits of living, are nearly the same; if he can have their method and practice fully and accurately communicated to him. The latter is indispensable to enable him to adopt their experience as his own. It will probably be found, that many important agricultural processes are yet unsettled among our intelligent farmers, and some practise one way and some another—sowing of grass seed is an instance, whether it is best to sow it in the fall or spring, by itself alone, or with grain and what grain. Different practices and opinions on this head, will be found in the few communications the committee have received. Nothing in the opinion of the committee would tend more to settle these questions, which must be determined by experience, than an interchange of the opinions and accounts of the practices of scientific and experienced agriculturists, which a competition for these premiums would produce.

Although the committee entertain these views of the subject, they cannot but feel a discouragement from the want of interest the public appear to take in it, which certainly ought to lessen their confidence in its practicability, if not its utility. They however venture to recommend the continuance of a bounty for this object, for one year more; provided the trustees shall think themselves justified in raising the premiums to an amount, that will liberally indemnify the successful candidates for all the trouble and expense of taking the particular account required, and be considered an honorable mark of distinction to an intelligent practical agriculturist.

The Rev. Morrill Allen, of Pembroke, has claimed a premium for his farm of about seventy acres in that town. His statement, the committee think, shows him to be a scientific and judicious cultivator. He states, that he had no capital, and, in seamen's phrase, "was obliged to work his passage;" and it appears that he began with purchasing small parcels of land, one after another, gradually subdividing the bushes, and inclosing them with walls, and then proceeded to improve the soil. Part of the land consisted of old fields, which had been exhausted by tilling without manure. These he renewed principally by the incorporation of earths of different qualities; the cold and tenacious soils he dressed with silicious earths, and other materials that tended to open and warm them; and sandy soils he dressed with clay and swamp mud, and alluvions in which sand formed the chief part.—The committee think Mr Allen has shown judgment and discrimination in the mixture of earths, and making compost manures adapted to the quality of the soils to which they were to be applied, that is worthy of notice and imitation. It will be seen by Mr Allen's statement, that he makes yearly from 300 to 500 loads of compost manure, by carrying earths, swamp mud, and vegetables, into his barn-yards, and adapting the mixture to the soils it is intended for. This is rather a large quantity for the land he cultivates, and accounts for his crops

of grass on land once exhausted. Last year he planted seven acres of Indian corn, three loamy and four sandy soil, and in one acre of the latter, six cords of compost manure, and in another six cords of lime were spread, but he omits to state the quantities produced on these particular acres. No manure was laid on the other five acres, and the whole produced two hundred and ninety-eight bushels, which may be considered a fair crop for the quantity of manure used. Mr Allen's rotation of crops is simple. He tills nine acres, which he plants alternately with corn or rye, and once in five or six years plants with potatoes, or beans, or some other vegetables, which he thinks makes a favorable change from his common course; but here again he omits the quantity of manure used. His practice, he says, is, as soon as he has taken off the crop of rye, in August, to plough in the stubble and sow grass seed, which produces herbage that he afterwards ploughs in as a green dressing. This practice the committee take upon themselves to recommend, convinced that the farmer would find his labor and expense amply compensated, by its mellowing and enriching his land, and saving his manure, the most precious article on his farm. The committee regret that Mr Allen has not stated when he sowed his rye, whether in the spring or fall. It was, they believe, generally been thought, that in common seasons Indian corn would not be ripe for gathering in season to sow winter rye. If this can be effected by planting early, or using corn that ripens early and yields well, it might often be found a convenient and advantageous succession of crops.—Spring rye is by many not thought so certain a crop; but on this question a more extensive knowledge of the practice and experience of successful farmers is wanted. Mr A. has also omitted the quantity of rye produced in this rotation of crops; but he tells us that in laying down his tilled land, he prefers sowing his grass seed alone in the month of August, that September will answer better than either of the spring months, and that it is better to sow it with winter rye than with any spring grain. His clayey soils, not suitable for grain, he sometimes turns over with a plough immediately after the grass is cut, rolls down the furrows, and puts on a dressing of manure and seed again. In this way, hay is his principal crop; and it appears, that upon twenty acres which had been ploughed and laid down, and twelve acres of meadow and irrigated land, he usually cuts, according to his estimate, thirty-three and three quarters tons of English hay of first quality, ten tons of second quality, and fourteen and one third tons of inferior hay, making about fifty-eight tons, better than one ton and a half to an acre, and over a ton of the first quality to an acre. The committee regret Mr Allen did not receive the trustees' notification in season to ascertain the quantity of hay made this year, as he put it into his barns. The estimate furnished is one made in 1827, when the hay was in the barn; and he says his crops have varied but little for four or five years past. Mr A. sells from ten to fifteen tons of hay annually, and keeps but a small dairy. Mr Allen states, that forty acres of his land are of a light sandy soil, and so much exhausted by tilling without manure, that he was discouraged from attempting to recover it in his usual way, and that last spring he ploughed three acres, fenced it in, and sowed it with lucist seed, which have come up and look well, and he expects, if the worm should spare them, they will

enrich his land, and produce a valuable though distant crop of timber and cord-wood. He has also ploughed and sowed five acres, this fall, with white pine seed, and was about ploughing in several acres with white-oak acorns. These experiments the committee consider useful to the public and creditable to the enterprising cultivator, and they most heartily wish him success. One man and a boy sixteen years old, are employed constantly on the farm; and in addition, day-laborers are frequently hired.

It would give the committee pleasure to be able to recommend a premium to this respectable and skilful cultivator; but, considering that the statement of the applicant to whom a premium is given, should not only show that his farm was judiciously cultivated, and his particular method, but also the quantities and amount of all the products, with as great certainty as the nature of the case will allow, in order that other farmers may be able and induced to improve his example; they think they should not be justified in recommending a premium to be awarded him; but they hope the trustees will see fit to bestow on him a gratuity of fifty dollars, for the example he has set of judicious and skilful husbandry.

Peter Thacher, Esq., of Attleborough, has claimed a premium for his farm in that town, consisting of three hundred acres. Mr Thacher's statement shows that he has exercised good judgment in subdividing, renovating, and enriching his extensive farm. It appears, that about ten years ago he purchased an old farm of two hundred acres, now part of his farm, that for several years yielded him only three or four tons of hay, where he now cuts from thirty to forty tons of English hay. His method of cultivating, he says, has been to remove hedges and subdue the bushes by degrees, and plant but little and manure that highly. He usually spreads five cords of manure on an acre, and puts five more in the hills, and for four or five years past has gathered crops of two hundred bushels of potatoes and sixty bushels of corn to an acre. That which Mr T. seems to consider as his greatest improvement, is the bringing into good cultivation a piece of wet land, on the sides of a hill, covered with weeds and bushes. He commenced with the upper part, ploughed half an acre, drained it, and then carried on a quantity of old hay and long manure, and planted it with potatoes and hoed them without ploughing, and it yielded a large crop of good potatoes; and in this way he reduced the whole piece, and it now produces a great crop of English hay. His rotation of crops has been potatoes the first year, the second corn, and the third spring rye, with which he sows grass seed as early as the state of the ground will permit, and rolls it down with a heavy roller. He prefers spring rye to oats, to lay his land with, and the spring to the fall, and thinks the grass seed takes better with rye than oats. Mr T.'s practice is to make large quantities of compost manure in his barn-yard and hog-pens; in the fall he carries it all out of his yard, and the next spring spreads the manure thrown out of the barn, over the straw and hay that have been collected in the yard during the winter, and covers the whole with a crust of loam that he carts in, which he thinks prevents the strength of the manure from escaping. This compost he uses both for his corn and grass. Mr T. has five hundred apple trees on his farm, four hundred of which are mostly natural fruit, and appear to have received no particular atten-

tion from him; the other hundred are young trees engrafted with good fruit, and these he has practised washing every spring with soap and ley, mixed in equal parts, and digging around and manuring them. He keeps fifty sheep, for some of which he says he has received a premium in his own county; but takes no more butter and cheese than is wanted in his own family. The committee were particularly pleased to find that Mr T. was able to carry on this large farm without any ardent spirits. This practice, wherever adopted, will prove as beneficial to the laborer as the farmer—highly beneficial to both.

Although the committee cannot report that they consider Mr Thacher entitled to the premium proposed by the trustees, they with pleasure state, that they think he has great merit as an agriculturist, in subdividing and bringing to a state of good cultivation a farm, which a few years since, consisted of rough, exhausted, and profitless land.

Jonathan Allen, Esq., of Pittsfield, in the county of Berkshire, has also presented a claim for a premium on his large and excellent farm in that town, accompanied by a statement of his manner of cultivating, and the products he gets from it. The farm consists of forty acres of meadow or interval, which receives its manure annually from the overflowing of the Housatonic, and about two hundred and ten acres of upland. Mr Allen appears to have exercised much agricultural science, as well as care and attention, in the cultivation of his farm and in making useful agricultural experiments. It will be recollected, that Mr Allen applied for a premium on this farm last year and presented a statement of his manner of cultivating it, the crops it produced, the rotation he has practised, and the result of his experience as to the best time and manner of laying down land to grass. This statement was noticed by the committee, and published with their report in the Massachusetts Agricultural Repository. His statement as to the general course of his husbandry is not materially varied this year, and the committee regret to find almost the same want of particularity as to the quantity of products. The quantity of hay, his principal product, rests on estimate, without having weighed a load; a small part only of the winter rye and oats were threshed, and no part of his spring rye or beans were threshed or in any way measured; but his Indian corn was, and four acres were found to produce four hundred and fifty bushels of ears; Indian corn was grown upon the same land the year before, and this year it was manured with seventeen loads to the acre, put in to the hills. Sheep are the principal stock of the farm; he kept four hundred and thirty this year, from three hundred and fifty of which he sheared eight hundred and fifty-one pounds of wool of the first quality. May he considers the best time for lambs to come. Mr Allen states, that in years past, he has made experiments in raising potatoes, and this year has made many more with care and attention, which, in the judgment of the committee, entitle him to the thanks of the public. For a particular account of these experiments they refer to his statement, which accompanies this report, and recommend it to the attention of agriculturists. From a remark of Mr Allen, that he could not with convenience thresh out his grain in season to measure it so early as was required, the committee apprehend he must have misunderstood their regulation, which only requires that the application should be made by the first of October,

but the evidence or particular statement may be exhibited any time before the first of December. It appears to the committee that Mr Allen has cultivated his farm like a skilful and attentive agriculturist, and realized great products, and they hope profits; but his statement is too general and indefinite, leaving the quantities of the greatest part of the product to depend on estimate; and they think does not, on the whole, show his cultivation so superior as to justify them in reporting in favor of a premium. Considering, however, the pains Mr Allen has taken to introduce upon his farm a variety of vegetable products and choice fruit, and especially the nice care and attention he has given to the cultivation of potatoes, the most valuable of our roots, the committee recommend a gratuity of thirty dollars to be granted him.

WM. PRESCOTT.
P. C. BROOKS.

Silk-worms.—The editor of the *Jerseyman*, published in Morristown, N. J., states, that a gentleman engaged in the culture of silk informed him, that "the leaves of the oak were equally acceptable to the silkworm, as those of the mulberry tree." For the twentieth time we would suggest to editors the propriety of bestowing much attention to the true nature of silkworms, before they venture to publish such statements as the above. They are calculated to do much mischief, by disappointing new beginners, and causing waste of time and money. The editor of the *Jerseyman* is assured, that silkworms will only eat oak leaves, as men eat old shoe soles, when reduced to a state of starvation; that there is no substitute for the mulberry leaf in the production of silk; and that whoever asserts the contrary, is either uninformed on the subject or disposed to hoax his too credulous auditor.—*American Farmer*.

Fruit Trees.—Great complaints are made by orchardists and others at the North, of the destruction of fruit trees during the past winter. The severity of the last winter has been no less fatal to the tender and more choice fruit trees of this part of the country; a large proportion of peach trees are absolutely killed, as well as apricots, nectarines, and the more choice kinds of plums and cherries. The foreign grape vines have nearly all been killed to the ground.—*Illinois Advocate*.

Peach Trees.—A friend informs us, that he has saved his peach trees from destruction by the *bercer*, by placing the cinders from the forge around the roots. This method keeps the trees in a perfectly healthy state; and was discovered by the flourishing appearance of a tree near a blacksmith's shop.—*Salem Observer*.

Cast Sheet Lead.—The "Baltimore Shot Tower Company," it will be seen by their advertisement, offer to the public lead cast in sheets, to be used for the covering of houses and for all purposes to which lead of this description is usually applied, especially when exposed to the action of the weather. Lead thus prepared is said to be as little affected by the heat of the sun as copper; and it will no doubt be extensively used, forming as it does, a durable, impenetrable, and incombustible roof.—*Baltimore paper*.

France, with a population of 32,000,000 has 5,000,000 paupers; 130,000 thieves; and 3,000,000 who have no certainty of a month's subsistence.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, June 6, 1832.

NOTICE.

The Massachusetts Society for Promoting Agriculture will hold their annual meeting at the hall of the Union Bank, on Wednesday, the 13th day of June next, at 11 o'clock, A. M., for the choice of officers and such other business as may come before them.

BENJ. GUILD, *Ag. Rec. Sec'y.*

THE SEASON.

The present season is backward and unpromising beyond all precedent, so far as our memory or reading extends. For about eighteen days, immediately preceding this, June 5th, we have had nearly uninterrupted northeast winds, lulling and shifling a little, occasionally, as if to take breath for fresh efforts.

"See now a dull northeast wind blows
From horrible ice islands,
Now blasts from everlasting snows,
Which crown the polar highlands."

Although Indian corn had in many instances made its appearance above ground, it is now yellow, sickly, and we fear incurably consumptive. Many kinds of garden seeds have rotted in the ground, and those which have germinated are in a worse state as respects the prospects of a crop, than if they had never been, but were to be planted. We have seen early cabbages, however, in the garden of Mr Lowell, which appeared to enjoy this Siberian weather; but beans, squashes, &c., had barely remains enough of vegetation, to show that they had existence; but most of them were so far gone that no summer's sun could be expected to resuscitate them. Grass, particularly lucerne and tall meadow oat grass, (of which Mr Lowell has a flourishing field,) were very backward, but thick at the bottom, and promised an abundant crop of hay.

Mr Lowell had cut down between sixty and seventy of the trees of his orchard, which were so thoroughly smitten by the plague of the last season as not to put forth any leaves, and he apprehends that many more are mortally diseased. All his Baldwin apple trees are gone; all or most of his peach, cherry, and plum trees. And Mr Lowell thinks that he shall not be certified of the full extent of his loss, till about the 15th of June, as some trees show signs of vegetation, notwithstanding the hand of death is upon them, from the same principle which causes twigs which belong to sticks of wood, cut and lying on a wood-pile, to show leaves in the spring, which the first hot sun will destroy.

If we New Englanders can receive any consolation from companionship in our miseries of the season, we have it in this case. The Nashville (Tennessee) Republican of May 24th, says, "The weather still continues cold and unfavorable for agriculture. Corn and cotton must suffer much. Since Monday the 7th inst., on which day we were visited by a tremendous tempest, there has been hardly a day of fine growing weather; for three mornings in succession, our thermometer at sunrise has stood as low as fifty degrees. Besides the direct bad effect of such a temperature, it must lead to great destruction from the worm."

"We have discovered further evidence of the

extreme cold of last winter, in the destruction of a great number of forest trees. Nearly all the large and lofty sweet gum trees at the bottoms are entirely killed; making the forest in many places still bear the appearance of winter. Many trees of other descriptions have suffered in the same way."

The Providence Daily Advertiser, likewise complains as follows:—

"On Thursday night last, [May 24.] there was a fall of snow in this vicinity, and on Friday morning the fields presented the novel appearance, for this season of the year, of being covered with snow. Our oldest inhabitants say, they do not remember of having seen so much snow on the ground in a former year, so late as the 25th of May. The thermometer on Thursday and Friday last, fell to forty degrees. Great-coats, cloaks and fires, were in great demand. It is thought that the storm will not have an unfavorable effect upon the fruit, grass, or English grain. The growth of Indian corn will probably be very much retarded by the wet and cold; though we believe there is very little corn up, as yet, in this vicinity."

SHEARING SHEEP, &c.

Deane's New England Farmer states, that "we shear our sheep in general too early in this country. In England, where the spring is more forward than in this country, the approved time of shearing is from the middle to the latter end of June. They should be washed in a warm time; after this they should run three or four days in a clear pasture, before they are shorn. It is good for them to have time to sweat a little in their wool, after washing."

Mr Lawrence says, "June seems [in England] to be the general shearing month, and where no extraordinary precautions are taken, the business had better be delayed till towards mid-summer, more especially in cold backward springs; because in such seasons we seldom, until that period, have any settled fair weather. Besides, a more perfect fleece is obtained, and fuller of yolk from the perspiration of the animal."

"Washing previous to clipping the sheep is the general custom, with few exceptions, in this country; indeed it is proper with all long-wooled sheep, but not so easily practicable with the matted, greasy, and impenetrable fleeces of the Spanish and carding-wool breed, which in Spain they invariably shear dry, as has been the practice in Devonshire, with the short-wooled sheep, for centuries."

It is observed by London, that "sheep shearing in Romney Marsh, [England] commences about mid-summer and finishes about the middle of July. Those who shear latest apprehend that they gain half a pound weight in every fleece, by the increased perspiration of the sheep and consequent growth of the wool. Besides, they say, in early shearing the wool has not the condition which it afterwards acquires. But then in late shearing the fleece will have the less time to grow, so as to protect the animal against the rigors of the succeeding winter; and if a year's interval is allowed between each clipping time, after your routine is established the wool will have had the same period for its growth, whether you shear early or late. Sheep with fine fleeces, which are shorn without being washed on the back of the animal, may be clipped earlier in the season than

those which are exposed to suffer for half an hour or more in cold water."

Lemuel W. Briggs, Esq., of Bristol, R. I., in articles published in the New England Farmer, volume iii. pages 273, 287, stated certain facts, which would seem favorable to early shearing; and in certain circumstances, and particularly with sheep which are not washed, there can be no doubt but the practice is beneficial. Mr Briggs stated in substance, that Mr Rouse Potter, of Providence island, Narraganset bay, Rhode Island, who kept nine hundred and fifty sheep and lost but two the preceding winter, begins to shear them by the first of May if the weather is favorable, and continues daily until he completes his shearing. For the first week, he puts those sheared under cover or in close yards every night; by that time the wool will grow so as to give them a sufficient covering. By this practice of early shearing, he gains much wool, which formerly, when he put his shearing off till the middle of June, the sheep would shed; and farther, when thus early sheared, the wool begins to start and grow much quicker than when shearing is deferred to the usual time. He says, that formerly, being exposed immediately after shearing to the rays of the sun, their bare backs would frequently become sore and scabby, when no wool will grow till healed, and then what does grow from these scars is thinner and coarser than the rest.

"Mr Potter states, that he has found from actual experiment, that he not only gets more wool which would otherwise be lost, but the succeeding wool will be from half an inch to an inch longer, if sheared early, than it will be if delayed to the usual time of shearing. And further, there is not the same necessity for washing the sheep, as the wool is much cleaner, more free from sand and dirt, when taken off early, than it would be if suffered to remain on their backs until a hot sun had compelled them to seek refuge under walls and fences."

The foregoing authorities are apparently altogether contradictory, as respects the time of year in which to shear sheep. But it is to be observed, that Mr Potter did not wash his sheep before shearing, which must make considerable difference with regard to the risk from cold; and Mr Potter appears to have been careful to shelter his sheep after shearing, which must in a great measure obviate the disadvantages of early shearing.

From the Halifax Recorder of May 16.

THE SEASON IN NOVA SCOTIA.

The Apostle's virtue of being content with whatsoever state he is placed in, should be practised now when it is so much required, and when discontent and grumbling find so many excuses for creeping in and spoiling our bosoms. In this third week of May, when we were wont to have the atmosphere balmy and the face of nature blooming, and perhaps when we were wont to treat those blessings slightly, we have blackness and darkness above, and the melancholy tinge of March upon our fields. Monday and Tuesday we had a gale from the east, accompanied with heavy chilling rain; the wind veered from the southward round by the east to the north, "against the sun;" and this, not favorable prognostic, has been followed by appropriate weather. The large sea-coal fire or the stove, is still a most necessary appendage to in-door comforts. Added to this, we have

distressing rumors of failure of fodder in the country, and consequent suffering of cattle and despondency of farmers. Here we cannot avoid to again express regret, that the profusion of last fall was so miserably husbanded, neglected, and almost despised in many instances.

It appears by the New England Farmer, that the backwardness of the spring is general over the American continent; and the United States and Canada, it would seem, feel its severity more than we do. Nevertheless, at this time particularly, when pestilence has walked over such a large portion of our globe, spreading terror and death wherever he has approached, the continuance of keen strong winds may be a blessing; by them, perhaps, our atmosphere is cleansed and the seeds of disease scattered, which sudden warmth might have nurtured into fearful vigor. Neither is it too late to experience a fine fruitful summer, which haply may be in reserve for us, in this treasury, who has so often crowned the year with goodness.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At a stated meeting of the Massachusetts Horticultural Society, held at their room on Saturday, June 2d, 1832, it was

Voted, That the thanks of the Society be presented to M. C. PERRY, Esq., for his valuable donation of seeds and grape cuttings.

It was then voted, That the seeds presented to the Society by M. C. Perry, Esq., be sent to Gorham Parsons, Esq., of Brighton, for cultivation, and the grape cuttings be committed to the care of Messrs Winslows, of Brighton.

Thomas B. Tremlett, of Dorchester, was admitted a member of the Society. Adjourned to Saturday next.

Flowers exhibited.—Fine tulips were offered by the following gentlemen: Amos Lawrence, of Boston; John Prince, of Roxbury; P. B. Hovey, of Cambridgeport; David Haggerston, of Charlestown; S. Walker, of Roxbury.—P. B. Hovey exhibited fine specimens of ranunculus.

The standing committee on flowers, &c, awarded the premium of four dollars, for the best tulips, to Mr S. Walker, of Roxbury.

R. L. EMMONS, *Chairman.*

Cloth Strainers.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, Milk and Cheese Strainers;—likewise, Gaul's patent Churn, the most approved churn in use; Levett's improved Cheese Press; Curd Mills for preparing curd, a very useful little implement for the purpose intended.— June 6.

Brass Balls for Cattle Horns.

FOR sale at the Agricultural Warehouse, Brass Balls for Cattle Horns, improved, which renders them easy for fitting and do not injure the growth of the horn. These balls are not only a safeguard against unruly animals, but add much to the appearance of a likely animal. June 6.

Situation Wanted.

A man who has worked thirty years at gardening in Europe, and considers himself competent in all out of doors business, wishes to get a situation. As he is averse to being idle, he will cheerfully endeavor to make himself useful in any other business about the house or farm, as occasion requires. Apply at this office. June 6.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No. 110 State street, by ALBERT FEARING & CO

Cast Steel Seythes.

JUST received at the Agricultural Warehouse, a further supply of Cast Steel Seythes of very superior quality and warranted in every respect; and were recommended by those persons who used them the past season, as being the best article of the kind in use. Likewise, a general assortment of steel-back and common Seythes, of the most approved manufacture. Likewise, a few dozen of Elder Hall's very superior Hay Rakes. June 6.

Wanted.

THE following numbers of the New England Farmer, for which the subscription price will be allowed:—No. 1 of vol. ii. Nos. 2 and 19 of vol. iv. No. 13 of vol. vi. Index to vol. vii. No. 2 of vol. viii.—Apply at the N. E. Farmer office. May 30.

Seed Corn, &c.

FOR sale at the New England Seed Store, No. 504 North Market Street, several kinds of Seed Corn in ears, the finest varieties cultivated in New England, 8, 12, and 16 rowed.

Also, a few seeds of the Early Lemon Squash, from the western part of this State, which is considered one of the finest varieties of summer Squash cultivated, being a week earlier than the Scalloped or Warded Squashes, and of much superior flavor, drier, and somewhat resembling the Canada Squash in taste; producing abundantly till killed by frost. Price 12½ cents per paper. May 23.

Straw and Palm-leaf Splitting Machine.

FOR sale at the Agricultural Warehouse, No. 504 North Market Street, Guild's Improved Palm-leaf and Straw Splitting Machine, calculated for fine and coarse straw.

Also, Cast Steel Seythes of superior quality, warranted genuine. May 23.

Pickering's Tree or Caterpillar Brushes.

FOR sale at the Agricultural Warehouse, No. 504 North Market Street, Pickering's Improved Tree Brushes.—This article, (which is likely to be in greater demand this season, than for many previous years,) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use. May 16.

Conqueror.

THE entire horse Conqueror will stand the ensuing season at the Ten Hills Stock farm in Charlestown, two and a half miles from Boston, at ten dollars, to insure a mare in foal, secured by a note at ten months, to be valid and payable in case the mare proves to have been in foal, and one dollar to the groom at the time of covering.

Conqueror was bred near Montreal (Canada) foaled in May, 1825, and sired by a noted Normandy horse out of a blood mare—he is rising 15 hands high and remarkably well grown, combining great power, generous spirit, good action, very docile in his temper, and of that hardy color, iron gray. This horse has taken three premiums in Canada, as the best horse in that country. He has probably as much, or more than any other horse now living, of the strains of blood so well known in N. E. by the name of "the Morgan breed"—from the best accounts the original Morgan horse was made up of the same strains of blood as Conqueror. Conqueror has proved a sure foal-getter, and is recommended to the public by

SAML. JAKUES.

The full blood horse Sportsman also stands as above—for pedigree see late Nos. of the Farmer. May 16, 1832.

Davis' Improved Dirt Shovel.

FOR sale at the Agricultural Warehouse, No. 504 North Market Street, Davis' Improved Dirt Shovel for excavating or leveling dirt.

This may certify that I have been using Shadrach Davis, Jr.'s patented Scraper, and am fully satisfied that it is much better than any other scraper of the kind, for digging and clearing cellars, that I have before used or seen. Fairhaven, July 12, 1831. ANSEL WHITE.

This may certify that I have used Shadrach Davis, Jr.'s patent Scraper on the roads in this town, and find it a machine superior to any other I ever used before, for removing earth; and would hereby recommend it to public patronage. LEVI SHAW. New Bedford, Aug. 22, 1831.

BRIGHTON MARKET—MONDAY, JUNE 4, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 268 Beef Cattle, (including 14 unsold last week,) 6 pairs Working Oxen, 15 Cows and Calves, 86 Sheep, and 160 Swine. 24 Beef Cattle remained unsold at the close of the market.

The Swine were reported last week.

PRICES. Beef Cattle—The Cattle generally were not of so good a quality as last week, but about the same prices were obtained; we shall quote the same—extra at \$7 a 7.25, prime at 6.50 a 6.75, good at 6, and thin at 5 a 5.75.

Working Oxen.—We noticed no sales.

Cows and Calves.—We noticed sales at \$17, 21, 23, 27 and 32.

Sheep.—We noticed the sale of one lot of sixty at \$5 each.

Swine.—We noticed one lot taken at a fraction short of 5 c for sows and 6 c for barrows; at retail, 6 c for sows and 7 c for barrows.

NEW YORK, June 1.—Stock of every description has been in demand and very scarce, Beef Cattle particularly so, and high prices have been paid; the average of sales this week being \$8; we quote from 7 to 9. Cows and Calves—sales are still made from \$18 a 25. Sheep—scarce, sales quick from \$3 a 6; Lambs 2.50 a 4. Live Hogs—but few arrive, and what do, sell quick at \$4 a 4.25 per hundred.

Miscellany.

EXCURSION IN FLORIDA.

BROWSVILLE, East Florida, Dec. 31, 1831.

MY DEAR F.—I have just returned from an excursion down the Halifax river, about forty miles from this place and eighty south of St Augustine. We meandered down a creek of about eleven miles; the water nearly torpid, yet clear; the shore lined with thousands of acres covered by fall grapes, marshes, and high palm trees. Before long we entered the Halifax river, an inland arm of the sea, measuring in breadth from a quarter to nearly a mile.

At sunrise the next morning, I and four negro servants proceeded in search of birds and adventures. The fact is, that I was anxious to kill some twenty-five brown Pelicans. I proceeded along a narrow shallow bay, where the fish were truly abundant. Would you believe it, if I was to say that the fish nearly obstructed our highway? Believe it or believe it not, so it was; the water was filled with them, large and small. I shot some rare birds, and putting along the shore, passed a point, when lo! I came in sight of several hundred pelicans perched on the branches of mangrove trees, seated in comfortable harmony, as near each other as the strength of the bough would allow. I ordered to back-water gently; the hands backed-water. I waded to the shore under the cover of the rushes along it, saw the pelicans fast asleep, examined their countenance and deportment well and leisurely, and after all, levelled, fired my piece, and dropped two of the finest specimens I ever saw.

The fish were as abundant as ever. I ordered the net to be thrown overboard, and in a few minutes we caught as many as we wanted—fine fish too, bass and row-mullets. The porpoises were as busy as ourselves, and devoured them at a great rate. The boat was abandoned; the game fastened on the backs of the negroes; the guns re-loaded, and on we proceeded through the marsh first, then through the tangled palmetoes, and scrubby, sturdy, live oaks, until we reached the sea beach. Pretty walking along the sea beach of Florida in the month of December! with the wind at north-east, and we going in its very teeth, through sand that sent our feet back six inches at every step of two feet that we made.

To give you an account of the little I have seen of East Florida, would fill a volume, and therefore I will not attempt it just now; but I will draw a slight sketch of a part of it.

The land, if land it can be called, is generally so very sandy that nothing can be raised upon it. The swamps are the only spots that afford a fair chance for cultivation; the swamps, then, are positively the only places where plantations are to be found. These plantations are even few in number; along the coast from St Augustine to Cape Carnaveral, there are about a dozen.

Sugar cane will prosper and doubtless do well, but the labor necessary to produce a good crop is great! great! Between the swamps of which I now speak, and which are found along the margin lying west of the sea inlet, that divides the main land from the Atlantic, to the river St John's of the interior of the peninsula, nothing exists but barren pine lands of poor timber and immense savannas, mostly overflowed, and all unfit for cultivation. That growth which in any other

country is called underwood, scarcely exists, the land being covered with low palmetoes, or very low, thickly branched, dwarf oaks, almost impenetrable to man.

I am extremely disappointed in this portion of the Floridas, and would not advise any one to visit it. It is not an uncommon occurrence to find snakes afloat, and at great distances from the shore. This appears, no doubt, surprising to those who live where there is almost nothing but dry land; still they ought to be good-natured and believe what others have seen. It has now been made notorious, that numerous respectable individuals whom duty or the love of adventure have led into the wilds of our country, have often seen snakes, and the rattle-snakes too, in the trees. The good people, therefore, who pass their lives in stores and counting houses, ought not to contradict these facts, because they do not meet with rattle-snakes, hissing and snapping at them from the paper mulberries, as they go home to their dinners.

JOHN JAMES AUDOBON.

MODERN DEFINITIONS.

Marriage: The gate through which the happy lover leaves his enchanted visions and returns to earth.

Jury: Twelve prisoners in a box to try one or more at a bar.

Young Attorney: A useless member of society, who often goes where he has no business to be, because he has no business where he ought to be.

Beauty: An optical delusion.

Rural reflection: Potatoes and earth.

Woman's love: A rainbow melting in tears.

Moral rectitude: Great care not to be found out.

Public abuse: The mud with which every traveller is spattered on his road to distinction.

Love: A disease.

Constable: A species of snapping turtle.

Happiness: A dream.

Modesty: A beautiful flower that flourishes only in secret places.

Lawyer: A learned gentleman, who rescues your estate from your enemy and keeps it himself.

My dear: An expression used by a man and wife at the commencement of a quarrel.

Incestry: The boast of those who have nothing else to boast of.

Jalousy: Tormenting yourself for fear you should be tormented by another.

Martyr: That which all faiths have produced in about equal proportions; so much easier is it to die for religion than to live for it.

Tongue: A little horse, which is continually running away.

Melancholy: Ingratitude to heaven.

Originality: Undetected imitation.

Compunct politeness: "No, I thank you."

When Dr Sheridan called one morning on Miss M'Fadan, to take his leave of her for a few days, the young lady asked, in a tone that well expressed more than the words which accompanied it, how long he intended to stay away? To which he immediately replied:—

You ask how long I'll stay from thee;

Suppress those rising fears;

If you should reckon time like me,

Perhaps ten thousand years!

This reminds us of an elegant and complacent tetrastich, attributed to the Doctor's illustrious

poetical namesake, the late R. B. Sheridan, who having on one occasion, staid, not away, but too long with his fair one, exclaimed at parting:—

Too long I've staid—forgive the crime,

Like moments flew the hours;

How lightly falls the foot of time,

Where'er he treads on flowers.

The following is a monkish composition, the Latin not being classical. The word "tumba" is found in no Roman author. The epitaph runs thus:

Hic jacet, in tumba,
Rosamundi, non Rosanunda,
Non redoleo, sed olet,
Que redolere solet.

The literal translation is: "Here lies in the tomb, the rose of the world, not a fragrant rose; for she who used to exhale perfume, has now a disgusting odor." In English we might say:—

Within this dark and silent tomb repose
The bones of her, once styled the world's fair rose;
How chang'd, alas, is Rosamond the fair,
Whose fragrance once perfumed the ambient air.

"Accomplishments."—Many parents in the United States are now paying masters enormous prices for giving their children, what fashion is pleased to miscall, accomplishments; that is, things which are not learnt, and would be of no use if they were. Many a poor youth, at the same time, is laboring up the steep of practical knowledge, unaided and in his own way. In the next generation, how many of the former will be down in the world, and how many of the latter up?

Young Cleveland.

THIS truly beautiful and valuable Horse is of the Cleveland bay breed of horses, of fine even temper, five years old the 20th of May, fifteen and a half hands high and of a beautiful dark bay color, with black mane, tail and legs. He walks and trots remarkably easy and fast; and is equalled by very few for muscular strength, elegant movement, and perfect symmetry of form. He has proved himself a sure and first rate foot getter. The colts-sired by him possess a great share of bone and muscle.

The pedigree of Young Cleveland:—He was sired by the celebrated bay horse, Sir Isaac, the son of the noted horse, Molinex. Sir Isaac was presented to the Agricultural Society of this State, by Sir Isaac Coffin, and was selected under his order as superior of his breed, and the breed recommended by him as the most highly esteemed for gentlemen's carriages, and all draft, farming, and saddle purposes, of any horses in New England.—His dam was a first rate and high spirited native mare. He will stand the ensuing season, at the stable of the subscriber, in Franklin.

TERMS:—Three dollars the single leap; five for the season; and eight to insure the mare with foal; the money to be paid when the mares are taken away, on notes given payable the 1st October next. Those persons who put mares to the Young Cleveland and have them warranted, and part with them before foaling time, or neglect to bring their mares regularly to the horse through the season, will be considered holden for insurance money.

ELI M. RICHARDSON.

HOT WATER APPARATUS.

In a late number of London's Magazine, mention is made of a hot water apparatus in a pinery at the Earl of Egremont's, Patworth, Sussex, in which it is stated that the pinery is sixty feet long, and twelve feet wide; it is twelve feet high at the back, and five feet in front; the boiler is two feet in diameter; the quantity of water in the boiler and pipes is one hundred and sixty gallons.

A small fire was made each day at 3 o'clock in the afternoon, a little more fuel was added at 6 and 9 o'clock, and nothing more was done to the fire until the next day at 3 o'clock in the afternoon. The quantity of coal consumed is less than one third of what was used when the common flues were employed. According to the present system, the whole of the water, one hundred and sixty gallons, is in circulation twenty-five minutes after the fire is put under the boiler. There are nine houses of the Earl of Egremont's, heated on exactly the same plan, all of which act remarkably well. Upwards of twenty degrees more of heat could have been kept up, during the severe weather in January last, had it been found necessary.

These remarks are followed by a table, showing the results of a series of observations to ascertain the difference of the temperature without and within the house, the temperature of the water in the boiler, &c, which may be found in London's Magazine for April last, page 142.

The same work gives us the following, by Mr Peter Martin, foreman in the nursery of Messrs Murray & Coss, near Leeds.

TO DESTROY ANTS, WOODLICE, &c.

Take one pound of oatmeal and half a pound of coarse brown sugar, and mix them together; add to it two ounces of pepper, ground as fine as possible. Lay the mixture upon white earthen ware for woodlice and beetles, where they resort; and for ants, cover it over so as to prevent its getting wet.

Another way to destroy ants.—Toast the fleshy side of the out-side skin of bacon, till it crisps; then lay it on the ground at the root or stem of any fruit tree that is infested by ants. Put something over the stem to keep it dry; the ants will go under it and fasten to it; lift it up quickly and dip it into a pail of water.

An effectual mode of destroying Slugs, &c.—Take a quantity of cabbage leaves, and either put them into a warm oven or hold them before the fire till they are quite soft; then rub them with unsalted butter or any kind of fresh dripping, and lay them in the place infested with slugs. In a few hours the leaves will be found covered with snails and slugs, which may then of course be destroyed by any mode the gardener may think fit. [We have tried this at Bayswater, and found it attended with complete success.]

Woodlice and Earwigs, wherever they exist, will also be attracted by leaves thus prepared, if placed in the sheds they frequent.

To destroy the black and green Fly.—Take some strong yellow clay, such as is used for graining, put it into a tub and fill the tub for water; then let a man work it with his hands till it becomes like thin paint. Fill a pan, such as flower-pot-stand in, with it; and as only the points of young shoots are infested with the fly, dip them into the clay and water; in ten minutes it will dry on the leaves, and will completely destroy the flies or any other insects that may be upon them. The clay will look dirty on the trees for a few days, but the first shower of rain washes it completely off, and the shoots will look more healthy than before it was laid on. There is no fear of the return of the insects that season. The scale on pines may be destroyed by the same mixture.

To destroy the Bug [American blight, *Aphis lanigera*] upon fruit trees.—Take clay, as I directed for the fly, and work it till it becomes of the consistency of white-wash; mix with every six gallons of it, two pounds of cream of tartar, one pound of soft soap, and half a peck of quick lime. When you think the weather is likely to continue dry for some time, take a bucket full of this mixture, and with a large brush wash over the bark of the trees, wherever you think that it is or has been infested with the bug. A man will do a great number of trees over in a few days, with a white-wash brush and this liquid. Five years ago, I had some young apple trees that were completely covered over with the bug; I washed them with this liquid, and I have never since seen the least sign of the bug upon them. I have practised the same method repeatedly on other trees, with the same success; and find it only necessary to be careful to do it in dry weather, so that the rain may not wash off the mixture for some time.

To destroy Flies and Wasps.—A mixture of pepper, sugar, and water, will do this effectually.

To make the bark grow over wounds and diseased places on forest or fruit trees, without fail and with speed.—When a branch is cut off or a tree is otherwise wounded, make the place smooth with a sharp knife; and if the tree be cankered, either cut away the part affected or scrape it out until you come to the sound wood. In all cases, make the surface as smooth as possible; then put half a pound of tallow into two pounds of tar, and warm it over a fire till the tallow is just melted in the tar, when one ounce of sulphur should be added and the whole stirred well together. The composition must then be laid on the parts that you want to heal, and I have found it by long experience to be an effectual cure, and superior by far to anything yet practised.

PEACH, PEAR, AND MULBERRY TREES, LUCERNE, &c.

The following is the substance of a communication received some time since, but which required condensation and correction before it could be fitted for the press; and want of room and of leisure has obliged us to defer till the present time, the publication of such papers as we thought would convey, or become the means of eliciting useful information.

MR FESSENDEN—I commenced making a se-

lection and transplanting fruit trees, about eight years since; and should like to be advised on several particulars.

I had about fifty peach trees from three to eight years old; some of which I inoculated myself, others I obtained from different nurseries; making a variety of about twenty kinds. From the above trees I have not had the pleasure of obtaining more than two bushels of peaches. This spring I find nearly half the trees are entirely dead, and the remaining number appear to be at a stand whether to live or die. I have cut down or taken up by the roots from fifteen to twenty, the most of which were seven or eight years old. As those I have left standing appear to signify their intention to live a little longer, by sending forth a few leaves, I should like to know if there is any probability of their resuming their health and vigor. If not, I should be induced to lay them prostrate, by putting the axe to their roots, as I have dug round them from year to year and they have borne me no fruit. I have varieties of ten or twelve kinds of plums, none of which are injured by the winter in the east, as I can perceive. A few apricots appear to be alive, except a few branches.

With regard to my pear trees, I have lost from six to ten, but do not know exactly, as two or three give encouragement of sending forth shoots just above where the buds were inserted. These trees were from the well known and respectable nursery of William H. and Sons, Flushing, Long Island.

A few years since, there was much said about French cover, or larceny; and in the spring of 1830, I obtained four or five pounds of seed and sowed it on thirty or forty rods of ground. The land was light and dry on which it was sown, and had been previously planted. I spread three or four loads of good manure, and ploughed it in before the seed was sown. The result was, that it came up very well; but the most of it died before autumn, except near the manure heap, where it grew sixteen or eighteen inches, and a part of it bloomed the first season. There is this spring a few stalks or sprigs alive. Several of my neighbors sowed some the same season, and the experiment proved equally disastrous. It had been said by some, I suppose inexperienced person, that it would grow on poor land. I am convinced that it requires a very rich soil. The land that I tried it on I believe is the right kind, all except the quality of it. I planted it with potatoes the last year and again this. I have some thoughts of making it rich by spreading an abundance of manure on it, and giving it another trial. I suspect the land on which persons have met with good success, is such as would produce three tons of herds grass or English hay per acre.

I have taken considerable pains to inform myself on the subject of silk business, and everything connected with the manufacture of silk; and have about four thousand mulberry trees of one and two years' growth. The land on which my nursery is, I believe is not quite so rich as it ought to be for that purpose, as the greater part of the trees have grown only from two to three feet in a season; whereas I have a few on richer land, which have grown from seven to nine feet last season. I have transplanted several hundreds of seedlings

this spring, on good land, and mean to spread considerable manure among those of one and two years' growth. I believe they are worth as much as though they were grown on land that would send them up higher than one could reach, the first year. I have sold a few trees and shall sell more if I have an opportunity. I mean to keep enough for myself, as I am determined to go into the silk business, if their is any probability of its merely paying for the expense of labor, &c.

I have thought of planting a few trees for large standards, but a greater part in hedge rows, as the leaves can be gathered so much better. Still, at times, I feel almost discouraged, as many who have tried it to a limited extent, say it does not pay half the labor. Then again, I see articles in newspapers, which say that it can and will be made a profitable business.

I kept in the summer of 1830, a few silkworms, just to try them. They did well, though kept in a common room, and perhaps not attended to so well as they ought to have been. If any of your able and experienced correspondents, or you yourself, will give advice on any or all of the above topics, I should feel very much obliged, as I am young, and not in circumstances to enter very largely into experiments, without a prospect of remuneration. Still, I am very anxious to be of some use to the community, as well as myself, by improvements in agriculture and the useful arts.

Yours, &c. JAMES LEONARD.

Remarks by the Editor.—With regard to the peach, we have heretofore published many articles on the subject of the cultivation of this fruit; and are compelled reluctantly, to express an opinion, that our climate in New England is not so well adapted to its perfection. An abridged view, [in about ten pages,] of such observations as would be most likely to be useful in the case of our correspondent, may be seen in the New American Gardener, page 232, written by the editor, and for sale at the New England Farmer office. An article published in page 13, of the present volume of our paper, would lead to the conclusion that we are in the habit of killing peach trees by kindness, or cultivating them too highly. It is there said, that "peach trees in a pasture not tilled, are in a healthy sound state, while those in the gardens and cultivated fields have decayed," &c. See, likewise, pages 51, 54, 75, 101, 322, 325.

With regard to lucerne, we have nothing new at present to offer. The soil should be rich, deep, dry, and free from weeds. The plants for the first year should be kept as well weeded as Indian corn, and for that reason, in Europe, are often sown in drills, so as to admit the hoe between them. See pages 53, 70, and 230 of the current volume of the New England Farmer.

For directions concerning mulberry trees and silk, our correspondent may, perhaps, find something useful in pages 51, 61, 77, 124, 142, 232, and 238, of the said current volume of the New England Farmer.

CHEESE.

When cheeses are made from unskimmed milk they are called new-milk cheeses, although a part of the milk has been kept over night or longer. These are the richest and most valuable. Two-meal cheeses are made of the evening's milk skimmed, mixed with the morning's milk unskimmed. Two-meal cheeses, when well made, without any

mixture of sour milk, are almost as valuable as new-milk. A third sort is made of milk, the whole of which has been skimmed. These are of course of the least value. If your milk be not just come from the cow, make it blood warm, and put in your rennet, but no more than will just make the curd come. Add an ounce of fine salt to as much curd as will make a cheese of fifteen pounds, and in proportion for a greater or less. Stir the curd till it is gathered; put it in a strainer, and with your hands work out all the whey; then lay it in a clean linen cloth, put it in the press, and let it stand there two hours; then take it out, rub it over with fine salt, put it in another dry cloth, and put it in the press eight hours; then take it out again, put it in another dry cloth, and put it in the press again, where it is to remain till the next cheese is ready. When taken out of the press, put it in brine twenty-four hours, and add to the brine about a tea spoonful of salt-petre. Some little additions of salt and salt-petre must be occasionally made to the brine; and let it be cleansed as soon as necessary, by heating it and taking off the scum. When you take the cheese out, dry it with a cloth; bind it round with a long string to make it keep its shape, which must be kept round it for some days, and let it be daily turned on the shelf for two months.

Various receipts for making rennet, have been given by different writers. The following is simple, and perhaps as good as any: Empty the maw of its curd, wash it slightly, soak it with strong brine till it is well salted, dry it on boughs made for the purpose; then take two quarts of strong brine that will bear an egg, blood warm, and let the maw steep in this twenty-four hours, when the liquor will be fit for use; bottle it up, and cork it tight, and it will keep for a twelve month. About a tea cup full will be sufficient for the milk of ten cows. Some direct spices and a lemon sliced, to be put into this liquor. The rennet bag may also be salted and dried as before directed, and pieces of it occasionally used, by being previously soaked in warm water, and a quantity of this water used in proportion to the quantity of milk to be turned.

The acid contained in the maw is very apt to become rancid and to putrify, if a sufficiency of salt be not applied; care must therefore be taken to prevent this, by as much salt of the strongest kind as the rennet will receive.

In Holland, it is said, the cheese-makers use no rennet; but instead of this, they use a small portion of sea-salt (muriatic acid) for forming the curd. This is said to give the cheese a taste somewhat different from those which are made in the common mode. This acid should no doubt be diluted before it is put into the milk; and we cannot state what proportions it would be expedient to use. But the quantity might be ascertained by experiment.

The following method of making cheese has been recommended in the Massachusetts Agricultural Repository:

"The milk is universally set for cheese as soon as it comes from the cow. The management of the curd depends on the kind of cheese; thin cheese requires the least labor and attention.—Breaking the curd is done with the hand and dish. The finer the curd is broken the better, particularly in thick cheeses. Turning the milk differs in different dairies; no two dairy women conduct

exactly alike. Setting the milk too hot inclines the cheese to heave, and cooling it with cold water produces a similar effect. The degree of heat is varied according to the weather. The curd, when formed, is broken with what is called a triple cheese knife. The use of this is to keep the fat in the cheese; it is drawn the depth of the curd two or three times across the tub, to give the whey an opportunity of running off clear; after a few minutes the knife is more freely used, and the curd is cut into small pieces like chequers, and is broken fine in the whey, with the hand and a wooden dish. The curd being allowed about half an hour to settle, the whey is laded off with the dish, after it is pretty well separated from the curd. It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added to it and stirred a few minutes; some make use of the hot water in preference to the whey, and it is in both cases treated according to the nature of the curd; if it is soft, the whey or water is used nearly boiling; but if hard, it is used only a little hotter than the hand. After the curd is thoroughly mixed with the hot stuff, it is sufficed to stand a few minutes to settle and is then separated, as at the first operation. After the scalding liquor is separated, a vat or what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hand and pressed into the vat, to squeeze out the whey.

"The vat being filled as full and firmly as the hand can fill it and rounded up in the middle, a cheese cloth is spread over it, and the curd is turned out of the hoop into the cloth; the vat is then washed, and the inverted mass of curd, with the cloth under it, is turned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out and the cloth is taken off, washed, and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and salted, the cheese is placed on a board, and a handful of salt is rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewn on the upper side, and as much left as will stick to it; afterwards it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press, where it continues one night, and the next morning it is turned in the vat and continues till the succeeding morning, and is taken out and placed on the dairy shelf, where they are turned every day or every other day, as the weather may be. If it is hot and dry, the windows and door are kept shut; but if wet or moist, the door and windows are kept open night and day."

NEWLY BAKED BREAD.

"The following very judicious remarks," says the Andover, Mass. Journal, "were made by one of the most distinguished physicians in the country, in answer to inquiries from one of the officers of the Theological Seminary in this place. The letter it is believed, expresses the opinion universally entertained by eminent physicians."

DEAR SIR—In reply to the inquiry in your letter, I remark, that long ago, physicians were taught by observation and experience, that newly baked bread requires much greater stomach power to effect its digestion, than is necessary to accom-

plish the digestion of bread which is not new.— This difference is attributed to the greater adhesiveness of the hot bread, forming into a mass or masses less penetrable to the gastric juice.— Whether this should be regarded as a full explanation there might perhaps be some doubt, but that certain chemical changes are constantly going on in bread, from the moment it is baked until it is unfit for use, and that, when a day or two old, it is much more easily subjected to the delicate chemistry of the stomach, than it is when just taken from the oven, there can be no doubt.

A feeble stomach is always disturbed or oppressed by hot bread; and headache, vertigo, and sometimes cramp, cholera and convulsions, are caused by it. Those who are predisposed, constitutionally or by their vocations, to dyspepsia—nay, everybody, inasmuch as the preservation of health should be an object with everybody—ought to abstain from it. For although in some cases it may not for a time appear to do mischief, it is secretly undermining the powers of the stomach, and disease will some day make its appearance in a form more aggravated or obstinate, than if the stomach had been put to a less severe task.

The business of bread making is generally not enough attended to in our country. The yeast is too often not perfectly sweet, and when it has become sour, alkaline substances, as saleratus, or pearl-ash, or soda, do not restore it to its original fitness for the process of fermenting the dough. Another defect is, that the dough when put into the oven, is frequently not enough or too much fermented, the consequence of which is, that the bread is clammy or sour. Another and almost universal defect is, that the bread is not baked enough. The thickness of the loaf may be too great for the heat of the oven, or the heat may be so great as to burn or crisp the outside of the loaf, before the inner parts are done.

Hot bread should be banished from all our literary institutions; and if the guardians of these establishments were faithful to their trust, they would not only interdict it, but would take care that their students should be regularly furnished with well baked bread.

From the Albany Evening Journal.

LAMP OIL.

Knowing that fraud, to a great extent, is yet practised in the sale of lamp oil, notwithstanding we have a law to prevent it, and the fraud being so perfect that the senses of sight, smell, and taste, except in those of great experience, cannot distinguish between them, although the difference in price is very great when honestly sold.

Sperm oil being from 6s 8d to 7s a gallon, according to the quantity, while whale oil is but from 2s 6d to 3s 6d.

To detect the fraud, sperm oil weighs 7½ lbs. the gallon, while whale oil weighs 7 lbs. 10½ ozs. The specific gravity, in decimals, of sperm oil, is 8814, and whale oil is 9233.

Those that have Southworth's Spirit Hydrometer, will find that pure sperm oil stands 42 above spirit proof, and whale oil at 18 above, which is 2 degrees below W. when the balance weight is off, the thermometer standing at the same time at seventy degrees, adding four degrees or deducting on the hydrometer for every ten on the thermometer. If the balance weight is on, then oil stands

at eighty degrees above proof, and in sperm oil it will sink entirely.

The following is a correct test to try the purity of sperm oil:—Take spirit of any kind, in a wine glass, that is just fifty per cent above proof, and drop into it sperm oil, and it will swim on the surface; and with a spoon take fifteen drops of sperm oil and only one of whale oil, and mix them together, and this mixture will sink to the bottom; and any other mixture of whale oil, in larger proportion, will also sink.

Those that have the glass French hydrometer will find, when the thermometer is at eighty, sperm oil will stand on the hydrometer at thirty degrees and whale oil at twenty-two, and for every ten degrees less on the thermometer, one degree less on the hydrometer.

But Southworth's Oleometer is a correct test, for one per cent can be detected, and those that have one have a card to explain it.

Editors of papers, who will copy this and the law, will oblige most of their patrons, as everyone using oil is interested; and very generally they are getting only whale oil or mixture, when for the same money they ought to have pure sperm oil.

From the Portsmouth Journal.

THE FARMER.

The great bulk of mankind must always get their living by cultivating the soil. The character of farmers, therefore, settles the character of the community in general. The profits of farming are slow but sure.

The good farmer grows rich simply by the increased value which he every year gives to his farm. His buildings and fences are yearly growing better; his debts are also growing less, and his business more easy of management; so that by the time of life in which care becomes burdensome, he generally finds himself in a situation to travel the down hill of life with a good degree of comfort.

The poor farmer, on the other hand, is the reverse of all this. His affairs, so far as they depend on his management, grow worse and worse. His fixtures decay, and are patched up so as to do for the present; his soil is impoverished; his debts increase; his cares and perplexities multiply; and he finds himself, when old age unfits him for the burden, obliged to mortgage or sell his farm, and to live on the pittance which his property has gained in value by the rise of prices around him.

The greatest calamity to a farmer is a heavy debt. A fire is nothing to it, because the flames do not exact interest.

"The eye of a master does more work than both his hands," but it must be an eye wide awake.—There is a difference between eyes and no eyes.

To save expense and labor, is ready money with interest, because it saves time, which is more valuable than money.

GENERAL DIVISIONS OF A FARM.

1. Assign as much of your farm to the plough as you can manure thoroughly, with plaster or strong manure.

2. Keep no more for mowing than you can consume on your farm with profitable stock, unless in the neighborhood of some large town, where the sale of hay will purchase manure.

3. Keep no more stock upon your farm than you can keep well.

4. If it is an object to increase pasturage, it can be done by division fences to a very great extent.

HORSES.

Let every horse you keep be a good one, because he eats no more than a poor hack; and he will do more service, and sell for something if you wish to part with him.

THE SCIENCE OF HUSBANDRY.

All nature is governed by fixed laws or principles, and the true art of husbandry consists in a correct knowledge of these principles, with their application to every plant, every soil, and every change in the seasons. The design of cultivation is to assist nature. We govern nature only by obeying her laws.

There is no soil so good but it may be exhausted and ruined by bad tillage; and there is none so bad but it may be rendered fertile, if it can be swarded.

From the American Farmer.

POMOLOGICAL MANUAL.

William R. Prince, Esq., of the Linnaean Botanic Garden at Flushing, N. Y., has recently published the second part of the Pomological Manual, containing descriptions of a great variety of fruit, such as peaches, plums, nectarines, cherries, almonds, raspberries, strawberries and pears. He has reserved apples for the third part, and very judiciously, as he will be able to avail of the contents of several European publications on the subject, and among them the *Pyrus Malus Brentfordensis*. We have occasionally made copious extracts from this part of the Pomological Manual in advance of its publication, having been politely furnished with proof impressions by the author, and therefore our readers will have been enabled to form an opinion of the work for themselves.—We cannot omit referring, however, to a very prominent and valuable characteristic of the Pomological Manual; we refer to the names of fruit. Almost every kind of fruit has several names, by which it is known in different countries and in different parts of the same country. In the Manual, Mr Prince has adopted the name most generally applied to each kind, and at the same time given all the other names as synonyms, by which means, persons acquainted only with one of the local names are enabled to ascertain the true one. Besides this, it will save many persons the expense and vexation of purchasing the same fruit under a variety of names, under the supposition that they are obtaining several kinds. This is a peculiar feature of the "Treatise on the Vine," also, by the same author, and it cannot be too highly commended. There are several other valuable traits in this work, and among them we notice the exposition of an error long prevalent in all parts of the country, in relation to raspberries. What is commonly called the "Red Antwerp raspberry" is not an Antwerp, but a variety very inferior to that fruit. This error was pointed out to us last fall, while on a visit to Flushing, by Mr Prince. We would recommend the Pomological Manual to all orchardists and gardeners, as a valuable guide to their professional pursuits.

Solvent for Putty.—To move panes of old glass from sashes, spread with a small brush, a little nitric or muriatic acid over the putty, and it will soon become soft, and can be removed without injury.

Agriculture.

MASSACHUSETTS AGRICULTURAL SOCIETY.

To the Trustees of the Massachusetts Agricultural Society.

GENTLEMEN:—SITUATED at a distance from any considerable market town, it would be absurd in me to think of entering into competition in the aggregate amount of crops, with farmers in the vicinity of the city, where manure is attainable to any desired extent. On the supposition, that the management of farms is judged in reference to local advantages and inconveniences, my hope is founded of sustaining a claim to a premium. There have never been any very great improvements made on my farm in any one year. The object has been yearly to add something more in earthy and vegetable substances to the fields, than was taken from them in the removal of crops. To give a just idea of improvements made, a brief history of the operations may be necessary.

My first purchase of land was in 1802, fifteen acres; the greater part of which was in a very rough state, and as much of it as had been tilled reduced by severe cropping. The rocks were removed to inclose the lots, and the bushes subdued with the plough, as far as necessary means could be obtained for accomplishing those objects; the progress was not rapid in the beginning, because, being entirely destitute of capital, I was obliged, in seamen's phrase, to "work my passage."

When the fields were inclosed with walls, and the bushes subdued, attention was directed to the plots which had been tilled almost to exhaustion. And the principal means of renewing them within my power, was the incorporation of earths of different qualities. Cold and tenacious soils were dressed with silicious earth and other materials that tended to open and warm them. Sandy soils were dressed with clay, swamp mud, and alluvions in which sand formed the least considerable part. This course, in seven years, gave ten tons of English hay where less than two were obtained before, and about double the quantity of grain on the acre.

In 1817, another lot of sixteen acres, a large portion of it in similar state with the first, was purchased and managed in the same way. About the same time were purchased seven acres of fresh meadow; on which no other improvements have been made than clearing away bushes, tunnelling and cutting ditches in such directions as would irrigate the whole meadow. Another small lot was inclosed from a pasture, in 1820, and has since been cultivated as English meadow and tillage. Four acres of the above lots are light sandy soils; six acres hazel loam, suitable for grain or grass; five acres dark friable soil; fifteen acres argillaceous; and ten acres of irrigated fresh meadow. Seven acres were planted with Indian corn the present year—three acres of loam and four acres of sandy soil. On one acre of the loam about six cords of barn manure were spread and ploughed in; on another acre, where in other years meadow mud had been applied, six casks of lime were spread; in the other fields, which produced rye the preceding year, there was no application. The corn was planted in drills; this method has been in practice on the farm more than twenty years, and is in my judgment preferable to any other. The corn was harvested between 20th September and 20th October. Weight of the

whole crop 22381 pounds, 288 $\frac{1}{2}$ bushels. The same field the preceding year, produced one hundred and twenty bushels of rye. The present year there were only about two acres in rye, and the produce was twenty-five bushels.

There are nine acres in tillage, alternately planted with corn and rye, excepting once in five or six years each field is planted with potatoes, beans, or some other vegetable considered favorable as a change from the ordinary course. The stubble of rye is ploughed in, immediately after the removal of the crop, and some kind of seed applied to produce a charge to be ploughed in as green dressing. Potatoes this year were planted only on the borders of cornfields, under trees, and in other situations where not much produce could be expected,—eighty bushels were gathered. From two hundred to three hundred has been the average crop in the last four years. No other roots are cultivated except in the kitchen garden. Thirty-two acres are mowed, twenty of which have been ploughed and will produce good English hay in common seasons, with liberal manuring; but a succession of wet seasons has introduced on a part of it so much wild grass, that the hay is not now suitable for the market, though good stock hay. There are ten acres of irrigated land, as above mentioned, and two acres of fresh meadow over which water does not often pass. The hay was located before the offer of premium was published, in such manner that it is impossible for me to ascertain with accuracy the quantity. Some of it was placed in bails with old hay, and some of it sold in the fields. The crop of hay has varied very little for four years, yet supposed to have gradually increased. In 1827, the whole crop was measured in the mow in September, after it was thoroughly settled. Four cords of English hay were considered equal to a ton, and five cords of fresh. According to that measurement, there were thirty-three and three quarters tons of first quality, or good English hay; ten tons of second quality; and fourteen and two fifths tons fresh hay. Five acres then mowed are now in tillage. From two to three tons of second crop are annually cut, in situations where it is not convenient for cattle to feed.

Compost manure, made with reference to the quality of the soil where it is to be applied, is every year spread on the mowing land. Sand is made a principal ingredient of compost for clayey soils, and swamp mud or clay for loose soils.—From three to five hundred loads, forty bushels in the load, are made in a year and applied chiefly in autumn, not so much for choice as necessity, there being no other season of sufficient leisure to accomplish the work. In laying down tilled land to grass, I choose to sow the seed about the last week in August and put no grain with it; but any time in the month of September will do better than either of the spring months; and if sown with winter rye, it will do better than with spring grain. The clayey soils which are not suitable for grain, I sometimes turn over with the plough immediately after the grass is cut, roll down the furrows, and put on a dressing of manure and seed again. In this course, cultivated grass is renewed without the loss of any crop. I use chiefly berds grass seed, and put one fourth of a bushel on an acre.

I have forty acres of pasture of a light soil, and in the possession of other owners, it was alternately tilled and pastured in so quick succession, that

only very small crops of corn or rye can now be obtained. The number of acres discouraged me from attempting to renew it in my usual way of mixing soils; and therefore a plan is formed to renew it in the operations of nature. Last spring, a field of between two and three acres was fenced, ploughed, and sowed with the seed of the yellow locust tree. The seed came up well, and the most thrifty of the young trees are now three and a half feet high. If the worms should not expose me, there will probably be a very flourishing grove, which in a few years will effectually recruit the soil. In this connection, it may not be amiss to mention, that I have this fall sowed five acres of common land with the seed of white pine, and am now planting several acres with acorns, which is intended to protect against cattle with a fence.

The number of apple trees on the farm is eighty, most of them situated in two small orchards.—There are some scattered trees, and a few cultivated in the garden. Nearly half the trees have been grafted, chiefly with winter fruit. This year there are no apples. The last year, probably, there were a hundred bushels of winter apples and enough beside to make some six or eight barrels of cider. The principal attention given trees, after they have attained the bearing state and need little or no more pruning, is to scrape off the rough bark and moss early every spring, and wash the bodies of the trees and the large limbs with very strong soap-suds or a solution of potash.

The barns have been built in succession, and some of those first erected are of very incommodious form for the general purposes of a farmer. They were built when there was no expectation of needing much room for the storage of hay and grain, and some other uses of them were in contemplation. The first barn is twenty feet wide and thirty feet in length; the second, twenty and forty; the third, thirty feet square, built for the exclusive purpose of storing hay; the fourth, twenty-six and thirty; and the fifth, thirty feet square. Under a portion of two of the barns, openings are left to shelter the cattle from the severity of the weather. The barns were located with a view to convenience and facility in getting the hay and manuring the fields. There are four barn-yards, three of them are built square, and hollowed a little in the middle for the retention of the manure; the fourth is of irregular shape, to give the cattle access to a spring of water. Into the yards, such kinds of earth are carted, as are considered best adapted to the fields where the manure is to be applied. With the earth every sort of vegetable substance is incorporated, which can be easily obtained. These, with the droppings of the cattle, make rich beds of compost every year.

The usual stock on the farm consists of one horse, six oxen, three cows, and eight or ten young creatures. The horse and oxen not pastured much on the farm. From about the middle of July to the first of September this year, five cows were milked, two of them heifers of only two years old. The cows were under the care of a tenant.—Cheese-making was not commenced early in the season, and continued only to 20th September. Milk was daily taken for the use of the family, in which there are several young children. The return of cheese made was four hundred and sixty-four pounds. From the 20th September to 5th November, butter was made with four cows and the milk given to swine. The return of butter was seventy pounds. The cows have something

of mixed blood, but are chiefly of native-breed and were raised on the farm. Three swine only are kept, fed with the refuse of the house, boiled potatoes, and corn. The annual quantity of pork is about nine hundred pounds.

My cattle in winter are fed chiefly on hay; milch cows have some meal and vegetables; and oxen intended for beef the succeeding fall are fed with some grain the last of winter. Calves to be raised are suffered to suck one half the milk of the cows ten weeks, then put into a good pasture till October, when they are put with fattening cattle, where they soon learn to eat whatever is given out, and become very vigorous to endure the inclemencies of winter.

About two tons of beef are made in a year, on grass, green corn-stalks, and refuse hay. Oxen and cows are generally turned off to beef for some other reason than the particular age; and at what age it would be most profitable to turn off that of excellent qualities, is a question which has never employed much of my attention. The principal product of my farm is hay, of which ten or fifteen tons are annually put up for sale; the residue is sufficient to winter twenty-five head of cattle; but the pasture not being equal to the summering of nearly that number, a part of the stock wintered is often sold in the spring. One man and a lad sixteen years old labor constantly on the farm; in addition to which, day-laborers are frequently employed. The present year, twenty acres of the mowing land were put out on a share, and forty days' labor hired. One gallon of rum was used by some elderly laborers, who have worked on the farm more than twenty years in the hay season; and the owner supposed the cause of temperance would be injured rather than promoted, in withholding from these men their accustomed portion, who never in their lives, to his knowledge, drank to intoxication. Respectfully submitted,

MORRILL ALLEN.

Plymouth, ss. Pembroke, Nov. 21, 1831.—Personally appeared before me, the above named Morrill Allen, and made oath that the above statement by him subscribed, was true, according to his best knowledge and belief.

KILBORN WHITMAN, *Justice of Peace.*

Lot 1, fifteen acres, part in a rough state, part too much cropped.

Lot 2, sixteen acres, much the same as the above.

Lot 3, seven acres, meadow, fresh meadow.

Lot 4, small lot from a pasture.

Four acres are light sandy soil; six acres hard loam, suitable for grain and grass; five, a dark friable soil; fifteen, argillaceous; ten, irrigated fresh meadow.

This year, three acres of loam and four acres of sandy soil were planted with corn.

On one acre of loamy land, six cord of manure were ploughed in. On one acre of sandy, six casks lime; in other years, meadow mud had been put in.

On the other fields which produced rye the preceding year, no manure.

Corn planted in drills, gathered 298 $\frac{1}{2}$ bushels 42 $\frac{1}{2}$.

Nine acres in tillage, corn and rye alternately, excepting once in five or six years a crop of potatoes or beans.

The stubble of rye is ploughed in immediately after taking off the crop, and some kind of seed is applied to produce herbage.

From 200 to 300 bushels potatoes, his average crop for three or four years past.

Mows thirty-two acres, twenty of which has been ploughed, yields good English hay.

Ten acres of irrigated meadow, and two acres of fresh meadow.

1827. 30 $\frac{1}{2}$ tons of hay, first quality.

10 do. second quality.

14 $\frac{1}{2}$ fresh hay.

58

Sand principal ingredient for clayey, and swamp land in sandy loose soil, 300 to 500 loads, in autumn.

From the Gentle Farmer.

ALTERNATE HUSBANDRY.

There are few stronger indications of bad husbandry, to a secluded mind, than are furnished by the advertisements for the sale of farms. "Suitably divided into meadow, pasture, and plough land," are common recommendations, showing that the old system still prevails, of assigning to each of those objects a portion of the farm in perpetuity; in despite of the example of better husbandry, and the admonitions of common sense. No meadows will bear cutting many successive years, without deteriorating in quantity and generally in quality. No land can be subjected to perpetual tillage, without a greater supply of manure than most farmers are able to give it. The grasses will run out in the one, and fertility become exhausted in the other. There are comparatively few meadows, which, if drained (and if wet they will produce fine grasses) will not yield good grain, roots or pulse. And there is no tillage land but will produce grass. Alternation of crops is the main spring of profitable farming. Grass and grain are in this way made to benefit each other. The roots and haulm of the grass become food for the grain; while the culture of grain pulverizes and ameliorates the soil for the succeeding crop of grass.

Good economy requires that the meadow should be ploughed, and the ploughed land stocked with grass, whenever a manifest diminution in the crop is perceptible. Upon light soils, when even well managed, this will ordinarily happen once in every three or four years. Experience must have shown every farmer, that he cannot raise a good crop of wheat, of corn, or of flax, &c., upon the same field for several years in succession. And why? Because every species of plant takes from the soil a specific food, which other species do not take. The same law applies to grasses and grains, with this difference, that grain consumes more than grass of the food common to both, and therefore sooner impoverishes the soil. J. B.

FARM.

A writer in the Massachusetts Agricultural Repository, vol. v. page 320, in treating "on the extent of land necessary for a farm, and sufficient to support a family well and independently," has the following among other valuable remarks:—"We know men, active, intelligent and industrious, possessed of 30 or 40 acres of land, who are laboring for others or taking charge of their neighbors' concerns, upon the avowed reason, that they cannot support their families on so small an extent of land. But they do not realize the actual efficiency of the soil. Undoubtedly there are many honorable exceptions to the observation we are about to make;

as a general rule, however, it may be asserted, that the farmers of Massachusetts are yet to learn the immense productive power of a perfectly cultivated acre. Instead of seeking riches in augmenting the number of their acres, let them be sought in better modes of husbandry. As a general truth, we believe it may be asserted, that every farmer in Massachusetts, possessed of one hundred acres of land, might divide them fairly by quantity and quality, into thirds, and by a suitable cultivation make either third more productive than his whole hundred acres are at present. This is the operation at which those interested in the agriculture of Massachusetts ought to aim, to make farmers realize what cultivation can effect, and to teach the modes by which the productive power of the soil can best be elicited."

FARMER.

It is indispensable for the success of every undertaking, that a sufficient capital to carry it on, should be at command; and for that of farming in particular. When there is any deficiency with respect to that important particular, the farmer cannot derive sufficient profit from his exertions; for he may often be obliged to dispose of his crops at an undervalue, to procure ready money; or he may be prevented from purchasing the articles he may require, though a favorable opportunity may present itself. An industrious, frugal, and intelligent farmer, who is punctual in his payments, and hence in good credit, will strive with many difficulties and get on with less money, than a man of a different character. But if he has not sufficient stock to work his land properly, nor sufficiency of cattle to raise manure, nor money to purchase the articles he ought to possess, he must, under ordinary circumstances, live in a state of penury and hardship; and on the first unfavorable season, or other incidental misfortune, he will probably sink under the weight of his accumulated burdens. In general, farmers are apt to begin with too small a capital. They are desirous of taking large farms, without possessing the means of cultivating them. This is a great error; for it makes many a person poor, upon a large farm, who might live in comfort and acquire property upon a small one. No tenant can be secure without a surplus at command, not only for defraying the common expenses of labor, but in case any untoward circumstance should occur. When a farmer on the other hand, farms within his capital, he is enabled to embrace every favorable opportunity of buying with advantage, while he is not compelled, if the markets are low, to sell with loss.—*Code of Agric.*

Caterpillars.—We have on no former occasion, noticed the fruit trees so universally overrun with caterpillars as the present season. Aside from this circumstance, the prospect of fruit, apples especially, is remarkably good. We therefore hope that our farmers may be on the alert, and not suffer the bounties which otherwise would be conferred on them by Providence, to be lost for the want of little care and attention. A few hours would suffice to clear a considerable orchard of these marauders, and thus to save much valuable fruit which must otherwise inevitably be lost.—*Ms. Spy.*

Willows absorb moisture. This is true, but they emit a large portion which they draw from the earth, in perspiration. Willows planted near houses, on the side of springs or brooks, are apt to introduce fever and ague.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, June 13, 1832.

THE SEASON.

The season has at length become more propitious. We have had no spring, or rather, spring and summer have formed a union, blended their capital and credit, deposited their zephyrs, aromatic essences, buds, beauties, &c., in the warehouse of June, and are now going on gloriously, under the sign of the spotless sun and cloudless sky. We never knew such a May as we have recently escaped from.

She called out buds of tender kinds,
Dame Flora's fascinating nieces,
Then loosed the savage northeast winds,
To tear the pretty nymphs in pieces.

Old Boreas and May, no doubt,
Were too much hand and glove together,
And their conjunction brought about
Almost a month of horrid weather.

We hope there is yet time for most of our crops to come to maturity. Indian corn begins in some places, we are told, to show symptoms of resuscitation and revivification, and we have made some calculation on its maturation and fructification, instead of its threatened annihilation. It may be prudent to plant more potatoes. The Genesee Farmer tells us, that potatoes may be planted at "almost any time from the middle of May to the middle of July, yet, we think that they produce best when planted from the middle of May, or when left from the middle to the last of June. In the first case, the tubers make their growth before the mid-summer drought; and in the latter, after the fall rains have set in. In either case, the potatoes will be of better quality than when grown in the heat of summer, requiring the soil to be sufficiently moist."

Turnips, ruta baga, millet, &c., may be put in requisition to occupy fields intended for Indian corn, should there be a prospect of the latter's failure. "One swallow makes no summer," and the loss of one crop should not discourage a cultivator, for

"The mouse which has but one poor hole,
Is not a mouse of any soul."

SHEARING SHEEP, &c.

Mr Lawrence, an eminent English writer, asserts, "It has frequently appeared to me, on reflection, that it might be preferable to shear all kinds of sheep unwashed, and to wash them after shearing, when it would be much more effectual with respect to their health. Such as were affected with foulness or eruption of the skin, might be washed and scrubbed in a ley of water and wood ashes, in a large tub which would contain three. It would both conduce to the health of the sheep and promote the regular growth of the wool.—Wool would probably keep best in the grease, and dust might be shaken from it. Any difficulty in respect to fixing the price of wool in an unwashed state, would vanish in a season or two."

"Clipping off the coarse soiled wool about the thighs and docks," says London, "some weeks before the usual time of washing and clipping the sheep, is an excellent practice, as by this means the sheep are kept clean and cool when the season is hot; and with ewes, the udders are prevented from becoming sore."

In separating for the purpose of washing, the flock is brought to the side of the washing pool, and those lambs and sheep of different kinds, fit to be washed, are put into separate inclosures; and such lambs as are too young to be clipped are not washed, but confined in a fold or inclosure of any kind, at such a distance from the washing place that they may not disturb their mothers by bleating.

In performing the operation of washing, it was formerly the method to have the washers standing up to their breast in the water; but from the inconvenience and danger of it, (the men requiring a large supply of spirituous liquors, and being liable to be attacked with colds, rheumatism, and other diseases,) various other modes of performing the operation have been proposed. Among others, that of sinking an empty hog-head or other vessel of sufficient capacity for a man to stand in while washing the sheep, may be as eligible as any. A boat near a bold shore of a sheet of water, with one end aground, by which the sheep is introduced and put overboard, while the man who washes him remains in the boat and extends his arms over the sides, and thus performs the necessary manipulations, furnishes a convenient mode of washing sheep. A small perpendicular waterfall, under which sheep are conducted, may likewise be used to advantage for that purpose.

It was uniformly the practice, immediately after shearing, to smear the bodies of sheep with some ointment, in which tar is the chief ingredient. This, however, has been condemned, as causing a waste of wool in carding and manufacturing into cloth. But if the tar is mixed with a sufficient quantity of some greasy substance, the benefit may be obtained (which is to preserve against ticks and the scab, as well as to increase the growth of the wool), without any bad consequence resulting. A writer in Rees' Cyclopaedia, on wool, says much in favor of a composition much used in Northumberland, England, and gives the following directions for making it: "From sixteen to twenty pounds of butter are placed over a gentle fire and melted; a gallon of tar is then added, and the mixture is then stirred with a stick until the tar and butter are well combined, and form a soft tenacious ointment." Some skill is required in its application. The locks should be divided, and the ointment applied directly to the skin. It does no good to apply it to the outside of the wool, but it must come in contact with the skin. This is best effected by opening the wool along the neck and back, and applying the ointment with the finger. In short, you must apply it in such a manner that it will be most likely to spread over every part of the body. The quantity laid on each animal differs in different districts. In the lighter mode of greasing, one gallon of tar and twenty pounds of butter will be sufficient for fifty sheep. In Scotland, where greasing is applied merely to preserve the animal from inclemency of the climate, a much larger proportion of tar is used. This would be very injurious to the wool were it any other but the coarsest kind. To derive the greatest advantage from the ointment, both to the wool and the sheep, it should be applied immediately after shearing and again on the approach of winter. By the first greasing, the wool will be kept soft and moist during the sultry heats of July and August, and the top of the staple will not become harsh and discolored. One acknowledged advantage of greasing immediately after shearing should not be over-

looked—it destroys the sheep tick, and has a tendency to prevent cutaneous distempers, and to protect the skin against the bite of the fly.

Mr J. Nelson published a recipe for the scab on sheep, similar to the above, but which we should suppose might answer a still better purpose; it is as follows: "Take three gallons of tar and three gallons of train oil, boiled together, to which add three pounds of roll brimstone finely powdered and stirred in." This quantity is sufficient for ninety sheep. It is poured on with a pitcher or ladle from the top of the back-bone to the tail.

When the object is solely the destruction of ticks, a strong decoction of tobacco is probably as good an application as can be prescribed. Lambs often suffer much from ticks, after the sheep are sheared; as the ticks which are driven from the old sheep take refuge with the lambs. It will, therefore, be advisable to apply either the ointment or the tobacco decoction to the lambs as well as to their elders. And in all cases see that your application goes to and spreads over the skin as equally as possible, instead of wetting or smearing the outside surface of the fleece, where it will be of more harm than benefit.

DISEASE IN POULTRY.

MR FESSENDEN—I find in volume VII. page 111, of the New England Farmer, soap recommended for the gapes in chickens. I have tried it a number of times in various ways, and cannot find it of any use in that complaint. It is caused by worms in the windpipe; and it appears to me that we should look for a preventive, as a cure must be very difficult, owing to the seat of disease. We are losing a great proportion of our turkeys and chickens with this disease, and will feel much obliged if you will point out a remedy, or solicit one, through the columns of the New England Farmer.

I remain, with respect,

LEWIS BAILEY.

Somers, West Chester Co., N. Y.

Remarks by the Editor.—Several persons have assured us, that they have cured fowls diseased by gapes, by taking as much kitchen soap as will cover the thumb nail and having mixed it up with some meal dough, giving it to chickens. But as this remedy seems not to be always effectual, it might not be amiss to try the following, recommended by a writer in the American Farmer.

"Take a piece of *asafoetida* about the size of a hen's egg, beat it tolerably flat, and wrap a piece of cotton cloth round it, and nail it to the bottom of the trough where the hens are daily watered; this method is adapted in the spring of the year, when the hens begin to bring forth their young broods, and it will be attended with inevitable success in preventing that destructive disorder."

If any of our correspondents would be so good as to furnish us with information on this subject, they would oblige the editor and benefit the community.

MADDER, FRUIT TREES, &c.

To the Editor of the N. E. Farmer,—

I shall wish, at some future period, to make some remarks through the medium of your paper, on the cultivation of madder, having been engaged two years past in raising this article; it requiring three years to come to maturity, I have not dug any as yet; but a neighbor of mine has raised it several years, and has taken up in two years, fifteen

hundred pounds each year, to the acre. He informs me that he has never labored a day on it without earning three dollars per day. The seed he sells, at present, for twenty dollars per acre of two thousand four hundred hills. I know that it is a perfectly hardy plant and the cultivation simple; it requires rich soil. I forbear making further observations at this time, fearing it might be a common article of cultivation in your State.

A correspondent of yours wishes to be informed by others owning nurseries or orchards, on what kind of soil the greatest destruction has been produced, by the severity of the past winter. My nursery is on a sandy soil formerly covered with hemlock. I have lost many young apple trees, grafted; most of my pears, plums, and cherries. They have generally perished at the tops first, and the apple trees to within a foot or two of the ground. The soil in this section of country is generally a sandy loam; and no fruit trees except the plum and pear, have been materially injured in general. There is a prospect of a very large crop of apples, but the apples of the Eastern and Northern States are far superior to those growing in these parts. I shall not set another fruit tree on a hemlock soil. I ought to have taken agricultural papers previous to planting my nursery. One thing I ought to mention, that in transplanting a few plum trees last fall, I put a little straw round some of the trees and they escaped destruction. Yours, RUSSEL BRONSON.

Bridgewater, Oneida County, N. Y.

☞ We shall feel under great obligations to Mr Bronson, if he will furnish us with an article on the culture and preparation of madder; it being a plant of great importance to manufacturers, who import immense quantities from Europe. The culture of it, we believe, is almost unknown in New England. — *Editor.*

THE SEASON IN NEW BRUNSWICK.

[Extract of a letter from Gen. Coffin, dated St John, N. B. June 1, to the Editor of the New England Farmer.]

"I notice by the New England Farmer, that the season has been very backward with you, and the past winter uncommonly destructive to fruit trees. With us, the winter and spring have been severe and backward in an unprecedented degree. There are as yet but few signs of vegetation; our cellars were severely assailed by the frost, and many roots lost. In Nova Scotia, the spring has been uncommonly cold and cheerless, in some parts there has been much suffering from a failure of fodder."

Horse Quicksilver.

QUICKSILVER will stand this season at the stable of the subscriber, in Brighton, a few rods south of the meeting-house, and will cover only twenty mares the present season, at \$15 each, and \$1 in addition, to the groom. Mares warranted to be in foal, if \$20 is paid, and \$1 to the groom; and in discharge of warranty, the \$20 will be returned.

Quicksilver is a beautiful bright bay, three years old; his sire, Sir Isaac Coffin's horse, Barefoot, conspicuous in the racing calendar of England; his dam, Rebecca, from the imported Cleveland bay horse Sir Isaac, and Sky Lark, a native mare, well known for her fine form, speed, and bottom, once owned by Mr Leavitt of Salem, to whom persons are referred for her character, and will be to many others in Massachusetts and Maine. Quicksilver is thought by good judges to combine with great symmetry and delicacy of form, bone, muscle, and all the requisites for a first rate covering horse. Mares sent to him, and if left with the subscriber, will be well attended to on reasonable terms, but he will not be responsible for accidents. BENJAMIN W. HOBART.

Brighton, June 13, 1832. 11

Horse Pioneer.

PIONEER will stand for Mares the ensuing season at the following places: at the cattle fair hotel, in Brighton, every Saturday, P. M.; and Monday (except the 25th June,) through the season; at Warren's in Framingham, Tuesday, P. M.; at Eastbrook's in Worcester, on Thursday—returning, at Grafton on Friday, A. M., and arrive at Framingham the same evening, and at Framingham the 25th and 30th of June.

Pioneer is a dark bay, full fifteen and a half hands high, ten years old this spring, is a horse of remarkable fine figure, temper and action, and a sure foot getter; was sired by the imported horse Debash, out of a fine mare by Cub, owned by Gen. Van Rensselaer of Albany. Persons wishing to improve their breed of horses, are requested to call and examine for themselves. He is pronounced by good judges not to be inferior to any horse in the State. That the public generally may avail themselves of the services of said horse, he will stand at the moderate terms of \$6 the leap, \$10 the season, or \$15 to insure.

JOHN PELTON.

Brighton, June 13, 1832. 31

Treatise on Domestic Animals.

THIS day published, by Lilly & Wait, and Carter & Hendee, and for sale by J. B. RUSSELL, No. 50½ North Market Street, "A treatise on breeding, rearing, and fattening all kinds of poultry, cows, swine, and other domestic animals. By B. Moubay, Esq. Reprinted from the sixth London edition. With such abridgments and additions as it was conceived would render it best adapted to the soil, climate, and common course of culture in the United States. By Thomas G. Fessenden, Esq., editor of the New England Farmer." Price 75 cents.

June 13.

Canada Squash.

JUST received at the Seed Store connected with the New England Farmer, 50½ North Market street, Boston, a few pounds of small Canada crooked-neck Squash seed, that usually ripens about the first of August. Those who have lost their seed this spring, by rotting, will find this the best sort to sow at this late period, to insure a good crop of winter Squashes, as they ripen in so much shorter time than the common large winter crook-necks.

June 13.

Yellow Locust.

THIS day received at the New England Seed Store, 50½ North Market street, from Cincinnati, 100 pounds of Seed of the genuine Yellow Locust (*Robinia pseudo-acacia*)—all raised the past year in the State of Indiana, where the beauty and superiority of these trees have attracted general attention.

June 13.

Situation Wanted.

A married man from Scotland, who has been in this country but a few months, wants a situation as manager of a farm or otherwise. His wife would take care of a dairy, if desirable. Apply at this office. * June 13.

Bee Hives.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, a few of Dr Thatcher's improved Bee Hives, which surpasses all other hives now in use, as the honey can be taken from the hive without destroying the bees.

June 13.

J. R. NEWELL.

Boy Wanted.

A faithful lad of about 14, who has a good education and of a turn to make a good salesman, may hear of a good situation in this city, by applying at the Farmer office. His board and a suitable compensation for his clothes will be given him.

June 13.

Situation Wanted.

A man who has worked thirty years at gardening in Europe, and considers himself competent in all out of doors business, wishes to get a situation. As he is averse to being idle, he will cheerfully endeavor to make himself useful in any other business about the house or farm, as occasion requires. Apply at this office. June 6.

Lead Pipe and Sheet Lead.

BRIGHTON MARKET.—MONDAY, JUNE 11, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 352 Beef Cattle, 16 Cows and Calves, 800 Sheep and Lambs, and 185 Swine. 84 Beef Cattle remained unsold at the close of the market.

PRICES. Beef Cattle—Last week's prices could not be obtained, a falling off of 12½ a 17 cents per hundred heads; with the exception of one very fine ox, driven by Mr Sweetser of Athol, which was taken at 7,37½, none would be considered as extra. We quote prime at 6,50 a 6,62½, good 5,75 a 6, thin 5 a 5,50.

Cows and Calves.—We noticed sales at \$21, 22, 25, and 27.

Sheep.—We noticed lots of Lambs, with a few old Sheep, taken at \$1,88, 2,00, 2,33, 2,50, and 2,67. Two prime wethers, not sheared, were sold at \$5 each, and one sheared at 10.

Swine.—Sales rather slow; no lots were taken; a few were retailed at former prices, 6 cents for Sows and 7 c for Barrows.

NEW YORK, June 8.—In market this week 500 Beef Cattle, 100 Cows and Calves, 700 to 800 Sheep and Lambs—sales brisk; a few head of cattle were left over and not sold, and prices not quite as good as last week, the average being \$7,25, we quote 6,00 a 8,50. Cows and Calves \$20 to 35. Sheep—sales quick from 2,50 a 6, and a few very fine S. Lambs—sales from 2,50 a 3,50. Live Hogs—\$4 a 4,25.—*Daily Ad.*

Miscellany.

The following ode, composed by the Rev. Mr Pierpont, was sung at the late anniversary of the Massachusetts Temperance Society.

ODE.

Wake! wake! friends of your kind,
There's a demon, a demon abroad!
Ye'll scent him in every breath of the wind!
Around him no we, death and hell are behind!
The foe of man and of God,
The Prince of the devils is it,
I escaped from the bottomless pit;
I escaped in his wrath, or his mirth,
To put out the lights of the earth.

Watch! watch! creeping by stealth,
Like the serpent through Eden's shades,
The mansions of peace, and of worth, and of wealth,
Assuming the form of "a spirit of health,"
This "goblin damned" invades,
He claims, and the claim is allowed!
The young, and the fair, and the proud,
He claims and he brands them as slaves,
And drags them all down to their graves!

Hark! hark! hear ye the chain
That is clanking in yonder cell?
The demon is there with the felon insane;
He is tearing a heart, he is burning a brain!
That shriek is a maniac's yell.
That low, heart-rending moan
Is a wife's—she is sitting alone;
The man on whose arm she has leaned,
Has left her, to worship the fiend.

Arm! arm! good men and bold!
It's a question of life or of death:
His banners are floating, beneath are enrolled
Your brothers, your fathers, your children—all sell,
(Bear witness their tainted breath!)
As victims that soon shall expire
In the flames of unquenchable fire;
Expire on his altar accursed,
In the fire of unquenchable thirst.
On! on! the fall is decreed
Of the throne of the evil one;
At his feet shall immortals by heronombs bleed;
His vassals already cry out to be freed;
Resolve, and the work is done!
Resolve! and the pits that yawn,
From dewy eve till dawn,
That spirits infernal may rise,
No more shall insult the skies.

From Knowledge for the People.

MARRIAGE.

Why is the marriage ceremony celebrated with great splendor among the poor as well as the rich Jars?

Because every guest brings a present, chiefly consisting of plate; on which account the lower orders are anxious to invite as many as possible; and not unfrequently, when the wedded pair are very poor, these gifts are disposed of immediately, to defray the expense of the feast and assist the young couple in house-keeping.

The policy of marriage in humble life has been thus illustrated by an acute observer: "There are few laborers of either sex, who live to an old age unmarried; scarcely any, it is said, of tolera-

ble character; and this remark may be confirmed by any person's observation."

The witty S. Elton has three passages on marriage, which we cannot omit.—1. Of all the actions of a man's life, his marriage does least concern other people; yet of all actions of our life, 'tis most judged by by other people.—2. Marriage is nothing but a civil contract; 'tis true, 'tis an ordinance of God; so is every other contract, God commands me to keep it when I have made it.—3. Marriage is a desperate thing. The frogs in Essex were extreme wise: they had a great mind to some water, but they would not leap into the well, because they could not get out again.

Why are Green Green marriages so named?

Because the first mock priest, by whom this trade was founded, resided on the common or green betwixt Grafton and Springfield, on the borders of Scotland; but removed to the latter place in 1791, where his successors have since resided.

Why are not Green Green marriages prevented by the Scottish church?

Because the mock priest, or coupler, despises the threats of the kirk, as excommunication is the only penalty it can inflict. An attempt was made in the General Assembly of 1826, to have this shameful system of fraud and profanity suppressed, but without effect. Upon an average, three hundred couple are married in the year, and half a guinea is the lowest fee that is ever charged. In its legal effect, the ceremony performed at Green, merely amounts to a confession before witnesses, that certain persons are man and wife; and the reader is aware that little more is required to constitute a marriage in Scotland, a marriage which is perfectly binding in regard to property and the legitimacy of children.

Why were Fleet marriages so called?

Because they were performed in the Fleet-prison, by a set of drunken, swearing parsons, with their myrmidons, that wore black coats and pretended to be clerks and registers to the Fleet, playing about Ludgate Hill, pulling and forcing people to some peddling ale-house, or brandy-shop, to be married; and even on Sundays, stopping them as they went to church. In this way, from October, 1763, to February, 1765, there were performed in the Fleet, two thousand nine hundred and fifty-four marriages, without either license or certificate of banns. Pennant, at a later period, confirms this account of the nefarious traffic. He says, in walking by the prison in his youth, he was often accosted with "Sir, will you please to walk in and be married?" and he states, that painted signs, containing a male and female hand conjoined, with the inscription, "Marriages performed within," were common along the building. This glaring abuse continued many years, to the ruin of children and destruction of their parents; and it was only put an end to by the marriage act of 1753.

Why is it customary in some ranks to salute the bride the moment the marriage ceremony is concluded?

Because of the ancient and nuptial kiss in the church, enjoined by the York and Sarum Missals. So in dancing, a kiss was anciently the established fee of a lady's partner. What would the patronesses of Almshouses say to such a custom in these days?

Why does the bride usually wear a veil?

Because of its origin in the Anglo-Saxon custom

of performing the nuptial ceremony under a veil, or square piece of cloth, held at each corner by a tall man, over the bridegroom and bride, to conceal her virgin blushes; but if the bride was a widow, the veil was esteemed useless. At Sarum, there was a marriage before mass, the parties knelt together, and had a fine linen cloth (called the care cloth) laid over their heads during the time of mass, till they received the benediction, and then were dismissed.—*Brand.*

Why is it supposed that torches were borne at old English weddings, as in the heathen mythology?

Because of the following lines in Herrick's Hesperides, upon a maid that died the day she was married:

That morne which saw me made a bride,
The evening witness that I dy'd.
The holy lights wherewith they guide
Unto the bed the bashful bride,
Serv'd but as tapers for to bume,
And light my reliques to their urne:
This Epitaph, which here you see,
Supply'd the Epithalamie.

Young Cleveland.

THIS truly beautiful and valuable Horse is of the Cleveland bay breed of horses, of fine even temper, five years old the 20th of May, fifteen and a half hands high, and of a beautiful dark bay color, with black mane, tail and legs. He walks and trots remarkably easy and fast; and is equalled by very few for muscular strength, elegant movement, and perfect symmetry of form.

He has proved himself a sure and first rate foal getter. The colts sired by him possess a great share of bone and muscle.

The pedigree of Young Cleveland:—He was sired by the celebrated bay horse, Sir Isaac, the son of the noted horse, Molinex. Sir Isaac was presented to the Agricultural Society of this State, by Sir Isaac Coffin, and was selected under his order as superior of his breed, and the breed recommended by him as the most highly esteemed for gentlemen's carriages, and all draft, farming, and saddle purposes, of any horses in New England.—His dam was a first rate and high spirited native mare. He will stand the ensuing season, at the stable of the subscriber, in Franklin.

TERMS:—Three dollars the single leap; five for the season and eight to insure the mare with foal; the money to be paid when the mares are taken away, on notes given payable the 1st October next. Those persons who put mares to the Young Cleveland and have them warranted, and part with them before foaling time, or neglect to bring their mares regularly to the horse through the season, will be considered holden for insurance money.

Agriculture.

MASSACHUSETTS AGRICULTURAL SOCIETY.

ON THE BEST CULTIVATED FARMS.

BENJAMIN GILD, Esq.—

DEAR SIR—It is but a few days since I saw or knew of the premiums offered by the Massachusetts Agricultural Society, for the best cultivated farms; and a less number, since I thought of offering mine. Not being in the habit of writing, I fear I shall make a bungling hand at it. I do not suppose that mine will compare with many in Massachusetts, where there has been thousands laid out; but believing that I have made considerable improvements within a few years, with small expense; I therefore offer my farm, which lies in the East parish of Attleborough, containing about three hundred acres of land, lying nearly square. The soil is variable as to quality; there are about twenty acres of old fields, worn out, lying at one corner; about fifty acres deep black loam, and nearly clear of stones; about thirty acres of meadow or low land; about one hundred acres of wood-land lying upon one side; and another part of strong, moist, cold land, which never was ploughed, and might nearly all be made into excellent mowing land, but it is used as pasture. My English mowing lies at the head of a small spring brook, and has something of the shape of a plate, except that there is one place for the water to pass off; and the meadow or low land lies on said brook, to where it enters Ten Mile River.

Two hundred acres of this farm I purchased about ten years since, for which I paid five thousand dollars. The said farm was very much run out, having been let for a number of years. The first year I cut but three tons of English hay, that could be called good, on the farm that I sold. Two or three of the last years, I suppose I have cut from forty to fifty tons yearly. The last year I kept an account of what I sold, which was about eighteen tons, which I put into a barn by itself; that I sold for sixteen dollars per ton, by carting it five miles to Pawtucket. The remainder of my English hay I put into another barn for my stock; and it was quite certain that I did not sell half of it. This year I think I have put into the same barn twenty tons, for fall, which filled a thirty by forty feet barn, when it was first put up. I put more than this into another barn, for my stock. Of said hay all but about two loads was cut on the said two hundred acres, and I have turned out about fifteen acres to pasture that was formerly mowed. The method I have taken has been to move fences and subdue hedges, plant but little and manure highly. I have made it a rule for five or six years past, to plant about four acres with potatoes, and get from one to two hundred bushels per acre; and four with corn, yielding about sixty bushels per acre, of shelled corn. I generally spread on about five cords of manure to the acre, and put about as much more in the hill. My hands have told me, sometimes, that I should spoil my potatoes by putting in so much.

But the greatest improvement I have made is in subduing fallow land, which was always run

round as though it was worthless; and indeed it was, as it then lay, for it was in the way, lying in the middle of my mowing land and yielded nothing of any value. I began upon the upper side, (for it lay on a gentle descent,) and ploughed about half an acre for experiment and drained it as well as I could, but the water was constantly issuing out of the ground on every part in our driest seasons. My neighbors told me it was labor lost; but I carried in considerable old hay and long manure, and laid it out for potatoes and planted them on it, and boed them to subdue the ground, for we could not turn it over with the plough, that it would not turn back. In the fall we gathered a fine crop of large excellent potatoes. I think I have learnt by experience, that blue or red potatoes are better suited to this soil than white ones.

I went on till the whole was subdued, and laid down to herds grass and Rhode Island hay, being about four acres; and now it produces from two to three tons of good hay per acre, yearly. There is about six or eight inches of soil or mud on the top, and we then come to a hard pan of gravel and clay.

I have generally sown, for a number of years, five or six acres of pasture land to winter rye, such as was suitable, and put on no manure. I only take off a crop, and let it lie for pasture; generally sowing on Rhode Island seed with the rye. Sometimes I have sown it on the snow in the spring, for experiment, but I do not know that it makes much difference. My winter rye is usually light, say six or seven bushels per acre.

I have sown down mowing land with spring rye, believing it to be much better than oats for the land and also for the grass. The seed will take much better for some reason; and that ground which is not suitable for rye, I sow only with hay seed. I put on manure only when I plant it. Spring rye is generally quite good, say from twelve to fifteen bushels per acre. I generally reserve a spot for round or English turnips, and sometimes plough a piece of sward after taking off the hay, where I intend to plant the next year, turning it over smooth and spreading on some manure; then harrowing it well with a light harrow, to cover the manure, but not harrowing up the sward; then sow the seed thinly and harrow it in; and sometimes raise a good crop very early in this way, say from one to two hundred bushels per acre. I also sow turnip seed on my manure that I dress my corn with in the hill, and raise my early turnips for the family, and sometimes a large quantity of large turnips for the cattle. I have also made a point of raising a number of bushels of ruta baga, for my table and cattle, which I think are very excellent for milch cows.

I have about sixty acres of English mowing, and I generally have from twelve to fifteen acres of it up to corn, potatoes, and spring grain. I plant none but this. I have ploughed all of it; but shall not think of ploughing the low lands mentioned, any oftener than I find it necessary; but shall spread manure every fall.

The hay consists of herds grass or timothy, red top, Rhode Island, and clover. I have a ditch out

of a swamp, and ran water almost all my mowing in the fore part of the season. I mow about thirty acres of meadow or low land, which I think cuts about thirty tons of hay or nearly, and is principally the common brook meadow grass. I have thrown the water over a part of it, which has made considerable improvement to quantity and quality of hay. I like to raise my own hay-seed and sow it; I think it does much better than I can buy. I do not clean it, therefore, I cannot be particular as to quantity. I want but little Rhode Island or red top; but am not afraid of putting on too much herds grass or clover. If we do not put considerable clover seed on rich ground, the hay will be very coarse and nearly worthless. I choose the early spring sowing and think it the best; but wait till the ground gets dry, if it is not till the fall. I have been troubled about low ground taking the seed; and have a number of times sown in the spring, after the land was laid down, on what sward there was, and it has done well. I have about a hundred and thirty acres of pasture land, about one half of which was never ploughed. One half the other I plough and sow to rye, as before mentioned; the other quarter has scarcely been ploughed these forty years, or since my recollection.

The number of apple trees on the farm is about five hundred, mostly in orchards. One orchard of about one hundred trees was set out about forty years ago. One of about one hundred trees, about twenty years ago. One of about two hundred trees, about fifteen years ago. The greatest number of them are natural fruit. About fifty grafts have been grafted occasionally, as opportunity offered, and some of them are hardly in bearing. To those trees we have done but very little, except trimming, and putting chip manure and old manure around them, to keep the sward loose. I made about ninety barrels of cider last year, saved about ten barrels of excellent winter apples, and sold as many as thirty bushels of fall apples, and used a number of bushels in the family. As to making cider, my rule is to pick the apples as soon as I think them worth picking, and make them up into cider; and as soon as apples are ripe, shake and pick the rest, and put them into an apartment in the mill, so that they will not heat, and keep them till they are mellow and then make them up, and see that the mill and press are clean and sweet. I grind them out in the afternoon, and let them lie in the trough and on the press, till the next morning; then press the cider out, put it into clean casks, roll it into the cellar, place it where it is to stand, knock out the bung, let it work, and stop it again as soon as it is done.

I put the greater part into two hogsheds. I like them best, and am very careful to keep them sweet. My rule is, as soon as the cider is out, to wash them clean and dry them, and put them in the cellar; and if they get foul, I have tried to cleanse them by setting a rag (dipped in brimstone) on fire and putting it into the barrel, then bung it up, and sweeten them in that way; but the better way is to throw them aside, and get more. I calculate to pick all my apples by the first of October.

I have another orchard that was set out twenty years ago last spring, of one hundred trees, all selected and of the best kinds of fruit. There are twenty-eight kinds. This orchard I have nursed and manured highly, and it looks thrifty. I wash the trees with soap and ley, mixed in equal quantities, in the spring, which I think is far superior to anything else I have ever used or heard of.

As to my house, it is twenty-eight by thirty-three feet, two stories high; with a kitchen, sixteen by sixteen; a cheese-room, milk-room and luttery, running out back; with a well-room, wood-house, wagon-house; farmer's work-shop, thirty-three by sixteen; a tool-house, a corn-barn, chaise-house and a cider-mill, adjoining the kitchen and nearly reaching the barn, which is thirty by seventy, with two barn-floors. I can tie up twenty head of horn cattle, and put up four horses. There is a shed at one end, twelve by sixty; and a barn-yard adjoining, about five rods square (with a well in it,) where I keep my oxen, cows and sheep, not letting them get loose through the winter.

I have another barn, already mentioned, where I keep my hay for market, which is thirty by forty; another barn, twenty by thirty, which I fill, barn floor and all, with my poorest hay; a shed adjoining, sixty by twelve, with a warm yard adjoining, where I keep my young cattle, and let them go to a spring in the lot near said barn, to drink. This yard I clean out in the spring, heaping up the old hay and manure as soon as the frost is out, and at planting time draw it out and manure my potatoes with it, there being about twenty loads. My other yard, where I keep my other stock, I clean out in the fall; then fold my cattle in it all winter, then cart my green manure that was thrown out of the barns, and spread it all over the yard, and then cart in as many loads of loam and spread it over the manure, to keep it from drying up; then yard my cattle upon it all summer, ploughing and mixing it occasionally, out of this yard. I carted one hundred and nineteen half-coord loads of excellent compost last fall, forty loads of which I put on my corn ground for spring; the other seventynine loads I put on my English mowing, and spread it. This has been my method for a number of years, as to manure.

I have a hog-pen, also, walled in with a thick tight wall, about three rods square, the north corner of which is dug into a side hill, at which there is a nest covered with flat stones; at the south corner of which there is a pair of bars and a house to feed them. The northeast and northwest sides we can back a lead up, and tip it over the wall into the pen. This I clean out in the spring. Last spring I carted out sixty half-coord loads, which I spread on my planting land. My method here is, as soon as I clean it, to cart in old hay and straw, then loam and green manure, and add to it in the summer anything that will rot, such as bulrushes, brakes, and small whortleberry brush, which grow in our rocky pastures, and are regularly cut every other year, half yearly, and with weeds which we throw in when at leisure. I also go to the sea-shore, which is fourteen miles, and get a few loads of sea-weed, which I think very excellent to mix with other materials, and cart some mud out of a pond-hole in the woods, which is a mile off. I keep four oxen constantly and generally a pair of steers to work, five cows constantly, and about thirty-five head of young stock. I have always calculated to raise my own stock, and raise about eight or ten calves yearly, and

keep them till they are three years old. I have calculated to fat and sell one hundred dollars worth of beef yearly. I keep one horse, and about fifty sheep about one half blooded merinos. The quantity of butter and cheese I can tell nothing about, we make little excepting what we use in the family.

My stock is the native breed, except seven years since I purchased a very fine bull, that came from New Hampshire, said to be of the Beckworth breed. I have ever since kept a bull descended from him, and have taken a premium on some of them at the Bristol County Society, also on some cows of the same breed.

As to my hogs, (I calculate to raise my own pigs,) they generally weigh about three hundred pounds apiece, and are usually six in number.

As to labor on the farm, I have a son about nineteen years old, and I have usually one hand seven months in the year, at twelve or thirteen dollars per month; also a boy, and a number of hands in hay time. This year I hired about thirty days' work, at thirty dollars. I collected all my hay into barns and stacks before August. We work out our team nearly or quite enough to pay our help. We have not used any ardent spirits for 3 years, and get along much better than formerly when we did use it, for there is now no grumbling, as there was then, for want of more. We use cider, hop beer, sweetened water, and milk and water. I generally hire such help as have families, and want all their pay from the farm.

As to rotation of crops, I like to plant potatoes the first year, corn the second, and sow down the third year with spring rye, as early as the ground will permit. I sow nearly a bushel to the acre, then harrow, and roll it in with a good heavy roller.

I feed my stock in the fall with corn fodder and good hay till cold weather comes, then with my poorest hay till spring, then with better. I give milk cows some roots in winter, such as turnips and potatoes, beginning in the fall and continuing them through the winter, lightly, as they will hold out. I never have any roots to sell, except to hired help, although we have probably some years raised nearly a thousand bushels.

To my oxen I give five or six ears of corn daily; and when I work them hard, a little meal.

My calves that I intend to raise, (which must be entirely red,) I have sometimes suffered to suck and sometimes I have fed them with new milk, till they were weaned. But the better way, on the whole, in my opinion, is to take them from the cow at about five or six days old, and give them new milk a few times and then milk porridge once a day, and they will do very well without new milk; in a few weeks, a little dry meal is very excellent. I wean them usually at three months old. I usually keep six hogs, and fat them principally on pumpkins and potatoes, boiling them together; I have a kettle that will hold about three bushels, mixing them up with a little meal, adding more meal from time to time, till they are fat. I frequently give them a little green corn on the cob, for a change.

As to fattening cattle, I have no certain rule as to the age, but usually fat them young. I seldom keep cattle till they get on the decline. Some cattle will do very well till they are twelve years old, others fall younger; I usually fat them with grass and green stalks, and when they are done I turn them off as quick as possible.

As to sheep, I have taken the first premium at

the show in Bristol County, a number of times, on some of them. I let them run with the cattle in winter; they will pick out a good deal that the cattle will not eat. I give them a yard that they can run into, away from the cattle, where they usually lie. I also have a rack in that yard, made on purpose for them, set perpendicularly, that the seed may not get into their wool. I feed them with English hay. I have for some years, but not always, given them corn and turnips through the winter. I think they never did better than they did last winter. I kept them as usual, but without provender, till about the middle of February; then I fed them in these racks with fine clover hay; and after they begin to lamb, give them some corn and turnips, as long as they would eat hay. I let them out of the yard as soon as the grass starts up a little in the spring. I think they do best. I generally have them lamb the first of April, when I can keep my neighbors' runs away from them. I wish to mention one thing, which I fear you will think a pretty large story. I have a four years' old ewe sheep (a cade,) that never had a lamb; she is always fat, and never would eat any provender of any kind, and always goes with the young cattle and lives on the poorest hay I cut. Last spring I sheared 11½ pounds of fine wool from her. An agent of a large woollen establishment saw her, and said he never saw anything like her before; but this wool was two years old, not being sheared in 1830.

This rough draught was drawn in haste, and is quite imperfect. It is much longer than I expected when I began.

I am, dear Sir, very respectfully, your obedient humble servant,
PETER THATCHER.

P. S.—If I have anything to boast in farming, I must acknowledge that I received it from the New England Farmer. I began with the second volume, and have since read it very attentively.

Atthborough, East, September 28, 1831.

Bristol, ss. September 28, 1831.—Then personally appeared Peter Thatcher, subscriber to the foregoing statement of facts and description of his farm, and the management of the same, and made oath that the same is true.

NOAH CLAPLIN, Justice of Peace.

From the Genesee Farmer.

LEACHED ASHES FOR MANURE.

MR GOODSELL—A very general prejudice exists among farmers, against leached ashes for manure. Vast bodies of them are suffered to go to waste or lie idle, in every direction about the country. I know by experience that they are an excellent manure. I have tried them on my garden and in field culture, and always with satisfactory results. They are brought in vessels from Albany, Philadelphia, Baltimore, Boston and New York, and deposited at the landings on Long Island, sold at from twelve to twenty-five cents per bushel, carted from six to ten miles, and used as manure by the farmers of Long Island.

About twenty-five years ago I was on a visit to an uncle of mine, and saw him receive four dollars for fourteen bushels of leached ashes. I remarked, that the man could never hope to see his money again by spreading them on his land. He replied, *I know not how it is, but we grow rich by it.* I know many thousand acres of land on the Island, which are now producing fine crops of grass and grain, which formerly were too poor to produce

anything but *sorrel* and *mullen*. These have principally been made fertile by means of leached ashes, at this enormous cost of money and labor; and I am much at a loss to know why they are considered worthless among us, while they are in such request on the Island. They should be spread on the soil and intimately mixed by the plough, or used in compost. In either way, I believe they would be found equally useful to us.

Middlesex, N. Y., May 8, 1832. R. M. W.

FIELD MICE.

In the fall of 1829, I neglected to clean out the grass and weeds in my apple nursery, that contained some thousand trees. In the spring of 1830, I found two or three hundred wholly spoiled by the mice; many eat entirely off at the bottom, that were an inch and a half in diameter. I then declared that there should be no neglect in cleaning out the nursery the next fall, but owing to a pressure of business and cold weather commencing, I had not cleared out the nursery. I finally hit upon a plan to rout the mice. I took in a basket a bushel of shelled corn, and sowed it throughout the nursery in the grass. I then turned in twenty or thirty young hogs, and after a day or two I sowed another bushel; the shoats rooted the grass all over, and destroyed the mice and their habitations. Last fall I practised the same method, and find no appearance of mice. I have probably a thousand apple trees that are from one and a half to three inches in diameter, standing in grass fields. I pastured sixty or seventy hogs in them that contained the apple trees, and many times the hogs run in other fields; and there is no appearance of mice in any field where the hogs have run. I got so much in favor of the plan, that I turned them into the meadows, and let them in all my fields except where grain was sowed; and although they have been so numerous, I can discover very little of their work on my farm, containing three hundred acres of improved land, and quite a portion mucky land, such as is generally selected by the mice for their places of residence. I would observe, that there have been great complaints and much damage done in and about this section of country. Now it remains for others to say, whether the hogs eat up the mice as they do the rattle snake, or whether their trampling and continual rooting drive them off. Yours, respectfully,

JOHN SPICER.

East Barrington, Yates Co., N. Y., April, 1830.

MOUNT AUBURN.

In reply to inquiries frequently made, with regard to the progress of the undertaking at Mount Auburn, (says the Boston Courier,) the following statement will explain the present condition of the works. As soon as the ground was sufficiently settled after the rains in April, the making of the avenues and paths was begun, and has been diligently prosecuted until the whole are nearly completed. In effecting this, the stumps and other obstacles have been removed, the ground ploughed, levelled and rolled, until a hard and excellent road-surface is produced. Carriages, in great numbers, now pass with ease through every part of the ground, and ascend to the summit of the hill. No place in the environs of Boston has been more frequented with visitors, in the pleasant days which have occurred during the month past. A contract has been made for surrounding the whole ground with a substantial fence of close wooden poles

seven feet in height. The whole inclosure, four hundred rods in length, will be completed this season. A number of appropriate monuments to designate the lots of individuals, are now making, and some will be placed on the ground within the space of a few weeks. The planting of shrubs and flowers, the erection of a lofty stone gateway, and of a tower on the summit, with the other contemplated improvements, will take place in succession, as fast as the funds of the institution permit, and in regard to these the present popularity of the design leaves no reason for doubting. In the meantime it is hoped that proprietors of lots will give their aid, at an early period, to the general design, by erecting throughout the ground, such monumental emblems or simple inclosures, as a correct taste may suggest. Marble, granite, bronze, and cast iron, afford the requisite variety of materials for monuments, and of these a variety of plans may be seen at Mr Cary's stone-cutter's yard, in Front street. For inclosures, it is believed that a slight iron fence, or a connexion of stone posts with chains, will produce a most pleasing effect on the eye, where a monument is inclosed.

SUGAR FROM POTATOES.

We were rather incredulous upon this subject, and therefore expressed a hope that some one "near Jaffrey" would give us information. A few days since, Mr Henry Russell, of North Adams, Mass. called on us, having seen the notice. He assures us of the fact, that sugar, equal in strength to our maple sugar, has been manufactured by him, purely from the potato root, and believes he shall be able to manufacture sugar equal in strength and goodness to that made from the cane. He has made several barrels of molasses, which is the first process. A bushel of potatoes, weighing sixty-four pounds, will yield eight pounds of sugar! The expense of manufacturing he states at about four cents per bushel. Mr R. has already disposed of his skill to several persons, and is ready to enable others to commence the manufacture, for a reasonable consideration. Letters may be addressed to him, at North Adams, Mass. The present theory is, that alcohol (spirit) does not exist in grain, potatoes, &c, but is produced by the process of fermentation; so of sugar. The process which the potato undergoes produces sugar, and yet just as much alcohol may also be produced, as if the sugar had not been extracted! The molasses of potatoes produces alcohol of a fine flavor.

Silliman's Journal for January last, contains a communication, from which it appears that successful experiments have been made at Sackett's Harbor, N. Y. The sugar is said not to be so sweet as the Muscavado, but may be used for all kinds of domestic purposes. "It has already become a favorite; its taste is that of a delicious sweet; and as an article of diet is unquestionably more healthy and less oppressive to the stomach, than any other sweet ever used."—*Keene Sentinel*.

GARDENING AT SEA.

We were on board a vessel the other day, just about to sail for America, and were most hospitably received in a fine, airy, roomy cabin. The captain's wife was present, and on the supposition that she was a permanent inmate, we remarked, that though she could boast of not only a floating cottage, but a cottage ornee, she nevertheless lacked the comfort of a kail-yard for the cultivation of savoy and other pot herbs. "And there you are

wrong," said the captain, "and if you will go with me I'll soon show you as goodly a crop of greens as you would wish to look upon." Our curiosity being excited, we followed him to the hold, and there beheld on a large scale, a novelty, or rather phenomenon, in horticulture. The plan was this: A sufficient number of savory plants are pulled up by the roots, and replanted among the sand used for ballast. After a few days, the outer blades fall off, and on the other hand, new ones spring from the heart; and Capt. Carson assured us, that his stock of vegetables would continue quite fresh for months, and, barring accidents, thicken the broth of a dozen persons, lessen the chances of scurvy and otherwise mitigate the effects of salted provisions, till the man at the mast-head described their destination, Chaulcur bay, on the shores of America.—*Dunfries Courier*.

Native Country of Maize, or Indian Corn.—This grain, so important to the agricultural interests of America, appears to be of uncertain origin. Fuchs very early maintained that it came from the East; and Mathioli affirmed that it was from America. Regnir and Gregory have presented fresh arguments in favor of its Eastern origin. Among them is the name by which it has been long known in Europe: *Blé de Turquie*; and varieties, it is said, have been brought from the Isle of France, or from China. Moreau de Jonnés, on the contrary, has recently maintained, in a memoir read before the Academy of Science, that its origin was in America. The name *Blé de Turquie*, no more proves it to be of Turkish origin, than the name of the Italian Poplar proves that the tree grew wild in Italy. It can only signify that it spread from Turkey into the neighboring countries. Its general cultivation in southern Europe and the production of some new varieties, proves nothing with regard to the country of the species. In favor of its American origin, is the fact that it was found in a state of cultivation in every place where the first navigators landed. In Mexico, according to Hernandez; and in Brazil, according to Zeri; and that in the various countries it had proper names, such as *Maize*, *Flaotli*, &c. While, in the Old World, its names were either all of American origin, or names of the neighboring region, whence it was derived; and that, immediately after the discovery of America, it was spread rapidly in the Old World and soon became common, a fact not reconcilable with the idea of its former existence there. To these proofs Aug. de Saint Hilaire has added another. He has received from M. de Larranbaga, of Monte Video, a new variety of Maize, distinguished by the name of *Tunicata*; because instead of having the grains naked, they are entirely covered by the glumes. This variety is from Paraguay, where it is cultivated by the Guaycurus Indians, a people in the lowest scale of civilization; and where, according to the direct testimony of one of them, it grows in the humid forests as a native production.—*Arcana of Science*.

Radishes.—There is a radish growing at Perth, Van Diemen's land, in a shoemaker's garden (reserved for seed,) as thick as a stout man's thigh and from ten to eleven feet high; in fact, the radish appears to take a different character in the deep and moist sands of Perth.—*Hobart Town Courier*.

"Beware of little expenses; a small leak will sink a great ship."

Rural Economy.

From the American Farmer.

ON TRAINING OXEN.

MR SMITH—In the 1st No. of the 14th volume of the American Farmer, I see some remarks on the manner of "training cattle," and some inquiries respecting the best mode of doing it. I am pleased with your correspondent's ideas on this subject. I have recently learned a mode of breaking steers to the yoke, which seems to me so remarkably reasonable, so humane, and so well calculated to aid in effecting the object, that I take the liberty of offering it to you, that if you think it of sufficient interest you may communicate it. I would remark, that the training of steers to the yoke is not the work of an hour or a day. Before they work well, work must be made something of a habit with them. I think, however, they are the most docile of working animals, and if our efforts to subject them are directed by reason, they are more certainly successful than with the horse or the mule; and further, that they are more perfectly subjected to our control and manifest more intelligence in understanding our commands, than even the horse. This control over them is not obtained by cruelty or abuse, by whipping and beating, but by kind and generous treatment.

The mode of breaking alluded to, is as follows: On a stump or substantial post, fasten a pole with a pin, in such manner the pole will turn round as on a pivot. The pole may be some twenty feet long, and ought to be from the ground the height of the yoke when on the steer; fix the end of the pole similar to the end of a yoke, and then yoke the steer in it. By reversing the position of the steers, one may be yoked at each end of the pole at the same time. They will soon get so as to travel round the post or stump together. If it is feared the steer may injure himself by twisting round the end of the pole, this may easily be prevented by mortising in a small bar at the end of the pole. After they are yoked in the pole, let them remain a day or two, troubling them no farther than to feed them. After they have ceased to make efforts to extricate themselves from the pole, and will travel round quietly with it, yoke them together, and there will be no difficulty in using them behind a well-trained yoke of oxen. While yoked to the pole, it is well to familiarize them by rubbing and handling them, that they may learn to be approached without the fear of being injured.

In breaking cattle to the yoke, the first requisite is, to impress them with the conviction that they are perfectly subjected to our control, and that all their efforts to extricate themselves from it are unavailing. What is to be avoided particularly, is to prevent them from learning to "turn the yoke," from becoming sullen and lying down, and from the habit of running away. Now it does appear to me, that the above mode of first handling them, is eminently calculated to prevent them from acquiring either of the above vices. It is further recommended in this, that they are habituated to confinement without the possibility of injuring themselves, and all the necessity of whipping and beating them in the first handling, is entirely superseded. One thing to be especially avoided with young cattle, is, not upon any consideration to overtask them.

I would request anyone who makes a fair test of the above mode, to communicate the result. A very great aid in breaking young steers, is, in the first instance, simply to catch and tie them to a tree and let them remain tied for a day or two. By either of the above modes, and judicious handling after being taken in hand, so far as my observation goes, steers that have been little handled and are comparatively wild, are broke sooner and with greater facility than those which have been petted and are tame.

Should the above be the means of preventing a single scene of inhuman beating of young steers, for turning themselves in the yoke, or of beating them when they get sullen and lie down, or of twisting their tails to make them get up, it will be a most compensation for the trouble of one who subscribes himself

A FRIEND AND ADMIRER OF GOOD OXEN.

From the Genesee Farmer.

TRAINING CATTLE.

I was much pleased with an article in your last paper, taken from the New England Farmer, on training cattle. The frequent abuse of our laboring animals, by those who receive the benefits of their labors and who ought in return to treat them mercifully, has often given me great pain. Indeed, it is a matter to me perfectly surprising, how any intelligent being can so wantonly and unthinkingly abuse dumb animals, as many are in the daily habit of doing. I venture to say, from my own observation, (and that has not been limited in this particular,) that nine tenths of the perverseness of laboring animals, arises from the mismanagement, at some period or other, of those who train or use them. It appears to me, the rules of management in all these cases are extremely simple. You have only to study the natural disposition and history of the animals, to know how to manage them. By your own feelings, you can easily perceive that they can have but little heart or disposition to labor if scantily fed; of course, good feed is the first step in obtaining good labor. The next is to have your teams properly trained, so as to know you and also to be fond of you, and to love the sound of your voice, for animals are capable of much affection. I have known numerous instances of the kind, and in all cases with which I have been familiar, those who treated their cattle or horses with kindness, always obtained from them the most work, and that too in the easiest way.

I have employed, in the course of my business, a great many men and teams, both with oxen and horses, and I never yet knew a bawling, noisy, whipping teamster, who did a great day's work; nor have I scarcely known such a one who kept a fat team. The best man who ever did me any labor was a good substantial farmer; his oxen were always fat, and spry as colts; he would never hitch them to anything which he knew they could not draw, of course they were not discouraged; and he hardly ever spoke louder to his oxen than in a low tone of common conversation. He would frequently talk to them soothingly, and encourage them when he had a hard job on hand, which was often the case. After making a heavy pull, he would sometimes pat them on the back, but I rarely ever knew him to strike or worry his team. He carried a slender goad with a short lash, to guide them with, and a mere swing of the whip was sufficient for his purposes. I have known

several such persons in my life, and I do not hesitate to say, that any person who so manages his teams, will get more labor at less expense and with more ease to himself, than by the ordinary bawling, whipping method, so much practised in our country. All the difference with these people is, that the one understands and studies the nature and disposition of his animals, and the other does not. "An even temper and a steady hand," ought to be the teamster's motto, the world over.

From the Providence Daily Journal.

PRICES OF WOOL.

The following statement exhibits the comparative average prices of wool (imported the last year) at the present rate of duty, and at twenty per cent, as proposed by the Secretary of the Treasury.

Imported from	Cost per pound at present rates.	Cost per pound at twenty per cent.
	cts.	cts.
Netherlands,	62½	45
England,	57	40½
British American Colonies,	28½	19
Hanse Towns,	60	43
Hayti,	22	13.8
Spanish Atlantic ports,	36	24.32
Portugal,	23	14.42
Trieste and Adriatic ports,	51	36
Smyrna,	18½	10.90
Brazil,	9	4.18
Argentine Republic,	7½	2.81
South America,	11	5.15
Africa,	13	7.30
Mexico,	9½	4.20

By the foregoing bill, all wool unmanufactured, the value whereof, at the place of export, does not exceed ten cents per pound, will pay five per cent ad valorem; when the value exceeds ten cents per pound, it will pay twenty per cent ad valorem.

By the present tariff, wool of the same description pays four cents per pound, and fifty per cent on the cost on board. HENRY BOWEN, Sec'y.

By the above statement, exhibited by the Secretary of the Treasury, it will be seen that the prices of wool will be reduced as follows:—

On wool from the Netherlands the price will be reduced 17½ cents per pound.

On wool from England the price will be reduced 16½ cents per pound.

On wool from British American Colonies, 9½ cents per pound.

On wool from the Hanse Towns, 17 cents per pound, &c.

And it will be further seen, by the same estimate, that of the fourteen descriptions enumerated by the Secretary of the Treasury, the average price in this country, according to his estimate, will be 19½ cents per pound.

Experiments are making in Alabama, Florida, &c. to introduce the cultivation of the olive. Now that much more oil than usual is required, and the price is extremely high, seems an excellent time to press this cultivation.

NUTRIMENT OF WATER, &c.

The following article was written by the Editor of the *New England Farmer*, and is quoted from "Moubray's Treatise on Foultry," &c, lately published by Lilly & Wait, and Carter & Hendee, with additions, &c, by said Editor.

The importance of cooking food for animals is not generally so well appreciated as it ought to be; nor is the principal cause or source of improvement, as well in quantity as in quality of cooked food over its raw materials, known to every economist. The researches and deductions of philosophers and chemists, assure us that *water supplies food* for animals as well as plants. But in order that water may yield its best and greatest effect as nutriment, either for man or beast, it is necessary to *cook* it, or increase its nutritive powers by the agency of heat; by which water, when combined with certain substances of vegetable origin, is converted into wholesome, palatable, and often *solid food*.

It is a fact, which will be acknowledged as soon as stated, that a pound of Indian meal, of rice, or any other farinaceous substance, when boiled, contains more nourishment than several pounds in a raw state. Count Rumford has stated, that "from the results of actual experiment it appears, that for *each pound* of Indian meal employed in making a pudding, we may reckon *three pounds nine ounces* of the pudding.* And again, three pounds of Indian meal, three quarters of a pound of molasses, and one ounce of salt, (in all, three pounds thirteen ounces of solid food,) having been mixed with five pints of boiling water, and boiled six hours, produced a pudding which weighed *ten pounds and one ounce*.† Thus we gain from the raw material about 300 per cent in weight, and, no doubt, the gain as respects the quantity of nutriment contained in the pudding, over and above the component parts as they existed before boiling, was still greater. The gain of weight in rice, in consequence of boiling, is still more considerable than that of Indian meal, and everyone knows that a small quantity of oat-meal will produce a very great relative proportion of gruel.

I will give other examples, proving that water is not only capable of being converted by heat into solid nutriment, but may be made to compose a constituent part of sugar, one of the most nutritious of substances. It is remarked by De Saussure, that, "As starch boiled in water with sulphuric acid, and thereby changed into sugar, increases in weight, without uniting with any sulphuric acid, or gas, or without forming any gas, we are under the necessity of ascribing the change wholly to the *fixation or solidification of water*. Hence we must conclude, that *starch sugar is nothing else than a combination of starch with water in a solid state*. The sulphuric acid is not decomposed nor united with the starch as a constituent."

It appears, likewise, that Capt. Palter, of Sackett's Harbor, at the instance of Samuel Guthrie, of the same place, has succeeded in the manufacture of sugar from the potato; and a detail of the process by which this is effected, is given in Professor Silliman's *Journal* of January, 1832. It is there said, that

"A bushel of potatoes weighs about sixty pounds, and gives eight pounds of pure, fine, dry starch. This amount of starch will make five

pints of sugar, of the weight of nearly twelve pounds to the gallon, equal to seven pounds and a half to the bushel of potatoes, or a little less than a pound of sugar to a pound of starch. The sugar is not so sweet as the Muscovado sugar, nor is it actually so sweet as its taste would indicate.

"This sugar may be used for all domestic purposes. It ferments with great liveliness and spirit when made into beer, yielding a healthful and delicious beverage, and on distillation, a fine cider-brandy flavored spirit. It would, however, be most useful in making sweatments, and may be used upon the table instead of honey, for which it is a good substitute. It has already become a favorite with most people who have become acquainted with it. Its taste is that of a delicious sweet, and as an article of diet is unquestionably more healthful and less oppressive to the stomach, than any other sweet ever used."

The elements or chemical constituents of starch and of sugar, are nearly the same. According to Mr Gay Lussac and Thenard, one hundred parts of starch are composed of

Carbon, and a small quantity of saline and earthy matter,	43.55.
Oxygen,	49.68.
Hydrogen,	6.77.

Or, Carbon, 100.00.
Oxygen and hydrogen, in the proportions necessary to form water. 43.55.

Lavoisier concluded from his experiments, that sugar is composed of the following elementary proportions, in a hundred parts:—

Twentyeight,	carbon.
Eight,	hydrogen.
Sixtyfour,	oxygen.

Then to turn starch to sugar, it is merely necessary to subtract from the carbon of the starch, to wit, 43.55, 15.55, and it will stand 28 carbon.

To add to the oxygen of the starch, to wit, 49.68, 14.32, and it is 64 oxygen.

To add to the hydrogen of the starch, to wit, 6.77, 1.23, and it is 8 hydrogen.

Thus, by adding oxygen and hydrogen to starch, in certain proportions, and by subtracting or driving off as much carbon as will be equivalent to the additions, starch is changed to sugar. Water is composed of oxygen and hydrogen, and, together with the sulphuric acid, furnishes the elements necessary for the change, by the agency of the same heat which expels a part of the carbon.

Should any person still doubt whether water can exist in a solid state, combined with other substances, but not frozen, let him take the trouble to weigh a small quantity of quick lime, then slack it with water, and mark its increase of weight.

Braconnet, a celebrated chemist, raised vegetables in pure river sand, in litharge, in flowers of sulphur, and even among metal, or common leaden shot; and in every instance, nothing was employed for that nourishment but *distilled water*. The plants thrive, and passed through all the usual gradations of growth to perfect maturity. The author then proceeded to gather the entire produce, the roots, stems, leaves, pods, &c. These were accurately weighed, then submitted to distillation, incineration, lixiviation, and other ordinary means used in careful analysis. Thus he obtained from the vegetables all the materials peculiar to each individual species, precisely as if it had been cultivated in its own natural soil; viz. the various

earths, the alkalis, acids, metals, carbon, sulphur, phosphorus, nitrogen, hydrogen, &c. He concludes this important paper with these remarkable words: "Oxygen and hydrogen, with the assistance of solar light, appear to be the only elementary substances employed in the constitution of the whole Universe; and nature in her simple progress, works the most infinitely diversified effects by the slightest modification of the means she employs."

This chemist entertained an opinion founded on experiment, that the elements of water composed plants, the decay of plants formed the materials which constitute the earth; and of course the "Great globe and all which it inherit," so far as natural causes are concerned, are products of the modification and fixation of water. Other philosophers assure us, that the remains of marine animals, &c, are found on the highest mountains; and that there are many and incontrovertible proofs that the solid parts of the globe have gained on its waters, not only within the limits of authentic history, but in some cases within the memory of man.

From the London Horticultural Register.

HYDRANGEA HORTENSIS.

I hope you will not consider me as trespassing on the pages of your magazine, or intrusive on the patience of your readers, if I make a few observations on what has come under my notice, relative to the treatment of the *Hydrangea Hortensis*, with a view to *change the color* of the flowers.—Some years ago, I turned my attention to the cultivation of this plant, and looking over the pages of the *Encyclopedia of gardening*, I read the opinions of some eminent practical men, who stated that a compost of turf ashes or ashes of Norway spruce, &c, &c, would effectually change the color; this I made use of, but without the desired effect; for I found that the plants neither grew so healthy, nor were the trusses of the flowers so large, as when free from it, and the color was by no means a good blue. I next had recourse to a kind of peat-earth, which appeared to contain a small portion of oxide of iron; the plant in this grew very healthy and bore large trusses of flowers, but these too were far from being a good blue. Nevertheless, I am satisfied that when the soil can be obtained with a good portion of the oxide of iron, the flowers will be blue; but as I found this to be a method on which a practical gardener could by no means depend, I was very anxious to discover something that would answer the desired end. All the means I made use of proved ineffectual, I was forced, though reluctantly, to give up the experiment; but coming into the neighborhood in which I now reside, I was struck with the vigorous and healthy state of the *Hydrangers* kept by the cottagers here; the flowers are of an exquisitely fine blue, and in size the trusses are surpassed by none I ever saw; and a particular friend of mine, who had lived some years in the neighborhood, assured me that every year they blew the same beautiful color. The compost they are potted in is common sandy loam, mixed with about one third of fresh sheep's dung. A portion of the same dung is mixed with the water that is given to the plant; and I am informed that the young plants, which have been grown in all parts of the village, that have received this treatment, the same effects have been produced. I beg leave to submit the experiment to your readers.

* Rumford's Essays, vol. i. page 255, Boston ed.

† Rumford's Essays, vol. i. page 264, Boston ed.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, June 20, 1832.

INDIAN CORN.

When the plants are three or four inches high, run a furrow with a one-horse plough in the intervals between the rows, as near as can be conveniently done without injuring the plants; making two furrows in each, turned from the rows; and then the weeds should be killed with the hand-hoe, and a little fresh earth drawn about the plant—such were the directions of Dr Deane, Judge Peters, of Pennsylvania, however, observed that "wherever the *harrow* has been fairly tried, its advantages over the *plough*, in corn crops, have been decisively shown."

In Memoirs of the New York Board of Agriculture, vol. ii. page 25, it is said, that "every farmer prefers stirring the soil about the hills of corn at least three times during the season; but they differ considerably as to the times and methods. If the soil is sandy, or a fine loam, it may be harrowed once and ploughed twice, as a substitute for hoeing. But one should go through the field each time, with a hoe, and set up all those hills which have been disturbed by the team or plough. This method is not considered as preferable in any case, excepting where a farmer has land enough and labor is high. Three regular hoeings and ploughings, under all other circumstances, must be preferable.

POTATOES.

Potatoes may yet be planted; and those who have land to spare for that root, may possibly derive benefit from the following directions, copied from the work quoted above.

Seed potatoes should never be cut; one whole large potato is sufficient for a hill. The outside skin of a potato, called the cuticle, is the most durable part, and retains the moisture for the use of the young plants, until it is all exhausted. If potatoes are cut, the nutritive juice is absorbed in a great measure by the earth. The evil of cutting seed potatoes is more manifest on a dry soil than on a moist. It is a mistaken opinion, that a whole potato is not so good on account of bringing the plants too near together; for the roots will yield all we seek for, spread in all directions, and fill the hill.

Potatoes, if planted in a sandy soil, will yield one third more, if a table spoonful of plaster be thrown upon the naked potatoes in each hill, after they are dropped, and before they are covered.

Yard manure is very useful if laid over the potatoes in each hill, after an inch of soil has been laid on them; and then the hill covered as deep as usual. But if the manure is laid directly upon the naked seed or under it, a drought will injure the crop.

The most convenient method of raising potatoes, is to plant them upon the margin of corn-fields. Then a horse may turn upon them when ploughing among the corn, without injury.

Potatoes should be hoed when first up, just to clear out the weeds, without making any hill. After they grow up about six or seven inches, they should be hoed up for the last time. If weeds spring up among them, they should be pulled out, not hoed out. For if hoed again, many new potatoes will set, which will never grow large enough for use but will check the growth of the others.

CULTURE OF YELLOW LOCUST.

The *Robinia pseudo-acacia*, or Yellow Locust Tree, is superior to any other kind of wood for ship-tunnels, mill-cogs, and fence posts, as well as for various other purposes, besides possessing the remarkable property of enriching sandy soils. Its culture is very easy, and may be propagated in great abundance by sowing the seed in April, May, or June, in a bed of good sandy loam, which is its favorite soil, and covering half an inch deep.—Previous to sowing, put the seed in a basin, pour scalding water, and let it stand all night; pick out such seeds as are swollen, and plant them immediately; next evening repeat the same process with such as have not swollen the first night, mix the whole and sow them; they will come up in the course of the following month, numerously; for no seeds grow more freely. When a year old, transplant them out of the seed-bed into nursery rows, four feet distant, and, plant from plant, one foot in the row. Having two or three years' growth in these rows, they may be planted successfully in any warm and tolerably rich sandy ground. They may also be propagated by suckers, which they throw up abundantly, especially if some of the wide-extending roots be cut through with an axe. An acre of these trees, planted at two feet distant each way, will contain 10,800; at three feet distant, 4,840; and at four feet distant, 2,722; and it is thought at the South, that no appropriation of land is more lucrative than that devoted to this purpose.

HORTICULTURAL JOURNAL.

Kept at the garden of the proprietor of the New England Farmer, in Lancaster, Mass., thirty-five miles west from Boston, on the river Nashua.

May 25th. Very cold, snow during the past night, and remains on the surrounding hills till past noon; rainy, uncomfortable day. Rock Alyssum (*Alyssum saxatile*), Statice, Anemone, and Daisy-leaved Catch Fly (*Silene bellidifolia*), in bloom, beautiful dwarf perennial plants. Apple trees in full bloom; also, Lily of the Valley (*Convallaria racemosa*), and Trillium erectum, handsome indigenous perennials. Tulips in perfection.

26th. Cold morning, warmer in afternoon, and showery; sowed Mignonette, Dwarf Case-knife Beans, Musk-melons, and Drumhead Lettuce; and planted Potatoes.

27th. Cloudy, part of the day; planted Early Mohawk String Beans, and Melons; cold night.

28th. Frost in some places, very little damage done; fine day; planted Sweet Potato Slips, Beans and Melons; transplanted Ice Plants, Blue Comelina, and Tri-colored Anaranthus.

30th. Rainy, gloomy day; transplanted Indian Shot plants (*Canna indica*), and Sweet Potatoes; boisterous, stormy night, much rain.

31st. Windy and much rain through the day; some damage to hot-bed lights; river very high; Spiderwort (*Tradescantia virginica* and *alba*) in bloom, handsome perennials which continue to bloom through the summer; Coralline Peony (*Paeonia corallina*), beautiful single Peony; *Anchusa* and *Amsonia latifolia*, indifferent perennials; Columbine (*Aquilegia vulgaris purpurea* and *alba*), Snowy Phlox (*Phlox nivalis*), beautiful dwarf perennial; Periwinkle (*Vinca major*, minor and *herbacea*), and Honesty (*Lunaria biennis*), in bloom. Many birds found dead from the inclemency of the weather.

June 1st. Cloudy greater part of the day, more moderate; transplanted Indian Shot plants and Cypres vine, from hot-bed.

2d. Fair weather part of the day, very cold at night and squally; planted Yellow Pole Beans (a new variety from South America), New Early Orange Squash; transplanted Thunbergia and Seedling Dahlias, from hot-bed.

3d. Sunday; cloudy and rainy.

4th. Cloudy and cold; planted Early Long Warted Summer Squash, and sowed new flower seeds from Tuscany and China, in pots; Sweet Rocket (*Hesperis matronalis*), Perennial Flax (*Linum perenne*), and *Lycinus floescudi*, in bloom, handsome perennials.

5th. Cloudy and dull; planted Winter Squashes, wed Parsnips and Carrots.

6th. Cloudy and cold; vegetation at a stand, and prospect very discouraging; Forget-me-not in bloom, a neat little annual; planted Persian Melons and more Sweet Potatoes.

7th. Cloudy, a little warmer, sun shone a few minutes; Scentio Aureus in bloom (indigenous perennial). Sudden change of weather at one o'clock, P. M.: cold afternoon; prospect more discouraging; plants which have been taken from hot-bed in danger of perishing.

8th. Cloudy, sun shone an hour, warmer in forenoon; sudden change again at 1, P. M. and cold; planted more Long Warted Summer Squash.

9th. Cloudy, warmer in forenoon, colder in afternoon; apple trees still in bloom; arranged a circular clump of flowers of one hundred hardy annuals, as a specimen flower bed, so planted that the tallest are in the centre descending down to the outer circle which are dwarf plants, no two flowers of a color or shape beside each other, think it will have a pleasing effect; transplanted Ice Plants, and fine imported Balsams, from hot-bed; hoed Early Jefferson Corn, and planted over where destroyed by worms and cold; Peas have been hoed and look fine.

10th. Sunday; cloudy.

11th. Cloudy morning, a little rain; 10 o'clock the sun shines, fine warm day, prospect a little more encouraging; Iris plicata and *Paeonia officinalis* in bloom; Cyrtopodium in bloom, curious indigenous perennial.

The season is at this time at least twelve days later than it was last year, if I may judge from the blooming of flowers. Seed onions and beets look very promising; the onions which were sowed, very bad; they came up well four weeks ago, and have declined for three weeks, many have perished beyond all hope, and some parts of the beds will be so thin as hardly to pay for weeding—Long Blood Beet is making its appearance and looks promising; Lettuce, Carrots and Parsnips, well, but very backward; the Cabbages, Spinage, Salsify, Tomatoes, Sage, Summer-savory, Rhubarb, &c, came up well and only want warm weather; Beans are trying to push themselves out of the ground today; Sweet Potatoes in the same condition as when planted, grubs have destroyed some of them. Seeds in the Flower Garden come up well and the more hardy kinds are in good condition; but the tender annuals, and particularly such as were taken from the hot-bed, very bad, but think they will start soon.

Liberality consists not so much in giving a great deal as in giving seasonably.

CHOLERA.

We were not sensible till our paper was about going to press, that this disease is the all-absorbing subject. We have now but little room, and must therefore condense whatever we have to remark on this topic.

It is said, that fear is one of the most powerful of the causes which predispose to cholera. Those who dread it most will be most likely to be attacked. Dr J. E. Kay, of New York, who has resided in Constantinople and witnessed and suffered from this disease, says that the following was the most approved manner of treating it.

"As soon as the first symptoms appeared, fifty to one hundred drops of iudanum, according to the urgency of the case, were exhibited, combined with a few drops of oil of peppermint, in hot whiskey or gin; and this dose it was sometimes necessary to repeat. Blood was immediately drawn from one or both arms, and the bleeding was continued until perspiration or fainting ensued. The blood had a singularly black and viscid appearance, flowing with great difficulty; and in all the fatal cases which I saw, it was impossible to obtain it in any quantity. After the bleeding and the exhibition of the iudanum, the patient was carefully watched for a few hours, and if the pulse continued full and free, and the extremities had resumed their natural heat, nothing more was necessary than to attend carefully to his diet. If the pain, anxiety and gripping still continued, the pulse small and apparently obstructed, another dose of iudanum was given and bleeding again resorted to. The least error in diet occasioned a relapse, which made its appearance in the shape of local pains in the head, bowels, &c. For this, leeches were liberally applied; occasionally blisters; and, invariably, small and repeated doses of calomel and opium.

"Cholera is not contagious. My own experience is confirmed by that of every oriental physician with whom I consulted. It rarely attacked more than one in a family. The Turkish government, at the suggestion of the medical faculty, refused to establish quarantines against this disease, but took other steps which might be worthy of imitation elsewhere. A pamphlet was published by order of the government, giving a history of this disease, the means of guarding against it, and the best treatment to be employed. These tracts were gratuitously distributed in every town and village throughout the empire.

"The greatest mortality occurred among those whose mode of living was particularly meagre and abstemious. Cholera made its first appearance among the Jews of Smyrna, during one of their fasts, and committed great ravages. It is far from being my wish to recommend intemperance, but I do not hesitate to state, that the occasional use of stimuli, in the shape of generous wine, brandy, or gin and water, was found highly serviceable during the prevalence of the cholera at Constantinople. I need hardly remark that the habitually intemperate lose all the benefit of this remedy.

"Everything in this disease depends upon prompt medical aid. When this was resorted to at an early stage, cholera became a mild and easily manageable disease."

This disease has made its appearance in Quebec and Montreal, and is said to be "spreading with fearful and destructive rapidity." But we have not heard of its appearance within the limits of the United States, and every precaution which

prudence can suggest is put in practice, to guard against or mitigate its evils.

EDINBURGH REVIEW.

Lilly & Wait have this day published the 109th No. of the above work, which contains articles on the following subjects:—Mechanism of the Heavens; The Life of Thomas Ken, D. D.; An Historical Inquiry into the Productions and Consumption of the Precious Metals; Waverley Novels, new edition, with the Author's Notes; Tales of my Landlord, fourth and last series; Sketch of the Ryotwar System of Revenue Administration; Memoirs of the Life, Writings and Correspondence of James Currie, M. D., F. R. S.; Four Essays on Colonial Slavery; Greek Authoresses; Eugene Aram, a tale; Thoughts on the present state of Foreign Affairs; History of Poland; Memoires sur la Pologne, et les Polonais, depuis 1788 jusqu'à la fin de 1815; Constitutional Charter of the Kingdom of Poland; Memoirs of the Life and Administration of the Right Honorable William Cecil Lord Burchley.

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At an adjourned stated meeting, held on Saturday, June 16, Mr Otis Johnson, of Savannah, was elected a member.

Messrs Elijah Vose, Thomas G. Fessenden and Z. Cook, Jr., were appointed a committee to select and appoint a gentleman to deliver the next annual address before the Society.

Flowers exhibited.—Fine specimens of Anemones, Papaver bracteata, from Mr Haggerston, of Charleston; Scotch and other Roses, and a variety of flowers, from Messrs Winships, of Brighton; Double White Rocket, &c, &c, from Mr Walker, of Roxbury.

Horse Pioneer.

PIONEER will stand for Mares the ensuing season at the following places: at the cattle fair hotel, in Brighton, every Saturday, P. M., and Monday (except the 25th June) through the season; at Warren's in Framingham, Tuesday, P. M.; at Eastabrook's in Worcester, on Thursday—returning, at Grafton on Friday, A. M. and arrive at Framingham the same evening, and at Framingham the 25th and 26th of June.

Pioneer is a dark bay, full fifteen and a half hands high, ten years old this spring, is a horse of remarkable fine figure, temper and action, and a sure foot getter; was sired by the imported horse Debasch, out of a fine mare by Cub, own by Gen. Van Rensselaer of Albany. Persons wishing to improve their breed of horses, are requested to call and examine for themselves. He is pronounced by good judges not to be inferior to any horse in the State. That the public generally may avail themselves of the services of said horse, he will stand at the moderate terms of \$6 the leap, \$10 the season, or \$15 to insure.

Brighton, June 13, 1832.

JOHN FELTON.

Yellow Locust.

THIS day received at the New England Seed Store, 50½ North Market street, from Cincinnati, 100 pounds of Seed of the genuine Yellow Locust (*Rolobilia pseudoacacia*)—all raised the past year in the State of Indiana, where the beauty and superiority of these trees have attracted general attention.

June 13.

Situation Wanted.

A married man from Scotland, who has been in this country but a few months, wants a situation as manager of a farm or otherwise. His wife would take care of a dairy, if desirable. Apply at this office.

BRIGHTON MARKET.—MONDAY, JUNE 18, 1832.

Reported for the Daily Entrepreneur and Patriot.

At Market this day 197 Beef Cattle, (including 64 unsold last week,) 33 Cows and Calves, 820 Sheep and Lambs, and 68 Swine. 72 Beef Cattle remained unsold at the close of the market.

PRICES.—Beef Cattle.—Market unusually dull, sales slow and uneven, at reduced prices; the Butchers appeared determined to reduce prices considerably, but many of the Drivers were firm at a small reduction from last week. We quote one yoke at \$7; prime at 6 25 a 6 50; good at 5 50 a 6; thin at 5 a 5 25.

Cows and Calves.—We noticed sales at \$15, 16, 19, 24, 27, and 35.

Sheep.—We noticed a lot of 12 extra weathers (shear'd) taken at \$5 62 each; also a lot at 4 a 4 25 each; lots of Lambs with a few old sheep, as follows: \$1 50, 1 54, 1 67, 1 88, 2 00, 2 17, 2 25, 2 33, and one or two selected lots over fine at 2 50 a 2 75.

Swine.—Retail price for large shoats 5 cents for sows and 6 cents for barrows; small shoats 6c for sows and 7c for barrows.

Boy Wanted.

A faithful lad of about 14, who has a good education and of a turn to make a good salesman, may hear of a good situation in this city, by applying at the Farmer office. His board and a suitable compensation for his clothes will be given him.

Miscellany.

From the Hobart Town Gazette.

PARODY

On "When lovely woman stoops to folly."

Lines written on a lady spilling a cup of tea over her silk dress.

When lovely woman tilts her saucer,
She finds, too late, that tea will stain!
What ever made a lady cresser?
What art can set all right again?

Alas! with indignation burning,
French chalk she sees can never do!
Her gown is spoiled, in vain is turning,
The envious tea has soaked quite through.

Oh! that she could, more silk procuring,
Try a new breadth! but silk there 's not!
Then say what art, these evils curing,
Shall sooth the hapless fair one's lot?

The only art her fault to cover,
To hide the stain from every eye,
To wear an unsold dress about her,
Of poplar color, is—*to dye*.

From the Salem Gazette.

TERRIFIC PICTURE.

The following passage is extracted from Mr Sullivan's discourse, lately delivered in Boston, before the Massachusetts Society for the Suppression of Intemperance. After relating the history of the discovery of the art of distillation, which is said to have been made by the alchemists, in prosecuting their researches after the philosopher's stone, he proceeds, in a splendid prosopopeia:—

"If it be imagined, that the office of history is to announce the future, instead of recording the past, how would the world have received her tidings!

"In your researches after that which you should at once have known to be impossible, by the laws of nature, you have opened a fountain of misery which shall flow for ages. You have not contented yourself with pressing out the juices of the fruits bestowed upon you, and converting these into strong drink which you needed not—but you have taken this strong drink, and the harvest which was given to you for food, and have drawn from these a liquid, which is not food and which will not nourish nor sustain your earthly frame. This liquid shall be a curse upon you and your descendants. It shall be known wherever the arts of civilization are known. You shall call it the *elixir of life*. You shall believe it to be nutritious to the body and gladdening to the soul. The love of it shall grow with the use of it. It shall sooth the solitary hour and cheer the festive board. It shall charm away your griefs, and be the cause of your rejoicings. It shall be the inducement to communion and the bond of friendship. It shall be prized alike by the high and the low. It shall be the joy of princes, as well as of the meanest of mortals. It shall be the stimulant to laborious toil, and the reward for labor done. It shall be bought and sold, and make the dealer therein rich. It shall yield abundant revenues to sovereignty. Hospitality shall be dishonored in not offering it to the guest, and the guest shall be disgraced in not receiving it at the hand of his host.

"But— It shall visit your limbs with palsy; it shall extinguish the pride of man; it shall make the husband hateful to the wife, and the wife leathsome to the husband; it shall annihilate the love of offspring; it shall make members of society a shame and a reproach to each other, and to all among whom they dwell. It shall steal from the virtuous and the honorable their good name, and shall make the strong and the vigorous to totter along the streets of cities. It shall pervert the law of habit, designed to strengthen you in the path of duty and bind you in its iron chain. It shall disgrace the judge upon the bench, the minister in the sacred desk, and the senator in his exalted seat. It shall make your food tasteless, your mouth to burn as with a fever, and your stomach to tremble as with disease. It shall cause the besotted mother to overlay her new-born, unconscious that it dies beneath the pressure of her weight; the natural cravings of the infant shall make it strive to awaken her, who has passed, unheeded, to her last long sleep. The sun shall hide his face, that he may not behold the father's depravity; and the father shall see the object of his fondest hopes, turn to a foul and bloated carcase, that hurries to the grave. It shall turn the children of men into raving maniacs; and the broken ties of blood and affection shall find no relief, but in the friendly coming of death. As the seed which man commits to the earth, comes forth in that which he converts into spirit, so shall this product of his own invention, be as seed in his own heart, to bring forth violence, rapine and murder. It shall cause man to shut up his fellow man in the solitude of a grated cell. The prisoner shall turn pale and tremble in his loneliness, at the presence of his own thoughts; he shall come forth to die, in cold blood, by the hand of his fellow, with the spectacle of religious homage on a scaffold and amid the gaze of curious thousands. Poverty shall be made squalid and odious, even so that charity shall turn away her face in disgust. It shall attract the pestilence that walks even at noon-day, in darkness, to the very vitals of the drunkard, as carrion invites the far sighted bird of prey. The consumer of spirit shall be found dead in the highway, with the exhausted vessel by his side. Yea, the drunkard shall kindle a fire in his own bosom, which shall not depart from him till he is turned to ashes. The dropsical drunkard shall die in his delirium, and the fluid which has gathered in his brain, shall smell like spirit and like spirit shall burn. A feeble frame, an indecible mind, torturing pain and incurable madness, shall be of the inheritance which drunkards bequeath, to run with their blood, to innocent descendants."

FAIR SPORT.

A man in Wallingford recently killed a monstrous Catamount, in the following manner:— Having two sheep killed the night before, and supposing the aggressor a bear, he procured a large trap and set it in a position considered the most advantageous for taking him. On the following morning he went to the spot, and finding the trap gone, traced it to a tree at some distance, where he found the animal secure, although he had succeeded in ascending the tree to the length of the chain attached to the trap. With the assistance of his neighbors he succeeded in despatching him. He was truly a monster, measuring seven feet in

length, and weighing, though very lean, *one hundred and thirty pounds!* The first mark of the trap or animal, on the ground, was about sixteen feet from where the trap lay, from which it is supposed he must have leaped nearly or quite that distance, when the trap closed upon his leg.—*Rutland (Vermont) Herald*.

Sport for Gentlemen.—Take a double barrel fowling piece, with shot-bag and pouch, go into the fields and shoot the little birds that destroy the worms on the trees and the insects on the plants. If by your success the field birds should be killed off or frightened away, set yourself down upon a bank, and try your hand upon the useful and harmless swallows, who are skimming the meadows on their swiftest wing. It will show your skill as a marksman; and the pleasure of their dying scream will be greatly enlanced by the reflection, that their unfledged offspring will die of starvation in their nests. It would be excellent employment at least, and we know of one gentleman who makes it his sport.—*Connecticut Herald*.

Prizes vs. Blanks.—In order to show to the purchasers of lottery tickets, something like a fair view of the chances they have, for making money, we give the following results from a broker's books: He sold, in ten months, tickets amounting to 4565 dollars; and paid out in prizes, 1400 dollars, or less than one third.

Here then, was the sum of 3165 dollars carried out of this town and out of the State, for—nothing. It was, too, in many cases, drawn from the pockets of those who could very ill afford it.—*Portsmouth Journal*.

Horse Quicksilver.

QUICKSILVER will stand this season at the stable of the subscriber, in Brighton, a few rods south of the meeting-house, and will cover only twenty mares the present season, at \$15 each, and \$1 in addition, to the groom. Mares warranted to be in foal, if \$20 is paid, and \$1 to the groom; and in discharge of warranty, the \$20 will be returned.

Quicksilver is a beautiful bright bay, three years old; his sire, Sir Isaac Coffin's horse, Barefoot, conspicuous in the racing calendar of England; his dam, Rebecca, from the imported Cleveland bay horse Sir Isaac, and Sky Lark, a native mare, well known for her fine form, speed, and bottom, once owned by Mr Leavitt of Salem, to whom persons are referred for her character, and will be to many others in Massachusetts and Maine. Quicksilver is thought by good judges to combine with great symmetry and delicacy of form, bone, muscle, and all the requisites for a first rate covering horse. Mares sent to him, and if left with the subscriber, will be well attended to on reasonable terms, but he will not be responsible for accidents.

BENJAMIN W. HOBART.

Brighton, June 13, 1832. d

Canada Squash.

JUST received at the Seed Store connected with the New England Farmer, 504 North Market street, Boston, a few pounds of small Canada crooked-neck Squash Seed, that usually ripens about the first of August. Those who have lost their seed this spring, by rotting, will find this the best sort to sow at this late period, to insure a good crop of winter Squashes, as they ripen in so much shorter time than the common large winter crook-necks.

June 13.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

¶ No paper will be sent to a distance without payment being made in advance.

Agriculture.

MASSACHUSETTS AGRICULTURAL SOCIETY.

ON THE BEST CULTIVATED FARMS.

BENJAMIN GUILD, Esq.—

SIR—I wish to offer my farm for premium. It lies in the east part of the town of Pittsfield, upon Boston and Albany stage road, containing two hundred and fifty acres or thereabout. The soil is alluvial and loam; forty acres of it good woodland, principally covered with sugar-maple. I have also, in one square lot, forty acres of meadow, almost perfectly level, and overflowed by the waters of the Housatonic river (by which it is bounded on the east,) in the spring of the year when the snow melts away, generally, and sometimes twice or thrice in the year; so that it never requires any manure; and I have nothing to do but to keep up my fences and cut the grass, which is all of an excellent quality, consisting of herds or timothy, clover, and fine English; has produced this year one hundred and six loads, which we have estimated to weigh one ton each, as we get it in, well made. This lot lies upon the east side of the road, opposite to my house; and the residue of my farm upon the west side of the road, pretty nearly in a square form, a little elevated above the meadow, say eight or ten feet, and rises but little to the western extreme of the farm. I have an orchard lot, consisting of about eighteen acres, which I mow, and which has produced this year twentythree loads, which we have estimated at one ton each, of excellent hay; making in all one hundred and twenty-nine loads.

The residue of my farm consists of pasturage and tillage, say one hundred and fortyseven acres, all good, which I have improved alternately for pasturage and tillage by a rotation of crops; first for wheat or rye, then corn, then oats or other spring grain, with clover and grass. I have improved it the present season as follows: Of winter crops twenty acres, called, but if accurately measured would fall a little short of that quantity; it has, however, produced 4568 sheaves, 900 of which we have threshed, and which yielded fifty-one and a half bushels of first quality rye; three acres of winter wheat, which produced 911 sheaves, of which we have not threshed any.

These two crops were sown upon old pasture land, summer-fallowed, and without manure. The nine hundred and eleven sheaves of wheat, or sixty shock and eleven sheaves, will yield by fair estimate three quarters of a bushel to the shock, which will amount to forty-five and a half bushels. I have raised fourteen acres of oats on land on which I had beans last year. After putting a light sprinkling of manure of twenty loads, the fourteen acres produced 3,800 sheaves, of which I have threshed 550 sheaves, which yielded fiftyfour bushels; very nearly one bushel to ten sheaves. I have also raised two acres of spring rye, which produced 601 sheaves; of this crop I have not threshed any, but it is a good one, and so good as to give me the B. A. Society's first premium. I had oats upon the land last year, but I put twenty loads of manure upon it. I sowed two acres of

marrowfat peas upon land on which I had potatoes last year, but the crop failed almost entirely, and I got but twelve bushels. I have also raised one acre of buckwheat where I had beans; put six loads manure and sowed one bushel of seed, which produced seventeen bushels. I have also raised two acres of white beans, which is a very good crop, but which I have not been able to harvest. The time you have fixed on for making application, (1st October,) is a little too early for my convenience, and I shall not be able to make my statement complete in all respects. For instance, it would be considerable loss to me, I should think, to thresh out all my grain thus early, particularly oats, as the straw makes tolerable feed in winter; and it also furnishes employment for my man who takes care of the sheep and barn. Potatoes I have considered among the first and most valuable crops that the farmer raises; I have therefore made several experiments, and by far too many for my interest; yet my experience may be useful to others, and I have concluded to state some of my experiments, and offer some few remarks.

Some few years ago, believing that the quantity usually raised from an acre might be increased materially, I accordingly ploughed one acre of mellow land, dragged it, and furrowed it out at three feet a part, and filled the furrows with well-rotted manure. I then sorted out the largest and best potatoes, and planted them in the furrows on top of the manure, placing one potato every six or eight inches apart; then planted in the whole forty-five bushels; they were well covered, and hoed three times, and at digging they were found to be almost all of them very small, not larger than walnuts, perhaps not as many good ones of good size as I planted. This I charged to the season as being unfavorable, and the subject passed off.

Two years since, I set out twentyfour cuttings of grapes in my garden, where the ground was rich, being well manured, by sticking the ground end into a small potato about the size of a hen's egg, and placing that in the ground three or four inches deep; these were not hoed; the grapes all died, and in the fall I pulled and dug the potatoes somewhat early in the season, for eating. The quantity and large size excited the curiosity and astonishment of us all. Last year I planted in the garden, by way of experiment, one of the smallest potatoes, one of middling size, and one of the largest, in separate hills; and then put two, and three, and four in hills, where the land was equal; the result was, that the single potatoes produced the largest and much the best, but not so many in number of small size. I have made several other experiments, and quite enough. Upon examining a potato, it will be found that each, whether large or small, has from six to ten eyes or sprouts; and if it be fair to calculate that each sprout will produce from six to ten potatoes, each potato will yield from thirty-six to sixty potatoes, which number is by far too great to be congregated in the circumference of a hill; the consequence is, a great proportion of them are small, and if more seed is planted, the greater the number of small ones and less of large. This year I planted about three acres, and upon one acre I put fortyfour loads of coarse manure from my sheep yards; the cart

body somewhat heaped, say about thirty bushels to the load; spread it over the land and ploughed it in; then dragged, then furrowed at three feet apart one way only, and dropped the potatoes without sorting, the smallest as well as large, at about two and a half feet apart, and covered, and hoed them twice. I planted eighteen and a half bushels of seed. On the next seven eighths of an acre, by the side of the first, I put twenty-five loads of manure, ploughed and furrowed as before, and dropped my potatoes single at three feet apart, planted seventeen bushels of seed, and hoed twice. The third acre was ploughed and dragged and furrowed as before, and a shovel full of manure, at about three feet, put in each hill, in all twelve loads, and hoed them but once, the same sort of seed in all, which is called the Burr potato, of flesh color, and excellent for table use. The result is as follows: The first acre produced 425½ bushels; the second, seven eighths of an acre, produced 250½ bushels; and the third acre we have not completed the digging of, owing to the constant rains for the week past; but we have dug part of them, perhaps one fourth part, and in such a way and places as to ascertain with a good degree of certainty, that this acre will not produce over one hundred and sixty bushels.

I have also raised one acre of ruta baga, which now promises a large crop. They are not sufficiently grown to pull, therefore I cannot ascertain the quantity. The land was well fitted by putting 20 loads of manure upon it, before ploughing; then by spreading five loads of leached ashes and one load of unleached. I have strong hopes of a very large crop, although I do not consider it a very valuable one. I have also raised four acres of corn upon land on which I had corn last year, fitting it by putting seventeen loads of manure to the acre, by dunging in the hill. The four acres, which I have measured accurately, as well as my potato lands, have produced four hundred and fifty bushels of ears.

I have ploughed and sowed five and a half acres of winter rye, or thereabouts, and two acres of winter wheat upon the land upon which I have raised potatoes. This I have fitted, and intend to sow this day.

In addition to the above, I have let out about nine acres of land to be sowed to oats, on shares or for one half, and for which I have received 1347 sheaves. I have also let out about four and a half acres, which have been planted to corn, in the same way, or for one half, and had it dunged in the hill. This is a fine crop, and not yet harvested; besides about one acre and a half more, for buckwheat and potatoes. The land on which I have raised my oats, I have seeded down to clover and grass seed principally.

The number of apple trees in my orchard is one hundred and forty-nine, and I have several others scattered over the farm. Seven years since, I put in one thousand grafts by contract, principally of winter fruit, such as greenings, Spitzenbergs, gilliflowers, russets, golden sweetings, and seek-no-further, &c, of which I have a great abundance this year; but owing to the incessant rains for a week past, I have not been able to gather them. I shall have, probably, between 100 and 200 bush-

els. I have cider apples, and a great supply for family use, enough probably to make forty or fifty barrels, which I do not usually make until some time in October, and have not yet done it. My manner of making cider is the common one.

As to sowing grass seed, I usually seed down about ten acres annually, with four quarts of clover and four quarts of herdsgrass to the acre, which I consider plenty for mowing land. I have made several experiments. After taking off a corn crop, I have ploughed and sowed nothing but grass seed; this was done in the month of October and it took well, but did not get to maturity fully the next season. I have also sowed with rye in the fall, and also upon snow covering wheat and rye, and also in the spring with spring wheat, rye and oats; and I am satisfied that to sow clover and herdsgrass in the spring with oats, is the best time and way.

My barn is one hundred feet long and forty feet wide, standing east and west, with a floor through it lengthwise, over which is another floor, each twelve feet wide. Upon the south side of my barn I have a tier of stables extending the whole length, twelve feet wide, which is sufficient to put up twenty-five head of cattle. I have one shed extending from the west end of my barn, south, one hundred and twenty feet, half of it twenty feet wide and the other half fourteen feet, capable of holding thirty or forty loads of hay overhead. I have three or four other temporary sheds of less value. My barn-yard is one hundred and twenty feet square, divided by a line of fence through the centre each way, making four yards of about sixty feet square, with a shed for each and a well of water in the centre, from which I water each. In each of these I have wintered about one hundred sheep, and make my manure principally by bedding them with straw. Of my sheep, I have now about the same number as last year, four hundred and thirty, having disposed of nearly as many as my increase by lambs. I sheared three hundred and fifty, which produced eight hundred and fiftyone pounds of first quality wool, sold for seventy-five cents per pound. I raised only eighty-four lambs, in consequence of a severe rain storm the first week in May, which is the time I usually have them yearned. I lost a considerable number. I keep them in separate flocks, and feed them in winter out of boxes prepared so that they can put in their heads on either side, and not waste the hay. This business of growing wool was my principal object in farming; but the low price the wool has brought for three or four years past, has almost wholly discouraged me. I have been disposed to reduce my flock about one half, because I could not grow the wool for the price it has brought. This year, however, it has brought a fair compensation for growing. My sheep are first quality, merino and saxon, the fleeces light. I have kept only two yoke of oxen, three cows, and three horses. From my cows, which are of the first quality, we have made butter only enough for family use. Of swine, I only keep and fat enough for family use, and some little surplus to pay laborers. I am now feeding six of the Byfield breed, which I intend to make weigh from 300 to 400 pounds each. I have one that will now weigh more than four hundred. I make my pork by boiling potatoes the fore part of the season, then pumpkins, provender and corn.

In addition to my crops, I shall have probably 30 bushels of English turnips. I have a large garden

in which I put out one thousand cabbage plants; have raised six and a half bushels of onions, a great supply of beets, parsnips, carrots, winter squashes; besides water-melons, musk-melons, cucumbers, &c. I have ten peach trees, ten pear trees, and about one hundred filbert bushes, which have all borne finely, except peaches, with which I cannot succeed here at all. As to amount of labor, I have had but one hired man for six months, to whom I paid ten dollars per month, or sixty dollars. I have two boys, almost men, belonging to my family, besides my own labor. I have paid for day laborers, according to my account, sixtythree dollars and fifty cents only. You will notice the amount of labor performed with little help and little expense, but I have yet considerable more to do; I have yet to cut, I think, more than ten loads of rowen hay, and intend to sow a number of acres of late rye. Having made no cider the last year, I made trial of molasses and water, but all would not do, I was obliged to furnish a little ardent to my day laborers to get through haying and harvesting; the precise quantity I do not know, but I think it would not amount to more than twelve, or fifteen dollars. To recapitulate,—

58 acres of mead. mowed & produced 129 loads hay.	
20 do. of rye	produced 456 ⁸ sheaves.
3 do. winter wheat	do. 911 do.
11 do. oats	do. 3680 do.
2 do. spring rye	do. 601 do.
2 do. marrowfat peas	do. 12 bushels.
1 do. buck wheat	do. 17 do.
2 do. white beans	
3 do. potatoes	do. 836 do.
4 do. corn	do. 450 do.
5 do. ruta baga	do. 500 by estimate.

15 acres let out on shares, the produce of which not yet ascertained, except 1347⁸ sheaves of oats. The residue of my farm is wood and pasture.

In this statement, I believe I have not overestimated or over-rated any item; and I am inclined to think that my corn, which we completed last evening, if accurately measured by stricken measure, would hold over something like a half of a peck to the basket, which we heaped.

I am, dear Sir, very respectfully, your obedient humble servant,
JONATHAN ALLEN.

Berkshire, ss., Pittsfield, Sept. 29, 1831.—Then the above named Jonathan Allen personally appeared, and made oath that the foregoing statement by him subscribed, is, according to his best belief and judgment, true.

JOSHUA DANFORTH, Justice of the Peace.

FOR THE NEW ENGLAND FARMER.

The following, from an experienced cultivator in the State of Maine, we have been permitted to copy from a communication sent to Hon. JOHN WELLES, of Boston.

AGRICULTURAL MEMORANDA.

I have proved the value of parsnips as a substitute for my usual green food. The experiment was made on a cow, exhibited as a fat cow, about eight years since, at Brighton. It was not long before she was turned into pasture. On carrots and turnips she gave twelve pounds of butter per week. While fed on turnips she gave 13³ lbs. per week. They were better than Indian meal.

You recollect two heifers I sent to the Denton bull. I have one now left, and from the produce

of her second calf, which was killed at four years old and weighed nine hundred pounds, I have a cow with her third calf. The cow gives two pails full of milk per day, of which the calf takes a little more than half, and is very large and well shaped.

The cow exhibited at Brighton met with an accident, and at five and a half months lost her calf, and was afterwards unfit for breeding. In the five and a half months she gave,

Of butter,	202 ³ lbs.
Of cheese,	38 lbs.
Milk for the calf,	482 quarts.

In the first fifty days she gave fifty pounds of butter, and on an average rather more than nine quarts per day of milk to the calf.

From the same heifer, which I sent to Northborough, a calf was raised last year by Mr Howard, which at seven weeks old he sold for twenty-five dollars. An accident happened to it at five months, and when dressed it weighed three hundred and seventy-five pounds.

FOR THE NEW ENGLAND FARMER.

NEGLECTED CATERPILLARS.

MR. FLETCHER.—I had occasion last week to visit Lowell, and as I rode past the farms on my way, I was astonished to see fruit trees and especially the apple, so much neglected. The pruning knife and its use, I should judge, was not known to the proprietors of these farms; and the caterpillar in the thick tops of the trees, finds a secure and unmolested retreat; so abundant were their nests, that in many cases the branches appeared white with them. It would certainly be more creditable to the managers of these farms, to cut down, at once, these monuments of their neglect, than to remain the subject of remark to all those who pass, and as so many proofs of their want of interest in horticulture.

G. L.

Boston, June 9, 1832.

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS HORTICULTURAL SOCIETY.

On Saturday, 23d inst., Messrs Winships, of Brighton, exhibited a collection of herbaceous plants; amongst them, a very fine specimen of Delphinium sinensis, and Scotch and other Roses.

By Mr David Haggerston, of Charlestown, a fine collection of Ranunculuses and Anemones, for premium; also, by the same, yellow, pink, tea, and Moss Roses.

By J. Prince, Esq., Liriodendron tulipifera, or Tulip Tree.

By Mr Plippis, of Charlestown, Moss Roses and other flowers.

From Young's Farmer's Calendar.

BURN DRY WEEDS FOR MANURE.

Our young farmers may perhaps want to be reminded, that spreading any sort of dry vegetable substance on the land and setting fire to it, previous to harrowing in or drilling turnip seed, is one of the most powerful manures that can be used. There are situations where fern from wastes, warrens, &c, may be collected in almost any quantity; if he has it in his power to preserve more than he wants for littering, he should save it carefully for this use. In the fens of Cambridge and Lincoln,

[England.] it has long been a custom to burn out and other stubbles of reaped crops, and the effect resulting from it was probably the origin of a practice which I first heard of in the latter country, that of burning straw for this purpose.

It subsists on the wolds. At Lord Yarborough's I first heard of this custom. His Lordship's tenant, Mr Richardson, a very good and intelligent farmer, gave me the account, having long practised it with success. The quantity is about five tons to an acre. At Great Lumber, he straw-burnt a piece in the middle of a field preparing for turnips, and on each side of it manured with ten loads of yard dung to an acre, and the burnt part was visibly superior in the crop. In another piece the same comparative trial was made in 1796, for turnips, which crop was much the best on the burnt part; and in 1797, the barley equally superior. On another farm he had at Wold Newton, he did it for turnips, then barley, and laid with sainfoin; and the burnt straw was better in all those crops than yard dung. Burning gorse in this manner returns great crops, but the expense is too high. He is clearly of opinion, that it is the warmth from the fire that has the effect, and not the ashes; for the quantity is nothing, and would blow away at one blast. It is proper to observe, that they do not value straw used in feeding cattle, at more than four or five shillings per ton.

Mr Mallis, of Lumber, is of the same opinion, and thinks four tons enough; he never knew that quantity fail for turnips.

This straw-burning husbandry I found again at Beleshy. Mr Lloyd, who, as I should observe, is an excellent farmer, thinks that it takes six tons per acre, which will last longer in its effect and beat the dung which that straw would make, and in general lasts longer than common dunging. Keeping much cattle, he cannot practice it, but highly approves it.

In discourse at Horncastle Ordinary, on burning straw, the practice was much reprobated; yet an instance was produced that seemed to make in favor of it. Mr Elmhurst, of Hazlethorpe, burnt twelve acres of *cole-seed* straw on eight acres of the twelve, and the effect was very great, and seen even for twenty years; he sowed wheat on it, four bushels to an acre, and had five quarters; the four acres upon which nothing was burnt, was much the better land, yet the crops on the burnt part were by that made equal to the rest. But in another similar experiment for turnips, Mr Rancliff observed the result, and the effect, though good, lasted only for one crop. Mr Kirkham, who was in company, gave it as his opinion, that as cattle would not eat stubble, it might be beneficial to collect and stack that and before turnip sowing burn it.

The Rev. Mr Allington, of Swinop, has cut and carried gorse, and spread it on other land, and burnt it in May for a manuring for turnips; but has done it twice and it answered very well; but of course it is to be noted, that this is done only when it cannot be sold for faggots, which sell at eight shillings per hundred; so that the expense would be £4 an acre, as one thousand are produced per acre, and he burnt the produce of one acre upon another; the effect was great in the turnips; the barley was better for it; but he has not attended to it in the seeds, because hard stocked with sheep. He has burnt on the land for turnips, the long straw dung from the surface of the farm-yard, and he had better turnips there than where the

dung was laid. This has been the case in two experiments he has made.

A general practice through the mountains of Gascony, and almost to Bayonne, is that of manuring for *raves*, a sort of turnip, with the ashes of burnt straw. I observed several fields quite black, and demanding what it was, my guide told me of this common practice here; afterwards I saw them sowing straw quickly over land, part of which had been already burnt on. They do this on a wheat stubble, but not thinking that stubble enough is left, they add much wheat straw, and setting fire to it, burn the weeds as well as the straw, and clean as well as manure the land. With such quantities of fern on all their extensive wastes, I asked why they did not burn that and keep their straw? The reply was, that fern makes much better dung than straw, so they burn the straw in preference. As soon as the operation is over, they plough the land and harrow in rave seed. One large field, thus treated, I saw ploughing for that crop. They both hoe and hand-weed the raves, and have them sometimes very large, many as big as a man's head; use them for oxen.

HOGS FATTENED ON SWEET APPLES.

It appears by an article published in the New York Farmer, that Mr William Canfield, of Scho-dach, Rensselaer County, N. Y., owns an orchard wholly grafted with sweet apples, in which he has kept hogs most of the season, where the grass and a little they were sufficient to promote their growth. About the time when hogs always manifest a disrelish for grass, the worm-eaten apples began to fall, sufficiently matured to become eatable. As they advanced in size and ripeness they became more and more agreeable, and more nutritious, until the hogs began to fatten rapidly on no other food. The trees were therefore shaken or beaten with light poles, so as to throw down a due quantity of the most ripened fruit. This process was continued until the whole herd was become sufficiently fattened. Then Indian corn was given in about half the common quantity for about one week, and full feeding of it another week. This brought them to the butchering, and the pork was not inferior to that which is fattened in a more expensive manner. One full grown tree or two inferior ones was found sufficient for a hog, weighing two hundred and fifty pounds.

A writer, whose communication was published in the New England Farmer, volume v. page 82, states as follows:—

"I have tested by ten years' experience, the value of apples as food for animals. I keep five or six hogs in my orchard upon nothing but apples and a little swill; and have uniformly found them to grow and gain flesh faster than hogs fed upon anything else, except grain. On the first of November they are very decent pork, after which I feed them about six weeks on grain before I kill them; and I believe I have as fat hogs and as good pork as my neighbors, who give to their hogs double the quantity of grain that I do to mine."

Not only are apples of use in feeding hogs, but hogs are useful in preserving apples from the curculio or the worm, that injures and destroys a very large portion of our fruit. When swine are permitted to go at large in orchards, they devour the fruit as it falls, together with the curculios in the maggot or larva state, which may be contained in such fruit. Fruit, however, may be gathered as fast as it falls and given to hogs con-

finued in a sty, or not permitted to run in an orchard. But in order to insure the destruction of the insects as well as to prepare the fruit for the swine, so that it may yield its greatest quantity of nutriment, it should be boiled; and a little bran or Indian meal, or other farinaceous substance added to the fruit while boiling, will make a compound which will greatly promote the growth and fattening of these animals. Sweet apples contain more nourishment, but all apples and every kind of fruit are useful when thus prepared and applied. If no wormy fruit was ever suffered to lie on the ground long enough for the worms to escape into the ground, we should soon extirpate this pernicious insect.

HORTICULTURAL JOURNAL,

Kept at the garden of the proprietor of the New England Farmer, in Lancaster, Mass., thirty-five miles west from Boston, on the river Na-haway.

June 12.—Warm; mild shower at night; planted Early Frame Cucumbers, Early Scallop Squash, and Sweet Corn; *Clorkea pulchella*, *Paeonia officinalis* and *P. albicans* in bloom.

13th.—Ratty morning, cloudy day.

14th.—Very warm day; planted Squashes, Melons, Beets, and Carrots.

15th.—Very warm; *Phlox maculata* and *P. suaveolens* in bloom, (beautiful perennials 2½ feet high)—also Yellow Day Lily (*Heimerocallis flava*), African Poppy, Blue Sophora, Scotch Roses, Perennial Lupins.

16th.—Very warm; *Anchusa pinnatifida* (a fine perennial) Snow Ball, Rose Acacia, and *Campanula speculum* in flower.

17th.—Very hot and windy; Oriental Poppy, (a very splendid perennial) in bloom; also *Snagdragon* and Foxglove.

18th.—Fair, with few flying clouds; thermometer at noon 62°; *Potentilla atrosanguinea* (an elegant perennial) in bloom; flower seeds from Tuscany and China, presented to the Massachusetts Horticultural Society, by Hon. T. H. Perkins and Mr Ombrosi, vegetated finely.

19th.—Thermometer at noon 67.

20th.—Thermometer 79; *Valerian rubra* (a handsome perennial) in bloom; *A-paragus* sowed May 3, just begins to make its appearance. Rose hogs first noticed; several varieties of flower seeds from the West Indies, presented by Miss Dix, of Boston, mostly gathered by her in St Croix, have grown finely; among the collection are several splendid varieties of *Convolvulus*, which have vegetated well, and give promise of ripening their seed.

21st.—Thermometer 82 at noon; *Campanula persicifolia*, (a handsome perennial) in bloom; the common Squash and Yellow Striped Begg first noticed; White Mulberry Seed, sowed May 12, just coming up.

22nd.—Thermometer 82; *Spiraea filipendula*, and *Delphinium sinensis*, (beautiful perennials) in bloom; also common *Larkspur*, and the Oriental Poppy, the latter one of the most showy perennials cultivated.

Among the present ornaments of the Flower Garden, the beautiful *Clarkea* (*Clarkea pulchella*), of which a drawing is subjoined, deserves particular notice. It was first introduced into England in 1827, from Columbia river, and received its generic name in honor of Capt. Clark, the companion of Capt. Lewis in his journey up the Missouri. As a neat, showy annual, it has few superiors, and is well calculated for being grown in beds or masses, or as single plants in borders. That it may flower in perfection it should be sown in September where it is to remain, or it can be transplanted early in the spring, being as perfectly hardy as the *Cercopsis tinctoria*. When thus managed it continues in flower nearly all the summer; and although it may have disappointed the expectation of some who have sowed it in pots, or given it an imperfect trial, or expected a gorgeous show, it will be admired by all who have seen it in perfection, that it will vie with the *Cercopsis tinctoria* as one of the most popular and prettiest ornaments of the garden.

Rural Economy.

OBSERVATIONS ON THE CULTIVATION OF SILK. — No. 1.

Mr J. D. Homergue, in his letter to the Hon. Andrew Stevenson, Speaker of the House of Representatives in Congress, says: "In one acre of land there are 43,560 square feet, on which may be planted 3000 mulberry trees, (from 4 to 3½ feet apart.) These will yield, at the age of seven years, 90,000 pounds of leaves; 30 pounds to a tree; producing 7,500 pounds of cocoons. At 25 cents per pound, these cocoons will sell for \$1,875; at 40 cents, \$3000; at 50 cents, \$3,750."

In Fessenden's New American Gardener, page 272, it is said, "one ounce of seed will produce about 40,000 worms, who consume about 1000 lbs. of leaves and produce from 80 to 100 pounds of cocoons; and 12 pounds of cocoons give about 1 pound of silk." In the Franklin Journal, volume 2, pages 22, 94, and 139, Count Dondola says, "The quantity of leaves actually consumed by 200,000 worms, is, in the first age, 20 pounds; second, 55 pounds; third, 215 pounds; fourth, 620 pounds; fifth, 3,820 pounds; making in all, 4,731 pounds of leaves — and that where trees are convenient, two persons will attend and feed 210,000 worms, until ten days from spinning, when five or six active children are necessary." It is also known, that four or five weeks, where the worms are well fed, completes the time of feeding. The Massachusetts Journal, of 1828, volume 10, No. 2, page 137, says, "A single acre planted with the mulberry, will produce from five to six hundred pounds of raw silk," but the number of trees is not mentioned.

According to the above calculations, 240,000 worms will consume 6000 pounds of leaves, requiring the time and attention of two women for five weeks, which, at \$3 per week each, including board, is \$30; and six children, ten days each, at \$2 per week, is \$12; making the cost \$42 for 6000 pounds of leaves. At that rate, 90,000 pounds of leaves, the produce of one acre, would feed 3,600,000 worms, and the cost for feeding them, \$705, which, being deducted from \$1,875, the price of the produce, leaves \$1,170 for the annual income of one acre of trees. Thus, by the above calculations, differing but little in the amount, it is seen that the income afforded by one acre, after seven years, must be immense. This acre, it is to be presumed, must be of the best quality and the trees highly cultivated, to produce so much. Mulberry trees will grow on poor land, but the produce will be comparatively small. But supposing Mr Homergue's calculations to be made from the best kind of land, and that we have much poor rocky land; let us call the product of leaves only one ninth as much as is estimated above, we have only three pounds of leaves from each tree, and lest it may require more help to feed the worms, we will say four women and twelve children; which will reduce the cocoons to 750 pounds and the sales to \$187 50, and the cost of feeding will be \$141, and there will then remain \$46 50 for the annual income of one acre.

All the uncertainty in these calculations, arises from the quantity of leaves produced on an acre, and that must vary according to the quality and cultivation of the soil; all the rest can be ascertained from actual experiment. But I understand it is the practice of some to let their trees on shares: one fourth of the cocoons to those who gather the leaves, one half to those who tend and

feed the worms, and the other fourth to the owner of the trees, which, if the trees produced 90,000 pounds of leaves, and the cocoons sold for \$1,875, would be for one half \$937 50, and one fourth, \$468 75. But supposing the trees to produce one tenth only of this quantity, then one half would be \$93 75, and one fourth, \$46 87½. This amounts to about the same thing as calling the labor of gathering the leaves and feeding the worms, double what it is calculated in the Franklin Journal, at the price of wages and board which I have calculated.

Now taking the smallest estimate of income, and in what way can a farmer, remote from a sea-port town, acquire so much with so little capital and labor, in about five weeks' time? If any person will point out any way, and prove it to the satisfaction of the Legislature or Agricultural Society, I think he would merit a great reward. But this business may be particularly recommended to "Overseers of the Poor" in every town, who have a farm — and every town ought to have one — to keep their paupers; for if one half their paupers are able to gather leaves and feed worms five weeks, this business would support all of them a year, exclusive of the cost of an overseer. Permit me to suggest one consideration more — if all the highways in country towns were ornamented with a row of mulberry trees, on each side, half a rod apart, each mile would contain 130 trees, the income of which, after seven years, would probably pay for repairing all the highways and the expenses of the public schools, if the inhabitants would restrain their cattle and sheep from going at large. There is another method of producing silk from mulberry trees, one year after transplanting them; which is, to plant them in rows, three feet by two apart, which would give about 7000 to an acre; and every other year, with a sharp instrument, to cut them off within three or four inches of the ground, and feed them out or cut them off every year. But whether this method will produce as much or more silk, than to omit picking the leaves for seven years, I have not obtained information sufficient to decide.

If any gentleman will point out the errors of the above calculations and furnish to the public more correct ones, he will much oblige a well wisher to agriculture and domestic industry.

To be concluded next week.

DAIRY.

The following extracts from celebrated English writers may be useful, although they relate to very common processes, and which ought of course to be well understood.

"I take it that oftentimes in very hot weather, the milk in a cow's udder, much agitated by driving or running about, is in a state not very far different from that carried on in a churn, which frequently makes the great difficulty in what is called bringing the cheese, or fixing the curd in the tub or pan; I have often heard dairy-women say, that it is sometimes very difficult to make it come at all, and instead of one hour, (the time very commonly given by dairy-women, in bringing cheese,) that it will frequently not come in three, four, or five hours, and then in such an imperfect state, as to be scarce capable of being confined either in the cheese-vat or press; and when released from the press, will heave or puff up, by splitting or jointing, according as the nature or state of the curd happens to be. Whenever people find their cows

in this situation, which in hot summer evenings must often happen, especially where water is scarce, or in grounds where there is very little shade; then it is, that making use of a little cold spring water, before earning or rendling, is useful, as that will make the runnet take effect and the milk coagulate much sooner. It often happens, in some dairies, that the work is quite at a stand; the dairy-women not knowing how to hasten the coagulum, or coming of the cheese, thinks of putting more runnet in to forward it; but the nature of runnet being such as will dissolve the curd in part coagulated, if more be put in, disturbs the whole and prevents its becoming curd at all, or in a very imperfect state, remaining in the whey in an undigested state that will neither turn to curd or cream, and a principal part of the richest of the milk is then cast away with the whey. Cold water, with a little salt, as hereafter recommended, will in a great measure prevent this difficulty. One great point or thing to be observed, in first setting off or rendling the milk, is carefully to observe the state of the milk as to heat or cold; the grand medium or state it should be in when you put the runnet into it, is what may be properly understood milk-warm; if you find it to be warmer than that, it is recommended to put some fresh spring water into it, in such quantity as will reduce it to a milk-warm state; a quart, two, three, four, or more, according to the quantity of milk to be so cooled; many people may think water will hurt the milk or impoverish the cheese, experience shows it will not, but is a means of the runnet more immediately striking or operating with the milk. I would recommend the use of a thermometer, to show the degree of heat milk bears. I doubt not, one may be constructed on a very easy plan that will cost a very little money, and it will be well worth while to be at a small charge to regulate a fault, of putting milk together too hot, which is of more ill consequence than people are aware of.

"Sometimes, if cheese be laid out when first made, or coming from the press is dried outwardly by means of a harsh cool air, when at the same time the inside of the cheese remains in a moist state; though the coat is hard and dry, when that cheese is exposed to heat, either by lying near a hot wall, or near tiles in hot weather, or by the immediate heat of the sun, it will be drawn up round, in the same manner and by the same cause that a board is made round or coffered up by the heat of the sun. Rank cheese very often heaves, from the cause before given, that makes it rank. Cheese is very apt to split or divide in the middle by being salted within, especially when people spread salt across the middle of the cheese when the vat is about half filled, which curd, though in a small degree separated by salt, never closes or joins, and is much easier coffered up or drawn round than other cheese; especially thin cheese made in what we call Gloucester vats, being round or rising in the bottom, and the slider or cheese-board that is laid over it, made convex also, in order to make the cheese thinnest in the middle, that it may dry quick for early sale. Then, if salted within, and being laid soft on the shelf to dry, as it hears only on the edge all around, it is almost sure to split, and it is often seen; scarce a cheese in some dairies, of this form, but what do split. Salting a little in the milk is greatly preferable, for these dairies in particular." — *Teamley*.

"It is a fact well established, that the season has great influence on the quality of cheese, es-

pecially on the defect more immediately under notice. In 1783, a dry hot summer, scarcely any dairy could make good cheese. In some dairies more than half the make was hollow; and even in the best dairy I had an opportunity of examining, numbers were "cye," while in a common season, and more especially in a cool summer, the same dairy has scarcely a defective cheese.

"In North Wiltshire, an experienced and very intelligent dairy-woman observed, that when the "crazy" (the crow-foot) is in full blow, she finds her cheese particularly inclined to heave; while a dairy farmer of the highest class in the same district, has observed, that when the creeping trefoil white clover (*trifolium repens*) has been in full blow, and in particular abundance, he has heard the loudest complaints of the licentious disposition of the cheese. It is not probable that any one species of plants is the sole cause of the disorder. Almost every cheese has its peculiar flavor and its different degree of acrimony. Nothing is more likely to give that almost caustic quality which some cheeses are possessed of, than the common and bulbous crow-foots; not only their flowers, but their leaves, are singularly acrid. On the other hand, there are several circumstances which render it probable, that a redundancy of the creeping trefoil tends to aggravate the disorder. Dry seasons, by keeping the grass short, give it an opportunity of spreading. Manure is well known to encourage it, sometimes in a singular manner.—Sheep-feeding pasture grounds produce a similar effect; partly owing, perhaps, to the blade grasses being kept short, and in part to the soil being meliorated by a fresh manure; and it has been observed, that a suit of cow-grounds, which have been occasionally fed hard with sheep, are very difficult to make cheese from; while a few sheep among cows may, by picking out the clover, be serviceable to the dairy."—*Marshall.*

MADDER.

(*Rubia Tinctorum*).—The following directions for raising this plant are copied from "the Emposium of Arts."

This plant may be propagated either by offsets or seeds. If the latter method is preferred, the seed should be of the true Turkish kind, which is called *tizari*, in the Levant. On a light thin soil, the culture cannot be carried on to any great profit. The soil in which the plant delights is a rich sandy loam, being three feet in depth, or more.

The ground, being first made smooth, is divided into beds four feet wide, with alternate alleys half as wide again as the beds. The reason of this extraordinary breadth of the alleys will appear presently. In each alley is to be a shallow channel for the convenience of irrigating the whole field, &c. That part of the alley which is not occupied may be sown with legumes.

The madder seed is sown broadcast, in the proportion of from twentyfive to thirty pounds per acre, about the end of April. In a fortnight or three weeks the young plants begin to appear; and from this time to the month of September, care must be taken to keep the ground well watered and free from weeds.

If the plants are examined in autumn, they will be found surrounded with small yellow offsets, at the depth of two inches; and early in September, the earth from the alleys is to be dug out and laid over the plants of madder, to the height of two or

three feet.* With this the first year's operation ceases.

The second year's work begins in May, with giving the beds a thorough weeding; and care must be taken to supply them with plenty of water during the summer. In September the first crop of seed will be ripe; at which time the stems of the plants may be mown down, and the roots covered a few inches with earth taken, as before, out of the alleys.

The weeding should take place as early as possible in the spring of the third year; and the crop, instead of being left for seed, may be cut three times during summer, for green fodder; all kinds of cattle being remarkably fond of it.

In October the roots are taken up, the offsets carefully separated, and immediately used to form a new plantation; and the roots, after being dried, are sold, either without further preparation or ground to a coarse powder, and sprinkled with an alkaline lye.

The roots lose four fifths of their weight in drying; and the produce of an acre is about two thousand pounds weight of dry saleable madder.

Madder usually sells for about thirtytwo dollars per hundred; so that the produce of an acre, as above stated, would amount to six hundred and forty dollars.

TO BOIL POTATOES.

Being almost half sick from the changeable weather, I the other day retreated to the kitchen corner, a comfortable place when the cook is good natured. She was a new comer, a native of Wales. The potatoes were peeled, and put into the water after it had commenced boiling. After they were about sufficiently boiled the water was poured off, and the sauce pan containing them again put on the coals to drive off the moisture. Two or three times in the course of ten minutes, she took off the lid and shook up the potatoes, bringing those at the bottom to the top. In this last operation consists the whole art of boiling a potato. The steam is allowed to escape from all the potatoes and from all parts of the sauce-pan. If a towel is put over the potatoes while they are steaming, it absorbs the moisture that condenses on the under side of the lid and drops again on the potatoes. When the lid is taken off to shake up the potatoes, the towel is also taken out. Potatoes managed in this manner, are superior beyond all comparison, to those cooked in the common way.—*N. Y. Far.*

ILLINOIS BUTTER.

The editor of the Illinois Advocate complains bitterly of the quality of the butter brought to Edwardsville, Illinois. Even high prices, it appears, have no effect in producing it of good quality. The cause is rather a curious one, and we will let him speak for himself. "If high prices would be of any effect here, cause of complaint would have long since been removed. But the cause is innate in the makers, and in consequence, good butter is as rare in this market as pine-apples in Iceland.—*Eccc signum.* A few days since, we purchased a few pounds (Hobson's choice,) and although the morning was cool and the butter had been up in nice rolls, we were obliged to lift it out of the vessel in which it had been brought, by spoonsful. What a pity that hogs are so much easier raised in this country than cows; and that,

* Inches, we suspect it should be, instead of feet.

in consequence, *lard* is so cheap as to make it profitable to mix it in butter in the proportion of at least *one half*. Greasy doesings these."

CULTURE.

Soap suds is one of the best antidotes against insects, as well as a very good manure. Trees, shrubs, garden vegetables, &c, if showered with this liquid once or twice a week, would not be injured by worms and bugs, and would flourish surprisingly. Watering plants, such as potatoes, turnips and even flax, with sea-water, has been recommended with Dr Deane; but he says, "salt water applied to tender plants, most commonly proves too strong for them, if applied when the ground is dry; but if it be wet, the strength of the soil is abated by mixing with the juices in the soil, before it is taken up by the roots, and thus it is rendered innocent and safe, as I have found by experience." Do not forget to place a handful of ashes or plaster, or mixture of both, on your hills of corn and potatoes, just before the first or second hoeing. These substances are usually applied after hoeing, but it has been thought better to cover them with earth, lest the sun and air steal away their fertilizing qualities. Soap suds is the best of manures for cucumbers, melons, &c.

BEES.

Watch your bees, for it is about time to look out for swarms. This useful insect meets with less attention from us farmers, than it merits. Bees cost almost nothing at all but a little care, and a few hives which almost any farmer can make. Some believe, and apparently on good grounds, that a garret or any other unoccupied dark room will answer every purpose of a beehive; and Dr Smith asserts, that bees in a garret, "with so much room before them and a few small orifices through which they might get into the open air, never would swarm till the whole garret was completely stored with comb." But in order that you may manage your bees to the best advantage, you had better procure the little treatise on bees, written by Dr Thacher and Dr Smith, which may be had of any of the Boston booksellers, as well as at the New England Farmer's office.

Yellow Locust Tree.—A writer in the New York Farmer, recommends this tree as one of the most valuable for various purposes, that we have in the country. The wood is tough, elastic, grows rapidly, and outlasts almost or quite all other kinds of wood. A fence post five inches in diameter, he says, will remain sound for fifty years. For sills of houses and other timber exposed to dampness, he says it will last longer than any other wood. It is highly valued in ship-building.

Specific for Cholera.— "The following simple recipe," says a Calcutta paper received by the last arrival, taken at a single draught, "seldom fails of affording instant relief to the patient, viz. one ounce cinnamon water, thirtyfive drops tincture of opium, one drachm spirits of lavender, and two drachms tincture of rhubarb."

Antidote to the Cholera.—The Board of Health of Quebec recommend to every citizen to provide himself with a phial of laudanum and one of pepper-mint, to be carried about the person, and resorted to immediately upon the attack of the malady. —*New York American.*

NEW ENGLAND FARMER.

Boston, Wednesday Evening, June 27, 1832.

FOR THE NEW ENGLAND FARMER.

LIME, GYPSUM, &c, AS MANURES.

MR. EDITOR.—I have no desire to disturb Professor Eaton in his school-room, nor in his laboratory; but when he leaves these and sets up as a teacher of practical agriculture, his opinions are fair subjects of criticism. If they are crude or inconsistent, he should be permitted to explain the one and reconcile the other. If erroneous, they should be exposed; for error becomes prejudicial in proportion to the elevation of the source from which it emanates. A Professor of the Sciences and a teacher youth, ought, above all others, to be circumspect in the assumptions he makes on practical subjects.

You published in a late paper, a letter from Professor Eaton to Mr C. Minor, some extracts from which follow, and which I beg you to reproduce with the accompanying remarks.

"Pulverized limestone (carbonate of lime) will supersede," says the Professor, "all manures, when it is well understood."

Again, "Four times the quantity of ground limestone is required, to equal quick lime the third year, but it will continue its effects unabated ten times as long. Quick lime loses its effects in about ten years; carbonate of lime improves the first ten years and diminishes but little the next ten years, and its effects may be perceived fifty years."

Here we are treated with an entire new theory as to the food of plants, without a reason being assigned, or a single experimental demonstration given; and this too by a philosopher and a teacher! and a man withal, who, according to his own declaration, has for twelve years had the care of a million and a half acres of land!!

I had considered it a pretty well settled opinion, that carbonate of lime (powdered limestone) produced no other than a mechanical effect upon the soil; i. e. that it rendered clays more porous, and sands more compact and retentive of moisture, and in this way was beneficial to most soils in the same way that sand and clay are, as mere earths, and in no other. And although it has been experimentally tried, I have never heard of its being applied in quantity, and seriously doubt if a single load has ever been applied under the Professor's eye, or even in the State of New York, as a fertilizer to soils.

As the extract I have made affords no clue, I was extremely at a loss to understand the *modus operandi* of this all-quickening principle, which is destined to supersede animal and vegetable manures, until I read the following.

"Farmers," continues the Professor, "will never reason correctly until they submit to the established maxim, [established how and by whom?] that their cultivated vegetables receive their chief nutritious matter from the atmosphere."

The only way to perceive the Professor's consistency, is to suppose that he designs, by some occult process to convert this carbonate of lime into atmospheric air, that all plants may then feed themselves and to the full, without the aid of man, with this true pabulum of vegetable life and development. What a discovery this to the proprietors of sandy barrens, who spend their time and

money in transporting to their farms the prutrescent manures of your city.

But I have not done with the wonders of this wonderful man. "Plaster of Paris," says he, "stimulates vegetable action, as a glass of brandy stimulates a hardy laborer to eat an unusual quantity, but it affords no nutritious matter." Now I beg leave respectfully to inform the Professor of a fact, which I presume has not come to his knowledge, viz., that many entire plants, such as in New England are denominated *English* grains and *English* grasses, belong to the *temperate cause* and absolutely resist the intoxicating influence of this vegetable stimulant; or in other words, that it neither causes them to eat more nor to grow more; and that all the families of plants which inhale the saline breezes of the ocean, have declared a total abstinence from all gypsum stimuli.

As my sheet is not full, I send you one other specimen of agricultural quackery, recorded in the same paper which contains Professor Eaton's learned letter. It follows:—

"But neither unleached ashes, nor lime in caustic state, should in any case come in contact with the seed corn or young plant." I can only regret that the admonition came too late to enable me to profit by it, as I had limed my corn as I do my wheat, before planting; and have often strewn lime on my wheat crop to destroy the fly, and unleached ashes on my corn to kill grubs, and to impart fertility. Indeed, Mr Editor, it is the first time that I learnt that lime and ashes were destructive, in the ordinary topical application, to the vitality of plants. B.

Memorandum.—May 22. Sent my man with one of Pickering's caterpillar brushes, affixed to a pole, at S. A. M., into the orchard. At 11 he returned, having destroyed, according to his account, more than two hundred nests of caterpillars.—June 1. Finding he had not done his work thoroughly, sent him out again two hours.—June 14. Have not seen a worm on the trees since the last operation.

POMOLOGIST.

Remarks by the Editor.—We are sorry not to be able to agree with our respected correspondent, in some of his theories, opinions, &c. But as the points on which we differ are among those most controverted, and may be called the *metaphysics of agriculture*, it will not be at all wonderful if we do not always exactly coincide. The theory of the action of lime on soils is as unsettled as that of magnetic attraction, or the causes and sources of caloric; but its discussion can do no harm and may be beneficial.

Mr B. says, "I had considered it a pretty well settled opinion, that carbonate of lime (powdered limestone) produced no other than a mechanical effect upon the soil; i. e. that it rendered clays more porous, and sands more compact and retentive of moisture, and in this way was beneficial to most soils in the same way that sand and clay are, as mere earths, and in no other." This is a well expressed condensation of Sir Humphrey Davy's doctrine; but other philosophers have held tenets a little variant from those of that great chemist. It is now contended, that lime when mixed contains an excess of carbonic acid. It is capable of absorbing not only that quantity which it possessed in its natural state, (being about forty-five parts in one hundred,) but an additional quantity, forming what chemists call an *hypercarbonate*. This is said

to be highly soluble in water, which accounts for the admission of lime into the structure of plants; and that excess of carbonic acid adheres very loosely to its base (the mild lime,) and is liberated without any extraordinary degree of heat. The carbonic acid, a most important article of vegetable food, is copiously evolved in the putrefactive process of manures; the calcareous earth fixes and prevents its escape, forms with it a hypercarbonate, and readily imparts it in union with water, towards the nourishment of crops. It is supposed to do more; it unites with the carbonic acid floating in the air; and when there is a scarcity of aliment in the soil, it seizes and secures this food in the atmosphere, and afterwards disperses it according to the calls and necessities of vegetation. Hence the necessity of keeping lime on the surface. It is then ready to intercept and combine with the carbonic acid, which is generated by the fermentation of the putrescent matter lying at lower depths, and to attract the same gas (the carbonic acid) from the surrounding air.*

There are three forms in which lime is generally used in agriculture. 1. Carbonate of lime. This is the most common state in which it is found on the surface of the earth, in quarries of marble, &c, and it is then combined with almost half its weight of carbonic acid or fixed air. 2. Quick lime, or caustic alkali. When limestone is strongly heated, the carbonic acid gas is expelled, and then nothing remains but the pure alkaline earth; in this case there is a loss of weight, and if the fire has been very high, it approaches to one half the weight of the stone; but in common cases, limestones, if well dried before burning, do not lose much more than from thirty-five to forty per cent, or from seven to eight parts out of twenty. 3. Slacked lime. This is merely a combination of lime with about one third part of its weight in water; i. e. 55 parts of lime absorb 17 parts of water; and in this case it is composed of a definite proportion of water, and is called by chemists *hydrate of lime*; and when hydrate of lime becomes carbonate of lime by long exposure to air, the water is expelled and the carbonic acid gas takes its place.† We will briefly advert to the peculiar uses of lime in each of these states.

Carbonate of lime is the only state in which lime can become a part of the substance of plants. As well might an animal swallow red hot cinders as plants be nourished by lime, except when it is a carbonate, i. e. mild or effete. When lime is quick, or caustic, or water-slacked, or air-slacked, it consumes or corrodes plants, more or less, according to the degree of its causticity; and in one of those states, (viz. quick or caustic,) it is used to destroy useless or noxious vegetation. But caustic lime cannot long remain on the ground or exposed to air, without passing into a carbonate and becoming mild.

Suppose a given quantity of lime is wanted for a given area of land; there are advantages in employing highly caustic lime, because it is lighter, and will manure more soil, pound for pound, than mild lime. Limestone, in burning, generally loses from thirty-five to forty per cent of its weight, and if while yet in its most caustic state it is spread upon the soil, it recovers at least its original weight (some writers say somewhat more,) while lying where it has been spread; and is then and there

* See Letters of Agricola, and Mr Pickering's Address to Mass. Agr. Soc. N. E. Farmer, vol. I. page 213.

† Davy's Agr. Chemistry.

ready and willing to perform its good offices, by yielding from time to time a part of its substance, both of lime and carbon, to the wants of vegetation.* In other words, place sixty pounds of hot lime directly from the kiln, in a field where you wish to use it for manure, and then let it become mild by exposure to air and water, (either or both,) and your sixty pounds will have become somewhat more than one hundred pounds. Therefore, one of the advantages in using hot lime consists in its being of lighter carriage in proportion to its power as a manure, than mild lime. "A ton of lime-stone," says Dr Cooper, in Willich's Domestic Encyclopedia, "ought to be reduced in the kiln to 1100 weight, otherwise it is not sufficiently burnt. It will gain two thirds of the lost weight by exposure to air for a week or ten days."

The paragraph of Professor Eaton's (quoted above by B.) in which he says, "four times the quantity of ground limestone is required to equal quick lime," &c, the latter being more durable, appears to us very strange—indeed, incomprehensible. Ground limestone is lime saturated with carbonic acid; quick lime is lime deprived of carbonic acid by heat; but the latter is hourly acquiring the state of the former. Ground limestone is carbonate of lime, and quick lime is pure lime *in transitu*, or on its way to the same state. The former is 6, the latter is becoming half a dozen.—Ground limestone will last longer than pulverized quick lime, *because it is less effluvious while it does last*. Quick lime is more easily and more completely committed, and presents more surface to the action of its solvents, than ground limestone; and the former is therefore sooner efficacious; and its efficacy is less lasting. London says, that "machines for pounding limestone have been erected [in Great Britain,] but the effect of the powder so obtained, both as a manure and for cement, is so much inferior to that of burnt lime, that they have long since been laid aside." *En. of Agr.* p. 562. Other writers, however, speak highly of the efficacy of pulverized limestone as a manure.

We have scarcely room or leisure at present, to remark on some other points and assertions of Mr B., to which we cannot yield assent. That air contributes to the nourishment of plants by yielding its gasses, particularly its carbonic acid gas to their use, is a fact in which we thought all theorists were agreed. Sir Humphrey Davy says, "The principal consumption of the carbonic acid in the atmosphere, seems to be in *affording nourishment to plants*; and some of them appear to be supplied with carbon chiefly from this source."—Carbon is not the only "nutritious matter" which vegetables receive from the atmosphere. The leaves of living plants appear to act upon the aqueous vapor of the atmosphere, in its elastic form, and to absorb it. Some vegetables increase in weight from this cause, when suspended in the atmosphere and unconnected with the soil; such are the house-leek and different species of the aloes. Water is likewise absorbed from the soil, and that soil is said to be most fertile which has the greatest power to absorb water.† Instead, therefore, of an "occult process to convert carbon-

ate of lime into atmospheric air," it seems that atmospheric air is converted into carbonate of lime, or at least yields its carbon and water to quick lime, which is thus made a carbonate, and the latter in its turn supplies plants with those indispensable to vegetation.

We have room for but a word or two in reply to the "agricultural quackery" of which we are accused. It consists in our having stated that "neither unleached ashes nor lime in a caustic state, should in any case come in contact with seed corn or young plants." Dr Deane, in his N. E. Farmer, in speaking of unleached ashes as manure, said, "If they be spread upon ground which has tender plants, it should be done just before a rain, which will dissolve and soften their acrimony. For tender plants, when the weather is dry, will be apt to be injured by them; at least if they are in contact with the stems or leaves." And with regard to lime in a caustic state, Sir John Sinclair says, "A new method of burning without fire has lately been discovered. This consists in substituting quick lime for fire. The lime in its most caustic state, fresh from the kiln, is laid on the vegetable surface to be consumed; and before it is weakened by exposure to the air, a quantity of water, just sufficient to put it in powerful action, is applied," &c. We will also make use of the shield of Sir Humphrey Davy, "quick lime," he observes, "in its pure state, whether in powder or dissolved in water, is injurious to plants. I have in several instances killed grass by watering it with lime-water." But it is only in its most virulent state of causticity, that lime destroys vegetation.

Sportsman and Conqueror.

THESE Horses will stand the ensuing season, at the Ten Hills Stock Farm, in Charlestown, two and a half miles from Boston, on the Medford turnpike; for particulars, see late Nos. of the New England Farmer, and Bills. They are confidently recommended to the public by the subscriber.

SAMUEL JAKES.

Ten Hills Stock Farm, May, 1832.

Sportsman's get may be seen on the farm.

Horse Pioneer.

PIONEER will stand for Mares the ensuing season at the following places: at the cattle fair hotel, in Brighton, every Saturday, P. M., and Monday (except the 25th June,) through the season; at Warren's in Framingham, Tuesday, P. M.; at Eastbrook's in Worcester, on Thursday—returning, at Grafton on Friday, A. M. and arrive at Framingham the same evening, and at Framingham the 25th and 26th of June.

Pioneer is a dark bay, full fifteen and a half hands high, ten years old this spring, is a horse of remarkable fine figure, temper and action, and a sure foal getter; was sired by the imported horse Delah, out of a fine mare by Cub, own by Gen. Van Rensselaer of Albany. Persons wishing to improve their breed of horses, are requested to call and examine for themselves. He is pronounced by good judges not to be inferior to any horse in the State. That the public generally may avail themselves of the services of said horse, he will stand at the moderate terms of \$6 the leap, \$10 the season, or \$15 to insure.

JOHN FELTON.

Brighton, June 13, 1832.

Situation Wanted.

A merced man from Scotland, who has been in this country but a few months, wants a situation as manager of a farm or otherwise. His wife would take care of a dairy, if desirable. Apply at this office.

June 13.

Boy Wanted.

A faithful lad of about 14, who has a good education and of a turn to make a good salesman, may hear of a good situation in this city, by applying at the Farmer office. His board and a suitable compensation for his clothes will be given him.

June 13.

BRIGHTON MARKET—MONDAY, JUNE 25, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 209 Beef Cattle, (including 36 unsold last week.) 14 Cows and Calves, 1671 Sheep and Lambs, and 710 Swine. About 20 Beef Cattle remained unsold at the close of the market.

PRICES. Beef Cattle—The quality of cattle was better than last week, but prices averaged about the same. We quote for three or four extra yoke at \$6 75; prime at 6 a 6 50; good at 5 25 a 5 75; thin at 4 75 a 5 25.

Cows and Calves.—We noticed sales at \$17, 20, 24, 30 and 32.

Sheep—Lots of Lambs with a few old sheep were taken at \$1 62, 1 75, 1 80, 1 92, and 2 25; weathers at 2 92, 3 00, 3 25, and 3 50.

Swine—No sales were noticed, about all reported remain on hand close of the market.

NEW YORK, June 23.—Market this week well supplied with stock. Sales low and at reduced prices. 600 beef cattle have arrived, and of these 100 remain over. The average of sales this week, is one dollar per hundred less than last. We quote beef cattle 5 50 a 7 50 per hundred.

Sheep and Lambs; from 1000 to 1500 have arrived. Sales tolerably brisk, for sheep \$2 a 4 50; lambs 1 75 a 3 50. Swine; what few arrive sell alive at 4 a 4 50; dressed at 6 1/2 a 6 3/4.—Daily Ad.

* Lime is soluble in water in the proportion of one part of the former to about 750 of the latter. It is owing to this solubility that the water in limestone countries becomes hard, and that rivers embedded in limestone cut their channel so deep.

† Agr. Chemistry, Lec. iv. v. and vii.

Miscellany.

FOR THE NEW ENGLAND FARMER.

THE FARMER'S SONG.

I envy not the mighty king
Upon the splendid throne—
Nor crave his glittering diadem,
Nor wish his power mine own:
For though his wealth and power be great,
And round him thousands bow
In reverence—in my low estate
More solid peace I know.

I envy not the miser—he
May tell his treasure o'er,
May heaps on heaps around him see,
And toil and sigh for more;
I'd scorn his narrow, sordid soul,
Rapacious and unjust;
Nor bow beneath the base control
Of empty gilded dust.

Let warriors mount fame's giddy height,
Gain glory's gallant mead—
Be calm, collected in the fight,
Where thousands round them bleed;
I envy not their victor's wreath,
Their courage nor their fame;
Their laurels are a fleeting breath,
Their glory but a name.

My wants are few, and well supplied
By my productive fields,
I court no luxuries besides,
Save what contentment yields;
More pure enjoyment labor gives,
Than wealth or fame can bring;
And he is happier who lives
A FARMER than a king.

CLEAN BEDSTEADS.

We copy the following directions for cleaning bedsteads, from the New Haven Register. The method appears to be novel—at least we have never seen the same directions in print before; and we think with the writer, that those who will take the trouble to follow them, may be pretty certain of comfortable beds for the rest of the season. The common method of attacking the vermin in bedsteads with *hot water*, is entirely useless; it will neither destroy the bug nor its eggs. Painting the bedstead with verdigris, or washing it with spirits of turpentine, are not only inefficient, but almost as loathsome as the insect.

Directions.—If your bedsteads are already populated with those animals, scald them (the bedsteads) with *boiling vinegar*. The mortices and tenons should be held a minute in the hot vinegar, and upon all places where the eggs are deposited the hot liquid should be suffered to remain about a minute, or to run over them that length of time. The bed-cord should be taken out and dipped in the boiling vinegar.

This will destroy not only the bugs but the eggs: the acid of the vinegar eating off the lime that constitutes the shell of the egg. This operation should be performed upon all the bedsteads in the house, at the same time. To prevent waste of the vinegar, a large kettle or tub should be placed so as to catch the vinegar as it is poured on. Remember that the vinegar should be *boiling hot*.

But this will not prevent the bugs from again infesting the bedsteads, if any should happen to have hid themselves in the bedclothes, or in the cracks of the floor or of the partition. To prevent them from again populating the bedsteads, it is necessary to brush over the bedsteads lightly with the following wash:—

Alcohol, half a pint; spirits of turpentine, half a pint; camphor, half an ounce—mix together. The articles may be had at the apothecaries or druggists, and will cost a shilling. The above quantity is sufficient for four bedsteads. I use a painter's brush to put on the wash; but a few bristles tied together will do as well. The whole of each bedstead should be touched lightly with the wash. It dries instantly and is agreeable in its smell, and possesses the advantage of not soiling or staining the bedding or curtains, though freely applied even to them.

If the bedsteads are not old, not much infested with the insects, the wash above mentioned will be sufficient without scalding with vinegar; both, applied in succession, are absolutely infallible, in the worst cases. If thoroughly performed, not a bug will ever appear in the house again, unless brought there in other bedsteads.

STEAM CARRIAGES.

A committee of the British House of Commons, after instituting a minute inquiry into the subject of steam carriages for the purpose of draughts on common roads, come to the following conclusions:

1. That carriages can be propelled by steam, on common roads, at an average rate of ten miles per hour.
2. That at this rate they have conveyed upwards of fourteen passengers.
3. That their weight, including engine, fuel and water, and attendance, may be under three tons.
4. That they can ascend and descend hills of considerable inclination, with facility and safety.
5. That they are perfectly safe for passengers.
6. That they are not, (or need not be,) if properly constructed, nuisances to the public.
7. That they will become a speedier and cheaper mode of conveyance, than carriages drawn by horses.
8. That as they admit of greater breadth of tire than other carriages, and as the roads are not acted on so injuriously as by the feet of horses in common draught, such carriages will cause less wear of roads, than the ordinary vehicles drawn by horses.
9. That on some roads tolls have been imposed which would be prohibitory of their being used.

A SABBATH EVENING.

How delightful is the stillness of a Sabbath evening; I never enjoy the delights of such a time without feeling grateful, that the wise God of the universe has given us one day out of the seven, in which we have time to meditate upon his perfections, and to send our thoughts forth in the contemplation of another and a better existence. The Sabbath has had a sensible effect upon the affairs of men; in fact, it is necessary to his very existence. If our thoughts were always fixed upon this world and the things of it, how few of us would ever prepare for a better; it is therefore necessary, that a particular time should be set apart for this particular object. But on a Sabbath evening all nature seems to enjoy repose; there is

no noise to disturb us, nothing to occupy our attention, no sports; the sound of the hammer is hushed, and the ploughman's voice. All that we hear is now and then the distant bell, telling the hour of prayer, sounding forth its sweet notes upon the still air, and resting like spirits upon the ear. The pathway is filled with persons in pairs, winding their way to church, to meet with God in his temple! Oh, who would give up his blessed day, who does not feel that God has consecrated it. Doubtless, when he makes his second appearance, it will be on the Sabbath. Let us then consecrate the Sabbath evening to his service, that when he comes, he may find us ready to meet him in the heavens.—*Virginia Farmer.*

The Home of a Poetess.—The Boston Transcript contains a letter from Hartford, Conn., which says: "I must not omit telling you that we passed half an hour in roaming over the romantic gardens and woodlands, that surround the residence of Mrs. Sigourney. Her husband, who is himself a man of letters and taste, has ornamented his estate with everything that can render it desirable, as the home of talent and genius. I do not wonder that Mrs. Sigourney has written so much exquisite poetry. The muses must be her frequent companions; for, if, as it is fabled, they sometimes condescend to visit the planet earth, they can never return to the fairy land without having fanned their wings in the breezes, which sigh around her romantic bowers."

Cholera.—It is stated in the London papers, that at Masselburgh, in Scotland, the authorities, after the appearance of the cholera, adopted the plan of fumigating the streets, lanes and houses, with chlorine, raised from sea salt and magnesia by means of sulphuric acid; and it is worthy of remark, that from the commencement of this operation the disease rapidly diminished in number of cases and in virulence, so that in eight days it had entirely ceased at Fishermrow.

Our today is worth two tomorrows.—*Franklin.*

Horse Quicksilver.

QUICKSILVER will stand this season at the stable of the subscriber, in Brighton, a few rods south of the meeting-house, and will cover only twenty mares the present season, at \$15 each, and \$1 in addition, to the groom. Mares warranted to be in foal, if \$20 is paid, and \$1 to the groom, and in discharge of warranty, the \$20 will be returned.

Quicksilver is a beautiful bright bay, three years old; his sire, Sir Isaac Coffin's horse, Barefoot, conspicuous in the racing calendar of England; his dam, Rebecca, from the imported Cleveland bay horse Sir Isaac, and Sky Lark, a native mare, well known for her fine form, speed, and bottom, once owned by Mr. Leavitt of Salem, to whom persons are referred for her character, and will be to many others in Massachusetts and Maine. Quicksilver is thought by good judges to combine with great symmetry and delicacy of form, bone, muscle, and all the requisites for a first rate covering horse. Mares sent to him, and if left with the subscriber, will be well attended to on reasonable terms, but he will not be responsible for accidents.

BENJAMIN W. HOBART.

Agriculture.

From the Massachusetts Agricultural Repository and Journal.

REPORT OF THE COMMITTEE

*On Experiments, Discoveries, and Inventions,
Trees, Live Hedges, &c.*

The committee of the Massachusetts Society for Promoting Agriculture, to whom were referred claims for premiums for experiments, inventions and discoveries, as also for plantations of forest trees and apple trees, and other descriptions of agricultural industry, as specified in their list of premiums, beg leave to report: that there were no premiums claimed for experiments in turning in green crops as manure, nor for the successful use of the drill plough in the cultivation of any small grain or seeds; but there were two claims for the third premium offered by the Society, under the head of experiments, inventions, and discoveries, viz. For an effectual and satisfactory mode of *destroying* the bee-moth, or of *preventing* its ravages. It will be obvious that the two branches of this subject are essentially distinct. To *destroy* the moth by any artificial process, is radically and substantially different from *preventing* its ravages, or its access to the hive. Both would be equally useful if the end should be obtained, which is protection; but it is obvious that the means may be, and (we may almost say) *would* be essentially different.

The first communication received on this interesting but difficult subject, by the committee, was from the venerable Dr James Thacher, of Plymouth. This paper was worthy of the good sense and well known research of the author, and did not in any degree diminish the respect which the committee felt, for this veteran promoter of all the arts subservient to the cause of agriculture. In examining it, however, with the care and exactness which their commission required, they could not perceive that it fulfilled the conditions on which alone their authority reposed, to wit, "an *effectual* and *satisfactory* mode of *destroying* the bee-moth, or of *preventing* its ravages."

The committee might rest here, and rely upon the conviction, that they had exercised their judgment with due discretion; but they owe it to Dr Thacher and to the public, to state the grounds on which their opinion was founded. As to the first branch, Dr Thacher seems distinctly to admit, that he knows of no "*effectual* and *satisfactory*" mode of *destroying* the bee-moth, and seems to consider it as a desideratum not yet obtained. He does indeed suggest the idea of *destroying* the bee-moth by solutions of sugar with poison; but, besides that, the same remedy may be equally fatal to the bees, it must be in its nature imperfect.

We have no evidence that the bee-moth has so strong a desire of food, as to counteract the more powerful influence of its instinct, to place its eggs in places adapted to its future progeny. In short, though it is the suggestion of an ingenious mind, employed in speculations for the public good, yet as to its "*effectual* and *satisfactory*" operation, there is too little evidence offered.

Upon the second branch of the premium, that of prevention, Dr Thacher proposes an inclosed apiary. There is no doubt that an inclosed apiary

forms some check to the ravages of the insect. But then it should be considered, that apiaries thus inclosed have been in operation for thirty years past, and have proved neither "*effectual* nor *satisfactory*."

Dr Thacher indeed alludes to a grating placed before the hives at night, but gives no definite mode of applying it. This remedy is much more fully developed in the next communication; though we are compelled to say that Dr Thacher has not afforded an "*effectual* and *satisfactory*" mode of preventing the ravages of the bee-moth, yet for his continued labors and research on this interesting subject, the committee recommend to the trustees that a gratuity of ten dollars be paid to him.

The only other communication on this subject, is from the Rev. J. R. Barbour, of Newbury, (Byfield.)

This communication is very elaborate, interesting, and important, shewing great perseverance, accuracy, and uncommon practical observation, as well as mechanical contrivance. It would be impossible for the committee to do anything like justice to the plans and suggestions of Mr Barbour, in any abstract which they could make, and they would therefore recommend that the whole communication from him, together with the letter of Mr Parsons which accompanied it, should be published in the Journal and New England Farmer. This great advantage would be derived from it, that if the committee have erred in their opinion as to its title to the premium offered by the Society, ingenious persons may be induced to try his plans, and experience may show that the difficulties which present themselves to the committee, are not well founded. Mr Barbour's communications have reference to two distinct points.

The first, to the prevention of the ravages of the bee-moth; the second, to the more easy and effectual acquisition of the labors of the bee, without their entire extermination. As no premium has been offered for this, the most interesting part of Mr Barbour's discoveries, we might pass it over in silence; but such a course would not suit either our feelings, nor comport with our duties. We feel ourselves then bound to say, that Mr Barbour's suggestions and plans appear to us to be very ingenious and important, and we recommend them to the attention of those who cultivate bees; and as a proof of our estimate of their ingenuity, we recommend to the Society, to pay to Mr Barbour ten dollars, being the half of all the premiums offered on this subject, and that he be requested to permit his apparatus, transmitted to us, to be exhibited in the Agricultural Repository in Boston, under the management of Mr Newell.

The other branch of Mr Barbour's inventions, or claims, respects the prevention of the entrance of the bee-moth into the hives, by a screen of mill-net, to be put up every evening and to be removed every morning. Such a remedy would appear perfect. Why then not grant the Society's premium? We reply in few words. First, because Mr Barbour has the candour to admit, that the suggestion came to him from Rev. Mr Noyes, of Needham. We are not told how far this suggestion went, but we are led to believe that Mr Noyes was the inventor. Secondly, because we seriously

doubt whether a remedy which requires attention twice a day, is fitted for common use. Yet as the first suggestion of a mode, said to be effectual, if men will be scrupulous in its application, came first before the public through Mr Barbour, we recommend the grant of a gratuity to him of ten dollars. But in this gratuity, justly due to an ingenious man, who has devoted his time and learning to a subject very interesting to the cause of agriculture, we are constrained to say, that it is not certain at what hour the bee-moth takes its flight. An omission of one half hour may be fatal. If, as is asserted and as is probable from analogy, a single mill-net lays five hundred eggs, it may prove as fatal to a hive, as if there was a free intercourse.

We admit that these precautions, sedulously and scrupulously followed, might be effectual. But it should not be for one moment admitted, that as a general or universal practice, it would be available.

To be concluded next week.

ITEMS IN RURAL ECONOMY,

ORIGINAL AND SELECTED. BY THE EDITOR.

Washing Salads, &c.—James Simson, a writer for the Gardener's Magazine, concludes a pretty long article on the best mode of washing Water Cresses and other Salads, so as to free them from the larva of insects and worms, as follows:

"Mr Brown, of Dalkeith, suggested the idea of having a tub of salt water from the sea, and steeping them a few minutes in that. We immediately adopted the advice, and succeeded perfectly in detaching everything of the animal kind from the leaves referred to. My mistress was so much pleased with the thing, that she has since had every kind of salad washed in this way, especially such as grow close to the ground and are apt to have worms and slugs gathered with them. We have even had small red worms come out of cabbages and lettuce, besides green flies and caterpillars. After the vegetables remain three or four minutes in the salt water cistern, whatever has been in them comes out, and is seen writhing and dying in the water. The vegetables are then taken out and washed with fine fresh water, in the usual way." The same water may be made to last for weeks, if the insects are strained from it.

A new method of raising Peas.—A writer for the Gardener's Magazine, recommends a new mode of raising early peas, &c. This consists in having a quantity of turf cut into pieces of about nine or ten inches long, and three or four broad, which are placed in a regular manner over the surface of a hot-bed, grass side downwards, and a row of peas is sown on each row of turf, and afterwards covered with soil: when they are fit for transplanting, no more is required than to lift out the turf, piece by piece, with the peas growing upon it, and place them where they are to produce the crop. By this means the roots receive no injury, nor do the plants sustain any check by transplanting. This method may be practised with similar success in the raising of potatoes, beans, &c.

To preserve Cauliflowers, &c.—Charles Macintosh, in the Gardener's Magazine, says, "I have been able to keep cauliflowers for a length of time, by cutting them in a dry day, stripping off all

From the Farmer's Manual.

the leaves, and then burying them among bog mould. The idea first struck me in Scotland, from considering that bog mould was antiseptic and capable of resisting putrefaction, particularly if excluded from atmospheric air. I covered some heads of cauliflower in July, under the rubbish taken from the bottom of an old *peat stack*, and in November following found them still fit for use. I pointed out to your brother some this year, at Stratton, that had been laid up six weeks and still good; this I was, in consequence of the long drought, obliged to do; and for weeks it was sent to table, and found as good as if newly cut. It is necessary to wash them well, as they are very black when taken out."

Liquid Manure, Soot, &c. — Sir H. Davy characterizes soot as "a powerful manure, possessing ammoniacal salt, empyreumatic oil, and charcoal, which is capable of being rendered soluble by the action of oxygen or pure vital air." Mr John Robertson, writer for the Gardener's Magazine, says, "on meadows, [mowing land,] I have used soot with great advantage in substance, and though sown by the hand, one dressing gave me always heavy crops of hay for two successive seasons. But this is a wasteful mode of applying it, a great proportion of its ammonia, one of its most active ingredients, being volatilized and dissipated in the atmosphere. When dissolved in water there is no waste; it is all available, and for horticultural purposes I have used it mostly in that state, mixing it up in the proportion of about six quarts of soot to a hogshhead of water. Asparagus, peas, and a variety of other vegetables I have manured with it, with as much effect as if I had used solid dung; but to plants in pots, particularly to pines, I have found it admirably well adapted; when watered with it, they assume a deep healthy green and grow strong and luxuriant. I generally use it and clean water alternately, and always over-head in summer; but except for the purpose of cleansing, it might be used constantly with advantage."

"Other materials for liquid manures are often difficult to procure, and tedious in their preparation; but soot, sufficient for the gardener's purposes, is almost everywhere at hand and in a few minutes prepared."

"Were gardeners more generally aware, that no manures can be taken up in a state of solidity by plants as food, and that they can only be absorbed by them in a gaseous or liquid state, to which all solid manures applied must be previously reduced, before any benefit can be derived from them, they would in many cases facilitate the process by using them in a liquid state. In houses where rains have not access, it appears to me superior to any other mode of administering manure to trees."

A simple and effectual method of destroying the Red Spider. — Mr A Kendall, in a communication for the Gardener's Magazine, advises for the above mentioned purpose the following application:

"To one gallon of rain water add six ounces of soft soap, which is to be completely dissolved before using. When used, it is to be beaten into a fine lather, (a common hearth brush, I find, answers the purpose best.) The lather only is then to be taken in each hand and carefully applied to the upper and under side of every leaf that is infected. If the disease is not violent one dressing will be sufficient; but where every part of the plant is infected two dressings are required, as it will only kill those insects that are actually im-

mersed in the fluid. The best time for applying this remedy is in the evening, after which the glasses are to be close shut down for the night. The reason for using the lather only, is, the insects are immersed a much longer time in the fluid than they would be by the application of plain soap and water. This remedy may at first appear a tedious one, but I can assure you, from my own experience, that it is not so; for any person may dress a three light frame, where the plants are properly thinned and where every leaf requires to be dressed, in one hour; and where is the gardener that would grudge even a day, to preserve the flavor of his fruit and save his plants from certain destruction? The above receipt is not confined to melons only, for no plant, however tender, to which I have applied it, appears to be in the least degree injured by it."

Bones for Manure. — A good way for gardeners to collect bones for vine borders and other purposes, is to make it known in the neighborhood, that they will give so much per hundred weight for all that is brought to them. As they are received, they should be broken by hammers into small or large pieces, as the effect is intended to be immediate and powerful, or gradual and prolonged. For distant effect, a number of bones should be buried whole; on the same principle that opium-eaters envelope their pills in paper, to retard their dissolution in the stomach. — *Gardener's Magazine.*

Yeast as a Manure. — It is not generally known, that yeast is one of the most powerful manures in existence. Some experiments have been tried with grass plots and different culinary vegetables, from which it appears that a very small quantity of yeast, after it has become putrid and useless to the brewer or baker, will effect wonders when mixed with water and applied to plants as liquid manure. The only danger seems to be in making it too rich. We would recommend such of our readers as have leisure and opportunity, to try it on pines, vines, the Brassica family, especially cauliflowers, the potato, as a pickle for wheat and other seeds, and for watering new sown plants and similar elegant seeds. — *Id.*

Packing and preserving Seeds. — Mr Anderson, of the Chelsea Botanic Garden, says, he received from the East Indies twenty-four seeds or nuts of *Corypha taliera*; twelve of them were carefully wrapped up in paper, not one of which germinated; and twelve of them were bedded in charcoal, everyone of which grew freely.

Remedies against the *Aphis Lanigera*, or American Blight. — Tobacco water, soft soap, soot and salt in equal quantities, and old urine, have all been recommended in different articles in the Gardener's Magazine, as specifics against the above named disease.

Pea Pods. — In a German publication it is stated, that pea pods when green, if boiled in water with a little sage or a few hops added, and the whole afterwards fermented, will produce liquor not inferior to beer.

Mixing Soils. — It was a maxim of Kliegg, a famous philosophical farmer of Switzerland, that "Every species of earth may be instrumental to the improvement of another of opposite qualities."

White Weed — Plaster of Paris, we are told, will destroy white weed. Another remedy is to pasture the land with sheep.

MAKING HAY FROM CLOVER.

The cutting and curing of clover is a very nice and critical farming, and demands the first attention. The heads and leaves of clover are its principal value, the stalk when coarse is of little use; therefore, in order to preserve the most valuable parts, cut your clover in dry weather; and when the dew is dried off from the first swaths, turn them over gently, without spreading, until you come to the swaths which are free from dew, let these be untouched until noon, unless showers or a storm become threatening, in this case, break off your mowers and get your clover from the swath into small cocks. Let the cocks be made with the fork, with only once or twice rolling. But if the weather continues fair, let your mowers keep on and your haymakers follow with their forks, and put all the swaths into small cocks. The next day let these cocks stand, and go on cutting as before; proceed thus until you have secured your clover. In two, three, or four days, as the weather may be, the clover first cut will be fit to cart if the weather proves fair, if not, the rains will never penetrate farther than the winds and sun can dry; the clover will be injured only upon the surface. Should a long cloudy or moist turn of weather succeed, you may give your clover air by taking off the top of each cock and placing it fer the bottom, and thus with your fork change the order of your cocks by bringing the bottoms to the top; this mode will cause your cocks to shed rain better than the common mode of turning them over at once with the fork. When you find your clover sufficiently cured for housing, take the first good hay-day, turn over your cocks in the morning when the dew is off, and as soon as the moisture is dried from the bottoms, clear your field as fast as possible. Thus you will secure all the valuable parts of your clover, viz: the head and leaves, in full blossom and as perfect a green as when growing. And your horses will hold their flesh and do more service on this clover, without grain, than on clover cured in the common method with the usual quantity of grain. And you will readily experience the saving in expense, which, although of importance, will be found to be of minor consideration in this mode of husbandry.

A few loads of clover may always be housed in this mode with safety; but if your fields are large, some precaution will become necessary, to guard your mows against heating, which is not only injurious to the clover, but will prove injurious to your horses and give them a cough. To prevent both these evils, let your clover stand in the cock a day or two longer; open it carefully when you are ready to cart, *without spreading*; let your bays be open under the bottom for a free circulation of air; fill several large bags with hay, set them erect upon the floor of your bays, mow the clover around them with as little treading as possible; raise up the bags with the rise of your mow, and when your mow is finished remove the bags. These openings will serve as ventilators and secure your mows from heating. If you reserve your wheat or rye straw for this purpose, and cover your clover occasionally as you mow it, with straw, your straw will not only prevent your mow from heating, but imbibe the moisture of your clover and become valuable feed for your horses and cattle, and thus become a double saving. One bushel of salt sprinkled upon your clover as you

mow it, will preserve it against heating, and doubly repay you in the value it will give to your hay.

From Deane's New England Farmer.

MOWING.

They who have not been in their youth accustomed to do this work, are seldom found to be able to do it with ease or expedition. But when the art is once learnt, it will not be lost.

As this is one of the most laborious parts of the husbandman's calling, and the more fatiguing as it must be performed in the hottest season of the year, every precaution ought to be used which tends to lighten the labor. To this it will conduce not a little, for the mower to rise very early and be at his work before the rising of the sun. He may easily perform half the usual day's work before nine in the morning. This work will not only be made easier by the coolness of the morning air, but also by the dew on the grass which is cut more easily for being wet. By this means, he may lie still and rest himself during the hottest of the day, while others who begin late are sweating themselves excessively; and hurting their health, probably, by taking down large draughts of cold drink to slake their raging thirst. The other half of his work may be performed after three or four o'clock; and at night he will find himself free from fatigue.

If the mower would husband his strength to advantage, he should take care to have his scythe and all the apparatus for mowing, in the best order. His scythe ought to be adapted to the surface on which he mows. If the surface be level and free from obstacles, the scythe may be long and almost straight, and he will perform his work with less labor and greater expedition. But if the surface be uneven, cradley, or chequered with stones or stumps of trees, his scythe must be short and crooked. Otherwise he will be obliged to leave much of the grass uncut, or use more labor in cutting it. A long and straight scythe will only cut off the tops of the grass in hollows.

A mower should not have a snead that is too slender; for this will keep the scythe in a continual tremor and do much to hinder its cutting. He must see that it keeps perfectly fast on the snead; for the least degree of looseness will oblige him to use the more violence at every stroke; many worry themselves needlessly by not attending to this circumstance.

Mowing with a company ought to be avoided by those who are not very strong, or who are little used to the business, or who have not their tools in the best order. Young lads, who are ambitious to be thought good mowers, often find themselves much hurt by mowing in company.

Mowers should not follow too closely after each other; for this has been the occasion of fatal wounds. And when the dangerous tool is carried from place to place, it should be bound up with a rope of grass or otherwise equally secured.

"Mr de Lisle," says the Complete Farmer, "introduced in England the mowing of wheat. The method is this: the scythe he uses is at least six inches shorter in the blade than the common scythe, and instead of a cradle, has two twigs of osier put semi-circular wise into holes made in the handle of the scythe, near the blade, in such a manner that one semi-circle intersects the other.

"By this method of mowing wheat, the stand-

ing corn is always at the left hand. The mower mows it inward, bearing the corn he cuts on his scythe, till it comes to that which is standing, against which it gently leans. After every mower follows a gatherer, who, being provided with a hook or stick about two feet long, gathers up the corn, makes it into a gavel, and lays it gently on the ground. This must be done with spirit, as another mower immediately follows."

SNAKE BITES.

The American Farmer has a long article under this head, written by a physician of the south, who pretends to have had considerable experience on the subject. Though his remarks relate to the bite of the rattle-snake, they are equally applicable to all others that are poisonous. He shows conclusively the futility of the many sovereign remedies recommended in such cases. The spirits of hartshorn has been thought an infallible cure for the bite of a rattle-snake; the wonderful efficacy of this prescription is founded entirely on the supposition, that the poison of the snake contains an acid. He not only proves that this supposition is unfounded, but shows that the alkaline properties of the hartshorn must be destroyed by the acidity of the stomach, before it has time to undergo the operation of digestion, and thus be fitted for mixing with the blood in order to be carried to the poison. He states, that in the beginning of his practice he believed hartshorn to be a certain remedy for snake bites, and administered it accordingly; but careful observation and experience convinces him to the contrary. He relates a number of cases in support of his position, among which are the following:

"Walking with a gentleman in his field, he trod on a rattle-snake; he was without shoes, and the snake bit him in the hollow of his foot. He was very much alarmed, appeared to be in pain, and vomited much; he was very faint, he could not walk, yet would not agree that I should leave him to go for help to get him home. As he begged for a remedy and I seemed to think that I, as a doctor, ought to do something, I brought my hat full of water, washed the wound, and put a chew of tobacco to it, tying it on with my handkerchief. We waited several hours, when he became easy and we walked home. A chew of tobacco in this case, was just as good as hartshorn."

He relates another case of a man whom he came across while travelling, who was bitten on the ankle; he says, "he was very sick, covered with a cold sweat, appeared in the extremest pain, vomited much, and greatly alarmed; grew worse very fast, and in a little time I really thought the man must die. The only thing we had like medicine, was a phial of the essence of lemon; as he was very faint, I directed him to smell of it, and as he was greatly alarmed and begged so much for help, to pacify him and to quiet much as possible his alarm, I told him to drink it all and it would cure him. He did so. After several hours he began to mend, and when I left him I considered him out of danger."

He relates another case in which camphor was applied and proved equally successful. Also the case of a horse that was bitten and given over to inevitable death, but recovered without any specific treatment. From all of which he concludes, "the rattle-snake bite runs through nearly the same symptoms, under any treatment of specifics."

He says, "when we shall properly ascertain the true nature of snake bites, we will find they have poison of sufficient strength to throw the functions of a man in great, very great, disorder; to make him very sick, cause great pain, to make him sick almost unto death, but seldom to kill. When a snake bite is fatal, death is immediate, and for the most part before any remedy can be applied."—The bite of an imprisoned snake is considered even more dangerous, than the bite of one in a natural state.

The treatment which he recommends for a snake bite, is to wash the wound well with warm soap-suds; and then apply a very large poultice made of Indian meal, sufficient to cover the whole limb, to be renewed as often as they become cool; never bind a ligature about the limb above the wound, but if the swelling extends up the limb and great tightness is produced, the part above the poultice should be rubbed freely with laudanum and olive oil. If the patient be very much alarmed, laudanum should be given freely; forty drops followed in an hour with forty more, will not be too much. When the pulse sinks and the patient becomes covered with cold sweat, give brandy toddy or wine freely, they will at such times bear large quantities with safety. Very few have actually died from snake bites, and these, with very few exceptions, have died almost instantaneously.

THE PALMER WORM.

This is a small worm about half an inch in length, with many legs and extremely nimble. It appears at different times in different parts of the country. I have seen them only on apple and oak trees, in any great abundance; they give trees the same appearance that the canker worm does. They appeared in the county of Cumberland in the year 1791, about the middle of June, eating off the covering of the leaves on both sides and leaving the membranous part entire. The following year there was none to be seen; and I have not known them in any place two years in succession. The seeds of them may be constant, wanting only a particular state of the weather to produce them. The spring which preceded their appearance had been remarkably dry, both in April and May. The history of this insect is so little known, that I will not undertake to say how they may be successfully opposed. I made snakes under the fruit trees, without any apparent effect. As they let themselves down by threads, they may be thinned by shaking the trees and striking off the threads. Their ravages had not any lasting effect; for the orchards that had been visited by them bore plentifully the following year.—Deane's Farmer.

Vitality of Seeds.—On boring for water, lately, at a spot near Kingston-upon-Thames, some earth was brought up from a depth of three hundred and sixty feet; this earth was carefully covered over with a hand-glass, to prevent the possibility of any other seeds being deposited upon it; yet, in a short time, plants vegetated from it. If quick lime be put upon land, which from time immemorial has produced nothing but heather, the heather will be killed, and white clover spring up in its place.

To scare Birds from Cherries.—Fasten the ends of long shreds of cotton to the branches and let them blow about.

OBSERVATIONS ON THE CULTIVATION
OF SILK. — No. 2.

Concluded from page 396.

Having heretofore made some extracts, calculations and remarks, on the growth and manufacture of silk, in relation to its productiveness and relative value, I now make a few more, hoping that it might be the means of exciting the agriculturists to a further consideration and examination of the subject. The committee appointed by the Legislature of Massachusetts, to consider the expediency of encouraging the growth of the mulberry tree and the culture of silk, in their report says, "they have examined the subject attentively, and find it to be of much greater importance than was at first supposed; and they are satisfied beyond a doubt, that we have the power to produce and manufacture silk in this commonwealth, to an immense extent; and that no difficulty is to be encountered, either from soil or climate; that little capital is required to commence the culture of silk, except that capital which consists in knowledge. The culture of silk is important in relation to the amount of silk imported and consumed in this country, which exceeds \$7,000,000; while the amount of broad stuff exported is on an average less than \$6,000,000. The committee feel warranted in saying, that as soon as the article can be produced, a good home market will be found at such prices as to afford a profit on the expense and labor bestowed upon it.

The white mulberry tree is easily cultivated, does not require the best soil, and serves for a valuable purpose for hedges, and is highly ornamental." Mr Jonathan H. Cobb, in his Manual, says, "the white mulberry tree forms an excellent live fence, and when once established, is probably the most permanent of any other; everything is useful in the mulberry tree, its leaves are valuable in the silk which they produce by nourishing the silk worm; its fruit is excellent for poultry, and mixed with currants to make pies; the wood is useful for joiners, for fuel, and for ship timber; and the bark of the root for medicine as a vermifuge; that exclusive of using the leaves for feeding of silk worms, the cultivating the trees extensively by farmers, where wood is becoming scarce, is well worth their attention, for there cannot possibly be any risk or loss in the business; the leaves if not used will enrich the land, and the trees are easy to be obtained. Therefore, there is nothing to retard commencing the business extensively, but negligence and unbelief, for says Mr Peter S. Du Ponceau, "I see no more difficulty in cultivating the mulberry, than any other fruit tree; and the art of raising silk worms seems to reduce itself to a few simple rules easy of observance." And in his communication to the Speaker of the House of Representatives in Congress, says, "that the culture of the mulberry and the rearing of silk worms, have considerably increased during the past year in almost every State in the Union; that throwing mills have been erected and are in operation in many places; that cocoons in Philadelphia sell for forty cents per pound, and that the coarsest of reeled silk has been sent to Mexico and sold for four dollars and seventyfive cents per pound."

And instead of the business being overdone, during the present generation or for a century to come, is not probable. Only consider that America now imports more than \$7,000,000 worth an-

ually, and France pays annually from fifteen to twenty millions for raw silk, and prefers American to any other, and the prospect of a market is immense; and let no one fear of interfering with others in this business, for if there were one hundred where there is now one engaged in it, it would be better than it now is; on every account, filatures, throwing mills, looms, and further information in the business would be increased, and regular markets opened and established all over this country. If any one is yet doubting as to the utility and profitableness of the business, who have help suitable and sufficient, let them read the Franklin Journal, the Manual published under the authority of Congress, the first number of the Silk Culturist, by Dr Felix Pascalis, of New York; Mr William B. Vernon's abridgement of the large French work of M. de la Brosse; Essays on American silk, by Messrs D. Homergue and Du Ponceau, of Philadelphia, and a pamphlet published by Gideon B. Smith, Esq., of Baltimore; Fessenden's New American Gardener; the several volumes of the New England Farmer; and Jonathan H. Cobb's Manual; and I think they must be convinced, that the silk business will in time become a great source of wealth to America, and a profitable and honorable employment for the fair sex, the aged and the infirm, as well as the youth; for all the aforesaid writers agree in recommending it to be a healthy and profitably business; though different writers make a difference in the amount produced from an acre of mulberry trees. But none estimate it to be less than \$200 worth of sewing silk from an acre of about seventy trees, and the net profit be \$86; and the highest calculation from 3,000 trees on an acre, to be \$1,875, selling the cocoons at twentyfive cents per pound. Now take the medium of those two, the produce would be about \$1,038 from an acre, and allow three fourths for the labor, and there remains \$829.

I further remark, that the education of youth is of the utmost importance to the public. May I be permitted to address the inhabitants of every school district, that they would seriously and without delay, consider the importance of connecting the silk business with summer schools, by procuring two or three acres of suitable land near each school-house, and have them well covered with mulberry trees and fenced with a mulberry hedge, with sheds near the school-house, for feeding the worms and reeling the silk; and having a suitable mistress and twentyfour scholars and over, to be employed in gathering leaves and feeding worms at times, not interfering with regular school hours, for the term of four months; the silk worms to be hatched in succession, once in eight or ten months; and the produce of the silk will be more than enough to pay the wages and board of the mistress, at twenty dollars per month, and the board of the scholars at one dollar per week, during that time. This can be proved by actual experiment and arithmetical demonstration, if we may believe the testimony of all the silk growers and authors on the silk business.

A shed may be erected near a school-house, of the following dimensions, viz. twenty feet long and sixteen feet wide, with nine feet posts, boarded with square edged boards, the roof slunged, but no floor, two small windows, one at each end; two frames made like ladders, for four tier of shelves, fifteen feet long and four and a half wide, the lower ends of the ladder to be two and a half

feet above the ground, and two and a half feet between them. At one end of the shed, four more shelves the height of the others, thirteen feet long, one foot and eight inches wide. These twelve shelves will serve for one hundred thousand worms, and will consume about twentyfive hundred pounds of leaves, previous to their spinning cocoons, after each hatching, and produce two hundred and eight pounds of cocoons and make twenty-six pounds of reeled silk, according to Messrs Homergue's and Cobb's calculations. And by hatching the worms in succession for sixteen weeks, the second hatching in fourteen days after the first, and then in ten days, and then once in eight days, until there is ten hatchings, which at that rate will make two thousand and eighty pounds of cocoons, and two hundred and sixty pounds of reeled silk, which at the lowest price that Mr Cobb has sold his for, \$4 50 per pound, amounts to \$1170, or selling the cocoons at 40 cents, the price at Philadelphia, they would amount to \$832; or say 25 cents, the lowest price offered anywhere, they amount to \$530. Then allowing the mistress \$20 per month, and the board of the twentyfour scholars for sixteen weeks, each at \$1 per week, it amounts to \$464, which deducted from \$530, there remains \$66; which allowing three acres of land and the trees to cost \$600, the \$66 will pay the interest of the money and \$20 left to pay interest for two sheds, which will be wanted if the silk is reeled. Thus you have the children schooled and boarded without any expense to their parents or the town, and interest on the capital in the bargain. What more do you want, but faithful resolution.

B. B.

[Cobb's Manual is published by direction of his Excellency Gov. Lincoln, and numbers of them are to be distributed to every town in the Commonwealth, for the use of the inhabitants. It gives very general and particular information in raising the tree and silk worms, and reeling the silk, &c. And is a very useful book to afford correct information in every branch of the business, though there are some extracts taken from Messrs Parmentier, Homergue, and Dandolo, in pages 23, 24, 40 and 41, where some of the amounts mentioned are not correct.]

From the Gloucester Farmer.

CULTIVATION OF ASPARAGUS.

When I planted my asparagus bed, two years ago this month, (May,) I had a quantity of horn shavings and chips. They were spread over the ground, and my gardener was directed to dig them into the bed prepared for asparagus. He was an Englishman, and the best man I ever saw handle a spade. But he scolded bitterly about it; he declared it would never grow, and no doubt wished in his heart it would prove so.

For the first year no effect at all was observable; last year the plants were tolerably thrifty; and for two weeks past, this spring, I have been daily cutting large quantities of the finest asparagus, half an inch in diameter. These shavings have begun to decompose, and their fertilizing power is enormous. They contain a quantity of ammonia.

Last spring, a year ago, I spaded up a piece of ground with a good supply of horn shavings on it. It had been manured with nothing else. I sowed

a few seeds of the Sea Kale. They came up, but the cut worm made sad work with them, and a part only lived. In autumn I cut some crowns and pieces of root from the living ones to fill the missing places, and they are now pushing out with great vigor. I have cut some fine blanched shoots this spring from the large ones. It is equal to asparagus, and affords a pleasant variety for the table. Another spring they will be in perfection.

Last spring I purchased a dozen roots of the Pie Plant, for two dollars. I divided every root into as many pieces as I had crowns, and planted them. I had forty-four fine plants from them, and furnished my family with all they wanted for tarts and pies, and had plenty to give away besides.—These were planted on the same piece of ground with the sea kale, two feet apart, and grew in great luxuriance. Both pie plant and kale were covered in the fall with fresh horse manure. It has not been removed, and their large thrifty crowns are pushing through, rank and green as ever I saw it. All the ground for these plants was tilled only in the usual way of making garden beds.

From the Barnstable Journal.

CULTIVATION OF CRANBERRY.

The cranberry is a native of New Holland, Europe and America; it grows spontaneously in the flat, sandy, and in some of the mossy bogs in this country. At sandy neck, on the north side of Barnstable harbor, are quite extensive tracts covered with the wiry vines of the cranberry, and are estimated to produce in favorable seasons one thousand bushels of fruit. The cranberry grows most luxuriantly in soils composed almost wholly of beach sand, where water, at all seasons of the year, can be obtained a few inches below the surface. It can be profitably cultivated. A particular account of the method pursued by Mr Henry Hall, of Dennis, was some time since given in this paper. He has been engaged in the cultivation of this fruit upwards of twenty years, and his grounds have averaged about seventy bushels per acre, annually. Mr Hall practised taking the plants from their natural situations in autumn, with balls of earth about their roots, and setting them three or four feet distant from each other. In the course of a few years, they spread out and cover the whole surface of the ground, requiring no other care thereafter, except keeping the ground so well drained as to prevent water from standing over the vines. The cranberry may also be propagated from the seed. It should be planted in autumn, as soon as the fruit is ripe, and a year afterwards the young plants may be transplanted to the situations where it is intended for them to grow.—There are many situations in this country, and we doubt not in every part of England, well adapted to the profitable cultivation of the cranberry. Grounds that are overgrown with fine rushes or moss, may be rendered suitable by spreading over a thick dressing of beach sand, previous to transplanting the vines.

From the Genesee Farmer.

BUGS IN PEAS.

MR EDITOR—I would mention, that I have been in the habit of raising several acres of peas yearly, for some years past. I selected my seed in the fall, and put it up in barrels. The spring following, after my ground was fitted, on examining my seed peas I found that quite a portion had

heated, moulded and spoiled, and the balance appeared to be much inhabited with bugs, it being all I had of the last season's crop. But on reflection, I went to the rack-barn and found ten bushels of old peas, that had laid over one year in consequence of their being buggy. I had bought new seed and let them lay. I examined the peas, and found them, to a pea, light shells and the bugs gone or decayed. I had little faith in their sprouting, but sowed the ten bushels on about three acres, beside the others. They came up well, and produced a fine crop perfectly clear of bugs, while the others along side were very buggy. I sowed the same kind last season, and raised probably three hundred bushels; this spring they appear to be a little buggy. I am calculating to keep over a few bushels to change them again next season. This proves a certain cure with me.

Respectfully, yours, JOHN SPICER.
East Barrington, Yates Co., May, 1832.

SPLITTING OF TREES.

Many valuable fruit and shade trees are every year lost by the splitting of their trunks, at the branching of the limbs. Many kinds of trees are prone thus to split, and they are seldom preserved when this happens. Hooping, absurd as it is, has often been tried, and as often failed. I have now growing a thrifty locust that was split in this way by the wind, two years since. I secured it in this manner: with a bit, suited in size to the tree, I bored a hole through the centre of the trunk, a little below the top of the split. Through this hole I put an iron bolt which filled it, having a head upon one end and a screw cut upon the other. The head rested upon the bark, and a nut being screwed on at the other end, the gaping wound in the tree was closed. To draw it more closely, I pressed the limbs towards each other above, while one turned the nut until all was tight. The protruding end of the bolt I then filed off, and the growth of the tree in ninety days covered every part of the bolt and nut from sight. The tree is now as sound as any I have, and certainly is not in danger of falling again in the same place. Should this hint be deemed worth recording, it may be the means of saving many trees that would otherwise be lost, from splitting as I have mentioned.

II.

INSECTS OF APPLE TREES.

This is the very time when the small insects, called lice, upon apple trees are hatching. As they come forth from under the small shell where the eggs have remained during winter, they appear a small downy speck, travel a small distance upon the tree and locate themselves, and produce a covering similar to the one from which they emerged. While they are unprotected with the shell, the application of strong soap suds to the branches where they are, proves at once their destruction; besides, it gives the tree a healthy appearance and destroys most of the small fungus growing upon the bark. We hope those who have fruit orchards will not forget to make the application.

THE CURCULIO.

It has been a question, whether the curculio which destroys our plums and nectarines, has sagacity enough to abstain from depositing its eggs in fruit which hangs over a pavement, or other places where its larvæ must perish. And the fol-

lowing extract of a letter, from a late Senator of the United States, will show that the affirmative may be safely taken in this case:—

"I remember to have conversed with the late Col. Forrest, who was a sagacious and experienced gardener. He suggested, that what Dr Tilton had communicated to the public in regard to the curculio, had been mostly obtained from him. He had closely studied its manner, and was led to plant his nectarine trees slanting over his fish pond. The insect avoided depositing its eggs in so dangerous a situation, where its young could have no chance of escape.—*American Farmer.*

The leaves of the vine are greedily devoured by all cattle, especially the cow, sheep, and hog, which are excessively fond of them. They are a great resource during a dearth of fodder. But it should not be forgotten, that the wood will not ripen without the leaves; and that they are a great protection against the frost, as well as essential towards a mature and plentiful crop. They should not be plucked; but, as they fall, should be gathered, heaped in a dry place, or salted and packed hard in barrels. They may be packed alternately with straw or hay, which soaks the taste of the leaves and becomes a new delicacy to the cattle.—*Fine Dresser's Manual.*

Keep cool and temperate.—This caution was never more needed than now. The happy medium between indifference and apprehension, should govern the public action in the present circumstances, which may happily pass off without a severe visitation, but which should it come, ought to be met with calmness, energy, and above all a firm reliance on the goodness of an Almighty Providence. The measures proposed by the City Council, are not to be received as indications of alarm, but as a determination to do all in the power of the authorities to avert an evil that may come upon the city.—*Boston Press.*

Locusts.—For a week past, large swarms of locusts could be seen and heard upon the trees in a grove near this village; since which, the old story is current, that exactly seventeen years ago these insects in considerable quantities were in the same place. One thing is certain: the earth is perforated with holes, from which they have emerged. The letter W is also to be seen upon their wings, which those who deal in the marvellous interpret as denoting War; but in our opinion it denotes large crops of Wheat, such being altogether the most probable from present indications.—*Fredonia Censor.*

Stocking Factory.—The stocking factory in this town has gone into operation. We examined the first pair of cotton stockings made at the factory, which we found to be handsomely executed, equal in our opinion to imported. We hope the proprietor will meet with sufficient encouragement, so as to enable him to continue the establishment and to make it a profitable concern.—*Portsmouth (N. H.) Journal.*

Cow Cabbage.—At a meeting of the Sterlingshire Horticultural Society, a tree, or cow cabbage, five feet high and eighteen inches in circumference, was exhibited. "This giant succulent being stationed on the terrace of the adjoining bowling-green, and surrounded by enormous competing savoy, formed a most imposing group."

NEW ENGLAND FARMER.

Boston, Wednesday Evening, July 4, 1832.

THINNING CROPS, PLANTS, LEAVES, FRUITS, &c.

Thinning Seedling Crops.—Marshall observes, that the thinning of seedling crops should be done in time, before the young plants have drawn one another up too much. All plants grow stronger and ripen their juices better when the air circulates freely round them, and the sun is not prevented from an immediate influence; an attention which should be paid from the first appearance of plants breaking ground. In thinning close crops, such as onions, carrots, turnips, &c, be sure that they are not left too near, for instead of reaping a greater produce there will be a loss. When they stand too close they will make tall and large tops, but are prevented swelling in their roots; it is better to err on the wide side, for though there will be fewer plants, they will be finer and better flavored.

Thinning the Leaves of Fruit Trees.—The leaves have too essential an office as organs of growth to the entire plant, to be lightly parted with; and where the climate is not deficient in heat, compared with the nature of the plants, or the portion of the year in which its season for vegetation falls, their shade is more likely to be serviceable than detrimental, even in the last stage of fruiting. Thus cherries, raspberries, strawberries, currants, and other species, whose full term of fructification is more than comprehended in our summer, reach perfect maturity and acquire the color proper to each, though ever so much covered with leaves; whereas, for those kinds which ripen with difficulty here, because the direct rays and most intense reflection of the sun, is scarcely equal to the heat in the shade during the summer of their native climate, it is proper, when the fruit has nearly attained its full size, and is naturally losing its absolute greenness, to remove some of the leaves which shade it too much. Were the leaves thinned sooner it would prejudice the growth of the fruit; and should they even now be swept off unsparingly, the growth of the year's shoots might be arrested. The leaves which cover the fruit, whether peaches, grapes, late pears, or other late ripening fruits, must be removed gradually, that is, at two or three times in the course of five or six days; otherwise the unusual full heat of the sun darting upon the fruit, would occasion the rud to crack.

Nicol, a Scotch writer on gardening, says, "My practice has been, as the fruits begin to color, to pick off every leaf that may overhang them; thus very much enhancing their beauty and flavor. In late seasons, if the leaves of wall-trees hang longer than usual, they may be brushed off; in order to let in the sun and air the better to ripen the wood. This brushing, however, should be cautiously performed, never brushing much at a time. The leaves should not be forced off violently. The shoots from which the leaves are to be displaced, should be gently stroked upwards and outwards, but never the reverse way, else there is danger of hurting the buds. Trees exposed to the wind seldom require this care; but sometimes espaliers may, and if so, the same course is to be pursued as above.

Thinning Stone Fruit.—Thinning the over-

abundant set fruit on apricot, nectarine, peach, and plum trees, is a necessary duty, as many of these in good seasons set more than they can nourish or bring near to perfection. This thinning, however, must be cautiously performed and by degrees. If the trees have set their fruit very thick in particular parts only, such parts should be moderately thinned out now, *(the fore part of the season,)* and the other parts not yet. But if the fruit be very thickly set all over the tree, let it be generally thinned off to half its extent, early in the season; deferring the final thinning till the stoning be over, that is, till the shells be quite hard and the kernel is formed. For most trees, especially those anywise unhealthy, drop many of their fruit in the time of stoning; so that the thinning had better be performed at two or three different times; always observing to reserve the fullest, brownest, and best formed fruit."

THE AMERICAN FARRIER.

We have recently been favored with a copy of an useful work, entitled "The American Farrier; containing a minute account of the formation of the horse, from the extremity of the head to the hoof; with a description of all the diseases to which each part is liable, the best remedies to be applied in effecting a cure, and the most approved mode of treatment for preventing disorders; accompanied with a copious alphabetical list of medicines, describing their qualities and effects when applied in different cases; and a complete treatise on rearing and managing the horse, from the foal to the full grown active laborer. Compiled chiefly from the celebrated 'Library of Useful Knowledge,' just published by a committee of one hundred and fifty eminent agriculturists, who have used every means in their power in investigating this useful branch of agriculture. The American Farrier contains the result of their experiments and researches, with the treatise which they offer to the public. Illustrated with engravings, &c. By H. L. BARKUM."

The above, quoted from the title page, appears to give a correct sketch of the contents of the work, and an anticipation of its value which is fully realized in its pages.

The language of the book is simple, and no "hard words" are used, which are not defined in a vocabulary which precedes the treatise.

The following extract is a sample of the work. Under the head "Principles of Breeding," it is remarked, that "the first axiom we would lay down is, that like will produce like, that the progeny will inherit the qualities or mingled qualities of the parents. We would refer to the subject of diseases, and again state our perfect conviction, that there is scarcely one by which either of the parents is effected, that the foal will not inherit or at least the predisposition to it; even the consequence of ill usage or hard work will descend to the progeny. We have had proof upon proof, that blindness, roaring, thick-wind, broken-wind, spavins, curbs, ring-bones, and founder, have been bequeathed, both by the sire and the dam, to the offspring. It should likewise be recollected, that though these blemishes may not appear in the immediate progeny, they frequently will in the next generation. Hence the necessity of some knowledge of the parentage, both of the sire and the dam.

"Peculiarity of form and constitution will also

be inherited. This is a most important but neglected consideration; for however desirable or even perfect may have been the conformation of the sire, every good point may be lost by the defective form or want of blood in the mare. There are niceties in this, of which some breeders used to be aware, and they employed their knowledge to great advantage, when they were careful that the essential points should be good in both parents, and that some minor defect in either should be met and got rid of by excellence in that particular point in the other, the result was creditable to their judgment and highly profitable. The unskilful or careless breeder will often so badly pair the animals, that the good points of each will be in a manner lost; the defects of both will be increased, and the produce will be far inferior to both sire and dam." Page 223.

The above remarks are sound and practical, and will apply to the breeding of other domestic animals as well as the horse.

ROUSSEAU ON BOTANY.

A friend has sent us extracts from letters written by the celebrated J. J. Rousseau to the Duchess of Portland, on the subject of botany. We are very much obliged to the person who conferred the favor upon us, but the extracts are, we fear, too verbosely and loosely written to prove interesting to our readers, who are mostly persons who have no time to bestow on essays which are rather curious than useful. We cannot say but Rousseau may have written something on the subject of botany, which might be worthy of attention at this stage of that science, (for it has made great advances since Rousseau's time,) but the twelve pages of letter paper with which we have been favored, contain but little besides "confessions" of ignorance and incapacity in the writer, and professions of admiration for the Duchess, who is honored with his lucubrations. We, however, highly appreciate the kind intentions of our correspondent, who has favored us with the manuscript alluded to; which we have preserved and shall retain, subject to his order.

MASSACHUSETTS HORTICULTURAL SOCIETY.

SATURDAY, June 30, 1832.

Mr John A. Kendrick, of Newton, and Mr William E. Payne, of Boston, were admitted members.

The exhibition of Flowers this day was very fine, and the variety such as has very rarely if ever been witnessed in our vicinity. They were from the gardens of Messrs Winships of Brighton, Mr Haggerston of Charlestown, Mr Aspinwall of Brookline, Mr J. A. Kendrick of Newton, Mr Zebecde Cook, Jr. of Dorchester, Mr William Kendrick of Newton, Mr Nathl Davenport of Milton, Mr A. Walker of Roxbury, and Mr H. A. Breed of Lynn. A writer in the Boston Transcript, who appears to be well versed in horticulture, stated that "there were at least one hundred and fifty varieties of the rose in the various bouquets.

"Messrs Winships' collection of roses," according to the same paper, "was by far the largest and yielded to none in beauty. Besides about fifty varieties of the rose, among which were the white, red, and black moss rose, we noticed many choice herbaceous plants; among them were *Anchusa ochroleuca*, *Galium profusum*, *Silene parviflora*,

Spirea tripolata, do. *trifoliata*, do. *aruncus*, *Clematis alpina*, do. *verticillata*, do. *integrifolia*, *Philox. listoniana*, *Geranium striatum*, *Verbasum purpurea*, *Lichnis albus*, *Robus purpurea*, *Campanula latifolia*, *Achillea montana*, *Fumaria speciosa*, *Valeriana rubra*, *Viola grandiflora*, *Digitalis lutea*, do. *grandiflora*, do. *pentstemon*, *Lysimachia nummularia*. There were also three species of the *Pæonia*, viz. *whitejii*, *humie*, and *odoratissima*.

"Mr Haggerston's flowers were also attractive; they consisted chiefly of pinks and roses of the finest kind.

"Bouquets were also exhibited from the gardens of Kenrick of Newton, Davenport of Milton, Breed of Charlestown, Cook of Dorchester; in this collection was a beautiful specimen of the *Magnolia glauca*, raised in Mr C's garden."

Five large flat Turnips were also presented for premium, by Mr Nathaniel Davenport, of Milton.

Fruits Exhibited.—The fruits exhibited this day, consisted of strawberries, which were all of the finest quality.

By Elijah Vose, Esq., of Dorchester, Downton strawberries very large, fine apple do.

By Mr Haggerston, of the Charlestown vineyard, Keene's seedling, of celebrated reputation, Wilmo's superb, and Mulberry strawberries; this last is a valuable and productive variety, and we are informed by Messrs Haggerston and Senior, that it is supposed to have originated in the western parts of N. York, and was sent by the late Hon. Rufus King to the late Hon. Mr Gore, and to England. Mr Haggerston exhibited strawberries the previous Saturday, which were the first fruits of the season.

From Mr Davenport, of Milton, a fine specimen of Downton.

HORTICULTURAL JOURNAL,

Kept at the garden of the proprietor of the New England Farmer, in Lancaster, Mass., thirty-five miles west from Boston, on the river Nashaway.

June 23. Thermometer 78 at noon. English Iris in bloom; also, *Pæonia whitejii*, *Gilia capitata*, *Glaucium fulvum*, and *Silene armeria*, the latter a very showy annual.

24th. Thermometer 85 at noon. *Oenothera speciosa* and *O. fruticosa* in bloom; also, *Penstemon levigatus*.

25th. Thermometer 84; cloudy and foggy day. *Pyrethrum pardinum* and *Campanula medium* in bloom.

27th. Thermometer 68; cloudy and rainy. *Gladiolus communis* in bloom; also, *Orchis fimbriata* (a beautiful indigenous perennial), and *Lythrum salicifolia* (a handsome perennial).

28th. Thermometer 76; cloudy and windy. Transplanted Sweet Potatoes, &c.

29th. Thermometer 49 in the morning, 73 at noon. *Spigelia marylandica* in bloom; also, *Coropis grandiflora*, *Clematis alpina*, *Coronella coronata*, and *C. agrostemma*, all handsome perennials.

30th. Thermometer 80 at noon.

Broom Corn.—It is stated in the Hampshire Gazette, that broom corn seed has been used for fattening cattle by some feeders for several years; and immense quantities have been consumed in this way the past winter. Cattle fed upon it mixed with corn, are said to be of the first quality.

Bene Plant.

SEEDS of the Bene Plant, in packages of 12½ cents each, for sale at the New England Seed Store, 50½ North Market Street.

This is an esteemed medicinal plant for the summer complaints of children; the green leaves thrown into a tumbler of water, converts it into a thin tasteless mucilage. July 1.

Turnip Seed.

FOR sale at the Seed Store connected with the New England Farmer, No. 50½ North Market Street, Boston: White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this establishment.

Also—Ruta Bags of the first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cocombers, for pickling, warranted genuine and fresh.

Also—A few packages of Dale's Hybrid Turnip Seed, a new variety, highly esteemed in Scotland. Price 12½ cents per paper. July 4.

Sportsman and Conqueror.

THESE Horses will stand the ensuing season, at the Ten Hills Stock Farm, in Charlestown, two and a half miles from Boston, on the Medford turnpike; for particulars, see late Nos. of the New England Farmer, and Bills. They are confidently recommended to the public by the subscriber.

SAMUEL JACKES.

Ten Hills Stock Farm, May, 1832.

Sportsman's get may be seen on the farm.

Horse Pioneer.

PIONEER will stand for Mares the ensuing season at the following places: at the cattle fair hotel, in Brighton, every Saturday, P. M., and Monday (except the 25th June) through the season; at Warren's in Framingham, Tuesday, P. M.; at Eastbrook's in Worcester, on Thursdays—returning, at Grafton on Friday, A. M., and arrive at Framingham the same evening, and at Framingham the 25th and 26th of June.

Pioneer is a dark bay, full fifteen and a half hands high, ten years old this spring, is a horse of remarkable fine figure, temper and action, and a sure foot getter; was sired by the imported horse Debash, out of a fine mare by Cub, owned by Gen. Van Rensselaer of Albany. Persons wishing to improve their breed of horses, are requested to call and examine for themselves. He is pronounced by good judges not to be inferior to any horse in the State. That the public generally may avail themselves of the services of said horse, he will stand at the moderate terms of \$5 the leap, \$10 the season, or \$15 to insure.

JOHN PELTON.

Brighton, June 13, 1832.

Horse Quicksilver.

QUICKSILVER will stand this season at the stable of the subscriber, in Brighton, a few rods south of the meeting-house, and will cover only twenty mares the present season, at \$15 each, and \$1 in addition, to the groom. Mares warranted to be in foal, if \$20 is paid, and \$1 to the groom; and in discharge of warranty, the \$20 will be returned.

Quicksilver is a beautiful light bay, three years old; his sire, Sir Isaac Coffin's horse, Barefoot, conspicuous in the racing calendar of England; his dam, Rebecca, from the imported Cleveland bay horse Sir Isaac, and Sky Lark, a native mare, well known for her fine form, speed, and bottom, once owned by Mr Leavitt of Salem, to whom persons are referred for her character, and will be to many others in Massachusetts and Maine. Quicksilver is thought by good judges to combine with great symmetry all the delicacy of form, bone, muscle, and all the requisites for a first rate covering horse. Mares sent to him, and if left with the subscriber, he will be well attended to on reasonable terms, but he will not be responsible for accidents.

BENJAMIN W. HOBART.

Brighton, June 13, 1832.

Pickering's Tree or Caterpillar Brushes.

For sale at the Agricultural Warehouse, No 51 and 52 North Market Street. Pickering's Improved Tree Brushes. This article, (which is likely to be in greater demand this season, than for many previous years,) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use. May 16.

WOOL MARKET.—The wool market is at present very unsettled and prices merely nominal, and correct quotations cannot be given; until Congress shall have settled the Tariff question, we shall have no regular markets.

VEGETABLE MARKET.—New Potatoes, 1 dollar a peck; Green Peas, 1 dollar per bushel; Strawberries, 31 cents per box; Cherries, 17 cents per quart; Turnips, 12½ cents per dozen; Onions, 6 cents per bunch.

Bee Hives.

JUST received and for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, a few of Dr Thaxter's improved Bee Hives, which surpasses all other hives now in use, as the honey can be taken from the hive without destroying the bees. June 13. J. R. NEWELL.

Cloth Strainers.

FOR sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, Milk and Cheese Strainers; likewise, Gault's patent Churn, the most approved churn in use; Leve's improved Cheese Press; Curd Mills for preparing curd, a very useful little implement for the purpose intended. June 6.

Miscellany.

FOR THE NEW ENGLAND FARMER.

MIDSUMMER.

Midsummer's all pervading heat,
Does sturdy farmers suit and service;
But makes lank dandies wilt like weeds,
And white fac'd belles "amazing nervous."

We hale and hardy cultivators,
Of well wrought iron fibres boasting,
Already being rather brown,
Dont mind a little extra toasting.

To us midsummer's hottest rays
Present no sort of molestation,
Though such a blaze might dissipate
The devotee of dissipation.

Inur'd to open air and toil,
We spurn effeminate indulgence,
Now revel in the polar blast,
Now bask in tropical effulgence.

But pleasure's pamper'd parasite,
Like Sybarite of yore is troubled;
If lounging on his bed of flowers,
He finds a single rose leaf doubled.

GOOD INK.

Every person who has had occasion to examine the early records of New England, in the public offices, must have been often struck not only with their elegant penmanship, but with their beautiful ink, as clear and as black as if written yesterday. A large proportion of the records of only thirty or forty years date, is in such bad hand writing and such faint miserable ink, as to be scarcely legible, and two hundred years hence much of these later records will be entirely useless. I have often thought it would be a great acquisition, if we could ascertain exactly the mode in which our ancestors wrote their best ink. There is nothing like the experience of two hundred years in such a case.

In Evelyn's *Sylva* is a receipt for making ink, as follows: "Take 4 ozs. galls; 2 ozs. copperas; 1 oz. gum arabic. Beat the galls gross, and put them in a quart of claret or French wine to soak eight or nine days, setting it in a hot sun in summer and by the fire in winter, stirring it often. Then add the copperas and gum, and in a day or two it will be fit for use."

Some years ago I made a little ink according to this direction, and found it superior to any I had purchased. It run freely, and some of the writing now before me is of a beautiful black.—*Gen. Far.*

THE BIAATTEE ROBBER.

When the young Biatee is about three or four years of age, his education or training is commenced by his being compelled to walk and run a given distance daily, and as he advances in years the exercise is increased. He must acquire the art of bleating like a sheep, barking like a dog, crowing like a cock, braying like an ass, and in like manner of imitating all kinds of animals. He must be able to throw himself on any occasion which may require, into every kind of attitude; to crawl along or lie as flat as possible on the ground; to run like a dog; to stand on his head with his legs extended widely, so as to appear in the dusk like the stump of a tree, &c.

A sentinel of the 4th Bengal cavalry, on duty,

heard something move about the head ropes of his horses. On looking round, he saw what he supposed to be a large dog, which ran between his legs and nearly upset him. The sentinel, however, had heard of the ability with which many of the natives could imitate different animals, and was not satisfied with this explanation of the noise that had first excited his attention. He still suspected that some reguery was on foot, and the better to detect it, he placed himself behind what appeared to be the stump of a tree, at a short distance from the spot on which he had been previously standing. On this supposed stump he hung his helmet; and bent on the most attentive scrutiny, he placed his head between the two limbs of the stump, so as (unperceived) to command a direct view of the quarter from whence the noise originally proceeded. This, however, was too much for the thief, (for such in reality was the supposed tree stump,) who, unable to restrain his laughter, and finding his situation somewhat critical, suddenly executed a somerset upon the astonished soldier, and made clear-off with his helmet.

Preservation of Iron from Rust.—A mastic or covering for this purpose, proposed by the Societe d'Encouragement, at Paris, is as follows: Eighty parts of pounded brick, passed through a silk sieve, are mixed with twenty parts of litharge; the whole is then rubbed up by the muller with linseed oil, so as to form a thick paint, which may be diluted with spirits of turpentine; well cleaning the iron before it is applied. From an experience of two years, upon locks exposed to the air and covered daily with salt water, after being coated twice with this mastic, the good effects of the preparation have been thoroughly proved.

Female Society.—Without female society, it has justly been said, that the beginning of men's lives would be helpless, the middle without pleasure, and the end without comfort. The celebrated Dr. Ablember makes a reflection that does honor to the female sex and to his own feelings: "We are in a peculiar manner," says he, "in want of the society of a gentle and amiable woman, when our passions have subsided, to participate in our cares, calm and alleviate our sufferings, and enable us to support our infirmity. Happy is the man possessed of such a friend! and more still if he can preserve her and escape the misfortune of her survival."—*Ladies' Pocket Magazine.*

Love your Wife.—The man who tenderly loves his wife, will have the greater pleasure in lessening her care and lightening her enjoyment. The professions that he held out to engage her affections, were all that language could express; his conduct that of the warmest attachment. Can a woman, when she feels an increased cause for that attachment, bear the sad reverse? A Scotch ballad very prettily expresses the pleasure an affectionate wife feels at the approach of her husband:

"His very foot has music in't,
When he comes up the stairs."

A Receipt to Fill a Newspaper.—His printer came running to the publisher of a newspaper, and said, "Sir, we have a space in the paper which we don't know how to fill." "Nothing is easier," said the publisher; "insert that, 'last week an elderly gentleman, walking through St James' park, was knocked down by two ruffians, and robbed of his

money and his gold-headed cane.'" The printer soon after came back again, and told his master there were several words too many. "Why then," said the publisher, "you may leave out the gold-headed cane."

Presence of Mind.—Presence of mind is that rare and desirable disposition which displays itself in a temper intrepid and serene. It qualifies persons to take advantage of every occurrence of the moment, to profit instantly by the mistakes and faults of others, and to be fertile in all resources that peculiar situations may oblige them to fly to. A man may be a man of genius or of business, but he cannot be a hero without presence of mind.

Young Cleveland.

THIS truly beautiful and valuable Horse is of the Cleveland bay breed of horses, of fine even temper, five years old the 20th of May, fifteen and a half hands high, and of a beautiful dark bay color, with black mane, tail and legs. He walks and trots remarkably easy and fast; and is equalled by very few for muscular strength, elegant movement, and perfect symmetry of form.

He has proved himself a sure and first rate foal getter. The colts sired by him possess a great share of bone and muscle.

The pedigree of Young Cleveland:—He was sired by the celebrated bay horse, Sir Isaac, the son of the noted horse, Molinieux. Sir Isaac was presented to the Agricultural Society of this State, by Sir Isaac Coffin, and was selected under his order as superior of his breed, and the breed recommended by him as the most highly esteemed for gentlemen's carriages, and all draft, farming, and saddle purposes, of any horses in New England.—His dam was a first rate and high spirited native mare. He will stand the ensuing season, at the stable of the subscriber, in Franklin.

TERMS:—Three dollars the single leap; five for the season; and eight to insure the mare with foal; the money to be paid when the mares are taken away, on notes given payable the 1st October next. Those persons who put mares for the Young Cleveland and have them warranted, and part with them before foaling time, or neglect to bring their mares regularly to the horse through the season, will be considered holden for insurance money.

ELI M. RICHARDSON.

Treatise on Domestic Animals.

THIS day published, by Lilly & Wait, and Carter & Hemen, and for sale by J. B. RUSSELL, No. 504 North Market Street, "A treatise on breeding, rearing, and fattening all kinds of poultry, cows, swine, and other domestic animals. By B. Monbray, Esq. Reprinted from the sixth London edition. With such abridgments and additions as it was conceived would render it best adapted to the soil, climate, and common course of culture in the United States. By Thomas G. Fessenden, Esq., editor of the New England Farmer." Price 75 cents. June 13.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year, but which may be paid within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If No paper will be sent to a distance without payment being made in advance.

Agriculture.

From the Massachusetts Agricultural Repository and Journal.

REPORT OF THE COMMITTEE

On Experiments, Discoveries, and Inventions,
Trees, Live Hedges, &c.

Concluded from page 301.

The next application which has been made for a premium, is for an efficient and satisfactory mode of extirpating the worm which attacks the locust tree. The only applicant for this premium is William Bacon, Esq. of Richmond, Berkshire county. The experiments of Mr Bacon are exceedingly interesting, and we hope that others, influenced by his example, will pursue the same course. There can be no doubt that the cautious stoppage of all the apertures, by which the locust borer either enters or makes his exit, would materially lessen its depredations; but our objections to granting a premium to this discovery are, first, that he had disclosed his discovery (if it be one) to the public in the New England Farmer, volume ix. No. 3; and it was not the purpose of the Society to grant premiums to persons, who, from enlightened and liberal views, had already discussed their discoveries.

Secondly, they can perceive little distinction between Mr Bacon's experiments and those of General Dearborn, long since given to the public on the same subject.

Lastly, extensive experiments by some members of the committee have satisfied them, that local application to the root, or the stems, or lower branches, can be, in any important degree, a protection against the borer of the locust tree, which chooses in preference the young branches of the present year's growth.

The committee feel the great importance of procuring a remedy for this deplorable evil, which deprives the State of the most valuable of its forest trees, so important in naval architecture. — Scarce any sum would be too great an expenditure, which would banish this destructive insect; as our climate is as favorable to the culture of the locust tree, as that of the Middle and Southern States. But a knowledge of the ravages of the insect, brings them to the conclusion, that the remedy proposed by Mr Bacon is not so *effective* or *satisfactory*, as to justify them in awarding to him the Society's premium, though he merits their thanks for his experiments, and the laudable spirit which gave rise to them.

The only regular, and certainly the most meritorious application for premium, was on the best managed apple orchard, by Capt. John Mackay's, whose mode of treatment is set forth in the subjoined communication.

His orchard, in Weston, was visited and carefully inspected. It is on a side hill, with a gradual descent inclining to the north.

The soil is a heavy dark loam, originally very rocky. The trees, about one hundred and forty in number, cover about three acres of ground; their distance from each other is two rods. The trees, it appears, were set out partly in the spring of 1823 and partly in the spring of 1824. The ground, having been previously ploughed, was kept

up till 1827. Since then, they have been hoed round twice a year. Their appearance was certainly very thrifty, with a smooth bark, and every indication of careful attention. Their measurement was generally from twelve to fourteen inches.

In noticing Mr Mackay's method, it cannot be doubted, that a slight movement of the surface, oftener than he practised, would be expedient, even four or five times a year, as having a tendency to discourage weeds and the encroachment of the grass sward, as well as to facilitate the passage of the dews and showers to the roots; whilst the aggregate labor would be little increased thereby.

That this should not have forced itself into observation, can only be accounted for, by the fact, that in the use of ashes, the invariable production of weeds, consequent on the application of barn manure, was avoided. It may be doubted also, whether the stimulating principle in the wood ashes, to the extent of one peck to a tree, every other year, was the best course of procedure. — The process of vegetation is gradual, but constant and never ceasing. The means of fertile growth, therefore, should be in reference to this order of nature. An annual dressing seems most fitly to conduce to the mixture and enrichment of soil, the process of fermentation, and the best supply for vegetable growth. It would therefore follow, that a supply of a less quantity, annually afforded, would be better and safer, as the danger of sudden excess, often injurious, would be avoided. To what extent ashes or other stimulating principles may be applied, can only be determined by careful experiments. It is, however, long recommended and used to advantage of late, by many cultivators, is well known. Many too suppose, that the volatility and pungency of their salts are offensive and discouraging to the approach of the borer, and all insects, vermin, &c.

The general result, from personal examination made by the committee on premiums for the best managed apple orchards in this vicinity, for several years past, have most satisfactorily evinced, how invariably, in eight or ten years, an orchard may, with proper attention, be brought forward from the seed into good bearing. The practices in which these skilful cultivators appear to concur, may be briefly stated. First, to be careful not to set the tree beneath the upper stratum of earth or black soil. To go deeper is to insure the canker and a diseased condition. In a light soil, a burrow or two of stones beneath the upper stratum, prevents the passage of the roots into a poorer soil, whilst it supplies moisture when most needed; and artificially, in a part at least, affords that advantage for which a rocky soil is invariably distinguished. Secondly, to have the land previously ploughed and kept up for two or three years, taking care not to disturb the roots. After this, the land may be laid down to grass, and the surface near the trees occasionally slightly stirred, to prevent weeds and give a more ready passage of air and water about the root. Thirdly, about eight shovels of compost manure or five or six quarts of ashes, may be put to advantage at the root, and spread about in the spring.

To keep an orchard in a good bearing state, when it is deemed inexpedient to plough, from a

fear of injury to the roots, the land should be kept in good condition from frequent top dressing.

As to the applications to the body of the tree for a defence against vermin, &c, the subject is in a course of experiment.

The rubbing with a coarse cloth with soap and sand, and a wash with waste soap suds, appears both beneficial and economical.

A wash, also, has been in use by many, and it is highly recommended by the Messrs. Winship, "as preventing the destructive effects of the borer, killing the moss, and destroying other insects which injure the health of the tree, and giving vigor thereto. We recommend," say they, "one pound of potash to three quarts of water, to be laid on with a brush."

A coat of lime and cow-manure was used by Mr Mackay, mixed with clay, one third each, brought to the consistency of a suitable wash to be applied with a brush. This is in frequent practice and has been thought well of, as discouraging to insects. It may be a proper consideration, whether in the use of materials on the bodies of trees, in washes, there has not been some excess? Can the color of the bark be so unnaturally changed to a yellow hue, without injury? Or is the effect so superficial as not to deserve regard?

Although the committee do not feel authorized upon the principles which guide the Society, to recommend that a premium be awarded for this brief communication, they yet, for the presentation of this important subject to notice, with the degree of care and skill evidenced by a driving conclusion, we do recommend that a driving conclusion be paid to Captain John Mackay, twenty dollars.

In the visits made to several successful and highly skilful cultivators of the apple orchard,† it was lamentable to observe, that in most situations the borer had made his deadly visits. As a preventive, lime at the root has been recommended.

But the insect goes higher up. Some of our trustees have eased about the stem some way up, with lime mortar; but here the same objection applies, and nothing short of a complete envelopment of the trunk would seem to be wholly effectual.

In closing their report, the committee are aware of the motives which induced the society to lessen the frequency of Cattle Shows, with a view of applying the funds to certain objects in agriculture, which recent discoveries in science and arts have made interesting.

It is with regret, therefore, that they are obliged to state, that notwithstanding the offer of the whole income of the funds of the Society, as well as what arises from the liberality of the State, they are not able to present to the public more multiplied experiments, on the various subjects submitted to them.

The ploughing in of green crops is important,

* See Mr Wheeler's communication in the New England Farmer, vol. iv. page 348; also, Messrs Winship's, vol. viii. page 234.

† The orchards of C. Davis, Esq. Roxbury; A. Baldwin, Esq. Milton; Col. Phinney, Lexington; Mr Harding, Waltham, and Mr Crosby, of —, all of which indicated most skilful management.

and occupies much attention abroad. The subject of live hedges must in many parts of the country become prospectively important. So also the ingenuity of our manufacturers might present many improved implements of agriculture. To all of which subjects attention was invited, and liberal premiums offered.

The novelty of the mode may perhaps in some degree account for this, and the committee can only hope that our intelligent husbandmen may more readily show forth their good practices, for which it is well known many of them are so distinguished.

By order of the committee,
JOHN WELLES, Chairman.

Boston, Jan. 14, 1852.

ITEMS IN RURAL ECONOMY.

ORIGINAL AND SELECTED. BY THE EDITOR.

Salt in Agriculture.—A writer for the *Gardener's Magazine*, with the signature "Agronomic," in treating of salt as a manure, &c, says in substance, that its use may be comprehended under two general heads, viz. *destroying weeds and worms*. I find I can keep a large coach yard perfectly free from moss and weeds, for less than a shilling a year. This to gardeners must be very acceptable. When families go from home, the weeding of pavements is often a tedious job. I can also keep my gravel walks clear of moss and weeds at a tenth of the expense of breaking-up, raking, rolling, &c. Care should be taken in salting the walks, not to let any drop on the box-edges, as it kills that also and makes it very unsightly; it has also been found to discolor some of the skirts of ladies' dresses. I found it very effectual in destroying worms, &c, in the tan-pits, but the cure proved a great deal worse than the disease, as it chilled the whole surface of the tan, and a good way down. Nothing could answer to putrefaction, and yet it acts on certain bodies in a wonderful manner. It commenced operations against the curb-stones of the tan-pit at this place, and would soon have reduced them to a heap of sand, if I had not scraped them well and painted them also. And here, I believe, I have let out the secret why salt has been supposed to be a sort of manure, as it not only kills worms and weeds, but even acts upon certain earths and stones, in a similar manner that severe frosts do.

Equivocal Production of Plants.—It is undoubtedly a very remarkable phenomenon, that the earth when dug to the depth of eight or ten feet, or more, produces many sorts of plants, provided it is advantageously exposed to the sun; but what is more extraordinary, is that this new vegetation frequently affords plants of kinds which have never been remarked in the country. It is natural to ask, whence came these plants? Can it be admitted that the seeds of these new plants were contained in the several kinds of earth? But could all these seeds, which had been perhaps above 3000 years under ground, without having ever been exposed to the action of the sun, have preserved the power of germinating? If we strew ashes on high and arid heaths, we shall see, some time afterwards, clover and vetches growing there, though these two plants had never before been seen on those places. Shall we believe that the seeds of the clover and the vetches were previously in the ground, and only waited for a stimulus to germinate? But how did the seeds come

there? We know that high and arid heaths never produce clover; it cannot therefore be considered as proceeding from a plant which formerly grew there. But even did we admit the possibility that these kinds of earth may contain clover seed, this opinion cannot be maintained in some parts of East Friesland, where wild clover is made to grow by strewing pearl ashes on peat marshes.—*Bull. Univ.*

Cheap and efficacious Manure.—Raise a platform of earth on the head land of a field, eight feet wide, one foot high, and of any length according to the quantity wanted. On this first stratum of earth, lay a thin stratum of lime, fresh from the kiln; dissolve or slack this with salt brine from the rose of a watering-pot; add immediately another layer of earth, then lime and brine as before, carrying it to any convenient height. In a week it should be turned over, carefully broken and mixed, so that the whole mass may be thoroughly incorporated. This compost has been used in Ireland, has doubled the crops of potatoes and cabbages, and is said to be superior to stable dung.—*James Reed, in Gard. Mag.*

Caterpillars.—An edict is published annually by the government of the Netherlands, ordering all the proprietors of lands, and farmers, to clear off caterpillars from the trees twice a year, viz. before the 25th of March and the 25th of April, under pain of the infliction of a certain penalty, determined by law. Would not a law to that effect in this country be of service?

Pearl Barley as a substitute for Rice.—This substance is much used and highly recommended in England and Scotland. The conductor of the *Gardener's Magazine*, some time since, observed, that a grocer in London, (Robinson,) has obtained a patent for preparing barley in such a manner as to resemble rice.

Method of destroying Moles in meadows or gardens.—Collect earth-worms, kill them, and mix them up with the powder of *nuxvomica*. After the mixture has remained in a heap twenty-four hours, take the worms and place one or two here and there in the routes and holes of the moles. The desired effect is said to be a certain result.

From the *Gleaner Farmer*.

STRAW.

Since the introduction of threshing machines into this part of the country, it is a very common thing to see large heaps of straw around the barns where they have been in operation. Many farmers are at a loss what to do with it, or how to manage it to the best advantage; while others are so indifferent to these things, that to get it out of the way with the least trouble, is their only care.

It is an object of the highest importance to every judicious farmer, to understand the right application of manures. Plants need food as well as animals; and he who neglects to feed the former, night with as much propriety neglect the latter; for without the former, the latter could not exist. The existence of man and all the inferior animals, depend upon the annual quantity of plants which the earth brings forth for our use. But by a careless mode of culture and a neglect to supply the proper nourishment, the best soils will soon begin to degenerate, and at last refuse to pay the husbandman for his toil.

Dry straw is considered by some to be worth

but little for manure; and it is worth nothing, indeed, so long as it remains in this state. Others are prevented from applying it on account of its comparative bulk, and the consequence is, it is suffered to remain in the barn-yard, exposed to sun and rain, until it is reduced by fermentation to a black mass of carbonaceous matter.

By this means much of the manure is lost by evaporation, and the noxious gases constantly emanating from such a body, render the atmosphere very impure, and are oftentimes the cause of much sickness and disease; the neglect of man, thus suffering these gases to poison the air which he breathes; which if properly applied, would be converted by the order of nature into the most healthful nutriment.

The true economical method of making the most of manures, is to bury the whole under the soil before fermentation commences; in this manner the whole is saved. When decomposition takes place, the gases, as fast as liberated, are taken up by the roots of the growing plants, entering into new combinations and forming new plants, flourish for a period, and then wither and decay like the former. But to return to my subject—the best method of applying straw as a manure, is to spread it over the ground intended for corn, so as to completely cover it. When the ground is ploughed, a man should follow the plough with a rake, raking the straw into the furrow for a space just wide enough for the next furrow.

It is necessary that the ground should be ploughed deep, and the straw raked in and trod down completely; the raker walking in the furrow to tread the straw down, so that it may be all covered by the plough. The ground should not be ploughed again, as it would plough up the straw. If it is well covered, but little of it will be disturbed when working among the corn. The effects of the manure will be the greatest at the latter end of the season, when it is most needed. At the time of the filling out of the ears, the action of the manure in this way is peculiarly adapted to the purpose, as it then exerts its greatest influence, and causes the cob to be covered with kernels of good size to the very end.

The effects of manures applied in this manner last longer, although their immediate influence is not quite so energetic.

"It appears from the experiments of Hasselpatiz," says Dr Thompson, "that substances employed as manures, produce effects in times proportioned to their degree of putrefaction; those substances which are most putrid, producing the most speedy effects, and of course sooner losing their efficacy. Having manured two pieces of the same kind of soil, the one with a mixture of dung and straw, highly putrefied, the other with the same mixture newly made and the straw almost fresh, he observed, that during the first year, the plants which grew on the land manured with putrefied dung, produced a much better crop than the other; but the second year, (no new dung being added,) the ground which had been manured with the unputrefied dung, produced the best crop. The same thing took place the third year, after which both seemed to be equally exhausted."

The Vine.—A writer on the cultivation of the vine in Sidney, states, that the blight after the fruit is set, may be prevented by ringing the old wood which sustains the young branch.

SWINE.

The following was added to the American edition of *Moubray on Poultry*, &c., just published by Lilly & Wait, and Carter & Hendee; and was written and prepared for that work by the editor of the *New England Farmer*.

The Hon. Oliver Fiske, of Worcester, has rendered great service to the community by introducing to the notice of farmers in this county, a variety of this animal, called the Bedford breed.

The following is an extract from a letter to Mr Fiske, written by his Excellency Levi Lincoln, Governor of Massachusetts, and President of the Worcester Agricultural Society; originally published in the *New England Farmer*, vol. iii. p. 222.

"I have great pleasure in voluntarily offering myself, as your compurgator in the representations with which you have recently favored the public, of the Bedford breed of swine. The care and perseverance which have marked your attention to the prospects and value of these animals, and the success which has followed your exertions to introduce them to the favor of *practical* farmers, require, at least, an acknowledgment of obligation from all those who have been particularly benefited by your liberality, and from no one more than myself. This breed of swine has taken the place of a long legged, long nosed, flat sided, thriftless race, called by some the *Irish* breed, by others the *Russian*, which would barely pay by their weight for ordinary keeping, and never for one half the expense of fattening, if, indeed, grain would make them fat.

"I had three pigs butchered from the same litter, precisely seven and a half months old. Their weights when dressed were 230, 235, and 238½ pounds. One sold in Boston for 63 cents per pound; the other was put up for family use.—The expense of keeping and fattening these pigs, I am satisfied, was less than any other breed I have ever raised; and the proportion of bone and offal to the valuable parts, was surprisingly small. I have fifteen more on my farm, part designed for the market in the spring, and part to be kept over as store swine; and their appearance will furnish ocular satisfaction of the propriety of all which has been said in favor of the breed."

The above is followed by a communication from the Hon. O. Fiske, in which he says, "I have obtained the following account of the introduction of this breed of swine, from the Hon. T. Pickering. He saw them first on a farm of Gen. Ridgely, about fourteen miles from Philadelphia. Gen. R. informed him that they were brought to this country as a present to Gen. Washington, from the Duke of Bedford, who committed them to the care of an English farmer by the name of Parkinson. This man took a farm in the neighborhood of Baltimore; but instead of sending the swine to Gen. Washington, Parkinson sold them. Gen. Ridgely esteemed them very highly, and sent Col. Pickering a pair of them, in a vessel bound to Salem.

"Mr John Reed, of Roxbury, obtained the breed from Col. P.'s stock. From Mr Reed I obtained the offspring from separate litters, and transferred them to Worcester, where by avoiding the breed directly *in and in*, I have preserved them without degenerating. The race is most perfect and valuable when unadulterated; but affords a most valuable improvement to our native breed, when judiciously crossed."

Capt. John Mackay, of Boston, has exhibited at Brighton, a peculiar and excellent breed of swine, which have repeatedly received premiums from the Massachusetts Agricultural Society.

The author of *Gleanings in Husbandry*, an English work of merit, says, "There is an animal kept tame in some of the East India Islands, called *Baby-roussa*, of the same genus as the common swine; which, if it would bear our climate, would be a useful animal, as it lives solely on herbs and the leaves of trees, and never ravages gardens like swine; the flesh is well tasted."

The West India Islands and the Azores ought not to be forgotten, as producing a fine and delicate breed of pigs, originally, it might be presumed, Spaniards, which have at various periods found their way thither; such have been used for the purpose of refining our native breeds.

South America has also a fine breed of pigs. At Lord Somerville's show, in 1809, Mr Gibbs, seedsman to the Board of Agriculture, exhibited a black wild pig from Monte Video. The sow and litter were imported together, and were very savage. They were deep in form, with very fine bone. One of them fattened very young to twenty-four stone, and although ripe and carrying a sufficient quantity of *flair*, it had more flesh in proportion, in the opinion of the butcher, than he had ever before witnessed. There was the least possible offal, the inside seeming to be filled with flesh. It was remarked, that the great gut was smaller than the smallest gut of a small pig. This pork was excellent, inclining to the savory.

It has never occurred, that I am aware, to our breeders, to preserve any of the fine foreign varieties pure, whence possibly a still more delicate pork might be raised than any we at present possess, granting the attempt were made with those which furnish muscular flesh or lean, as well as fat. Some of the wild swine of the opposite continent are well adapted to such purpose, and are besides very prolific. Most countries abounding with forests have herds of swine; these animals, under such circumstance, being always ready to quit domestication. I remember, very many years ago, two young boars retiring, on French leave, to an extensive wood, then the property of Mrs Eldred, between Colchester and Mersea Island, which became subsequently, during several years, the terror of the neighborhood.

From the Farmer's Manual.

HARVEST.

For this most important business, you have had a whole season or I may say nearly a whole year to prepare. I presume, not one single farmer has left this employment to be attended to collaterally, when some other jobs may be finished; but has had his eyes open upon it as a work of the first moment, and is now ready with hands, and tools, and teams, provided. Your rye harvest first claims your attention; is the straw all turned, excepting at the joints? and is your kernel become so hard that you cannot mash it between your thumb and finger? or is the straw below the ear become so dry, that no juice can be forced out by twisting it? You may put in the sickle, if the weather is fine, and cut, and bind, and shock as you go, generally. But if your stalk is very stout and your ear full and heavy, let your gavils lie until the after part of the day, (thundergusts excepted.) You may then bind and shock, stack or cart,

with safety, provided you house your grain where it can have free air, or your mows do not become too large; in this case, your grain will need more curing. The advantages of beginning early upon your harvest, are several.

1. Your grain will yield more and whiter flour: will waste less by shelling. Your harvesting will be expedited, so as to prevent the waste of shelling, by having your last cuttings become too ripe, as is common when the first cuttings become fully ripe, at the commencement of harvest. You will have more time to attend to your turnip crops upon stubble lands, before the wheat harvest or after the wheat harvest. You will also be in readiness for your wheat harvest, which you may cut and manage as in your rye harvest. If you take the same precautions against heat in your grain as in your clover, by having your mows ventilated underneath with proper openings up through the mow, for the circulation of air, the trouble will be trifling compared with the safety and benefit.—When your harvest is housed, you have secured the prime object of your farm—bread,—this is truly the staff of life, the basis of good husbandry and good living.

If you discover a rust upon the straw of your rye or wheat, as is common upon lands highly manured with rich compost or yard dung, you may conclude vegetation is checked, and that your grain either begins or will soon begin to shrink.

Lose no time with your sickle; cut down your grain if the kernel is formed into a consistence; the juices in the stalk will afford more nutriment to the kernel in the gavel, than when standing, and your crop will be saved from ruin. This method is always safe and must never be omitted. When your straw is cured, shock, stack, or house it, as before. One or two days in good weather, will cure your grain in this state; but if the weather proves foul, bind and stack, or shock, for security, and open your stacks in fair weather, until they are fit to house. Every consideration must give place to the saving of your crop. Ridge-in with one foot ridges, such stubble lands as you design to winter-fallow for spring crops.

To Escape the effects of Lightning.—It is particularly dangerous to stand near leaden spouts, iron gates or palisades, at such times; metals of all kinds having so strong an attraction for lightning, as frequently to draw it out of the course which it would otherwise have taken.

When in a house, avoid sitting or standing near the window, door, or walls, during a thunder storm. The nearer a person is to the middle of a room, the better.

The greatest evil to be apprehended from lightning, is the explosion of powder-magazines.—These may, in a great degree, be secured from danger, by insulation or by lining the bulk-heads and floorings with materials of a non-conducting nature, the expense of which will not be great.

Cucurlio.—This little enemy to our stone fruits has not been as destructive this year as it was the last, and the prospect is now fair for a fine crop of cherries, plums and peaches. Apple orchards in this vicinity promise much fruit. The striped cucumber-lug has been less injurious to cucumber and melon plants this season, than it was last year. Wheat continues to promise a fine crop. — *Genesee Farmer.*

From the Farmer's Magazine.

ON CALCAREOUS MANURES.

If a piece of limestone be weighed before burning and again after burning, it will be found to have lost considerably; and the loss will be in proportion to the purity of the limestone and the accuracy of the burning process. The substance expelled by means of the heat was first ascertained by Dr Black, to be fixed air or carbonic acid gas; and the quantity of it which escapes in the burning lime, when collected and weighed, is precisely equal to the difference of weight between limestone and quick lime. In one hundred parts of pure carbonate of lime, the loss in burning will be forty-four; and this having been determined by the most accurate experiments, furnishes a criterion which may be of the utmost advantage in examining the comparative purity of different limestones. For instance, let a piece of limestone of three hundred grains be weighed exactly, and burnt in a strong fire; let it be weighed again upon cooling, and if it has lost forty-four per cent or one hundred and thirty-two grains, the limestone is of the purest kind; but as it never happens that any of our limestones are so pure as this, in any two given specimens, the one which has lost most weight in burning, so as to come nearest to this, is the purest, and the quarry from whence it may be taken should be preferred. Such accuracy may be admissible in preparing lime for building purposes; but for agricultural uses, the proportion of siliceous sand or clay to be found in limestone, deserves no consideration.

There is another mode of examining substances which contain carbonate of lime, which is more generally applicable, and is so simple that it may be resorted to by persons almost entirely ignorant of chemistry. The carbonic acid, which, as I have stated, escapes from lime in the process of burning, is so slightly united with it, that it may be separated by any of the mineral acids. Hence when we suspect the existence of carbonate of lime in any substance, if it is first powdered and then a little spirit of sea-salt diluted with water poured on it, the fixed air is disengaged, and occasions a boiling motion called effervescence, which is considered to indicate the presence of carbonate of lime. Any gentleman, particularly, living in a limestone district, would do well to examine every substance resembling marl or gravel by this criterion, by which a mine of wealth, hitherto disregarded, may be laid open to him. Vinegar would answer equally well for the purpose of a test; but if it is the farmer's intention to determine the proportion of carbonate of lime in any substance, he must have recourse to the muriatic acid or spirit of sea-salt. The whole apparatus necessary for this experiment, are a bottle of the acid, a glass funnel, some filtering paper, a small pestle and mortar, and a pair of accurate scales, with a series of weights descending from one hundred to a single grain. Such gentlemen as possess scales for weighing gold, which have long ceased to be of any use in their original destination, will do well to apply them to this purpose.

The filtering paper should be well dried, and formed with the hand so as to fit the inside of the glass funnel.

The acid should be diluted by the addition of two thirds of water. Substances intended to be operated upon, should be dried in the air and kept in bottles well corked.

One hundred grains appear to be sufficient for one experiment.

Keeping stacks clear of rats and mice.—Take one pound of nitre or salpêtre, and one pound of alum; dissolve them together in two pints of spring or well water; get a fillet of bran and make a mash thereof, putting in two pints of the above liquid, and mixing all together. When you build your stacks, every second course take a handful or two of said mash and throw upon them, till they come to the casing. Allowing your stacks to stand twenty years, rats or mice will not come near them.

From the Worcester Freeman.

CUCUMBERS.

Although this is rather an article of luxury than absolute necessity, yet it is one so easily obtained by every person and consequently of so general use, a few observations on its culture may not be unacceptable to our agricultural friends.

It can hardly have escaped the notice of the most unobserving, that during the fore part of the season, many of the blossoms on cucumber vines are what are usually denominated "false blossoms," which never produce fruit. We have seen it stated by a writer on gardening, that to prevent the appearance of these, and greatly to increase the productiveness of the vines when the plants have but two rough leaves, a stage to which they arrive within a few days after they first come up, the bud or top of the vine should be carefully cut off with a small knife or pair scissors, above these rough leaves, but not too close to them. This causes the plant to put forth runners sooner than it otherwise would do, in greater numbers and nearer the root of the plant; and thus it becomes more productive and at an earlier period than those plants on which this operation is not performed.

What the effect produced by such treatment is, we cannot say from personal experience, but a friend has informed us that he made the experiment last year, and that its success far exceeded expectation. The plants treated in this manner, produce fruit several days earlier and in greater abundance during the whole season, than others which were planted at the same time and in the same hills with them, which were not topped.

It is a common error, not only in relation to cucumbers, but also as to almost all other vegetables of this class, that too great a number are suffered to grow on a given quantity of ground. For instance, it is not unusual to find on a square rod, from one hundred to one hundred and fifty plants, which is at least too great a number by one half.

The root of the cucumber extends many feet in all directions; the fruits require, in order to be of a good quality, a large quantity of juices from the vine; and consequently, where too many plants are suffered to remain, the earth cannot yield the requisite supply, and instead of continuing vigorous and productive through the season, becomes feeble and barren.

Another common error in the culture of this vegetable, is suffering the vines to rest upon the ground. If instead of this, people would take the trouble of sticking them, or while the plants are

* The Scotch fillet varies, but is generally somewhat more than a Winchester bushel.

small laying between the hills brushwood, their labor would be richly compensated.

BONE-BUST FOR GRAIN.

The exportation of bones from Germany to England, constitutes a singular epoch in the annals of commerce. Myriads of tons have been already exported, without glutting the market or causing a cessation of the demand. In the vicinity of the North Sea, mills have been erected to pulverize them. This bone-powder or bone-dust, was long ago exclusively applied to the purposes of hot-houses, by German horticulturists; but the English, emboldened by their riches, have extended its use to general objects of agriculture, and fertilize by these expensive means, their cold, humid, and poorest lands, bringing them to the highest state of cultivation.

There is consequently a proverb, that "one ton of German bone-dust saves the importation of ten tons of German corn." As Malta formerly covered her naked rocks with foreign soil, so does England now fertilize her clay and sandy heaths with German bones. Near the sea shore, even the church yards are robbed of their venerable relics, which is only ironically excused by rendering the German bone trade popular.

An agriculturist having instituted some experiments to test the effects of this manure, obtained the following results:—1st. That in respect to the quantity of the corn, it effects a change as seven to five; in respect to quality, as five to four; in regard to the durability of the energy of the soil, as three to two.

It likewise yields the following collateral advantages:—1st. It destroys weeds. 2d. It diminishes the necessity of suffering the land to lay fallow. 3d. This concentrated manure or substitute for manure, is more easy of conveyance, less laborious to spread, and can with facility be applied to the steepest vineyards or other inaccessible lands, either in mountainous countries or in wet meadow land. 4th. It renders agriculture practicable without cattle, breeding, grazing, &c.

ONIONS FROM TIME IMMEMORIAL.

To give some idea to those who have not thought on the subject, of the effects of age upon a cultivated soil, I shall here mention a fact that struck me as being not a little singular at the time it occurred. At Dunstaffnage, near Oban in Argyshire, Scotland, which is a mountainous country and naturally a barren soil, a small garden was pointed out to me, on which was growing at the time one of the finest crops of onions I had ever seen. I took notice of it with some degree of surprise, because I had seen no other crop of onions in that district that was tolerable; but my surprise was a good deal augmented on being told, that the present crop in that garden was by no means remarkable; that it had been cropped with onions, year after year, from time immemorial; that the present owner of it, who was a man above eighty years of age, had never seen any other crop than onions upon that ground; and that the oldest person alive, when he was a boy, had told him the same thing, and the crop was always an excellent one. Dunstaffnage was a royal palace, belonging to the kings of Scotland at an early period of their history almost beyond record, and there can be little reason to doubt that this garden was brought under cultivation at that time, so that it cannot

now be less than five hundred years old, and probably several hundred years more. I question much if the soil could have been rendered capable of producing successive crops of such fine onions, for a great many years after it was first turned up from the waste, by any device that the ingenuity of man could have suggested. To judge, then, of the most profitable mode of cropping such old soils, by the same rules that would apply to those which had not had time to be fully matured, would be very absurd. Many cases of this sort would no doubt occur on our survey of the Netherlands, could it be properly effected.—*Dr. Jackson.*

BATHING.

Cold Bath.—1. We are never to enter the cold bath when the temperature of the body is below the standard of health; if it is a few degrees above this, the bathing will be proportionably more grateful and invigorating.

2. We should never remain long in the water, no longer than to secure a vigorous reaction. The common mistake on this point is, not only to remain in the water till the glow of warmth arising from the shock is established, but till it is dissipated by continuing in the water too long, or by returning too often.

3. We are to bathe before breakfast, or better before dinner.

4. We are to bathe when the stomach is empty or nearly so. And,

5. We are to bathe every second or third day only; or if our bathing depends on the tide, we may bathe several days in succession and then omit as many.

Warm Bath.—1. The warm bath should be entered by persons in health, at ninetythree degrees of heat, and after waiting a few minutes and attending to the sensations, its temperature should be so altered, if any alteration is required, as to render it the most grateful to our feelings.

2. The best time for bathing is the forenoon, after the breakfast is digested. The cases in which it is preferable or expedient to bathe in the morning or evening, are few, and to be regarded as exceptions to the general rule.

3. It is not easy to point out as a general direction, any precise period as the best time for remaining in the bath. It will often be useful to remain in the bath for half an hour, or even an hour.

4. The frequency of bathing should also depend much on circumstances. When the bath is taken to prevent disease and improve health, and is well borne, it may be used every second or third day.

5. Bathing should be preceded and followed by exercise.—*Dr. Coffin.*

IRISH PEASANT.

Let us take another view of the inmate of the cabin, for he may be found of all tints. Observe the half-clad peasant, breasting the storm with wiry sinews, his ragged coat streaming in the wind, travelling to some neighboring market with a load on his shoulders. This load is a web of linen cloth, for which, should he be fortunate enough, he may obtain from 6d. to 10d. a yard.

And this trifling sum is all that this man obtains for a yard of cloth, after having grown his own flax on land for which he must pay from thirty to eighty shillings per acre; after the labor attending

the pulling, watering, drying, cringing, dressing, spinning, weaving, and taking to market. Then, with the proceeds of the sale of this cloth, together with the sale of his corn, (for these men generally rent three or four acres of ground), he contrives to pay his rent. While himself and family live or rather drag out a miserable existence, entirely on potatoes; for his ducks and fowls, geese and turkeys, are all brought to market to enable him to purchase something to cover his nakedness; nor will his utmost exertions enable him to procure better fare.—*London.*

CURIOUS PEACH TREE.

We have lately examined a peach tree which was raised from the seed by Mr. A. Brown, of the town of Greece in this county, which is a great curiosity, as exhibiting variations from the common laws of vegetation. At the season when other trees put forth their blossoms, there may be seen upon this a great number of button-shaped buds or projections, corresponding in situation to the blossoms on other trees, which, instead of expanding and showing petals or flower-leaves, send out from thirty to forty small peaches. As these increase in size they make a singular appearance, and would have us to conclude, that the stamens and petals, by some unaccountable process, had been changed into rudiments of fruit. It is not uncommon among garden flowers, to see those monstrosities which we call double flowers, (as the double peony,) in which all the stamens have been converted into petals, from which circumstance such flowers do not produce seed; but we do not recollect to have seen an instance where stamens and petals both, appeared to have been converted into capsules or fruit. Should any of our nurserymen have noticed the like sports of nature, we would be glad to hear from them.—*Genesee Farmer.*

VINES IN POTS.

Any one who is curious to have vines in pots, full grown, should, at the time of pruning, take the stem through the hole in the bottom of the pot, and lay the rest of the vine from the bottom of the pot in the ground, they thus shoot much sooner. For such purposes, I take the old shoots that are to be cut out that season. For the pots, I use the same compost as for the border. I always keep rotten dung about the pots, as it makes the vines strike much sooner than keeping the pots dry. I have had twenty-five good bunches in a pot, and could have had more, but for thinning. When the fruit is at maturity, I cut the old bunch by the bottom of the pot, and remove the plant at pleasure, for ornament.

I have often taken notice, that in some sorts of vines the foliage turns brown, just as if it had got a little frost. Such vines are generally on a clay soil or on a bottom that does not let the roots push freely, so causing a stagnation of the sap.—*Cultivator Horticultural Society.*

HOP TOPS.

The hop forms an excellent substitute for asparagus, and the tops may be had the whole year round. Hop tops also form an admirable ingredient for a variety of dishes, such as soups, omelets, &c. Long experience in the practice of cookery, both in this and in my native country, for upwards of forty years, makes me bold in recommending hop tops. I was for some time in the kitchen of

the king of Sardinia, where the art was practised in all its branches. I was afterwards thirtyfour years with the Hon. D. F. Halyburton, as cook and house-steward. The being of delicate constitution, and eating no sort of animal food whatsoever, I was, on his account, obliged to study varieties of vegetable dishes. Hop tops formed one, on which I by chance stumbled and of which he very highly approved, finding it agreeable and very wholesome.—*Id.*

On Grafting the Vine.—This has been practised with perfect success at the Royal Gardens at Potsdam. The grafting is done as near the ground as possible, and grafts are chosen to be equal in diameter to the stock, so that both sides of the bark of the graft and that of the stock may fit exactly together. After being tied, the soil must be raised to cover the graft, and when the stock is too high this may easily be accomplished by a flower-pot filled with earth. By this way of engrafting, grapes may be obtained the first year, as large and plentiful as on any other vines.—*Id.*

The Crops.—The warm delightful weather with which the country has been blessed, during the last few weeks, has given a new aspect to the country and vegetation. The crop of hay which is now in process of gathering is abundant and remarkably excellent in richness. Wheat and rye promise rich crops, and a full garner to our husbandmen. In a ride through the meadows the other day, we noticed their almost exclusive devotion to various kinds of grain; a field of broom corn scarcely showing itself. Indian corn, however, looks feeble and sickly, and the crop must be small and valueless. The apple trees promise an unusual rich return, and other fruits not so bad or deficient in quantity as was anticipated. Cherries, strawberries, green peas, and other fruit and vegetable luxuries, are now abundant here.—*Northampton Courier.*

Diseases of Peach Trees.—The grub worm or borer, so injurious to peach trees, is not killed by a strong solution of corrosive sublimate. The best method is to examine the roots for a few inches under the surface, two or three times, at the season when most liable to be injured. With a sharp pointed knife, the worms may be detected and cut out. Tan-bark put around the roots, four or five inches deep, preserves them. If any one tree shows indications of the yellows, it should be immediately cut down or dug up. Soon after the tree is attacked by the yellows, several feeble branches grow out together in various parts of the limbs.—*New York Farmer.*

The Season.—A gentleman who has just returned from an excursion up the valley of the Connecticut river, informs us that the warm delightful weather for the last two or three weeks, has given a new aspect to vegetation in that region, and that the farmers are not without hope of yet seeing their crops fully ripened in their season. Hay will be abundant and cheap; apples will be more numerous than was anticipated; corn is coming forward rapidly, but cannot be quite as productive as usual; while cherries, strawberries, and all the early and delicate fruits, are at present enjoyed in full perfection.—*Boston Traveller.*

A London paper says, that 112,000,000 lbs. of butter are consumed annually in London.

NEW ENGLAND FARMER.

Boston, Wednesday Evening, July 11, 1832.

CLOSE OF THE TENTH VOLUME.

The lapse of time has brought us to the close of another and the tenth annual volume of the New England Farmer. We shall not attempt a retrospect of our labors, nor shall we trouble our readers with promises nor anticipations of future exertions. What we have done is humbly submitted as the only pledge we can offer for what we hope to perform. A tolerable share of industry, and an anxious desire to render services to our country and mankind, are our only claims to patronage; and on these we shall continue to rely until we shall perceive indications that our services are not wanted, or not appreciated, in the sphere to which we are devoting our labors.

Present appearances are favorable to the continued prosperity of the New England Farmer. It is true we have long been in the field, but it is wide and every day brings some useful novelty to notice, or gives new views of well known objects, which may lead to some improvement in the great arts to which our publication is devoted. We hope that our correspondents will continue to lighten our labors and cheer us in our course, by the results of experience and the deductions of agricultural and horticultural science, till with the aid of our own humble but unremitting efforts, the community may be benefited to the full extent of what our best friends and patrons have ever been led to anticipate.

The *Index* to the tenth volume of the New England Farmer is nearly completed, and will be printed and forwarded to our subscribers with all possible expedition.

GARDENER'S WORK FOR JULY.

Clean and prepare your ground where your early crops of peas, spinach, cauliflowers, and cabbages grow, and all other vacant spots, to cultivate thereon such plants as are proper to supply your table in autumn and winter, with later-grown productions. You may continue to sow crops of small salading every eight or ten days; but they should now be sown on shady borders, or else be shaded by mats, occasionally, from the mid-day sun, and frequently watered, both before and after the plants appear above ground. You may now plant out your celery plants in trenches, unless you have already performed that operation.—About the middle of July, and from that time to the end of the first week in August, you may sow turnips. Thin and transplant such lettuce as were sown last month and sow more lettuce seed in the beginning, middle, and last week of this month, in order to have a constant supply for the table. Sow likewise, radishes; and in the last week of this month, a good crop of spinach may be sown for autumn use; it will not then be so liable to run to seed as in the preceding months. It is a good practice to sow early kinds of cabbages about this time, for a supply of good greens during autumn. Collect all kinds of seeds as they come to maturity, cutting off or pulling up the stems with the seeds attached, as they ripen. Spread them in some airy place under cover, turning them now and then, that the seeds may dry and harden gradually, and be careful not to lay them so thick as to hazard their heating and fermenting. When they are sufficiently dry, beat out and clean the seeds,

and deposit them in bags or boxes till wanted. Give water to such plants as require it, but let this be always done in the evening, that it may be of use to the vegetables before the sun shall cause it to evaporate.

You may now inoculate or bud your fruit trees, and, where it can be done without inconvenience, it will be well to turn swine into your orchard to eat the fallen and decayed fruit, and thus destroy the insects which it contains. If, however, this cannot well be done, or you have not swine in sufficient numbers to devour all your fallen fruit, it will be well to gather and carry it from the ground before the insects which inhabit it, make their way into the earth, and make you destructive visitations another season.

CATTLE SHOW, &c. AT NORTHAMPTON.

We have received a handsome handbill containing notices of the "Cattle Show, Exhibition of Manufactures," &c. of the "Hampshire, Franklin, and Hampden Agricultural Society," which is to be held on Wednesday, Oct. 24, 1832. It is too long for us to copy at full length, but we will give an abridgment of some of the leading items. For the best Bull, more than one year old, to be kept for a sire within the limits of the Society for one year from and after the fair, \$8; for other bulls in succession, from the second best \$6, to the fourth best \$1. For the best Milch Cow, above three years old, \$3; for the best two years old Heifer, \$3, &c. For the best pair of Working Oxen, not less than four years old, &c, \$7, &c. For the best pair of Cattle for the stall, \$10, &c. For the best Merino Buck, &c, \$5. For the best Bear, &c, \$1. For the best Stud Horse, &c, \$8. For the best Blue Woollen Cloth, &c, not less than fifteen yards, \$6. For the best Woolen Cloth, other than Blue, &c, \$6. With premiums for a variety of other manufactures, including cassimere, satin, Scotch plaid, flannel, floor carpeting, hearth rugs, cotton counterpanes, woollen counterpanes, stockings, sheets, diaper, palm-leaf hats, and straw bonnets. For the best Butter, not less than twenty-five pounds, \$3. For the best Cheese, not less than one hundred pounds, \$3. For the best swarms of Bees, \$10; for the five best swarms, \$5, &c. The greatest number of Mulberry Trees, &c, \$15, &c. The greatest quantity of Cocoons, \$5, &c. Best acre of Winter Wheat on old land, \$10, &c. Best acre of Spring Wheat on old land, &c, \$10. For Winter Rye, Indian Corn, Potatoes, similar premiums. The prospectus containing the notices of which the above is an abridgment, is signed by MARK DOOLITTLE, President, and by DANIEL STEBENS, Cor. and Rec. Secretary.

MASSACHUSETTS HORTICULTURAL SOCIETY.

SATURDAY, July 7, 1832.

The standing committee on ornamental trees, flowers, &c, award the following premiums:—

To Mr David Haggerston, of Charlestown, for the best Rammulus, a premium of four dollars.

To Mr Augustus Aspinwall, of Brookline, for the finest Roses, a premium of five dollars.

To Mr David Haggerston, of Charlestown, for the best Anemones, a premium of three dollars.

Per order, R. L. EMMONS, Chairman.

Fruits exhibited.—The specimens of fruit ex-

hibited this day were not numerous, but were all of the most extraordinary quality.

By Elijah Vose, Esq. of Dorchester, Downton Strawberries. By Mr Haggerston, of Charlestown vineyard, Wilmot's Superb Strawberries. By Mr Geo. W. White, from Pomeroxy Place in Brighton, Black Tartarian and White Bigarreau Cherries.

WILLIAM KENRICK.

N. B.—The Strawberries and Cherries were very fine specimens, thought to be equal or superior to any ever exhibited at the Hort. Rooms. The show of Roses was rich and choice.

At a meeting held this day, the following gentlemen were admitted members of the Society:—Isaac L. Hedge, of Plymouth; George W. Bond, Francis Skinner, Elbridge Gerry Austin, and B. B. Grant, of Boston.

Fine Roses and other Flowers were exhibited by Messrs John A. Kenrick of Newton, Augustus Aspinwall of Brookline, Messrs Winslip of Brighton, William Kenrick of Newton, Samuel Walker of Roxbury, and Richard Ward of Roxbury.

The following circular was received by the President of the Society, accompanied with two bottles of wine. No. 10 was found to coincide with the description below, but No. 70 had been robbed of its contents by some inquisitive bacchanalian, who possessed more taste than honesty.

BROOKLYN, Long Island, }
June 27, 1832. }

SIR—Believing you feel a deep interest in the progress of our agricultural and horticultural concerns, I take the liberty to send you herewith two bottles of American wine, made from a grape lately introduced to our notice and called the *Isabella* grape.

Bottle No. 10 is the *pure juice*, to which two pounds of sugar per gallon were added, for fear of its running into the acetous fermentation.

Bottle No. 70 is one third water to two thirds juice. A gallon of brandy was added to a cask of nineteen gallons, three pounds of sugar for each gallon. The grapes from which this wine is made had been packed in wheat bran to preserve them through the winter, but on examining them a month after, I found them taking injury by fermentation, and therefore converted them into wine.

This being my first experiment at wine making, it must be regarded as a mere experiment. I cannot, however, learn that any other person has attempted to make wine of the *Isabella* grape, and therefore believed that my first essay might be of interest to cultivators generally.

My vineyard is young and covers nearly two acres, planted at different times. Some of the vines commenced bearing last season, and from them I sold about one thousand pounds of grapes, in the New York market. My attempt to keep grapes through the winter, in *wheat bran* and in dry sand, has failed. I am desirous of ascertaining the best mode of preserving them.

The *Isabella* vine is probably known to you as a most prolific bearer. It was introduced into Brooklyn from North Carolina, by Mrs Isabella Gibbs, the lady of George Gibbs, Esq. now of St Augustine, Florida. It is the ornament of almost all our yards and gardens, and the farmers and gardeners are beginning to raise the fruit in quantities for the New York market. It is known to thrive well in the western parts of New York, and

I trust is destined to be one of the sources of comfort and profit to our citizens.

I am, Sir, very respectfully,

ALEXEN SPOONER.

To the Pres. Mass. Horticultural Society.

HORTICULTURAL JOURNAL.

Kept at the garden of the proprietor of the New England Farmer, in Lancaster, Mass., thirty-five miles west from Boston, on the river Nashua.

July 3. Thermometer 84 at noon; fair. *Horis ananra*, *Convolvulus minor* (a most beautiful annual), *Lilium concolor* (an elegant dwarf lily), *Cereopsis lanceolata*, *Spirea ulmaria* (fine perennials), *Phlox carnea*, *Rudbeckia purpurea*, *Verbascum nigra*, and *Dianthus vulgaris*, in bloom.

July 4. Thermometer 81 at noon; fair. Planted Early Frame Cucumbers, (those planted earlier entirely free from bugs in this quarter, Squash and Melon Vines have also escaped their ravages.)

July 5. Thermometer 85; fair; ground getting dry. *Scorzonera tinctoria* (a pretty annual from Tangiers), in bloom; also, *Crepis rubra*, *Chrysanthemum cornaria* and *Lupinus pilosus*.

July 6. Thermometer 87; fair; ground very dry. Vines of all kinds look very promising. *Malva rosea*, *Cereopsis verticillata*, *Delphinium grandiflora*, and *Cucis canus*, all handsome perennials, in bloom; also, *Cereopsis tinctoria* and *Silene rubella* (both showy annuals), and *Thunbergia alata* (a superb new creeper from the East Indies).

July 7. Thermometer 86; cloudy.

Among the interesting plants that have recently been introduced into England, by the exertions of distinguished florists, the *Thunbergia alata* (so named from Doct. Thunberg, Professor of Botany in the University of Upsal) from the Eastern coast of Africa, has proved a great acquisition. It was first cultivated in England, in 1825, by R. Barclay, Esq. It is a climbing perennial, easily raised from seeds or cuttings, in light rich mould; comes into flower the first season when quite young, and continues producing numerous beautiful yellow flowers with a rich purple centre, in succession, for many months. It grows well in pots for the parlor, with a small trellis, and will endure a slight frost without injury. We have nearly two hundred plants just coming into flower, from seeds presented us by Dr Ward and Mr Charles Lawrence, of Salem. It does not flower in perfection, however, till the beginning of August. We believe it is in but few American collections.

Indian Corn, though rather backward in this quarter, looks finely. Rye, which was winter-killed in many instances, was benefited much by the cold spring, and promises a fine crop. Wheat, the culture of which appears to be increasing, with a few fields we have seen of it, look well. We noticed an acre of Tea Wheat last autumn, on the farm of Mr Samuel Whitmarsh at Northampton, that was in excellent condition and produced a heavy crop. Haying has commenced the past week, with the prospect of a good crop.

Notice.

THE annual meeting of the Roxbury Yeoman Association for the protection of Fields, Orchards, and Gardens, will be held at the Town House, on Saturday evening the 14th inst. at 8 o'clock, for the choice of officers and for transacting such other business as may come before said meeting. DAVID DUDLEY, Sec'y.

Roxbury, July 10, 1832.

P. S.—Members having subscription lists and collections, are requested to forward the same to the treasurer.

Cradles.

FOR sale at the Agricultural Warehouse, No. 50½ North Market Street, a few very excellent Grain Cradles. J. R. NEWELL.

Lead Pipe and Sheet Lead.

LEAD PIPE and Sheet Lead of all sizes and dimensions, constantly for sale at No. 110 State street, by ALBERT FEARING & CO.

Bone Plant.
SEEDS of the Bone Plant, in packages of 12½ cents each, for sale at the New England Seed Store, 50½ North Market Street.

This is an esteemed medicinal plant for the summer complaints of children; the green leaves thrown into a tumbler of water, converts it into a thin tasteless mucilage. July 4.

Turnip Seed.

FOR sale at the Seed Store connected with the New England Farmer, No. 50½ North Market street, Boston: White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this establishment.

Also—Ruta Bags of the first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted genuine and fresh.

Also—A few packages of Dale's Hybrid Turnip Seed, a new variety, highly esteemed in Scotland. Price 12½ cents per paper. July 4.

Horse Quicksilver.

QUICKSILVER will stand this season at the stable of the subscriber, in Brighton, a few rods south of the meeting-house, and will cover only twenty mares the next season, at \$15 each, and \$1 in addition to the groom. Mares warranted to be in foal, if \$20 is paid, and \$1 to the groom; and in discharge of warranty, the \$20 will be returned.

Quicksilver is a beautiful bright bay, three years old; his sire, Sir Isaac Coffin's horse, Barefoot, conspicuous in the racing calendar of England; his dam, Rebecca, from the imported Cleveland bay horse Sir Isaac, and Sky Lark, a native mare, well known by her fine form, speed, and bottom, once owned by Mr Leavitt of Salem, to whom persons are referred for her character, and will be to many others in Massachusetts and Maine. Quicksilver is thought by good judges to combine with great symmetry and delicacy of form, bone, muscle, and all the requisites for a first rate covering horse. Mares sent to him, and if left with the subscriber, will be well attended to on reasonable terms, but he will not be responsible for accidents. BENJAMIN W. HOBART.

Brighton, June 12, 1832.

Barefoot.

THE celebrated English Horse Barefoot will return from New York to the Brighton stable about the latter end of June. Barefoot has proved one of the most successful racers of his day, at York, Doncaster, Newmarket, Ascott, &c, and his pedigree exhibits the best blood known. epw May 23.

Treatise on Domestic Animals.

THIS day published, by Lilly & Wait, and Carter & Hendece, and for sale by J. B. RUSSELL, No. 50½ North Market Street, "A treatise on breeding, rearing, and fattening all kinds of poultry, cows, swine, and other domestic animals." By B. Moubray, Esq. Reprinted from the sixth London edition. With such abridgments and additions as it was conceived would render it best adapted to the soil, climate, and common course of culture in the United States. By Thomas G. Fessenden, Esq., editor of the New England Farmer." Price 75 cents. June 13.

Pickering's Tree or Caterpillar Brushes.

For sale at the Agricultural Warehouse, No. 50½ North Market Street, Pickering's Improved Tree Brushes.—This article, (which is likely to be in greater demand this season, than for many previous years) will be constantly for sale as above, made of the best materials and workmanship; and no doubt is the best article for the purpose of any now in use. May 16.

Brass Balls for Cattle Horns.

FOR sale at the Agricultural Warehouse, Brass Balls for Cattle Horns, improved, which renders them easy for fitting and do not injure the growth of the horn. These balls are not only a safeguard against unsuited animals, but add much to the appearance of a likely animal. June 6.

Printing Presses for Sale.

FOR sale at this office, one Smith's Imperial Press, one do. Medium, and one Ramage. July 11.

BRIGHTON MARKET—MONDAY, JULY 9, 1832.

Reported for the Daily Advertiser and Patriot.

At Market this day 534 Beef Cattle, (including 45 unsold last week) 8 Cows and Calves, and 2920 Sheep, 155 Beef Cattle and about 400 Sheep unsold.

PRICES. *Beef Cattle*.—The unusual number of Cattle at Market has caused a "glut." Sales dull and prices much reduced. We quote the one and four yoke, extra, some of which were engaged last week, at \$6; prime at 5 25 a 5 50; good at 4 75 a 5 25; thin at 4 45.

Cows and Calves.—A few sales were effected, price not known.

Sheep and Lambs.—We noticed lots of Lambs with a few old Sheep, taken at \$1 50, 1 58, 1 71, 1 88, 2 00, 2 08, 2 17, and 2 33; also, lots of Wethers at \$1 67, 2 00, 2 25, 2 50, 2 75, and 3 00.

Swine.—None at market.

NEW YORK, July 7.—In market this week, 400 Beef Cattle, 1000 to 1500 Sheep and Lambs. Beef Cattle not all sold, a few remaining over. Sales at fair prices, averaging \$6 25, ranging from 5 50 to 7. Sheep market tolerably brisk, sales from \$2 00 a 4 50. Lambs \$1 50 a 3 00.—*Daily Ad.*

IN the N. York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

Miscellany.

FOR THE NEW ENGLAND FARMER.

THE COLUMBIAN CULTIVATOR.

Son of the soil, inured to toil,
Behold the cultivator,

Lead forth his band to till the land,
The happiest wight in nature!

O'er Lawyer Pop and Doctor Slop,
And Captain Flash transcendent,
Church, camp and court, he must support,
Or ruin is impendent.

He feeds the great with pride elate,
Their prattlers and their charmers;—
Tips of the ton, ye live upon
The industry of farmers!

And though the train of vice and vain,
Society's excrescences,
Subsistence gain from crime and pain,
Misfortunes and malfacances,

Farmers may boast they flourish most,
Where all is love and unity—
Where wisdom guides and worth presides,
And crime meets no impunity.

From the Genius of Temperance.

THE WIFE.

"Fec'at thou no joy, no quiet happiness,
No soothing sense of satisfaction,
In loving and being loved? Is there no weight
Removed from the heart, in knowing there is one
To share all, bear all with thee? To sooth grief,—
Yea, to soften away its human pain
By a superior love, the cup to temper
With words of consolation and sweet hope,
That even its very bitterness shall seem sweet,
Forgotten in the love that offers it!"—*E. L. Reade.*

Woman's love, like the rose blossoming in the arid desert, spreads its rays over the barren plain of the human heart, and while all around it is black and desolate, it rises more strengthened from the absence of every other charm. In no situation does the love of woman appear more beautiful, than in that of wife. Parents, brethren and friends, have claims upon the affections; but the love of a wife is of a distinct and different nature. A daughter may yield her life to the preservation of a parent; a sister may devote herself to a suffering brother; but the feelings which induce her to this conduct are not such as those which lead a wife to follow the husband of her choice, through every pain and peril that can befall him, to watch over him in danger, to cheer him in adversity, and even remain undaunted at his side in the depths of ignominy and shame. It is a heroic devotion which a woman displays in her adherence to the fortunes of a hapless husband. When we behold her in her domestic scenes, a mere passive creature of enjoyment; an intellectual toy, brightening the family circle with her endearments, and prized for the extreme joy which that presence and those endearments are calculated to impart; we can scarcely credit that the fragile being who seems to hold her existence by a thread, is capable of supporting the extreme of human suffering. Nay, when the heart of man sinks beneath the weight of agony, that she should maintain her pristine

powers of delight; and, by her words of comfort and patience, lead the distracted murmurer to peace and resignation.

COMETS.

Comets are solid opaque bodies, with long transparent tails issuing from the side which is turned away from the sun. They move about the sun in very eccentric orbits or ellipses, and are more dense than the earth. The extreme heat, the dense atmosphere, the gross vapors, the chaotic state of the comets, seem to indicate at first view, that they are altogether unfit for the habitation of rational beings; and therefore some are of opinion, that they are so many hells for tormenting the damned with perpetual vicissitudes of heat and cold. But as the Deity displays his goodness wherever he exerts his power and wisdom, so we conclude that such large masses of durable matter as the comets are, however dissimilar to our earth, are not destitute of rational beings, capable of contemplating with wonder and acknowledging with gratitude, the wisdom, symmetry and beauty of the creation, which is more plainly to be observed in their extensive celestial tour, than our confined circuit.

In the year 1830, the inhabitants of the earth were greatly alarmed by the appearance of a blazing comet, which they expected would set the world on fire. Sir Isaac Newton calculates that this comet moves at the rate of 800,000 miles an hour, and in its nearest approach to the sun, is ten thousand times hotter than red-hot iron. Dr Olbers calculates that this comet will not appear again until the year 2000, and perhaps not then.

The comet which is expected at the present time is comparatively small; it is called Encke's comet, from the name of a German astronomer who discovered it.

The royal astronomer of Prague, David, says that it may be seen at its first appearance, by the best telescope, in the sign Pisces, and will for a time set with the sun. This comet will not interfere with the earth, until the law of gravitation is suspended and destroyed.—*Great Falls Journal.*

MOTION OF WAVES.

There is a curious optical deception attending the alternate elevation and depression of the surface of a liquid. The waves thus produced appear to have a progressive motion, which is commonly attributed to the liquid itself. When we perceive the waves of the sea apparently advancing in a certain direction, we are irresistibly impressed with the notion, that the sea itself is advancing in that direction. We consider that the same wave, as it advances, is composed of the same water, and that the whole surface of the liquid is in a state of progressive motion. A slight reflection, however, on the consequences of such a supposition, will soon convince us that it is unfounded. The ship which floats upon the waves is not carried forward with them; they pass beneath her, now lifting her on their summits, and now letting her sink into the abyss between. Observe a sea-fowl floating on the water, and the same effect will be seen. If, however, the water itself partook of the motion which we ascribe to its waves, the ship and the fowl would each be carried forward, and would have a motion in common with the liquid. Once on the summit of a wave, their motion would be as if they were propelled on the calm surface of the lake. Or if once in

the valley between two waves, there likewise they would continually remain, the one preceding and the other following them.—*Genius of Temperance.*

ANECDOTE.

The following is found in an ancient history of Connecticut. Soon after the settlement of the town of New Haven, several persons went over to what is now the town of Milford, where, finding the soil very good, they were desirous to effect a settlement. But the premises were in the peaceable possession of the Indians, and some conscientious scruples arose as to the propriety of dispersing and expelling them. To test the case, a church-meeting was called, and matters were determined by a solemn vote of that sacred body. After several speeches had been made in relation to the subject, they proceeded to pass votes; the first was the following: "Voted, that the earth is the Lord's and the fulness thereof." This passed in the affirmative. And, "Voted, that the earth is given to the saints." This was also determined like the former, *unanimously*. 3d, "Voted, we are the saints." Which was passed without a dissenting voice, the title was considered indisputable, and the Indians were soon compelled to evacuate the place, and relinquish the possession of the rightful owners.

In Old Coat.—A spendthrift, who had nearly wasted all his patrimony, seeing an acquaintance in a coat out of the newest cut, told him he thought it had been his great-grandfather's coat. "So it was," said the gentleman, "and I have also my great-grandfather's land, which is more than you can say."

Postscript.—George Selwyn once affirmed in company, that no woman ever wrote a letter without a postscript. "My next letter shall refute you," said Lady G. Selwyn soon after received a letter from her ladyship, and after her signature, "P. S. Who was right now, you or I?"

Sportsman and Conqueror.

THESE Horses will stand the ensuing season, at the Ten Hills Stock Farm, in Charlestown, two and a half miles from Boston, on the Medford turnpike; for particulars, see late Nos. of the New England Farmer, and Bills. They are confidently recommended to the public by the subscriber. SAMUEL JAQUES.

Ten Hills Stock Farm, May, 1832.

Sportsman's get may be seen on the farm.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[?] No paper will be sent to a distance without payment being made in advance.
